Description: Serialize evolvable properties of a `traceDarkMatter` implementation of the `position` component to array.
Code lines: 17
Contained by: module galacticus_nodes

subroutine: `nodecomponentpositiontracedarkmatterserializexml`

Description: Serialize the contents of a traceDarkMatter implementation of the position component to XML.
Code lines: 18
Contained by: module galacticus_nodes

function: `nodecomponentpositiontracedarkmattersizeof`
Description: Return the size in bytes of a traceDarkMatter implementation of the position component.
Code lines: 10
Contained by: module galacticus_nodes

function: `nodecomponentpositiontracedarkmattertype`
Description: Returns the type name for the traceDarkMatter implementation of the position component class.
Code lines: 13
Contained by: module galacticus_nodes

function: `nodecomponentpositiontype`
Description: Returns the type name for the position component class.
Code lines: 13
Contained by: module galacticus_nodes

type: `nodecomponentsatellite`
Description: Type for the `satellite` component class.
Code lines: 747
Contained by: module galacticus_nodes

subroutine: `nodecomponentsatellitebuilder`
Description: Build a generic `satellite` component from a supplied XML definition.
Code lines: 19
Contained by: module galacticus_nodes
Modules used: `fox_dom` galacticus_error

subroutine: `nodecomponentsatellitecreate`
Description: Create the `satellite` component of `self`.
Code lines: 38
Contained by: module galacticus_nodes
Modules used: galacticus_display galacticus_error iso_varying_string string_handling

subroutine: `nodecomponentsatellitedestroy`
Description: Destroy the `satellite` component of `self`
Code lines: 15
Contained by: module galacticus_nodes

subroutine: `nodecomponentsatellitedumpascii`
Description: Dump the content of a `satellite` component.
Code lines: 16
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string

subroutine: `nodecomponentsatellitefinalize`
Description: Finalize a generic `satellite` component.
Code lines: 13

Contained by: module galacticus_nodes

subroutine: nodecomponentsatelliteinitialize
Description: Initialize a generic satellite component.
Code lines: 15
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: nodecomponentsatellitemove
Description: Move instances of the satellite component, from one node to another.
Code lines: 112
Contained by: module galacticus_nodes
Modules used: galacticus_error

type: nodecomponentsatellitenull
Description: Class for the null implementation of the satellite component.
Code lines: 124
Contained by: module galacticus_nodes

subroutine: nodecomponentsatellitenullbuilder
Description: Build a null implementation of the satellite component from a supplied XML definition.
Code lines: 18
Contained by: module galacticus_nodes
Modules used: fox_dom galacticus_error memory_management

subroutine: nodecomponentsatellitenulldeserializeraw
Description: Deserialize the contents of a null implementation of the satellite component from raw (binary) file.
Code lines: 16
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: nodecomponentsatellitenulldeserializevalues
Description: Deserialize evolvable properties of a null implementation of the satellite component from array.
Code lines: 17
Contained by: module galacticus_nodes

subroutine: nodecomponentsatellitenullfinalize
Description: Finalize a null implementation of the satellite component.
Code lines: 13
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: nodecomponentsatellitenullinitialize
Description: Initialize a null member of the satellite component.
Code lines: 11
Contained by: module galacticus_nodes

function: `nodecomponentsatellitenullisactive`
Description: Return true if the null implementation of the satellite component is the active choice.
Code lines: 8
Contained by: module `galacticus_nodes`

function: `nodecomponentsatellitenullnamefromindex`
Description: Return the name of the property of given index for a `null` implementation of the `satellite` component class.
Code lines: 21
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

subroutine: `nodecomponentsatellitenullserializeascii`
Description: Serialize the contents of a null implementation of the satellite component to ASCII.
Code lines: 16
Contained by: module `galacticus_nodes`
Modules used: `galacticus_display` `iso_varying_string` `string_handling`

function: `nodecomponentsatellitenullserializecount`
Description: Return a count of the serialization of a null implementation of the satellite component.
Code lines: 15
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentsatellitenullserializeoffsets`
Description: Compute offsets into serialization arrays for a `null` implementation of the `satellite` component.
Code lines: 22
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentsatellitenullserializeraw`
Description: Serialize the contents of a null implementation of the satellite component to raw (binary) file.
Code lines: 14
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentsatellitenullserializevalues`
Description: Serialize evolvable properties of a `null` implementation of the `satellite` component to array.
Code lines: 17
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentsatellitenullserializexml`
Description: Serialize the contents of a null implementation of the satellite component to XML.
Code lines: 14
Contained by: module `galacticus_nodes`

function: `nodecomponentsatellitenullsizeof`

Description: Return the size in bytes of a null implementation of the satellite component.
Code lines: 9
Contained by: module galacticus_nodes

function: nodecomponentsatellitenulltype
Description: Returns the type name for the null implementation of the satellite component class.
Code lines: 13
Contained by: module galacticus_nodes

type: nodecomponentsatelliteorbiting
Description: Class for the orbiting implementation of the satellite component.
Code lines: 443
Contained by: module galacticus_nodes

subroutine: nodecomponentsatelliteorbitingbuilder
Description: Build a orbiting implementation of the satellite component from a supplied XML definition.
Code lines: 65
Contained by: module galacticus_nodes
Modules used: fox_dom galacticus_error memory_management

subroutine: nodecomponentsatelliteorbitingdeserializeraw
Description: Deserialize the contents of a orbiting implementation of the satellite component from raw (binary) file.
Code lines: 30
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: nodecomponentsatelliteorbitingdeserializevalues
Description: Deserialize evolvable properties of a orbiting implementation of the satellite component from array.
Code lines: 39
Contained by: module galacticus_nodes

subroutine: nodecomponentsatelliteorbitingfinalize
Description: Finalize a orbiting implementation of the satellite component.
Code lines: 14
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: nodecomponentsatelliteorbitinginitialize
Description: Initialize a orbiting member of the satellite component.
Code lines: 19
Contained by: module galacticus_nodes

function: nodecomponentsatelliteorbitingisactive
Description: Return true if the orbiting implementation of the satellite component is the active choice.
Code lines: 8

Contained by: module galacticus_nodes

function: nodecomponentsatelliteorbitingnamefromindex
Description: Return the name of the property of given index for a orbiting implementation of the satellite component class.
Code lines: 49
Contained by: module galacticus_nodes
Modules used: iso_varying_string

subroutine: nodecomponentsatelliteorbitingserializeascii
Description: Serialize the contents of a orbiting implementation of the satellite component to ASCII.
Code lines: 48
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string string_handling

function: nodecomponentsatelliteorbitingserializecount
Description: Return a count of the serialization of a orbiting implementation of the satellite component.
Code lines: 51
Contained by: module galacticus_nodes

subroutine: nodecomponentsatelliteorbitingserializeoffsets
Description: Compute offsets into serialization arrays for a orbiting implementation of the satellite component.
Code lines: 81
Contained by: module galacticus_nodes

subroutine: nodecomponentsatelliteorbitingserializeraw
Description: Serialize the contents of a orbiting implementation of the satellite component to raw (binary) file.
Code lines: 24
Contained by: module galacticus_nodes

subroutine: nodecomponentsatelliteorbitingserializevalues
Description: Serialize evolvable properties of a orbiting implementation of the satellite component to array.
Code lines: 39
Contained by: module galacticus_nodes

subroutine: nodecomponentsatelliteorbitingserializexml
Description: Serialize the contents of a orbiting implementation of the satellite component to XML.
Code lines: 29
Contained by: module galacticus_nodes

function: nodecomponentsatelliteorbitingsizeof
Description: Return the size in bytes of a orbiting implementation of the satellite component.
Code lines: 13
Contained by: module galacticus_nodes

function: `nodecomponentsatelliteorbitingtype`
Description: Returns the type name for the orbiting implementation of the satellite component class.
Code lines: 13
Contained by: module galacticus_nodes

type: `nodecomponentsatellitepreset`
Description: Class for the preset implementation of the satellite component.
Code lines: 221
Contained by: module galacticus_nodes

subroutine: `nodecomponentsatellitepresetbuilder`
Description: Build a `preset` implementation of the `satellite` component from a supplied XML definition.
Code lines: 54
Contained by: module galacticus_nodes
Modules used: fox_dom galacticus_error memory_management

subroutine: `nodecomponentsatellitepresetdeserializeraw`
Description: Deserialize the contents of a preset implementation of the satellite component from raw (binary) file.
Code lines: 17
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: `nodecomponentsatellitepresetdeserializevalues`
Description: Deserialize evolvable properties of a preset implementation of the satellite component from array.
Code lines: 17
Contained by: module galacticus_nodes

subroutine: `nodecomponentsatellitepresetfinalize`
Description: Finalize a `preset` implementation of the `satellite` component.
Code lines: 13
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: `nodecomponentsatellitepresetinitialize`
Description: Initialize a `preset` member of the `satellite` component.
Code lines: 14
Contained by: module galacticus_nodes

function: `nodecomponentsatellitepresetisactive`
Description: Return true if the preset implementation of the satellite component is the active choice.
Code lines: 8
Contained by: module galacticus_nodes

function: `nodecomponentsatellitepresetnamefromindex`

Description: Return the name of the property of given index for a `preset` implementation of the `satellite` component class.
Code lines: 21
Contained by: module galacticus_nodes
Modules used: iso_varying_string

subroutine: `nodecomponentsatellitepresetserializeascii`
Description: Serialize the contents of a preset implementation of the satellite component to ASCII.
Code lines: 37
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string string_handling

function: `nodecomponentsatellitepresetserializecount`
Description: Return a count of the serialization of a preset implementation of the satellite component.
Code lines: 15
Contained by: module galacticus_nodes

subroutine: `nodecomponentsatellitepresetserializeoffsets`
Description: Compute offsets into serialization arrays for a `preset` implementation of the `satellite` component.
Code lines: 22
Contained by: module galacticus_nodes

subroutine: `nodecomponentsatellitepresetserializeraw`
Description: Serialize the contents of a preset implementation of the satellite component to raw (binary) file.
Code lines: 15
Contained by: module galacticus_nodes

subroutine: `nodecomponentsatellitepresetserializevalues`
Description: Serialize evolvable properties of a `preset` implementation of the `satellite` component to array.
Code lines: 17
Contained by: module galacticus_nodes

subroutine: `nodecomponentsatellitepresetserializexml`
Description: Serialize the contents of a preset implementation of the satellite component to XML.
Code lines: 25
Contained by: module galacticus_nodes

function: `nodecomponentsatellitepresetsizeof`
Description: Return the size in bytes of a preset implementation of the satellite component.
Code lines: 12
Contained by: module galacticus_nodes

function: `nodecomponentsatellitepresettype`
Description: Returns the type name for the preset implementation of the satellite component class.
Code lines: 13

Contained by: module galacticus_nodes

subroutine: nodecomponentsatelliteremove
Description: Remove an instance of the satellite component from a node.
Code lines: 66
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: nodecomponentsatelliteserializeascii
Description: Serialize the content of a satellite component to ASCII.
Code lines: 16
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string

function: nodecomponentsatellitesizeof
Description: Return the size in bytes of a nodeComponentSatellite component.
Code lines: 9
Contained by: module galacticus_nodes

type: nodecomponentsatellitestandard
Description: Class for the standard implementation of the satellite component.
Code lines: 293
Contained by: module galacticus_nodes

subroutine: nodecomponentsatellitestandardbuilder
Description: Build a standard implementation of the satellite component from a supplied XML definition.
Code lines: 36
Contained by: module galacticus_nodes
Modules used: fox_dom galacticus_error memory_management

subroutine: nodecomponentsatellitestandarddeserializeraw
Description: Deserialize the contents of a standard implementation of the satellite component from raw (binary) file.
Code lines: 14
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: nodecomponentsatellitestandarddeserializevalues
Description: Deserialize evolvable properties of a standard implementation of the satellite component from array.
Code lines: 20
Contained by: module galacticus_nodes

subroutine: nodecomponentsatellitestandardfinalize
Description: Finalize a standard implementation of the satellite component.
Code lines: 11
Contained by: module galacticus_nodes

Modules used: memory_management

subroutine: nodecomponentsatellitestandardinitialize
Description: Initialize a standard member of the satellite component.
Code lines: 13
Contained by: module galacticus_nodes

function: nodecomponentsatellitestandardisactive
Description: Return true if the standard implementation of the satellite component is the active choice.
Code lines: 8
Contained by: module galacticus_nodes

function: nodecomponentsatellitestandardnamefromindex
Description: Return the name of the property of given index for a standard implementation of the satellite component class.
Code lines: 31
Contained by: module galacticus_nodes
Modules used: iso_varying_string

subroutine: nodecomponentsatellitestandardserializeascii
Description: Serialize the contents of a standard implementation of the satellite component to ASCII.
Code lines: 26
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string string_handling

function: nodecomponentsatellitestandardserializecount
Description: Return a count of the serialization of a standard implementation of the satellite component.
Code lines: 30
Contained by: module galacticus_nodes

subroutine: nodecomponentsatellitestandardserializeoffsets
Description: Compute offsets into serialization arrays for a standard implementation of the satellite component.
Code lines: 42
Contained by: module galacticus_nodes

subroutine: nodecomponentsatellitestandardserializeraw
Description: Serialize the contents of a standard implementation of the satellite component to raw (binary) file.
Code lines: 12
Contained by: module galacticus_nodes

subroutine: nodecomponentsatellitestandardserializevalues
Description: Serialize evolvable properties of a standard implementation of the satellite component to array.
Code lines: 20
Contained by: module galacticus_nodes

subroutine: nodecomponentsatellitestandardserializexml

Description: Serialize the contents of a standard implementation of the satellite component to XML.
Code lines: 19
Contained by: module galacticus_nodes

function: nodecomponentsatellitestandardsizeof
Description: Return the size in bytes of a standard implementation of the satellite component.
Code lines: 10
Contained by: module galacticus_nodes

function: nodecomponentsatellitestandardtype
Description: Returns the type name for the standard implementation of the satellite component class.
Code lines: 13
Contained by: module galacticus_nodes

function: nodecomponentsatellitetype
Description: Returns the type name for the satellite component class.
Code lines: 13
Contained by: module galacticus_nodes

type: nodecomponentsatelliteverysimple
Description: Class for the verySimple implementation of the satellite component.
Code lines: 174
Contained by: module galacticus_nodes

subroutine: nodecomponentsatelliteverysimplebuilder
Description: Build a verySimple implementation of the satellite component from a supplied XML definition.
Code lines: 24
Contained by: module galacticus_nodes
Modules used: fox_dom galacticus_error memory_management

subroutine: nodecomponentsatelliteverysimpledeserializeraw
Description: Deserialize the contents of a verySimple implementation of the satellite component from raw (binary) file.
Code lines: 12
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: nodecomponentsatelliteverysimpledeserializevalues
Description: Deserialize evolvable properties of a verySimple implementation of the satellite component from array.
Code lines: 16
Contained by: module galacticus_nodes

subroutine: nodecomponentsatelliteverysimplefinalize
Description: Finalize a verySimple implementation of the satellite component.
Code lines: 13
Contained by: module galacticus_nodes

