Professor	1. I want to have unittest where the assert statements are written. This unittest can test any dimension board. For example, when students make or select a desired 10 x 10 dimension board (streets and avenues), Professor will be able to run unittest and verify that it is a correct 10 x 10 dimension board. 2. I will be able to use NOSETESTS to do unittest and then prove that a script is FAILED or OK.
Student	1. I can use the same features from above and do several unittests if I make different dimension boards.
