

contmgr generate contact lists for Google, iPad, Fritz!Box, your hand bag

doc generated from the script with [gendoc](#)

ruby script, version=1.00

Usage

```
contmgr [options]
```

Description

contmgr creates files:

```
|<Contacts><User>.pdf| for printing a phone booklet,  
|<Contacts><User>.xml| for import in the Fritz box phonebook,  
|<Contacts><User>.vcf| for import in iPad and Google contacts
```

in the directory `CONTDIR` (defined below), using the file `Contacts.txt` (a tab-separated export of Thunderbird's address book) in the same directory.

`CONTDIR` is the directory part of the environment variable `CONTACTS`, which must be defined and should contain the full path to your tab-separated export of Thunderbird's address book.

Without the `--key` option, `<User>` will be empty, with it, `<User>` is replaced with the argument of the `--key` option.

Without the `--labels` option, `<Contacts>` will be `Contacts`, with it, `<Contacts>` will be `Labels`.

contmgr recognizes the following options:

<code>-k, --key=STRING</code>	selection key selects records containing the key in the AIM field
<code>-l, --labels</code>	print labels
<code>-r, --return</code>	use returnaddresses in labels
<code>-c, --company</code>	list company
<code>-e, --email</code>	list email
<code>-s, --fontsize=INT</code>	set fontsize (default: 11)
<code>-a, --noareacode=INT</code>	remove specified areacode from phonenumber
<code>-h, --help</code>	this help

If a key was given, then list only persons who have that key in the Screen Name field

Examples:

list all addresses, no company, include email, smallest font:

```
contmgr -es9
```

list Mia's addresses, no company, include email, remove areacode if 344:

```
contmgr -ea 344 -k Mia
```

list Anny's addresses, including email, fontsize 12, remove areacode if 345:

```
contmgr -e -a 345 -s 12 -k Anny
```

Change addresses and phone numbers only in TB's Personal Address Book.

Transfer to FritzBox:

```
contmgr -es9
```

produces:

- `~/Dropbox/Contacts/Contacts.xml`, Use that file on the FritzBox to restore the phone book.
- `~/Dropbox/Contacts/Contacts.pdf`, a printable address list, for your hand bag.
- `~/Dropbox/Contacts/Contacts.vcf`, use for import in [Google contacts](#) or [Fritz!Box](#).