Modules used: memory_management

subroutine: nodecomponentsatelliteverysimpleinitialize
Description: Initialize a verySimple member of the satellite component.
Code lines: 9
Contained by: module galacticus_nodes

function: nodecomponentsatelliteverysimpleisactive
Description: Return true if the verySimple implementation of the satellite component is the active choice.
Code lines: 8
Contained by: module galacticus_nodes

function: nodecomponentsatelliteverysimplenamefromindex
Description: Return the name of the property of given index for a verySimple implementation of the satellite component class.
Code lines: 24
Contained by: module galacticus_nodes
Modules used: iso_varying_string

subroutine: nodecomponentsatelliteverysimpleserializeascii
Description: Serialize the contents of a verySimple implementation of the satellite component to ASCII.
Code lines: 19
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string string_handling

function: nodecomponentsatelliteverysimpleserializecount
Description: Return a count of the serialization of a verySimple implementation of the satellite component.
Code lines: 22
Contained by: module galacticus_nodes

subroutine: nodecomponentsatelliteverysimpleserializeoffsets
Description: Compute offsets into serialization arrays for a verySimple implementation of the satellite component.
Code lines: 28
Contained by: module galacticus_nodes

subroutine: nodecomponentsatelliteverysimpleserializeraw
Description: Serialize the contents of a verySimple implementation of the satellite component to raw (binary) file.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: nodecomponentsatelliteverysimpleserializevalues
Description: Serialize evolvable properties of a verySimple implementation of the satellite component to array.
Code lines: 16
Contained by: module galacticus_nodes

subroutine: `nodecomponentsatelliteverysimpleserializexml`
Description: Serialize the contents of a verySimple implementation of the satellite component to XML.
Code lines: 16
Contained by: module galacticus_nodes

function: `nodecomponentsatelliteverysimplesizeof`
Description: Return the size in bytes of a verySimple implementation of the satellite component.
Code lines: 9
Contained by: module galacticus_nodes

function: `nodecomponentsatelliteverysimpletype`
Description: Returns the type name for the verySimple implementation of the satellite component class.
Code lines: 13
Contained by: module galacticus_nodes

type: `nodecomponentspheroid`
Description: Type for the `spheroid` component class.
Code lines: 971
Contained by: module galacticus_nodes

subroutine: `nodecomponentspheroidbuilder`
Description: Build a generic `spheroid` component from a supplied XML definition.
Code lines: 19
Contained by: module galacticus_nodes
Modules used: `fox_dom` galacticus_error

subroutine: `nodecomponentspheroidcreate`
Description: Create the `spheroid` component of `self`.
Code lines: 38
Contained by: module galacticus_nodes
Modules used: galacticus_display galacticus_error iso_varying_string string_handling

subroutine: `nodecomponentspheroiddestroy`
Description: Destroy the `spheroid` component of `self`
Code lines: 15
Contained by: module galacticus_nodes

subroutine: `nodecomponentspheroiddumpascii`
Description: Dump the content of a `spheroid` component.
Code lines: 16
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string

subroutine: `nodecomponentspheroidfinalize`
Description: Finalize a generic `spheroid` component.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: `nodecomponentspheroidinitialize`
Description: Initialize a generic `spheroid` component.
Code lines: 15
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

subroutine: `nodecomponentspheroidmove`
Description: Move instances of the `spheroid` component, from one node to another.
Code lines: 84
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

type: `nodecomponentspheroidnull`
Description: Class for the null implementation of the spheroid component.
Code lines: 124
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentspheroidnullbuilder`
Description: Build a `null` implementation of the `spheroid` component from a supplied XML definition.
Code lines: 18
Contained by: module `galacticus_nodes`
Modules used: `fox_dom` `galacticus_error` `memory_management`

subroutine: `nodecomponentspheroidnulldeserializeraw`
Description: Deserialize the contents of a null implementation of the spheroid component from raw (binary) file.
Code lines: 16
Contained by: module `galacticus_nodes`
Modules used: `memory_management`

subroutine: `nodecomponentspheroidnulldeserializevalues`
Description: Deserialize evolvable properties of a null implementation of the spheroid component from array.
Code lines: 17
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentspheroidnullfinalize`
Description: Finalize a `null` implementation of the `spheroid` component.
Code lines: 13
Contained by: module `galacticus_nodes`
Modules used: `memory_management`

subroutine: `nodecomponentspheroidnullinitialize`
Description: Initialize a `null` member of the `spheroid` component.
Code lines: 11
Contained by: module `galacticus_nodes`

function: `nodecomponentspheroidnullisactive`
Description: Return true if the null implementation of the spheroid component is the active choice.
Code lines: 8
Contained by: module galacticus_nodes

function: `nodecomponentspheroidnullnamefromindex`
Description: Return the name of the property of given index for a `null` implementation of the `spheroid` component class.
Code lines: 21
Contained by: module galacticus_nodes
Modules used: iso_varying_string

subroutine: `nodecomponentspheroidnullserializeascii`
Description: Serialize the contents of a null implementation of the spheroid component to ASCII.
Code lines: 16
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string string_handling

function: `nodecomponentspheroidnullserializecount`
Description: Return a count of the serialization of a null implementation of the spheroid component.
Code lines: 15
Contained by: module galacticus_nodes

subroutine: `nodecomponentspheroidnullserializeoffsets`
Description: Compute offsets into serialization arrays for a `null` implementation of the `spheroid` component.
Code lines: 22
Contained by: module galacticus_nodes

subroutine: `nodecomponentspheroidnullserializeraw`
Description: Serialize the contents of a null implementation of the spheroid component to raw (binary) file.
Code lines: 14
Contained by: module galacticus_nodes

subroutine: `nodecomponentspheroidnullserializevalues`
Description: Serialize evolvable properties of a `null` implementation of the `spheroid` component to array.
Code lines: 17
Contained by: module galacticus_nodes

subroutine: `nodecomponentspheroidnullserializexml`
Description: Serialize the contents of a null implementation of the spheroid component to XML.
Code lines: 14
Contained by: module galacticus_nodes

function: `nodecomponentspheroidnullsizeof`
Description: Return the size in bytes of a null implementation of the spheroid component.

Code lines: 9
Contained by: module galacticus_nodes

function: nodecomponentspheroidnulltype
Description: Returns the type name for the null implementation of the spheroid component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: nodecomponentspheroidremove
Description: Remove an instance of the spheroid component from a node.
Code lines: 50
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: nodecomponentspheroidserializeascii
Description: Serialize the content of a spheroid component to ASCII.
Code lines: 16
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string

function: nodecomponentspheroidsizeof
Description: Return the size in bytes of a nodeComponentSpheroid component.
Code lines: 9
Contained by: module galacticus_nodes

type: nodecomponentspheroidstandard
Description: Class for the standard implementation of the spheroid component.
Code lines: 777
Contained by: module galacticus_nodes

subroutine: nodecomponentspheroidstandardbuilder
Description: Build a standard implementation of the spheroid component from a supplied XML definition.
Code lines: 90
Contained by: module galacticus_nodes
Modules used: fox_dom galacticus_error memory_management

subroutine: nodecomponentspheroidstandarddeserializeraw
Description: Deserialize the contents of a standard implementation of the spheroid component from raw (binary) file.
Code lines: 23
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: nodecomponentspheroidstandarddeserializevalues
Description: Deserialize evolvable properties of a standard implementation of the spheroid component from array.
Code lines: 53
Contained by: module galacticus_nodes

subroutine: `nodecomponentspheroidstandardfinalize`
Description: Finalize a `standard` implementation of the `spheroid` component.
Code lines: 15
Contained by: module `galacticus_nodes`
Modules used: `memory_management`

subroutine: `nodecomponentspheroidstandardinitialize`
Description: Initialize a `standard` member of the `spheroid` component.
Code lines: 20
Contained by: module `galacticus_nodes`

function: `nodecomponentspheroidstandardisactive`
Description: Return true if the standard implementation of the spheroid component is the active choice.
Code lines: 8
Contained by: module `galacticus_nodes`

function: `nodecomponentspheroidstandardnamefromindex`
Description: Return the name of the property of given index for a `standard` implementation of the `spheroid` component class.
Code lines: 77
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

subroutine: `nodecomponentspheroidstandardserializeascii`
Description: Serialize the contents of a standard implementation of the spheroid component to ASCII.
Code lines: 57
Contained by: module `galacticus_nodes`
Modules used: `galacticus_display` `iso_varying_string` `string_handling`

function: `nodecomponentspheroidstandardserializecount`
Description: Return a count of the serialization of a standard implementation of the spheroid component.
Code lines: 83
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentspheroidstandardserializeoffsets`
Description: Compute offsets into serialization arrays for a `standard` implementation of the `spheroid` component.
Code lines: 137
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentspheroidstandardserializeraw`
Description: Serialize the contents of a standard implementation of the spheroid component to raw (binary) file.
Code lines: 21
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentspheroidstandardserializevalues`

Description: Serialize evolvable properties of a `standard` implementation of the `spheroid` component to array.
Code lines: 53
Contained by: module galacticus_nodes

subroutine: `nodecomponentspheroidstandardserializexml`
Description: Serialize the contents of a standard implementation of the spheroid component to XML.
Code lines: 33
Contained by: module galacticus_nodes

function: `nodecomponentspheroidstandardsizeof`
Description: Return the size in bytes of a standard implementation of the spheroid component.
Code lines: 14
Contained by: module galacticus_nodes

function: `nodecomponentspheroidstandardtype`
Description: Returns the type name for the standard implementation of the spheroid component class.
Code lines: 13
Contained by: module galacticus_nodes

function: `nodecomponentspheroidtype`
Description: Returns the type name for the spheroid component class.
Code lines: 13
Contained by: module galacticus_nodes

type: `nodecomponentspheroidverysimple`
Description: Class for the verySimple implementation of the spheroid component.
Code lines: 522
Contained by: module galacticus_nodes

subroutine: `nodecomponentspheroidverysimplebuilder`
Description: Build a `verySimple` implementation of the `spheroid` component from a supplied XML definition.
Code lines: 72
Contained by: module galacticus_nodes
Modules used: `fox_dom` galacticus_error memory_management

subroutine: `nodecomponentspheroidverysimpledeserializeraw`
Description: Deserialize the contents of a verySimple implementation of the spheroid component from raw (binary) file.
Code lines: 20
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: `nodecomponentspheroidverysimpledeserializevalues`
Description: Deserialize evolvable properties of a verySimple implementation of the spheroid component from array.
Code lines: 40
Contained by: module galacticus_nodes

subroutine: `nodecomponentspheroidverysimplefinalize`
Description: Finalize a `verySimple` implementation of the `spheroid` component.
Code lines: 14
Contained by: module `galacticus_nodes`
Modules used: `memory_management`

subroutine: `nodecomponentspheroidverysimpleinitialize`
Description: Initialize a `verySimple` member of the `spheroid` component.
Code lines: 17
Contained by: module `galacticus_nodes`

function: `nodecomponentspheroidverysimpleisactive`
Description: Return true if the verySimple implementation of the spheroid component is the active choice.
Code lines: 8
Contained by: module `galacticus_nodes`

function: `nodecomponentspheroidverysimplenamefromindex`
Description: Return the name of the property of given index for a `verySimple` implementation of the `spheroid` component class.
Code lines: 56
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

subroutine: `nodecomponentspheroidverysimpleserializeascii`
Description: Serialize the contents of a verySimple implementation of the spheroid component to ASCII.
Code lines: 47
Contained by: module `galacticus_nodes`
Modules used: `galacticus_display` `iso_varying_string` `string_handling`

function: `nodecomponentspheroidverysimpleserializecount`
Description: Return a count of the serialization of a verySimple implementation of the spheroid component.
Code lines: 59
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentspheroidverysimpleserializeoffsets`
Description: Compute offsets into serialization arrays for a `verySimple` implementation of the `spheroid` component.
Code lines: 95
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentspheroidverysimpleserializeraw`
Description: Serialize the contents of a verySimple implementation of the spheroid component to raw (binary) file.
Code lines: 18
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentspheroidverysimpleserializevalues`

Description: Serialize evolvable properties of a `verySimple` implementation of the `spheroid` component to array.
Code lines: 40
Contained by: module galacticus_nodes

subroutine: `nodecomponentspheroidverysimpleserializexml`
Description: Serialize the contents of a verySimple implementation of the spheroid component to XML.
Code lines: 29
Contained by: module galacticus_nodes

function: `nodecomponentspheroidverysimplesizeof`
Description: Return the size in bytes of a verySimple implementation of the spheroid component.
Code lines: 13
Contained by: module galacticus_nodes

function: `nodecomponentspheroidverysimpletype`
Description: Returns the type name for the verySimple implementation of the spheroid component class.
Code lines: 13
Contained by: module galacticus_nodes

type: `nodecomponentspin`
Description: Type for the `spin` component class.
Code lines: 334
Contained by: module galacticus_nodes

subroutine: `nodecomponentspinbuilder`
Description: Build a generic `spin` component from a supplied XML definition.
Code lines: 19
Contained by: module galacticus_nodes
Modules used: `fox_dom` galacticus_error

subroutine: `nodecomponentspincreate`
Description: Create the `spin` component of `self`.
Code lines: 38
Contained by: module galacticus_nodes
Modules used: galacticus_display galacticus_error iso_varying_string string_handling

subroutine: `nodecomponentspindestroy`
Description: Destroy the `spin` component of `self`
Code lines: 15
Contained by: module galacticus_nodes

subroutine: `nodecomponentspindumpascii`
Description: Dump the content of a `spin` component.
Code lines: 16
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string

subroutine: `nodecomponentspinfinalize`
Description: Finalize a generic `spin` component.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: `nodecomponentspininitialize`
Description: Initialize a generic `spin` component.
Code lines: 15
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: `nodecomponentspinmove`
Description: Move instances of the `spin` component, from one node to another.
Code lines: 112
Contained by: module galacticus_nodes
Modules used: galacticus_error

type: `nodecomponentspinnull`
Description: Class for the null implementation of the spin component.
Code lines: 124
Contained by: module galacticus_nodes

subroutine: `nodecomponentspinnullbuilder`
Description: Build a `null` implementation of the `spin` component from a supplied XML definition.
Code lines: 18
Contained by: module galacticus_nodes
Modules used: fox_dom galacticus_error memory_management

subroutine: `nodecomponentspinnulldeserializeraw`
Description: Deserialize the contents of a null implementation of the spin component from raw (binary) file.
Code lines: 16
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: `nodecomponentspinnulldeserializevalues`
Description: Deserialize evolvable properties of a null implementation of the spin component from array.
Code lines: 17
Contained by: module galacticus_nodes

subroutine: `nodecomponentspinnullfinalize`
Description: Finalize a `null` implementation of the `spin` component.
Code lines: 13
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: `nodecomponentspinnullinitialize`

