

Steps to run run jacamo (.jcm) files by double click (MAC OS)

1. open **Automator** application (available in Applications)
2. create a new **application**
3. add a run script action:

4. write the script:

```
/Users/jomi/pro/jacamo-svn/bin/jacamo.sh $1
```

(in case of jason .mas2j, the script will look like:

```
/Users/jomi/pro/jason/jason-svn/bin/mas2j.sh $1  
APPDIR=`dirname $1`  
/opt/local/bin/ant -f $APPDIR/bin/build.xml
```

)

replacing the path according to your installation.

The script jacamo.sh is available at the SVN of jacamo (it is not yet in the latest distribution file).

5. change the "Pass Input" to "as argument".
6. save
7. select a .jcm file, type command-I, in "open with" select the script saved in previous step.
8. click on "change all".

That's it.

Maybe MAC-OS will complain to run it, go to System Preference -> Security and click on "Open Anyway".