Description: Initialize a `null` member of the `spin` component.
Code lines: 11
Contained by: module galacticus_nodes

function: `nodecomponentspinnullisactive`
Description: Return true if the null implementation of the spin component is the active choice.
Code lines: 8
Contained by: module galacticus_nodes

function: `nodecomponentspinnullnamefromindex`
Description: Return the name of the property of given index for a `null` implementation of the `spin` component class.
Code lines: 21
Contained by: module galacticus_nodes
Modules used: iso_varying_string

subroutine: `nodecomponentspinnullserializeascii`
Description: Serialize the contents of a null implementation of the spin component to ASCII.
Code lines: 16
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string string_handling

function: `nodecomponentspinnullserializecount`
Description: Return a count of the serialization of a null implementation of the spin component.
Code lines: 15
Contained by: module galacticus_nodes

subroutine: `nodecomponentspinnullserializeoffsets`
Description: Compute offsets into serialization arrays for a `null` implementation of the `spin` component.
Code lines: 22
Contained by: module galacticus_nodes

subroutine: `nodecomponentspinnullserializeraw`
Description: Serialize the contents of a null implementation of the spin component to raw (binary) file.
Code lines: 14
Contained by: module galacticus_nodes

subroutine: `nodecomponentspinnullserializevalues`
Description: Serialize evolvable properties of a `null` implementation of the `spin` component to array.
Code lines: 17
Contained by: module galacticus_nodes

subroutine: `nodecomponentspinnullserializexml`
Description: Serialize the contents of a null implementation of the spin component to XML.
Code lines: 14
Contained by: module galacticus_nodes

function: `nodecomponentspinnullsizeof`

Description: Return the size in bytes of a null implementation of the spin component.
Code lines: 9
Contained by: module galacticus_nodes

function: nodecomponentspinnulltype
Description: Returns the type name for the null implementation of the spin component class.
Code lines: 13
Contained by: module galacticus_nodes

type: nodecomponentspinpreset
Description: Class for the preset implementation of the spin component.
Code lines: 194
Contained by: module galacticus_nodes

type: nodecomponentspinpreset3d
Description: Class for the preset3D implementation of the spin component.
Code lines: 201
Contained by: module galacticus_nodes

subroutine: nodecomponentspinpreset3dbuilder
Description: Build a preset3D implementation of the spin component from a supplied XML definition.
Code lines: 36
Contained by: module galacticus_nodes
Modules used: fox_dom galacticus_error memory_management

subroutine: nodecomponentspinpreset3ddeserializeraw
Description: Deserialize the contents of a preset3D implementation of the spin component from raw (binary) file.
Code lines: 26
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: nodecomponentspinpreset3ddeserializevalues
Description: Deserialize evolvable properties of a preset3D implementation of the spin component from array.
Code lines: 24
Contained by: module galacticus_nodes

subroutine: nodecomponentspinpreset3dfinalize
Description: Finalize a preset3D implementation of the spin component.
Code lines: 12
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: nodecomponentspinpreset3dinitialize
Description: Initialize a preset3D member of the spin component.
Code lines: 13
Contained by: module galacticus_nodes

function: `nodecomponentspinpreset3disactive`
Description: Return true if the preset3D implementation of the spin component is the active choice.
Code lines: 8
Contained by: module `galacticus_nodes`

function: `nodecomponentspinpreset3dnamefromindex`
Description: Return the name of the property of given index for a `preset3D` implementation of the `spin` component class.
Code lines: 23
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

subroutine: `nodecomponentspinpreset3dserializeascii`
Description: Serialize the contents of a preset3D implementation of the spin component to ASCII.
Code lines: 32
Contained by: module `galacticus_nodes`
Modules used: `galacticus_display` `iso_varying_string` `string_handling`

function: `nodecomponentspinpreset3dserializecount`
Description: Return a count of the serialization of a preset3D implementation of the spin component.
Code lines: 19
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentspinpreset3dserializeoffsets`
Description: Compute offsets into serialization arrays for a `preset3D` implementation of the `spin` component.
Code lines: 26
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentspinpreset3dserializeraw`
Description: Serialize the contents of a preset3D implementation of the spin component to raw (binary) file.
Code lines: 20
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentspinpreset3dserializevalues`
Description: Serialize evolvable properties of a `preset3D` implementation of the `spin` component to array.
Code lines: 24
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentspinpreset3dserializexml`
Description: Serialize the contents of a preset3D implementation of the spin component to XML.
Code lines: 22
Contained by: module `galacticus_nodes`

function: `nodecomponentspinpreset3dsizeof`
Description: Return the size in bytes of a preset3D implementation of the spin component.

Code lines: 11
Contained by: module galacticus_nodes

function: nodecomponentspinpreset3dtype
Description: Returns the type name for the preset3D implementation of the spin component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: nodecomponentspinpresetbuilder
Description: Build a preset implementation of the spin component from a supplied XML definition.
Code lines: 30
Contained by: module galacticus_nodes
Modules used: fox_dom galacticus_error memory_management

subroutine: nodecomponentspinpresetdeserializeraw
Description: Deserialize the contents of a preset implementation of the spin component from raw (binary) file.
Code lines: 13
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: nodecomponentspinpresetdeserializevalues
Description: Deserialize evolvable properties of a preset implementation of the spin component from array.
Code lines: 16
Contained by: module galacticus_nodes

subroutine: nodecomponentspinpresetfinalize
Description: Finalize a preset implementation of the spin component.
Code lines: 13
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: nodecomponentspinpresetinitialize
Description: Initialize a preset member of the spin component.
Code lines: 10
Contained by: module galacticus_nodes

function: nodecomponentspinpresetisactive
Description: Return true if the preset implementation of the spin component is the active choice.
Code lines: 8
Contained by: module galacticus_nodes

function: nodecomponentspinpresetnamefromindex
Description: Return the name of the property of given index for a preset implementation of the spin component class.
Code lines: 24
Contained by: module galacticus_nodes
Modules used: iso_varying_string

subroutine: `nodecomponentspinpresetserializeascii`
Description: Serialize the contents of a preset implementation of the spin component to ASCII.
Code lines: 22
Contained by: module `galacticus_nodes`
Modules used: `galacticus_display` `iso_varying_string` `string_handling`

function: `nodecomponentspinpresetserializecount`
Description: Return a count of the serialization of a preset implementation of the spin component.
Code lines: 22
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentspinpresetserializeoffsets`
Description: Compute offsets into serialization arrays for a `preset` implementation of the `spin` component.
Code lines: 28
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentspinpresetserializeraw`
Description: Serialize the contents of a preset implementation of the spin component to raw (binary) file.
Code lines: 11
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentspinpresetserializevalues`
Description: Serialize evolvable properties of a `preset` implementation of the `spin` component to array.
Code lines: 16
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentspinpresetserializexml`
Description: Serialize the contents of a preset implementation of the spin component to XML.
Code lines: 16
Contained by: module `galacticus_nodes`

function: `nodecomponentspinpresetsizeof`
Description: Return the size in bytes of a preset implementation of the spin component.
Code lines: 9
Contained by: module `galacticus_nodes`

function: `nodecomponentspinpresettype`
Description: Returns the type name for the preset implementation of the spin component class.
Code lines: 13
Contained by: module `galacticus_nodes`

type: `nodecomponentspinrandom`
Description: Class for the random implementation of the spin component.
Code lines: 180
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentspinrandombuilder`
Description: Build a `random` implementation of the `spin` component from a supplied XML definition.
Code lines: 24
Contained by: module galacticus_nodes
Modules used: `fox_dom` galacticus_error memory_management

subroutine: `nodecomponentspinrandomdeserializeraw`
Description: Deserialize the contents of a random implementation of the spin component from raw (binary) file.
Code lines: 12
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: `nodecomponentspinrandomdeserializevalues`
Description: Deserialize evolvable properties of a random implementation of the spin component from array.
Code lines: 16
Contained by: module galacticus_nodes

subroutine: `nodecomponentspinrandomfinalize`
Description: Finalize a `random` implementation of the `spin` component.
Code lines: 13
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: `nodecomponentspinrandominitialize`
Description: Initialize a `random` member of the `spin` component.
Code lines: 9
Contained by: module galacticus_nodes

function: `nodecomponentspinrandomisactive`
Description: Return true if the random implementation of the spin component is the active choice.
Code lines: 8
Contained by: module galacticus_nodes

function: `nodecomponentspinrandomnamefromindex`
Description: Return the name of the property of given index for a `random` implementation of the `spin` component class.
Code lines: 24
Contained by: module galacticus_nodes
Modules used: iso_varying_string

subroutine: `nodecomponentspinrandomserializeascii`
Description: Serialize the contents of a random implementation of the spin component to ASCII.
Code lines: 19
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string

string_handling

function: `nodecomponentspinrandomserializecount`
Description: Return a count of the serialization of a random implementation of the spin component.
Code lines: 22
Contained by: module galacticus_nodes

subroutine: `nodecomponentspinrandomserializeoffsets`
Description: Compute offsets into serialization arrays for a `random` implementation of the `spin` component.
Code lines: 28
Contained by: module galacticus_nodes

subroutine: `nodecomponentspinrandomserializeraw`
Description: Serialize the contents of a random implementation of the spin component to raw (binary) file.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: `nodecomponentspinrandomserializevalues`
Description: Serialize evolvable properties of a `random` implementation of the `spin` component to array.
Code lines: 16
Contained by: module galacticus_nodes

subroutine: `nodecomponentspinrandomserializexml`
Description: Serialize the contents of a random implementation of the spin component to XML.
Code lines: 16
Contained by: module galacticus_nodes

function: `nodecomponentspinrandomsizeof`
Description: Return the size in bytes of a random implementation of the spin component.
Code lines: 9
Contained by: module galacticus_nodes

function: `nodecomponentspinrandomtype`
Description: Returns the type name for the random implementation of the spin component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: `nodecomponentspinremove`
Description: Remove an instance of the `spin` component from a node.
Code lines: 66
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: `nodecomponentspinserializeascii`
Description: Serialize the content of a `spin` component to ASCII.
Code lines: 16
Contained by: module galacticus_nodes

Modules used: galacticus_display iso_varying_string

function: nodecomponentspinsizeof
Description: Return the size in bytes of a nodeComponentSpin component.
Code lines: 9
Contained by: module galacticus_nodes

function: nodecomponentspintype
Description: Returns the type name for the spin component class.
Code lines: 13
Contained by: module galacticus_nodes

type: nodecomponentspinvitvitska
Description: Class for the vitvitska implementation of the spin component.
Code lines: 294
Contained by: module galacticus_nodes

subroutine: nodecomponentspinvitvitskabuilder
Description: Build a vitvitska implementation of the spin component from a supplied XML definition.
Code lines: 33
Contained by: module galacticus_nodes
Modules used: fox_dom galacticus_error memory_management

subroutine: nodecomponentspinvitvitskadeserializeraw
Description: Deserialize the contents of a vitvitska implementation of the spin component from raw (binary) file.
Code lines: 20
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: nodecomponentspinvitvitskadeserializevalues
Description: Deserialize evolvable properties of a vitvitska implementation of the spin component from array.
Code lines: 23
Contained by: module galacticus_nodes

subroutine: nodecomponentspinvitvitskafinalize
Description: Finalize a vitvitska implementation of the spin component.
Code lines: 11
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: nodecomponentspinvitvitskainitialize
Description: Initialize a vitvitska member of the spin component.
Code lines: 11
Contained by: module galacticus_nodes

function: nodecomponentspinvitvitskaisactive

Description: Return true if the vitvitska implementation of the spin component is the active choice.
Code lines: 8
Contained by: module galacticus_nodes

function: nodecomponentspinvitvitskanamefromindex
Description: Return the name of the property of given index for a vitvitska implementation of the spin component class.
Code lines: 28
Contained by: module galacticus_nodes
Modules used: iso_varying_string

subroutine: nodecomponentspinvitvitskaserializeascii
Description: Serialize the contents of a vitvitska implementation of the spin component to ASCII.
Code lines: 27
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string string_handling

function: nodecomponentspinvitvitskaserializecount
Description: Return a count of the serialization of a vitvitska implementation of the spin component.
Code lines: 27
Contained by: module galacticus_nodes

subroutine: nodecomponentspinvitvitskaserializeoffsets
Description: Compute offsets into serialization arrays for a vitvitska implementation of the spin component.
Code lines: 39
Contained by: module galacticus_nodes

subroutine: nodecomponentspinvitvitskaserializeraw
Description: Serialize the contents of a vitvitska implementation of the spin component to raw (binary) file.
Code lines: 15
Contained by: module galacticus_nodes

subroutine: nodecomponentspinvitvitskaserializevalues
Description: Serialize evolvable properties of a vitvitska implementation of the spin component to array.
Code lines: 23
Contained by: module galacticus_nodes

subroutine: nodecomponentspinvitvitskaserializexml
Description: Serialize the contents of a vitvitska implementation of the spin component to XML.
Code lines: 20
Contained by: module galacticus_nodes

function: nodecomponentspinvitvitskasizeof
Description: Return the size in bytes of a vitvitska implementation of the spin component.
Code lines: 10

Contained by: module galacticus_nodes

function: nodecomponentspinvitvitskatype
Description: Returns the type name for the vitvitska implementation of the spin component class.
Code lines: 13
Contained by: module galacticus_nodes

type: nodeevent
Description: Base class for events attached to nodes.
Code lines: 39
Contained by: module galacticus_nodes

type: nodeeventbranchjump
Description: Class for branch jump events attached to nodes.
Code lines: 26
Contained by: module galacticus_nodes

subroutine: nodeeventbranchjumpdeserializeraw
Description: Deserialize a nodeEventBranchJump object from raw file.
Code lines: 13
Contained by: module galacticus_nodes
Modules used: iso_c_binding

type: nodeeventbranchjumpintertree
Description: Class for inter-tree branch jump events attached to nodes.
Code lines: 32
Contained by: module galacticus_nodes

subroutine: nodeeventbranchjumpintertreedeserializeraw
Description: Deserialize a nodeEventBranchJumpInterTree object from raw file.
Code lines: 16
Contained by: module galacticus_nodes
Modules used: iso_c_binding

subroutine: nodeeventbranchjumpintertreeserializeraw
Description: Serialize a nodeEventBranchJumpInterTree object to raw file.
Code lines: 19
Contained by: module galacticus_nodes
Modules used: iso_c_binding

subroutine: nodeeventbranchjumpserializeraw
Description: Serialize a nodeEventBranchJump object to raw file.
Code lines: 16
Contained by: module galacticus_nodes
Modules used: iso_c_binding

function: nodeeventbuildfromraw
Description: Build a nodeEvent class object from a raw dump file.
Code lines: 26

Contained by: module galacticus_nodes

subroutine: nodeeventdeserializeraw
Description: Deserialize a nodeEvent object from raw file.
Code lines: 22
Contained by: module galacticus_nodes
Modules used: iso_c_binding

subroutine: nodeeventserializeraw
Description: Serialize a nodeEvent object to raw file.
Code lines: 24
Contained by: module galacticus_nodes
Modules used: iso_c_binding

function: nodeeventsizeof
Description: Compute the size of the non-static parts of a spin object.
Code lines: 12
Contained by: module galacticus_nodes

type: nodeeventsubhalopromotion
Description: Class for subhalo promotion events attached to nodes.
Code lines: 26
Contained by: module galacticus_nodes

subroutine: nodeeventsubhalopromotiondeserializeraw
Description: Deserialize a nodeEventSubhaloPromotion object from raw file.
Code lines: 13
Contained by: module galacticus_nodes
Modules used: iso_c_binding

type: nodeeventsubhalopromotionintertree
Description: Class for inter-tree subhalo promotion events attached to nodes.
Code lines: 32
Contained by: module galacticus_nodes

subroutine: nodeeventsubhalopromotionintertreedeserializeraw
Description: Deserialize a nodeEventSubhaloPromotionInterTree object from raw file.
Code lines: 16
Contained by: module galacticus_nodes
Modules used: iso_c_binding

subroutine: nodeeventsubhalopromotionintertreeserializeraw
Description: Serialize a nodeEventSubhaloPromotionInterTree object to raw file.
Code lines: 19
Contained by: module galacticus_nodes
Modules used: iso_c_binding

subroutine: nodeeventsubhalopromotionserializeraw
Description: Serialize a nodeEventSubhaloPromotion object to raw file.

Code lines: 16
Contained by: module galacticus_nodes
Modules used: iso_c_binding

function: nullagestatisticsgetininteger0
Description: A null get rate function for a rank 0 nodecomponentagestatistics class.
Code lines: 14
Contained by: module galacticus_nodes

subroutine: nullagestatisticsscaleinoutdouble0
Description: A null scale rate function for a rank 0 nodecomponentagestatistics class.
Code lines: 17
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: nullagestatisticssetinoutdouble0
Description: A null set rate function for a rank 0 nodecomponentagestatistics class.
Code lines: 18
Contained by: module galacticus_nodes
Modules used: galacticus_error

function: nullbasicgetininteger0
Description: A null get rate function for a rank 0 nodecomponentbasic class.
Code lines: 14
Contained by: module galacticus_nodes

subroutine: nullbasicrateinoutdouble0
Description: A null rate rate function for a rank 0 nodecomponentbasic class.
Code lines: 21
Contained by: module galacticus_nodes

subroutine: nullbasicscaleinoutdouble0
Description: A null scale rate function for a rank 0 nodecomponentbasic class.
Code lines: 17
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: nullbasicsetinoutdouble0
Description: A null set rate function for a rank 0 nodecomponentbasic class.
Code lines: 18
Contained by: module galacticus_nodes
Modules used: galacticus_error

function: nullblackholegetininteger0
Description: A null get rate function for a rank 0 nodecomponentblackhole class.
Code lines: 14
Contained by: module galacticus_nodes

subroutine: nullblackholerateinoutdouble0

Description: A null rate rate function for a rank 0 `nodecomponentblackhole` class.
Code lines: 21
Contained by: module galacticus_nodes

subroutine: `nullblackholescaleinoutdouble0`
Description: A null scale rate function for a rank 0 `nodecomponentblackhole` class.
Code lines: 17
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: `nullblackholesetinoutdouble0`
Description: A null set rate function for a rank 0 `nodecomponentblackhole` class.
Code lines: 18
Contained by: module galacticus_nodes

subroutine: `nullspinsetinoutdouble0`
Description: A null set rate function for a rank 0 `nodecomponentspin` class.
Code lines: 18
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: `nullspinsetinoutdouble1`
Description: A null set rate function for a rank 1 `nodecomponentspin` class.
Code lines: 18
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

subroutine: `positionnulloutputcount`
Description: Increment the count of properties to output for a `null` implementation of the `position` component.
Code lines: 22
Contained by: module `galacticus_nodes`

subroutine: `positionnulloutputnames`
Description: Return the names of properties to output for a `null` implementation of the `position` component.
Code lines: 39
Contained by: module `galacticus_nodes`

subroutine: `positionoutput`
Description: Populate output buffers with properties to output for a `position` component.
Code lines: 42
Contained by: module `galacticus_nodes`
Modules used: `multi_counters`

subroutine: `positionoutputcount`
Description: Increment the count of properties to output for a generic `position` component.
Code lines: 15
Contained by: module `galacticus_nodes`

subroutine: `positionoutputnames`
Description: Establish the names of properties to output for a generic `position` component.
Code lines: 20
Contained by: module `galacticus_nodes`

function: `positionposition`
Description: Returns the default value for the `position` property for the `position` component class.
Code lines: 28
Contained by: module `galacticus_nodes`

function: `positionpositionattributematch`
Description: Return a text list of component implementations in the `position` class that have the desired attributes for the `position` property
Code lines: 52
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

function: `positionpositionhistory`
Description: Returns the default value for the `positionHistory` property for the `position` component class.

Code lines: 13
Contained by: module galacticus_nodes

function: positionpositionhistoryattributematch
Description: Return a text list of component implementations in the position class that have the desired attributes for the positionHistory property
Code lines: 41
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: positionpositionhistoryisgettable
Description: Returns true if the positionHistory property is gettable for the position component class.
Code lines: 8
Contained by: module galacticus_nodes

function: positionpositionhistoryrateget
Description: Returns a zero rate for the positionHistory property for the position component class.
Code lines: 13
Contained by: module galacticus_nodes

function: positionpositionisgettable
Description: Returns true if the position property is gettable for the position component class.
Code lines: 11
Contained by: module galacticus_nodes

function: positionpositionorphan
Description: Returns the default value for the positionOrphan property for the position component class.
Code lines: 13
Contained by: module galacticus_nodes

function: positionpositionorphanattributematch
Description: Return a text list of component implementations in the position class that have the desired attributes for the positionOrphan property
Code lines: 30
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: positionpositionorphanisgettable
Description: Returns true if the positionOrphan property is gettable for the position component class.
Code lines: 8
Contained by: module galacticus_nodes

function: positionpositionorphanrateget
Description: Returns a zero rate for the positionOrphan property for the position component class.
Code lines: 13
Contained by: module galacticus_nodes

function: positionpositionrateget

Description: Returns a zero rate for the `position` property for the `position` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

subroutine: `positionpostoutput`
Description: Perform post-output processing of a `position` component.
Code lines: 14
Contained by: module `galacticus_nodes`

subroutine: `positionpresetorphansoutputcount`
Description: Increment the count of properties to output for a `presetOrphans` implementation of the `position` component.
Code lines: 12
Contained by: module `galacticus_nodes`

subroutine: `positionpresetorphansoutputnames`
Description: Return the names of properties to output for a `presetOrphans` implementation of the `position` component.
Code lines: 17
Contained by: module `galacticus_nodes`

function: `positionpresetorphansposition`
Description: Return the position of the node.
Code lines: 35
Contained by: module `galacticus_nodes`

function: `positionpresetorphanspositionorphanget`
Description: Get the value of the `positionOrphan` property of the `presetOrphans` implementation of the `position` component using a deferred function.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `positionpresetorphanspositionorphangetfunction`
Description: Set the function to be used for the `get` method of the `positionOrphan` property of the `PositionPresetOrphans` component.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `positionpresetorphanspositionorphangetisattached`
Description: Return true if the deferred function used to get the `positionOrphan` property of the `PositionPresetOrphans` component class has been attached.
Code lines: 8
Contained by: module `galacticus_nodes`

function: `positionpresetorphanspositionorphangetvalue`
Description: Get the `positionOrphan` property of an `presetOrphans` implementation of the `position` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `positionpresetorphanspositionorphanset`
Description: Set the `positionOrphan` property of an `presetOrphans` implementation of the `position` component class.
Code lines: 20
Contained by: module `galacticus_nodes`
Modules used: `memory_management`

subroutine: `positionpresetorphanspositionset`
Description: Set the `position` property of an `presetOrphans` implementation of the `position` component class.
Code lines: 20
Contained by: module `galacticus_nodes`
Modules used: `memory_management`

subroutine: `positionpresetorphanspostoutput`
Description: Perform post-output processing for a `presetOrphans` implementation of the `position` component.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `positionpresetorphanstimeassignget`
Description: Get the `timeAssign` property of an `presetOrphans` implementation of the `position` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `positionpresetorphanstimeassignset`
Description: Set the `timeAssign` property of an `presetOrphans` implementation of the `position` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `positionpresetorphansvelocity`
Description: Return the velocity of the node.
Code lines: 35
Contained by: module `galacticus_nodes`

function: `positionpresetorphansvelocityorphanget`
Description: Get the value of the `velocityOrphan` property of the `presetOrphans` implementation of the `position` component using a deferred function.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `positionpresetorphansvelocityorphangetfunction`
Description: Set the function to be used for the `get` method of the `velocityOrphan` property of the `PositionPresetOrphans` component.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `positionpresetorphansvelocityorphangetisattached`
Description: Return true if the deferred function used to get the `velocityOrphan` property of the `PositionPresetOrphans` component class has been attached.
Code lines: 8
Contained by: module `galacticus_nodes`

function: `positionpresetorphansvelocityorphangetvalue`
Description: Get the `velocityOrphan` property of an `presetOrphans` implementation of the `position` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `positionpresetorphansvelocityorphanset`
Description: Set the `velocityOrphan` property of an `presetOrphans` implementation of the `position` component class.
Code lines: 20
Contained by: module `galacticus_nodes`
Modules used: `memory_management`

subroutine: `positionpresetorphansvelocityset`
Description: Set the `velocity` property of an `presetOrphans` implementation of the `position` component class.
Code lines: 20
Contained by: module `galacticus_nodes`
Modules used: `memory_management`

subroutine: `positionpresetoutputcount`
Description: Increment the count of properties to output for a `preset` implementation of the `position` component.
Code lines: 21
Contained by: module `galacticus_nodes`

subroutine: `positionpresetoutputnames`
Description: Return the names of properties to output for a `preset` implementation of the `position` component.
Code lines: 59
Contained by: module `galacticus_nodes`

function: `positionpresetposition`
Description: Return the position of the node.
Code lines: 36
Contained by: module `galacticus_nodes`
Modules used: `fgsl` `iso_c_binding` `numerical_interpolation`

function: `positionpresetpositionhistoryget`
Description: Get the `positionHistory` property of an `preset` implementation of the `position` component class.
Code lines: 10

Contained by: module galacticus_nodes

subroutine: positionpresetpositionhistoryset
Description: Set the positionHistory property of an preset implementation of the position component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: positionpresetpositionset
Description: Set the position property of an preset implementation of the position component class.
Code lines: 20
Contained by: module galacticus_nodes
Modules used: memory_management

function: positionpresetvelocity
Description: Return the velocity of the node.
Code lines: 36
Contained by: module galacticus_nodes
Modules used: fgsl iso_c_binding numerical_interpolation

subroutine: positionpresetvelocityset
Description: Set the velocity property of an preset implementation of the position component class.
Code lines: 20
Contained by: module galacticus_nodes
Modules used: memory_management

function: positiontimeassign
Description: Returns the default value for the timeAssign property for the position component class.
Code lines: 17
Contained by: module galacticus_nodes

function: positiontimeassignattributematch
Description: Return a text list of component implementations in the position class that have the desired attributes for the timeAssign property
Code lines: 30
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: positiontimeassignisgettable
Description: Returns true if the timeAssign property is gettable for the position component class.
Code lines: 9
Contained by: module galacticus_nodes

function: positiontimeassignrateget
Description: Returns a zero rate for the timeAssign property for the position component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: `positiontracedarkmatteroutputcount`
Description: Increment the count of properties to output for a `traceDarkMatter` implementation of the `position` component.
Code lines: 21
Contained by: module galacticus_nodes

subroutine: `positiontracedarkmatteroutputnames`
Description: Return the names of properties to output for a `traceDarkMatter` implementation of the `position` component.
Code lines: 45
Contained by: module galacticus_nodes

function: `positiontracedarkmatterpositionget`
Description: Get the `position` property of an `traceDarkMatter` implementation of the `position` component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: `positiontracedarkmatterpositionset`
Description: Set the `position` property of an `traceDarkMatter` implementation of the `position` component class.
Code lines: 20
Contained by: module galacticus_nodes
Modules used: memory_management

function: `positionvelocity`
Description: Returns the default value for the `velocity` property for the `position` component class.
Code lines: 23
Contained by: module galacticus_nodes

function: `positionvelocityattributematch`
Description: Return a text list of component implementations in the `position` class that have the desired attributes for the `velocity` property
Code lines: 41
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: `positionvelocityisgettable`
Description: Returns true if the `velocity` property is gettable for the `position` component class.
Code lines: 10
Contained by: module galacticus_nodes

function: `positionvelocityorphan`
Description: Returns the default value for the `velocityOrphan` property for the `position` component class.
Code lines: 13
Contained by: module galacticus_nodes

function: `positionvelocityorphanattributematch`

Description: Return a text list of component implementations in the `position` class that have the desired attributes for the `velocityOrphan` property
Code lines: 30
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

function: `positionvelocityorphanisgettable`
Description: Returns true if the `velocityOrphan` property is gettable for the `position` component class.
Code lines: 8
Contained by: module `galacticus_nodes`

function: `positionvelocityorphanrateget`
Description: Returns a zero rate for the `velocityOrphan` property for the `position` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `positionvelocityrateget`
Description: Returns a zero rate for the `velocity` property for the `position` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `satelliteboundmass`
Description: Returns the default value for the `boundMass` property for the `satellite` component class.
Code lines: 33
Contained by: module `galacticus_nodes`

function: `satelliteboundmassattributematch`
Description: Return a text list of component implementations in the `satellite` class that have the desired attributes for the `boundMass` property
Code lines: 48
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

function: `satelliteboundmasshistory`
Description: Returns the default value for the `boundMassHistory` property for the `satellite` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `satelliteboundmasshistoryattributematch`
Description: Return a text list of component implementations in the `satellite` class that have the desired attributes for the `boundMassHistory` property
Code lines: 30
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

function: `satelliteboundmasshistoryisgettable`
Description: Returns true if the `boundMassHistory` property is gettable for the `satellite` component class.
Code lines: 8
Contained by: module `galacticus_nodes`

function: `satelliteboundmasshistoryrateget`
Description: Returns a zero rate for the `boundMassHistory` property for the `satellite` component class.
Code lines: 13
Contained by: module galacticus_nodes

function: `satelliteboundmassisgettable`
Description: Returns true if the `boundMass` property is gettable for the `satellite` component class.
Code lines: 11
Contained by: module galacticus_nodes

function: `satelliteboundmassrateget`
Description: Returns a zero rate for the `boundMass` property for the `satellite` component class.
Code lines: 13
Contained by: module galacticus_nodes

function: `satelliteisorphan`
Description: Returns the default value for the `isOrphan` property for the `satellite` component class.
Code lines: 13
Contained by: module galacticus_nodes

function: `satelliteisorphanattributematch`
Description: Return a text list of component implementations in the `satellite` class that have the desired attributes for the `isOrphan` property
Code lines: 30
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: `satelliteisorphanisgettable`
Description: Returns true if the `isOrphan` property is gettable for the `satellite` component class.
Code lines: 8
Contained by: module galacticus_nodes

function: `satelliteisorphanrateget`
Description: Returns a zero rate for the `isOrphan` property for the `satellite` component class.
Code lines: 13
Contained by: module galacticus_nodes

function: `satellitemergetime`
Description: Returns the default value for the `mergeTime` property for the `satellite` component class.
Code lines: 29
Contained by: module galacticus_nodes

function: `satellitemergetimeattributematch`
Description: Return a text list of component implementations in the `satellite` class that have the desired attributes for the `mergeTime` property
Code lines: 59
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: `satellitemergetimeisgettable`
Description: Returns true if the `mergeTime` property is gettable for the `satellite` component class.
Code lines: 12
Contained by: module `galacticus_nodes`

function: `satellitemergetimerateget`
Description: Returns a zero rate for the `mergeTime` property for the `satellite` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `satellitenodeindex`
Description: Returns the default value for the `nodeIndex` property for the `satellite` component class.
Code lines: 17
Contained by: module `galacticus_nodes`

function: `satellitenodeindexattributematch`
Description: Return a text list of component implementations in the `satellite` class that have the desired attributes for the `nodeIndex` property
Code lines: 30
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

function: `satellitenodeindexhistory`
Description: Returns the default value for the `nodeIndexHistory` property for the `satellite` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `satellitenodeindexhistoryattributematch`
Description: Return a text list of component implementations in the `satellite` class that have the desired attributes for the `nodeIndexHistory` property
Code lines: 30
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

function: `satellitenodeindexhistoryisgettable`
Description: Returns true if the `nodeIndexHistory` property is gettable for the `satellite` component class.
Code lines: 8
Contained by: module `galacticus_nodes`

function: `satellitenodeindexhistoryrateget`
Description: Returns a zero rate for the `nodeIndexHistory` property for the `satellite` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `satellitenodeindexisgettable`
Description: Returns true if the `nodeIndex` property is gettable for the `satellite` component class.
Code lines: 9

Contained by: module galacticus_nodes

function: satellitenodeindexrateget
Description: Returns a zero rate for the nodeIndex property for the satellite component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: satellitenulloutputcount
Description: Increment the count of properties to output for a null implementation of the satellite component.
Code lines: 22
Contained by: module galacticus_nodes

subroutine: satellitenulloutputnames
Description: Return the names of properties to output for a null implementation of the satellite component.
Code lines: 39
Contained by: module galacticus_nodes

function: satelliteorbitingboundmasscount
Description: Return a count of the number of scalar properties in the boundMass property of an orbiting implementation of the satellite component class.
Code lines: 12
Contained by: module galacticus_nodes

function: satelliteorbitingboundmassget
Description: Get the boundMass property of an orbiting implementation of the satellite component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: satelliteorbitingboundmassjcbnzr
Description: Indicate that the boundMass property of an orbiting implementation of the satellite component class is inactive for differential equation solving.
Code lines: 12
Contained by: module galacticus_nodes

subroutine: satelliteorbitingboundmassrate
Description: Accumulate to the rate of change of the boundMass property of an orbiting implementation of the satellite component class.
Code lines: 31
Contained by: module galacticus_nodes

function: satelliteorbitingboundmassrateget
Description: Get the rate of change of the boundMass property of an orbiting implementation of the satellite component class.
Code lines: 23
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: `satelliteorbitingboundmassscale`
Description: Set the absolute scale of the `boundMass` property of an `orbiting` implementation of the `satellite` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

subroutine: `satelliteorbitingboundmassset`
Description: Set the `boundMass` property of an `orbiting` implementation of the `satellite` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `satelliteorbitingmergetimeget`
Description: Get the `mergeTime` property of an `orbiting` implementation of the `satellite` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `satelliteorbitingmergetimeset`
Description: Set the `mergeTime` property of an `orbiting` implementation of the `satellite` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `satelliteorbitingoutputcount`
Description: Increment the count of properties to output for a `orbiting` implementation of the `satellite` component.
Code lines: 21
Contained by: module `galacticus_nodes`

subroutine: `satelliteorbitingoutputnames`
Description: Return the names of properties to output for a `orbiting` implementation of the `satellite` component.
Code lines: 71
Contained by: module `galacticus_nodes`

function: `satelliteorbitingpositioncount`
Description: Return a count of the number of scalar properties in the `position` property of an `orbiting` implementation of the `satellite` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `satelliteorbitingpositionget`
Description: Get the `position` property of an `orbiting` implementation of the `satellite` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `satelliteorbitingpositionjcbnzr`

Description: Indicate that the `position` property of an `orbiting` implementation of the `satellite` component class is inactive for differential equation solving.
Code lines: 12
Contained by: module `galacticus_nodes`

subroutine: `satelliteorbitingpositionrate`
Description: Accumulate to the rate of change of the `position` property of an `orbiting` implementation of the `satellite` component class.
Code lines: 33
Contained by: module `galacticus_nodes`

function: `satelliteorbitingpositionrateget`
Description: Get the rate of change of the `position` property of an `orbiting` implementation of the `satellite` component class.
Code lines: 25
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

subroutine: `satelliteorbitingpositionscale`
Description: Set the absolute scale of the `position` property of an `orbiting` implementation of the `satellite` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

subroutine: `satelliteorbitingpositionset`
Description: Set the `position` property of an `orbiting` implementation of the `satellite` component class.
Code lines: 20
Contained by: module `galacticus_nodes`
Modules used: `memory_management`

function: `satelliteorbitingtidalheatingnormalizedcount`
Description: Return a count of the number of scalar properties in the `tidalHeatingNormalized` property of an `orbiting` implementation of the `satellite` component class.
Code lines: 12
Contained by: module `galacticus_nodes`

function: `satelliteorbitingtidalheatingnormalizedget`
Description: Get the `tidalHeatingNormalized` property of an `orbiting` implementation of the `satellite` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `satelliteorbitingtidalheatingnormalizedjcbnzr`
Description: Indicate that the `tidalHeatingNormalized` property of an `orbiting` implementation of the `satellite` component class is inactive for differential equation solving.
Code lines: 12
Contained by: module `galacticus_nodes`

subroutine: `satelliteorbitingtidalheatingnormalizedrate`

Description: Accumulate to the rate of change of the `tidalHeatingNormalized` property of an `orbiting` implementation of the `satellite` component class.
Code lines: 31
Contained by: module galacticus_nodes

function: `satelliteorbitingtidalheatingnormalizedrateget`
Description: Get the rate of change of the `tidalHeatingNormalized` property of an `orbiting` implementation of the `satellite` component class.
Code lines: 23
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: `satelliteorbitingtidalheatingnormalizedscale`
Description: Set the absolute scale of the `tidalHeatingNormalized` property of an `orbiting` implementation of the `satellite` component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: `satelliteorbitingtidalheatingnormalizedset`
Description: Set the `tidalHeatingNormalized` property of an `orbiting` implementation of the `satellite` component class.
Code lines: 10
Contained by: module galacticus_nodes

function: `satelliteorbitingtidaltensorpathintegratedcount`
Description: Return a count of the number of scalar properties in the `tidalTensorPathIntegrated` property of an `orbiting` implementation of the `satellite` component class.
Code lines: 12
Contained by: module galacticus_nodes

function: `satelliteorbitingtidaltensorpathintegratedget`
Description: Get the `tidalTensorPathIntegrated` property of an `orbiting` implementation of the `satellite` component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: `satelliteorbitingtidaltensorpathintegratedjcbnzr`
Description: Indicate that the `tidalTensorPathIntegrated` property of an `orbiting` implementation of the `satellite` component class is inactive for differential equation solving.
Code lines: 14
Contained by: module galacticus_nodes

subroutine: `satelliteorbitingtidaltensorpathintegratedrate`
Description: Accumulate to the rate of change of the `tidalTensorPathIntegrated` property of an `orbiting` implementation of the `satellite` component class.
Code lines: 38
Contained by: module galacticus_nodes

function: `satelliteorbitingtidaltensorpathintegratedrateget`
Description: Get the rate of change of the `tidalTensorPathIntegrated` property of an `orbiting` implementation of the `satellite` component class.

Code lines: 26
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: satelliteorbitingtidaltensorpathintegratedscale
Description: Set the absolute scale of the tidalTensorPathIntegrated property of an orbiting implementation of the satellite component class.
Code lines: 15
Contained by: module galacticus_nodes

subroutine: satelliteorbitingtidaltensorpathintegratedset
Description: Set the tidalTensorPathIntegrated property of an orbiting implementation of the satellite component class.
Code lines: 10
Contained by: module galacticus_nodes

function: satelliteorbitingvelocitycount
Description: Return a count of the number of scalar properties in the velocity property of an orbiting implementation of the satellite component class.
Code lines: 13
Contained by: module galacticus_nodes

function: satelliteorbitingvelocityget
Description: Get the velocity property of an orbiting implementation of the satellite component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: satelliteorbitingvelocityjcbnzr
Description: Indicate that the velocity property of an orbiting implementation of the satellite component class is inactive for differential equation solving.
Code lines: 12
Contained by: module galacticus_nodes

subroutine: satelliteorbitingvelocityrate
Description: Accumulate to the rate of change of the velocity property of an orbiting implementation of the satellite component class.
Code lines: 33
Contained by: module galacticus_nodes

function: satelliteorbitingvelocityrateget
Description: Get the rate of change of the velocity property of an orbiting implementation of the satellite component class.
Code lines: 25
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: satelliteorbitingvelocityscale
Description: Set the absolute scale of the velocity property of an orbiting implementation of the satellite component class.
Code lines: 13

Contained by: module galacticus_nodes

subroutine: satelliteorbitingvelocityset
Description: Set the velocity property of an orbiting implementation of the satellite component class.
Code lines: 20
Contained by: module galacticus_nodes
Modules used: memory_management

function: satelliteorbitingvirialorbitget
Description: Get the virialOrbit property of an orbiting implementation of the satellite component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: satelliteorbitingvirialorbitset
Description: Set the value of the virialOrbit property of the orbiting implementation of the satellite component using a deferred function.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: satelliteorbitingvirialorbitsetfunction
Description: Set the function to be used for the set method of the virialOrbit property of the SatelliteOrbiting component.
Code lines: 10
Contained by: module galacticus_nodes

function: satelliteorbitingvirialorbitsetisattached
Description: Return true if the deferred function used to set the virialOrbit property of the SatelliteOrbiting component class has been attached.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: satelliteorbitingvirialorbitsetvalue
Description: Set the virialOrbit property of an orbiting implementation of the satellite component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: satelliteoutput
Description: Populate output buffers with properties to output for a satellite component.
Code lines: 56
Contained by: module galacticus_nodes
Modules used: multi_counters

subroutine: satelliteoutputcount
Description: Increment the count of properties to output for a generic satellite component.
Code lines: 15
Contained by: module galacticus_nodes

subroutine: `satelliteoutputnames`
Description: Establish the names of properties to output for a generic `satellite` component.
Code lines: 20
Contained by: module `galacticus_nodes`

function: `satelliteposition`
Description: Returns the default value for the `position` property for the `satellite` component class.
Code lines: 18
Contained by: module `galacticus_nodes`

function: `satellitepositionattributematch`
Description: Return a text list of component implementations in the `satellite` class that have the desired attributes for the `position` property
Code lines: 28
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

function: `satellitepositionisgettable`
Description: Returns true if the `position` property is gettable for the `satellite` component class.
Code lines: 9
Contained by: module `galacticus_nodes`

function: `satellitepositionrateget`
Description: Returns a zero rate for the `position` property for the `satellite` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

subroutine: `satellitepostoutput`
Description: Perform post-output processing of a `satellite` component.
Code lines: 14
Contained by: module `galacticus_nodes`

function: `satellitepresetboundmasshistoryget`
Description: Get the `boundMassHistory` property of an `preset` implementation of the `satellite` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `satellitepresetboundmasshistoryset`
Description: Set the `boundMassHistory` property of an `preset` implementation of the `satellite` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `satellitepresetisorphanget`
Description: Get the `isOrphan` property of an `preset` implementation of the `satellite` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `satellitepresetisorphanset`
Description: Set the `isOrphan` property of an `preset` implementation of the `satellite` component class.
Code lines: 10
Contained by: module galacticus_nodes

function: `satellitepresetmergeboundmass`
Description: Return the satellite bound mass at the current time.
Code lines: 43
Contained by: module galacticus_nodes
Modules used: `fgsl` histories `iso_c_binding` numerical_interpolation

function: `satellitepresetnodeindex`
Description: Return the satellite node index.
Code lines: 40
Contained by: module galacticus_nodes
Modules used: `fgsl` histories `iso_c_binding` kind_numbers numerical_interpolation

function: `satellitepresetnodeindexhistoryget`
Description: Get the `nodeIndexHistory` property of an `preset` implementation of the `satellite` component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: `satellitepresetnodeindexhistoryset`
Description: Set the `nodeIndexHistory` property of an `preset` implementation of the `satellite` component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: `satellitepresetoutputcount`
Description: Increment the count of properties to output for a `preset` implementation of the `satellite` component.
Code lines: 20
Contained by: module galacticus_nodes

subroutine: `satellitepresetoutputnames`
Description: Return the names of properties to output for a `preset` implementation of the `satellite` component.
Code lines: 41
Contained by: module galacticus_nodes

function: `satellitepresettimeofmergingget`
Description: Get the `timeOfMerging` property of an `preset` implementation of the `satellite` component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: `satellitepresettimeofmergingset`
Description: Set the `timeOfMerging` property of an `preset` implementation of the `satellite` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `satellitepresetvirialorbitget`
Description: Get the `virialOrbit` property of an `preset` implementation of the `satellite` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `satellitepresetvirialorbitset`
Description: Set the `virialOrbit` property of an `preset` implementation of the `satellite` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `satellitestandardboundmasscount`
Description: Return a count of the number of scalar properties in the `boundMass` property of an `standard` implementation of the `satellite` component class.
Code lines: 12
Contained by: module `galacticus_nodes`

function: `satellitestandardboundmassget`
Description: Get the `boundMass` property of an `standard` implementation of the `satellite` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `satellitestandardboundmassjcbnzr`
Description: Indicate that the `boundMass` property of an `standard` implementation of the `satellite` component class is inactive for differential equation solving.
Code lines: 12
Contained by: module `galacticus_nodes`

subroutine: `satellitestandardboundmassrate`
Description: Accumulate to the rate of change of the `boundMass` property of an `standard` implementation of the `satellite` component class.
Code lines: 31
Contained by: module `galacticus_nodes`

function: `satellitestandardboundmassrateget`
Description: Get the rate of change of the `boundMass` property of an `standard` implementation of the `satellite` component class.
Code lines: 23
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

subroutine: `satellitestandardboundmassscale`

Description: Set the absolute scale of the `boundMass` property of an `standard` implementation of the `satellite` component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: `satellitestandardboundmassset`
Description: Set the `boundMass` property of an `standard` implementation of the `satellite` component class.
Code lines: 10
Contained by: module galacticus_nodes

function: `satellitestandardmergetimecount`
Description: Return a count of the number of scalar properties in the `mergeTime` property of an `standard` implementation of the `satellite` component class.
Code lines: 12
Contained by: module galacticus_nodes

subroutine: `satellitestandardmergetimejcbnzr`
Description: Indicate that the `mergeTime` property of an `standard` implementation of the `satellite` component class is inactive for differential equation solving.
Code lines: 12
Contained by: module galacticus_nodes

subroutine: `satellitestandardmergetimerate`
Description: Accumulate to the rate of change of the `mergeTime` property of an `standard` implementation of the `satellite` component class.
Code lines: 31
Contained by: module galacticus_nodes

function: `satellitestandardmergetimerateget`
Description: Get the rate of change of the `mergeTime` property of an `standard` implementation of the `satellite` component class.
Code lines: 23
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: `satellitestandardmergetimescale`
Description: Set the absolute scale of the `mergeTime` property of an `standard` implementation of the `satellite` component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: `satellitestandardmergetimeset`
Description: Set the `mergeTime` property of an `standard` implementation of the `satellite` component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: `satellitestandardoutputcount`
Description: Increment the count of properties to output for a `standard` implementation of the `satellite` component.

Code lines: 20
Contained by: module galacticus_nodes

subroutine: satellitestandardoutputnames
Description: Return the names of properties to output for a standard implementation of the satellite component.
Code lines: 38
Contained by: module galacticus_nodes

subroutine: satellitestandardpostoutput
Description: Perform post-output processing for a standard implementation of the satellite component.
Code lines: 10
Contained by: module galacticus_nodes

function: satellitestandardvirialorbitget
Description: Get the value of the virialOrbit property of the standard implementation of the satellite component using a deferred function.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: satellitestandardvirialorbitgetfunction
Description: Set the function to be used for the get method of the virialOrbit property of the SatelliteStandard component.
Code lines: 10
Contained by: module galacticus_nodes

function: satellitestandardvirialorbitgetisattached
Description: Return true if the deferred function used to get the virialOrbit property of the SatelliteStandard component class has been attached.
Code lines: 8
Contained by: module galacticus_nodes

function: satellitestandardvirialorbitgetvalue
Description: Get the virialOrbit property of an standard implementation of the satellite component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: satellitestandardvirialorbitset
Description: Set the value of the virialOrbit property of the standard implementation of the satellite component using a deferred function.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: satellitestandardvirialorbitsetfunction
Description: Set the function to be used for the set method of the virialOrbit property of the SatelliteStandard component.
Code lines: 10
Contained by: module galacticus_nodes

function: `satellitestandardvirialorbitsetisattached`
Description: Return true if the deferred function used to set the `virialOrbit` property of the `SatelliteStandard` component class has been attached.
Code lines: 8
Contained by: module `galacticus_nodes`

subroutine: `satellitestandardvirialorbitsetvalue`
Description: Set the `virialOrbit` property of an `standard` implementation of the `satellite` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `satellitetidalheatingnormalized`
Description: Returns the default value for the `tidalHeatingNormalized` property for the `satellite` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `satellitetidalheatingnormalizedattributematch`
Description: Return a text list of component implementations in the `satellite` class that have the desired attributes for the `tidalHeatingNormalized` property
Code lines: 28
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

function: `satellitetidalheatingnormalizedisgettable`
Description: Returns true if the `tidalHeatingNormalized` property is gettable for the `satellite` component class.
Code lines: 8
Contained by: module `galacticus_nodes`

function: `satellitetidalheatingnormalizedrateget`
Description: Returns a zero rate for the `tidalHeatingNormalized` property for the `satellite` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `satellitetidaltensorpathintegrated`
Description: Returns the default value for the `tidalTensorPathIntegrated` property for the `satellite` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `satellitetidaltensorpathintegratedattributematch`
Description: Return a text list of component implementations in the `satellite` class that have the desired attributes for the `tidalTensorPathIntegrated` property
Code lines: 28
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

function: `satellitetidaltensorpathintegratedisgettable`
Description: Returns true if the `tidalTensorPathIntegrated` property is gettable for the `satellite` component class.
Code lines: 8
Contained by: module `galacticus_nodes`

function: `satellitetidaltensorpathintegratedrateget`
Description: Returns a zero rate for the `tidalTensorPathIntegrated` property for the `satellite` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `satellitetimeofmerging`
Description: Returns the default value for the `timeOfMerging` property for the `satellite` component class.
Code lines: 29
Contained by: module `galacticus_nodes`

function: `satellitetimeofmergingattributematch`
Description: Return a text list of component implementations in the `satellite` class that have the desired attributes for the `timeOfMerging` property
Code lines: 63
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

function: `satellitetimeofmergingisgettable`
Description: Returns true if the `timeOfMerging` property is gettable for the `satellite` component class.
Code lines: 12
Contained by: module `galacticus_nodes`

function: `satellitetimeofmergingrateget`
Description: Returns a zero rate for the `timeOfMerging` property for the `satellite` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `satellitevelocity`
Description: Returns the default value for the `velocity` property for the `satellite` component class.
Code lines: 18
Contained by: module `galacticus_nodes`

function: `satellitevelocityattributematch`
Description: Return a text list of component implementations in the `satellite` class that have the desired attributes for the `velocity` property
Code lines: 28
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

function: `satellitevelocityisgettable`

Description: Returns true if the `velocity` property is gettable for the `satellite` component class.
Code lines: 9
Contained by: module `galacticus_nodes`

function: `satellitevelocityrateget`
Description: Returns a zero rate for the `velocity` property for the `satellite` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `satelliteverysimplemergetimecount`
Description: Return a count of the number of scalar properties in the `mergeTime` property of an `verySimple` implementation of the `satellite` component class.
Code lines: 12
Contained by: module `galacticus_nodes`

subroutine: `satelliteverysimplemergetimejcbnzr`
Description: Indicate that the `mergeTime` property of an `verySimple` implementation of the `satellite` component class is inactive for differential equation solving.
Code lines: 12
Contained by: module `galacticus_nodes`

subroutine: `satelliteverysimplemergetimerate`
Description: Accumulate to the rate of change of the `mergeTime` property of an `verySimple` implementation of the `satellite` component class.
Code lines: 31
Contained by: module `galacticus_nodes`

function: `satelliteverysimplemergetimerateget`
Description: Get the rate of change of the `mergeTime` property of an `verySimple` implementation of the `satellite` component class.
Code lines: 23
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

subroutine: `satelliteverysimplemergetimescale`
Description: Set the absolute scale of the `mergeTime` property of an `verySimple` implementation of the `satellite` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

subroutine: `satelliteverysimplemergetimeset`
Description: Set the `mergeTime` property of an `verySimple` implementation of the `satellite` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `satelliteverysimpleoutputcount`
Description: Increment the count of properties to output for a `verySimple` implementation of the `satellite` component.
Code lines: 21
Contained by: module `galacticus_nodes`

subroutine: `satelliteverysimpleoutputnames`
Description: Return the names of properties to output for a `verySimple` implementation of the `satellite` component.
Code lines: 37
Contained by: module `galacticus_nodes`

function: `satellitevirialorbit`
Description: Returns the default value for the `virialOrbit` property for the `satellite` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `satellitevirialorbitattributematch`
Description: Return a text list of component implementations in the `satellite` class that have the desired attributes for the `virialOrbit` property
Code lines: 52
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

function: `satellitevirialorbitisgettable`
Description: Returns true if the `virialOrbit` property is gettable for the `satellite` component class.
Code lines: 8
Contained by: module `galacticus_nodes`

function: `satellitevirialorbitrateget`
Description: Returns a zero rate for the `virialOrbit` property for the `satellite` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `spheroidabundancesgas`
Description: Returns the default value for the `abundancesGas` property for the `spheroid` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `spheroidabundancesgasattributematch`
Description: Return a text list of component implementations in the `spheroid` class that have the desired attributes for the `abundancesGas` property
Code lines: 37
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

function: `spheroidabundancesgasisgettable`
Description: Returns true if the `abundancesGas` property is gettable for the `spheroid` component class.
Code lines: 8
Contained by: module `galacticus_nodes`

subroutine: `spheroidabundancesgasrate`
Description: Accept a rate set for the `abundancesGas` property of the `spheroid` component class. Trigger an interrupt to create the component.
Code lines: 21

Contained by: module galacticus_nodes
Modules used: galacticus_error

function: spheroidabundancesgasrateget
Description: Returns a zero rate for the abundancesGas property for the spheroid component class.
Code lines: 13
Contained by: module galacticus_nodes

function: spheroidabundancesstellar
Description: Returns the default value for the abundancesStellar property for the spheroid component class.
Code lines: 13
Contained by: module galacticus_nodes

function: spheroidabundancesstellarattributematch
Description: Return a text list of component implementations in the spheroid class that have the desired attributes for the abundancesStellar property
Code lines: 37
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: spheroidabundancesstellarisgettable
Description: Returns true if the abundancesStellar property is gettable for the spheroid component class.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: spheroidabundancesstellarrate
Description: Accept a rate set for the abundancesStellar property of the spheroid component class. Trigger an interrupt to create the component.
Code lines: 21
Contained by: module galacticus_nodes
Modules used: galacticus_error

function: spheroidabundancesstellarrateget
Description: Returns a zero rate for the abundancesStellar property for the spheroid component class.
Code lines: 13
Contained by: module galacticus_nodes

function: spheroidangularmomentum
Description: Returns the default value for the angularMomentum property for the spheroid component class.
Code lines: 13
Contained by: module galacticus_nodes

function: spheroidangularmomentumattributematch
Description: Return a text list of component implementations in the spheroid class that have the desired attributes for the angularMomentum property
Code lines: 28
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: `spheroidangularmomentumisgettable`
Description: Returns true if the `angularMomentum` property is gettable for the `spheroid` component class.
Code lines: 8
Contained by: module `galacticus_nodes`

subroutine: `spheroidangularmomentumrate`
Description: Accept a rate set for the `angularMomentum` property of the `spheroid` component class. Trigger an interrupt to create the component.
Code lines: 21
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

function: `spheroidangularmomentumrateget`
Description: Returns a zero rate for the `angularMomentum` property for the `spheroid` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

subroutine: `spheroidcreatebyinterrupt`
Description: Create the `spheroid` component of `self` via an interrupt.
Code lines: 14
Contained by: module `galacticus_nodes`

function: `spheroidenergygasinput`
Description: Returns the default value for the `energyGasInput` property for the `spheroid` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `spheroidenergygasinputattributematch`
Description: Return a text list of component implementations in the `spheroid` class that have the desired attributes for the `energyGasInput` property
Code lines: 30
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

function: `spheroidenergygasinputisgettable`
Description: Returns true if the `energyGasInput` property is gettable for the `spheroid` component class.
Code lines: 8
Contained by: module `galacticus_nodes`

function: `spheroidenergygasinputrateget`
Description: Returns a zero rate for the `energyGasInput` property for the `spheroid` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `spheroidhalfmassradius`
Description: Returns the default value for the `halfMassRadius` property for the `spheroid` component class.
Code lines: 13

Contained by: module galacticus_nodes

function: spheroidhalfmassradiusattributematch
Description: Return a text list of component implementations in the spheroid class that have the desired attributes for the halfMassRadius property
Code lines: 41
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: spheroidhalfmassradiusisgettable
Description: Returns true if the halfMassRadius property is gettable for the spheroid component class.
Code lines: 8
Contained by: module galacticus_nodes

function: spheroidhalfmassradiusrateget
Description: Returns a zero rate for the halfMassRadius property for the spheroid component class.
Code lines: 13
Contained by: module galacticus_nodes

function: spheroidisinitialized
Description: Returns the default value for the isInitialized property for the spheroid component class.
Code lines: 13
Contained by: module galacticus_nodes

function: spheroidisinitializedattributematch
Description: Return a text list of component implementations in the spheroid class that have the desired attributes for the isInitialized property
Code lines: 41
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: spheroidisinitializedisgettable
Description: Returns true if the isInitialized property is gettable for the spheroid component class.
Code lines: 8
Contained by: module galacticus_nodes

function: spheroidisinitializedrateget
Description: Returns a zero rate for the isInitialized property for the spheroid component class.
Code lines: 13
Contained by: module galacticus_nodes

function: spheroidluminositiesstellar
Description: Returns the default value for the luminositiesStellar property for the spheroid component class.
Code lines: 13
Contained by: module galacticus_nodes

function: spheroidluminositiesstellarattributematch
Description: Return a text list of component implementations in the spheroid class that have the desired attributes for the luminositiesStellar property

Code lines: 37
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: spheroidluminositiesstellarisgettable
Description: Returns true if the luminositiesStellar property is gettable for the spheroid component class.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: spheroidluminositiesstellarrate
Description: Accept a rate set for the luminositiesStellar property of the spheroid component class. Trigger an interrupt to create the component.
Code lines: 21
Contained by: module galacticus_nodes
Modules used: galacticus_error

function: spheroidluminositiesstellarrateget
Description: Returns a zero rate for the luminositiesStellar property for the spheroid component class.
Code lines: 13
Contained by: module galacticus_nodes

function: spheroidmassgas
Description: Returns the default value for the massGas property for the spheroid component class.
Code lines: 13
Contained by: module galacticus_nodes

function: spheroidmassgasattributematch
Description: Return a text list of component implementations in the spheroid class that have the desired attributes for the massGas property
Code lines: 37
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: spheroidmassgasisgettable
Description: Returns true if the massGas property is gettable for the spheroid component class.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: spheroidmassgasrate
Description: Accept a rate set for the massGas property of the spheroid component class. Trigger an interrupt to create the component.
Code lines: 21
Contained by: module galacticus_nodes
Modules used: galacticus_error

function: spheroidmassgasrateget
Description: Returns a zero rate for the massGas property for the spheroid component class.
Code lines: 13

Contained by: module galacticus_nodes

function: spheroidmassgassink
Description: Returns the default value for the massGasSink property for the spheroid component class.
Code lines: 13
Contained by: module galacticus_nodes

function: spheroidmassgassinkattributematch
Description: Return a text list of component implementations in the spheroid class that have the desired attributes for the massGasSink property
Code lines: 30
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: spheroidmassgassinkisgettable
Description: Returns true if the massGasSink property is gettable for the spheroid component class.
Code lines: 8
Contained by: module galacticus_nodes

function: spheroidmassgassinkrateget
Description: Returns a zero rate for the massGasSink property for the spheroid component class.
Code lines: 13
Contained by: module galacticus_nodes

function: spheroidmassstellar
Description: Returns the default value for the massStellar property for the spheroid component class.
Code lines: 13
Contained by: module galacticus_nodes

function: spheroidmassstellarattributematch
Description: Return a text list of component implementations in the spheroid class that have the desired attributes for the massStellar property
Code lines: 37
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: spheroidmassstellarformed
Description: Returns the default value for the massStellarFormed property for the spheroid component class.
Code lines: 13
Contained by: module galacticus_nodes

function: spheroidmassstellarformedattributematch
Description: Return a text list of component implementations in the spheroid class that have the desired attributes for the massStellarFormed property
Code lines: 28
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: spheroidmassstellarformedisgettable

Description: Returns true if the `massStellarFormed` property is gettable for the `spheroid` component class.
Code lines: 8
Contained by: module `galacticus_nodes`

function: `spheroidmassstellarformedrateget`
Description: Returns a zero rate for the `massStellarFormed` property for the `spheroid` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `spheroidmassstellarisgettable`
Description: Returns true if the `massStellar` property is gettable for the `spheroid` component class.
Code lines: 8
Contained by: module `galacticus_nodes`

subroutine: `spheroidmassstellarrate`
Description: Accept a rate set for the `massStellar` property of the `spheroid` component class. Trigger an interrupt to create the component.
Code lines: 21
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

function: `spheroidmassstellarrateget`
Description: Returns a zero rate for the `massStellar` property for the `spheroid` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

subroutine: `spheroidnulloutputcount`
Description: Increment the count of properties to output for a `null` implementation of the `spheroid` component.
Code lines: 22
Contained by: module `galacticus_nodes`

subroutine: `spheroidnulloutputnames`
Description: Return the names of properties to output for a `null` implementation of the `spheroid` component.
Code lines: 39
Contained by: module `galacticus_nodes`

subroutine: `spheroidoutput`
Description: Populate output buffers with properties to output for a `spheroid` component.
Code lines: 72
Contained by: module `galacticus_nodes`
Modules used: `multi_counters`

subroutine: `spheroidoutputcount`
Description: Increment the count of properties to output for a generic `spheroid` component.
Code lines: 15
Contained by: module `galacticus_nodes`

subroutine: `spheroidoutputnames`
Description: Establish the names of properties to output for a generic `spheroid` component.
Code lines: 20
Contained by: module galacticus_nodes

subroutine: `spheroidpostoutput`
Description: Perform post-output processing of a `spheroid` component.
Code lines: 14
Contained by: module galacticus_nodes

function: `spheroidradius`
Description: Returns the default value for the `radius` property for the `spheroid` component class.
Code lines: 13
Contained by: module galacticus_nodes

function: `spheroidradiusattributematch`
Description: Return a text list of component implementations in the `spheroid` class that have the desired attributes for the `radius` property
Code lines: 41
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: `spheroidradiusisgettable`
Description: Returns true if the `radius` property is gettable for the `spheroid` component class.
Code lines: 8
Contained by: module galacticus_nodes

function: `spheroidradiusrateget`
Description: Returns a zero rate for the `radius` property for the `spheroid` component class.
Code lines: 13
Contained by: module galacticus_nodes

function: `spheroidstandardabundancesgascount`
Description: Return a count of the number of scalar properties in the `abundancesGas` property of an `standard` implementation of the `spheroid` component class.
Code lines: 12
Contained by: module galacticus_nodes

function: `spheroidstandardabundancesgasget`
Description: Get the `abundancesGas` property of an `standard` implementation of the `spheroid` component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: `spheroidstandardabundancesgasjcbnzr`
Description: Indicate that the `abundancesGas` property of an `standard` implementation of the `spheroid` component class is inactive for differential equation solving.
Code lines: 14
Contained by: module galacticus_nodes

subroutine: `spheroidstandardabundancesgasrate`
Description: Accumulate to the rate of change of the `abundancesGas` property of an `standard` implementation of the `spheroid` component class.
Code lines: 38
Contained by: module `galacticus_nodes`

function: `spheroidstandardabundancesgasrateget`
Description: Get the rate of change of the `abundancesGas` property of an `standard` implementation of the `spheroid` component class.
Code lines: 26
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

subroutine: `spheroidstandardabundancesgasscale`
Description: Set the absolute scale of the `abundancesGas` property of an `standard` implementation of the `spheroid` component class.
Code lines: 15
Contained by: module `galacticus_nodes`

subroutine: `spheroidstandardabundancesgasset`
Description: Set the `abundancesGas` property of an `standard` implementation of the `spheroid` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `spheroidstandardabundancesstellarcount`
Description: Return a count of the number of scalar properties in the `abundancesStellar` property of an `standard` implementation of the `spheroid` component class.
Code lines: 12
Contained by: module `galacticus_nodes`

function: `spheroidstandardabundancesstellarget`
Description: Get the `abundancesStellar` property of an `standard` implementation of the `spheroid` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `spheroidstandardabundancesstellarjcbnzr`
Description: Indicate that the `abundancesStellar` property of an `standard` implementation of the `spheroid` component class is inactive for differential equation solving.
Code lines: 14
Contained by: module `galacticus_nodes`

subroutine: `spheroidstandardabundancesstellarrate`
Description: Accumulate to the rate of change of the `abundancesStellar` property of an `standard` implementation of the `spheroid` component class.
Code lines: 38
Contained by: module `galacticus_nodes`

function: `spheroidstandardabundancesstellarrateget`
Description: Get the rate of change of the `abundancesStellar` property of an `standard` implementation of the `spheroid` component class.
Code lines: 26
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

subroutine: `spheroidstandardabundancesstellarscale`
Description: Set the absolute scale of the `abundancesStellar` property of an `standard` implementation of the `spheroid` component class.
Code lines: 15
Contained by: module `galacticus_nodes`

subroutine: `spheroidstandardabundancesstellarset`
Description: Set the `abundancesStellar` property of an `standard` implementation of the `spheroid` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `spheroidstandardangularmomentumcount`
Description: Return a count of the number of scalar properties in the `angularMomentum` property of an `standard` implementation of the `spheroid` component class.
Code lines: 12
Contained by: module `galacticus_nodes`

function: `spheroidstandardangularmomentumget`
Description: Get the `angularMomentum` property of an `standard` implementation of the `spheroid` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `spheroidstandardangularmomentumjcbnzr`
Description: Indicate that the `angularMomentum` property of an `standard` implementation of the `spheroid` component class is inactive for differential equation solving.
Code lines: 12
Contained by: module `galacticus_nodes`

subroutine: `spheroidstandardangularmomentumrate`
Description: Accumulate to the rate of change of the `angularMomentum` property of an `standard` implementation of the `spheroid` component class.
Code lines: 31
Contained by: module `galacticus_nodes`

function: `spheroidstandardangularmomentumrateget`
Description: Get the rate of change of the `angularMomentum` property of an `standard` implementation of the `spheroid` component class.
Code lines: 23
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

subroutine: `spheroidstandardangularmomentumscale`
Description: Set the absolute scale of the `angularMomentum` property of an `standard` implementation of the `spheroid` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

subroutine: `spheroidstandardangularmomentumset`
Description: Set the `angularMomentum` property of an `standard` implementation of the `spheroid` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `spheroidstandardcreatefunctionset`
Description: Set the create function for the `standard` implementation of the `spheroid` component class.
Code lines: 9
Contained by: module `galacticus_nodes`

subroutine: `spheroidstandardenergygasinputrate`
Description: Accumulate the rate of change of the `energyGasInput` property of the `standard` implementation of the `spheroid` component using a deferred function.
Code lines: 12
Contained by: module `galacticus_nodes`

subroutine: `spheroidstandardenergygasinputratefunction`
Description: Set the function to be used for the `rate` method of the `energyGasInput` property of the `SpheroidStandard` component.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `spheroidstandardenergygasinputrateisattached`
Description: Return true if the deferred function used to rate the `energyGasInput` property of the `SpheroidStandard` component class has been attached.
Code lines: 8
Contained by: module `galacticus_nodes`

function: `spheroidstandardisinitializedget`
Description: Get the `isInitialized` property of an `standard` implementation of the `spheroid` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `spheroidstandardisinitializedset`
Description: Set the `isInitialized` property of an `standard` implementation of the `spheroid` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `spheroidstandardluminositiesstellarcount`
Description: Return a count of the number of scalar properties in the `luminositiesStellar` property of an `standard` implementation of the `spheroid` component class.

Code lines: 12
Contained by: module galacticus_nodes

function: spheroidstandardluminositiesstellarget
Description: Get the luminositiesStellar property of an standard implementation of the spheroid component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: spheroidstandardluminositiesstellarjcbnzr
Description: Indicate that the luminositiesStellar property of an standard implementation of the spheroid component class is inactive for differential equation solving.
Code lines: 14
Contained by: module galacticus_nodes

subroutine: spheroidstandardluminositiesstellarrate
Description: Accumulate to the rate of change of the luminositiesStellar property of an standard implementation of the spheroid component class.
Code lines: 38
Contained by: module galacticus_nodes

function: spheroidstandardluminositiesstellarrateget
Description: Get the rate of change of the luminositiesStellar property of an standard implementation of the spheroid component class.
Code lines: 26
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: spheroidstandardluminositiesstellarscale
Description: Set the absolute scale of the luminositiesStellar property of an standard implementation of the spheroid component class.
Code lines: 15
Contained by: module galacticus_nodes

subroutine: spheroidstandardluminositiesstellarset
Description: Set the luminositiesStellar property of an standard implementation of the spheroid component class.
Code lines: 10
Contained by: module galacticus_nodes

function: spheroidstandardmassgascount
Description: Return a count of the number of scalar properties in the massGas property of an standard implementation of the spheroid component class.
Code lines: 12
Contained by: module galacticus_nodes

function: spheroidstandardmassgasget
Description: Get the massGas property of an standard implementation of the spheroid component class.
Code lines: 10

Contained by: module galacticus_nodes

subroutine: spheroidstandardmassgasjcbnzr
Description: Indicate that the massGas property of an standard implementation of the spheroid component class is inactive for differential equation solving.
Code lines: 12
Contained by: module galacticus_nodes

subroutine: spheroidstandardmassgasrate
Description: Accumulate to the rate of change of the massGas property of an standard implementation of the spheroid component class.
Code lines: 31
Contained by: module galacticus_nodes

function: spheroidstandardmassgasrateget
Description: Get the rate of change of the massGas property of an standard implementation of the spheroid component class.
Code lines: 23
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: spheroidstandardmassgasscale
Description: Set the absolute scale of the massGas property of an standard implementation of the spheroid component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: spheroidstandardmassgasset
Description: Set the massGas property of an standard implementation of the spheroid component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: spheroidstandardmassgassinkrate
Description: Accumulate the rate of change of the massGasSink property of the standard implementation of the spheroid component using a deferred function.
Code lines: 12
Contained by: module galacticus_nodes

subroutine: spheroidstandardmassgassinkratefunction
Description: Set the function to be used for the rate method of the massGasSink property of the SpheroidStandard component.
Code lines: 10
Contained by: module galacticus_nodes

function: spheroidstandardmassgassinkrateisattached
Description: Return true if the deferred function used to rate the massGasSink property of the SpheroidStandard component class has been attached.
Code lines: 8
Contained by: module galacticus_nodes

function: `spheroidstandardmassstellarcount`
Description: Return a count of the number of scalar properties in the `massStellar` property of an `standard` implementation of the `spheroid` component class.
Code lines: 12
Contained by: module `galacticus_nodes`

function: `spheroidstandardmassstellarformedcount`
Description: Return a count of the number of scalar properties in the `massStellarFormed` property of an `standard` implementation of the `spheroid` component class.
Code lines: 12
Contained by: module `galacticus_nodes`

function: `spheroidstandardmassstellarformedget`
Description: Get the `massStellarFormed` property of an `standard` implementation of the `spheroid` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `spheroidstandardmassstellarformedjcbnzr`
Description: Indicate that the `massStellarFormed` property of an `standard` implementation of the `spheroid` component class is inactive for differential equation solving.
Code lines: 12
Contained by: module `galacticus_nodes`

subroutine: `spheroidstandardmassstellarformedrate`
Description: Accumulate to the rate of change of the `massStellarFormed` property of an `standard` implementation of the `spheroid` component class.
Code lines: 31
Contained by: module `galacticus_nodes`

function: `spheroidstandardmassstellarformedrateget`
Description: Get the rate of change of the `massStellarFormed` property of an `standard` implementation of the `spheroid` component class.
Code lines: 23
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

subroutine: `spheroidstandardmassstellarformedscale`
Description: Set the absolute scale of the `massStellarFormed` property of an `standard` implementation of the `spheroid` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

subroutine: `spheroidstandardmassstellarformedset`
Description: Set the `massStellarFormed` property of an `standard` implementation of the `spheroid` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `spheroidstandardmassstellarget`
Description: Get the `massStellar` property of an `standard` implementation of the `spheroid` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `spheroidstandardmassstellarjcbnzr`
Description: Indicate that the `massStellar` property of an `standard` implementation of the `spheroid` component class is inactive for differential equation solving.
Code lines: 12
Contained by: module `galacticus_nodes`

subroutine: `spheroidstandardmassstellarrate`
Description: Accumulate to the rate of change of the `massStellar` property of an `standard` implementation of the `spheroid` component class.
Code lines: 31
Contained by: module `galacticus_nodes`

function: `spheroidstandardmassstellarrateget`
Description: Get the rate of change of the `massStellar` property of an `standard` implementation of the `spheroid` component class.
Code lines: 23
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

subroutine: `spheroidstandardmassstellarscale`
Description: Set the absolute scale of the `massStellar` property of an `standard` implementation of the `spheroid` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

subroutine: `spheroidstandardmassstellarset`
Description: Set the `massStellar` property of an `standard` implementation of the `spheroid` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `spheroidstandardoutputcount`
Description: Increment the count of properties to output for a `standard` implementation of the `spheroid` component.
Code lines: 24
Contained by: module `galacticus_nodes`

subroutine: `spheroidstandardoutputnames`
Description: Return the names of properties to output for a `standard` implementation of the `spheroid` component.
Code lines: 71
Contained by: module `galacticus_nodes`

subroutine: `spheroidstandardpostoutput`
Description: Perform post-output processing for a `standard` implementation of the `spheroid` component.
Code lines: 12
Contained by: module galacticus_nodes

function: `spheroidstandardradiusget`
Description: Get the `radius` property of an `standard` implementation of the `spheroid` component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: `spheroidstandardradiusset`
Description: Set the `radius` property of an `standard` implementation of the `spheroid` component class.
Code lines: 10
Contained by: module galacticus_nodes

function: `spheroidstandardstarformationhistorycount`
Description: Return a count of the number of scalar properties in the `starFormationHistory` property of an `standard` implementation of the `spheroid` component class.
Code lines: 12
Contained by: module galacticus_nodes

function: `spheroidstandardstarformationhistoryget`
Description: Get the `starFormationHistory` property of an `standard` implementation of the `spheroid` component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: `spheroidstandardstarformationhistoryjcbnzr`
Description: Indicate that the `starFormationHistory` property of an `standard` implementation of the `spheroid` component class is inactive for differential equation solving.
Code lines: 14
Contained by: module galacticus_nodes

subroutine: `spheroidstandardstarformationhistoryrate`
Description: Accumulate the rate of change of the `starFormationHistory` property of the `standard` implementation of the `spheroid` component using a deferred function.
Code lines: 12
Contained by: module galacticus_nodes

subroutine: `spheroidstandardstarformationhistoryratefunction`
Description: Set the function to be used for the `rate` method of the `starFormationHistory` property of the `SpheroidStandard` component.
Code lines: 10
Contained by: module galacticus_nodes

function: `spheroidstandardstarformationhistoryrateget`
Description: Get the rate of change of the `starFormationHistory` property of an `standard` implementation of the `spheroid` component class.
Code lines: 26

Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: spheroidstandardstarformationhistoryrateintrinsic
Description: Accumulate directly (i.e. circumventing any deferred function binding) to the rate of change of the starFormationHistory property of an standard implementation of the spheroid component class.
Code lines: 38
Contained by: module galacticus_nodes

function: spheroidstandardstarformationhistoryrateisattached
Description: Return true if the deferred function used to rate the starFormationHistory property of the SpheroidStandard component class has been attached.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: spheroidstandardstarformationhistoryscale
Description: Set the absolute scale of the starFormationHistory property of an standard implementation of the spheroid component class.
Code lines: 15
Contained by: module galacticus_nodes

subroutine: spheroidstandardstarformationhistoryset
Description: Set the starFormationHistory property of an standard implementation of the spheroid component class.
Code lines: 10
Contained by: module galacticus_nodes

function: spheroidstandardstarformationrateget
Description: Get the value of the starFormationRate property of the standard implementation of the spheroid component using a deferred function.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: spheroidstandardstarformationrategetfunction
Description: Set the function to be used for the get method of the starFormationRate property of the SpheroidStandard component.
Code lines: 10
Contained by: module galacticus_nodes

function: spheroidstandardstarformationrategetisattached
Description: Return true if the deferred function used to get the starFormationRate property of the SpheroidStandard component class has been attached.
Code lines: 8
Contained by: module galacticus_nodes

function: spheroidstandardstellarpropertieshistorycount
Description: Return a count of the number of scalar properties in the stellarPropertiesHistory property of an standard implementation of the spheroid component class.
Code lines: 12

Contained by: module galacticus_nodes

function: spheroidstandardstellarpropertieshistoryget
Description: Get the stellarPropertiesHistory property of an standard implementation of the spheroid component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: spheroidstandardstellarpropertieshistoryjcbnzr
Description: Indicate that the stellarPropertiesHistory property of an standard implementation of the spheroid component class is inactive for differential equation solving.
Code lines: 14
Contained by: module galacticus_nodes

subroutine: spheroidstandardstellarpropertieshistoryrate
Description: Accumulate the rate of change of the stellarPropertiesHistory property of the standard implementation of the spheroid component using a deferred function.
Code lines: 12
Contained by: module galacticus_nodes

subroutine: spheroidstandardstellarpropertieshistoryratefunction
Description: Set the function to be used for the rate method of the stellarPropertiesHistory property of the SpheroidStandard component.
Code lines: 10
Contained by: module galacticus_nodes

function: spheroidstandardstellarpropertieshistoryrateget
Description: Get the rate of change of the stellarPropertiesHistory property of an standard implementation of the spheroid component class.
Code lines: 26
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: spheroidstandardstellarpropertieshistoryrateintrinsic
Description: Accumulate directly (i.e. circumventing any deferred function binding) to the rate of change of the stellarPropertiesHistory property of an standard implementation of the spheroid component class.
Code lines: 38
Contained by: module galacticus_nodes

function: spheroidstandardstellarpropertieshistoryrateisattached
Description: Return true if the deferred function used to rate the stellarPropertiesHistory property of the SpheroidStandard component class has been attached.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: spheroidstandardstellarpropertieshistoryscale
Description: Set the absolute scale of the stellarPropertiesHistory property of an standard implementation of the spheroid component class.
Code lines: 15

Contained by: module galacticus_nodes

subroutine: spheroidstandardstellarpropertieshistoryset
Description: Set the stellarPropertiesHistory property of an standard implementation of the spheroid component class.
Code lines: 10
Contained by: module galacticus_nodes

function: spheroidstandardvelocityget
Description: Get the velocity property of an standard implementation of the spheroid component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: spheroidstandardvelocityset
Description: Set the velocity property of an standard implementation of the spheroid component class.
Code lines: 10
Contained by: module galacticus_nodes

function: spheroidstarformationhistory
Description: Returns the default value for the starFormationHistory property for the spheroid component class.
Code lines: 13
Contained by: module galacticus_nodes

function: spheroidstarformationhistoryattributematch
Description: Return a text list of component implementations in the spheroid class that have the desired attributes for the starFormationHistory property
Code lines: 28
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: spheroidstarformationhistoryisgettable
Description: Returns true if the starFormationHistory property is gettable for the spheroid component class.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: spheroidstarformationhistoryrate
Description: Accept a rate set for the starFormationHistory property of the spheroid component class. Trigger an interrupt to create the component.
Code lines: 21
Contained by: module galacticus_nodes
Modules used: galacticus_error

function: spheroidstarformationhistoryrateget
Description: Returns a zero rate for the starFormationHistory property for the spheroid component class.
Code lines: 13
Contained by: module galacticus_nodes

function: `spheroidstarformationrate`
Description: Returns the default value for the `starFormationRate` property for the `spheroid` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `spheroidstarformationrateattributematch`
Description: Return a text list of component implementations in the `spheroid` class that have the desired attributes for the `starFormationRate` property
Code lines: 41
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

function: `spheroidstarformationrateisgettable`
Description: Returns true if the `starFormationRate` property is gettable for the `spheroid` component class.
Code lines: 8
Contained by: module `galacticus_nodes`

function: `spheroidstarformationraterateget`
Description: Returns a zero rate for the `starFormationRate` property for the `spheroid` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `spheroidstellarpropertieshistory`
Description: Returns the default value for the `stellarPropertiesHistory` property for the `spheroid` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `spheroidstellarpropertieshistoryattributematch`
Description: Return a text list of component implementations in the `spheroid` class that have the desired attributes for the `stellarPropertiesHistory` property
Code lines: 37
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

function: `spheroidstellarpropertieshistoryisgettable`
Description: Returns true if the `stellarPropertiesHistory` property is gettable for the `spheroid` component class.
Code lines: 8
Contained by: module `galacticus_nodes`

subroutine: `spheroidstellarpropertieshistoryrate`
Description: Accept a rate set for the `stellarPropertiesHistory` property of the `spheroid` component class. Trigger an interrupt to create the component.
Code lines: 21
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

function: `spheroidstellarpropertieshistoryrateget`
Description: Returns a zero rate for the `stellarPropertiesHistory` property for the `spheroid` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `spheroidvelocity`
Description: Returns the default value for the `velocity` property for the `spheroid` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `spheroidvelocityattributematch`
Description: Return a text list of component implementations in the `spheroid` class that have the desired attributes for the `velocity` property
Code lines: 41
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

function: `spheroidvelocityisgettable`
Description: Returns true if the `velocity` property is gettable for the `spheroid` component class.
Code lines: 8
Contained by: module `galacticus_nodes`

function: `spheroidvelocityrateget`
Description: Returns a zero rate for the `velocity` property for the `spheroid` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `spheroidverysimpleabundancesgascount`
Description: Return a count of the number of scalar properties in the `abundancesGas` property of an `verySimple` implementation of the `spheroid` component class.
Code lines: 12
Contained by: module `galacticus_nodes`

function: `spheroidverysimpleabundancesgasget`
Description: Get the `abundancesGas` property of an `verySimple` implementation of the `spheroid` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `spheroidverysimpleabundancesgasjcbnzr`
Description: Indicate that the `abundancesGas` property of an `verySimple` implementation of the `spheroid` component class is inactive for differential equation solving.
Code lines: 14
Contained by: module `galacticus_nodes`

subroutine: `spheroidverysimpleabundancesgasrate`
Description: Accumulate to the rate of change of the `abundancesGas` property of an `verySimple` implementation of the `spheroid` component class.

Code lines: 38
Contained by: module galacticus_nodes

function: spheroidverysimpleabundancesgasrateget
Description: Get the rate of change of the abundancesGas property of an verySimple implementation of the spheroid component class.
Code lines: 26
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: spheroidverysimpleabundancesgasscale
Description: Set the absolute scale of the abundancesGas property of an verySimple implementation of the spheroid component class.
Code lines: 15
Contained by: module galacticus_nodes

subroutine: spheroidverysimpleabundancesgasset
Description: Set the abundancesGas property of an verySimple implementation of the spheroid component class.
Code lines: 10
Contained by: module galacticus_nodes

function: spheroidverysimpleabundancesstellarcount
Description: Return a count of the number of scalar properties in the abundancesStellar property of an verySimple implementation of the spheroid component class.
Code lines: 12
Contained by: module galacticus_nodes

function: spheroidverysimpleabundancesstellarget
Description: Get the abundancesStellar property of an verySimple implementation of the spheroid component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: spheroidverysimpleabundancesstellarjcbnzr
Description: Indicate that the abundancesStellar property of an verySimple implementation of the spheroid component class is inactive for differential equation solving.
Code lines: 14
Contained by: module galacticus_nodes

subroutine: spheroidverysimpleabundancesstellarrate
Description: Accumulate to the rate of change of the abundancesStellar property of an verySimple implementation of the spheroid component class.
Code lines: 38
Contained by: module galacticus_nodes

function: spheroidverysimpleabundancesstellarrateget
Description: Get the rate of change of the abundancesStellar property of an verySimple implementation of the spheroid component class.
Code lines: 26

Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: spheroidverysimpleabundancesstellarscale
Description: Set the absolute scale of the abundancesStellar property of an verySimple implementation of the spheroid component class.
Code lines: 15
Contained by: module galacticus_nodes

subroutine: spheroidverysimpleabundancesstellarset
Description: Set the abundancesStellar property of an verySimple implementation of the spheroid component class.
Code lines: 10
Contained by: module galacticus_nodes

function: spheroidverysimpleisinitializedget
Description: Get the isInitialized property of an verySimple implementation of the spheroid component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: spheroidverysimpleisinitializedset
Description: Set the isInitialized property of an verySimple implementation of the spheroid component class.
Code lines: 10
Contained by: module galacticus_nodes

function: spheroidverysimpleluminositiesstellarcount
Description: Return a count of the number of scalar properties in the luminositiesStellar property of an verySimple implementation of the spheroid component class.
Code lines: 12
Contained by: module galacticus_nodes

function: spheroidverysimpleluminositiesstellarget
Description: Get the luminositiesStellar property of an verySimple implementation of the spheroid component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: spheroidverysimpleluminositiesstellarjcbnzr
Description: Indicate that the luminositiesStellar property of an verySimple implementation of the spheroid component class is inactive for differential equation solving.
Code lines: 14
Contained by: module galacticus_nodes

subroutine: spheroidverysimpleluminositiesstellarrate
Description: Accumulate to the rate of change of the luminositiesStellar property of an verySimple implementation of the spheroid component class.
Code lines: 38
Contained by: module galacticus_nodes

function: `spheroidverysimpleluminositiesstellarrateget`
Description: Get the rate of change of the `luminositiesStellar` property of an `verySimple` implementation of the `spheroid` component class.
Code lines: 26
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

subroutine: `spheroidverysimpleluminositiesstellarscale`
Description: Set the absolute scale of the `luminositiesStellar` property of an `verySimple` implementation of the `spheroid` component class.
Code lines: 15
Contained by: module `galacticus_nodes`

subroutine: `spheroidverysimpleluminositiesstellarset`
Description: Set the `luminositiesStellar` property of an `verySimple` implementation of the `spheroid` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `spheroidverysimplemassgascount`
Description: Return a count of the number of scalar properties in the `massGas` property of an `verySimple` implementation of the `spheroid` component class.
Code lines: 12
Contained by: module `galacticus_nodes`

function: `spheroidverysimplemassgasget`
Description: Get the `massGas` property of an `verySimple` implementation of the `spheroid` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `spheroidverysimplemassgasjcbnzr`
Description: Indicate that the `massGas` property of an `verySimple` implementation of the `spheroid` component class is inactive for differential equation solving.
Code lines: 12
Contained by: module `galacticus_nodes`

subroutine: `spheroidverysimplemassgasrate`
Description: Accumulate to the rate of change of the `massGas` property of an `verySimple` implementation of the `spheroid` component class.
Code lines: 31
Contained by: module `galacticus_nodes`

function: `spheroidverysimplemassgasrateget`
Description: Get the rate of change of the `massGas` property of an `verySimple` implementation of the `spheroid` component class.
Code lines: 23
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

subroutine: `spheroidverysimplemassgasscale`
Description: Set the absolute scale of the `massGas` property of an `verySimple` implementation of the `spheroid` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

subroutine: `spheroidverysimplemassgasset`
Description: Set the `massGas` property of an `verySimple` implementation of the `spheroid` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `spheroidverysimplemassstellarcount`
Description: Return a count of the number of scalar properties in the `massStellar` property of an `verySimple` implementation of the `spheroid` component class.
Code lines: 12
Contained by: module `galacticus_nodes`

function: `spheroidverysimplemassstellarget`
Description: Get the `massStellar` property of an `verySimple` implementation of the `spheroid` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `spheroidverysimplemassstellarjcbnzr`
Description: Indicate that the `massStellar` property of an `verySimple` implementation of the `spheroid` component class is inactive for differential equation solving.
Code lines: 12
Contained by: module `galacticus_nodes`

subroutine: `spheroidverysimplemassstellarrate`
Description: Accumulate to the rate of change of the `massStellar` property of an `verySimple` implementation of the `spheroid` component class.
Code lines: 31
Contained by: module `galacticus_nodes`

function: `spheroidverysimplemassstellarrateget`
Description: Get the rate of change of the `massStellar` property of an `verySimple` implementation of the `spheroid` component class.
Code lines: 23
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

subroutine: `spheroidverysimplemassstellarscale`
Description: Set the absolute scale of the `massStellar` property of an `verySimple` implementation of the `spheroid` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

subroutine: `spheroidverysimplemassstellarset`
Description: Set the `massStellar` property of an `verySimple` implementation of the `spheroid` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `spheroidverysimpleoutputcount`
Description: Increment the count of properties to output for a `verySimple` implementation of the `spheroid` component.
Code lines: 24
Contained by: module `galacticus_nodes`

subroutine: `spheroidverysimpleoutputnames`
Description: Return the names of properties to output for a `verySimple` implementation of the `spheroid` component.
Code lines: 65
Contained by: module `galacticus_nodes`

subroutine: `spheroidverysimplepostoutput`
Description: Perform post-output processing for a `verySimple` implementation of the `spheroid` component.
Code lines: 12
Contained by: module `galacticus_nodes`

function: `spheroidverysimpleradiusget`
Description: Get the `radius` property of an `verySimple` implementation of the `spheroid` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `spheroidverysimpleradiusset`
Description: Set the `radius` property of an `verySimple` implementation of the `spheroid` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `spheroidverysimplestarformationrateget`
Description: Get the value of the `starFormationRate` property of the `verySimple` implementation of the `spheroid` component using a deferred function.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `spheroidverysimplestarformationrategetfunction`
Description: Set the function to be used for the `get` method of the `starFormationRate` property of the `SpheroidVerySimple` component.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `spheroidverysimplestarformationrategetisattached`

Description: Return true if the deferred function used to get the `starFormationRate` property of the `SpheroidVerySimple` component class has been attached.
Code lines: 8
Contained by: module galacticus_nodes

function: `spheroidverysimplestellarpropertieshistorycount`
Description: Return a count of the number of scalar properties in the `stellarPropertiesHistory` property of an `verySimple` implementation of the `spheroid` component class.
Code lines: 12
Contained by: module galacticus_nodes

function: `spheroidverysimplestellarpropertieshistoryget`
Description: Get the `stellarPropertiesHistory` property of an `verySimple` implementation of the `spheroid` component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: `spheroidverysimplestellarpropertieshistoryjcbnzr`
Description: Indicate that the `stellarPropertiesHistory` property of an `verySimple` implementation of the `spheroid` component class is inactive for differential equation solving.
Code lines: 14
Contained by: module galacticus_nodes

subroutine: `spheroidverysimplestellarpropertieshistoryrate`
Description: Accumulate to the rate of change of the `stellarPropertiesHistory` property of an `verySimple` implementation of the `spheroid` component class.
Code lines: 38
Contained by: module galacticus_nodes

function: `spheroidverysimplestellarpropertieshistoryrateget`
Description: Get the rate of change of the `stellarPropertiesHistory` property of an `verySimple` implementation of the `spheroid` component class.
Code lines: 26
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: `spheroidverysimplestellarpropertieshistoryscale`
Description: Set the absolute scale of the `stellarPropertiesHistory` property of an `verySimple` implementation of the `spheroid` component class.
Code lines: 15
Contained by: module galacticus_nodes

subroutine: `spheroidverysimplestellarpropertieshistoryset`
Description: Set the `stellarPropertiesHistory` property of an `verySimple` implementation of the `spheroid` component class.
Code lines: 10
Contained by: module galacticus_nodes

function: `spheroidverysimplevelocityget`

Description: Get the `velocity` property of an `verySimple` implementation of the `spheroid` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `spheroidverysimplevelocityset`
Description: Set the `velocity` property of an `verySimple` implementation of the `spheroid` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `spinnulloutputcount`
Description: Increment the count of properties to output for a `null` implementation of the `spin` component.
Code lines: 22
Contained by: module `galacticus_nodes`

subroutine: `spinnulloutputnames`
Description: Return the names of properties to output for a `null` implementation of the `spin` component.
Code lines: 39
Contained by: module `galacticus_nodes`

subroutine: `spinoutput`
Description: Populate output buffers with properties to output for a `spin` component.
Code lines: 48
Contained by: module `galacticus_nodes`
Modules used: `multi_counters`

subroutine: `spinoutputcount`
Description: Increment the count of properties to output for a generic `spin` component.
Code lines: 15
Contained by: module `galacticus_nodes`

subroutine: `spinoutputnames`
Description: Establish the names of properties to output for a generic `spin` component.
Code lines: 20
Contained by: module `galacticus_nodes`

subroutine: `spinpostoutput`
Description: Perform post-output processing of a `spin` component.
Code lines: 14
Contained by: module `galacticus_nodes`

subroutine: `spinpreset3doutputcount`
Description: Increment the count of properties to output for a `preset3D` implementation of the `spin` component.
Code lines: 13
Contained by: module `galacticus_nodes`

subroutine: `spinpreset3doutputnames`

Description: Return the names of properties to output for a `preset3D` implementation of the `spin` component.
Code lines: 31
Contained by: module galacticus_nodes

subroutine: `spinpreset3dpostoutput`
Description: Perform post-output processing for a `preset3D` implementation of the `spin` component.
Code lines: 10
Contained by: module galacticus_nodes

function: `spinpreset3dspinvectorcount`
Description: Return a count of the number of scalar properties in the `spinVector` property of an `preset3D` implementation of the `spin` component class.
Code lines: 13
Contained by: module galacticus_nodes

function: `spinpreset3dspinvectorget`
Description: Get the `spinVector` property of an `preset3D` implementation of the `spin` component class.
Code lines: 10
Contained by: module galacticus_nodes

function: `spinpreset3dspinvectorgrowthrateget`
Description: Get the `spinVectorGrowthRate` property of an `preset3D` implementation of the `spin` component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: `spinpreset3dspinvectorgrowthrateset`
Description: Set the `spinVectorGrowthRate` property of an `preset3D` implementation of the `spin` component class.
Code lines: 20
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: `spinpreset3dspinvectorjcbnzr`
Description: Indicate that the `spinVector` property of an `preset3D` implementation of the `spin` component class is inactive for differential equation solving.
Code lines: 12
Contained by: module galacticus_nodes

subroutine: `spinpreset3dspinvectorrate`
Description: Accumulate to the rate of change of the `spinVector` property of an `preset3D` implementation of the `spin` component class.
Code lines: 33
Contained by: module galacticus_nodes

function: `spinpreset3dspinvectorrateget`
Description: Get the rate of change of the `spinVector` property of an `preset3D` implementation of the `spin` component class.
Code lines: 25

Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: spinpreset3dspinvectorscale
Description: Set the absolute scale of the spinVector property of an preset3D implementation of the spin component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: spinpreset3dspinvectorset
Description: Set the spinVector property of an preset3D implementation of the spin component class.
Code lines: 20
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: spinpresetoutputcount
Description: Increment the count of properties to output for a preset implementation of the spin component.
Code lines: 21
Contained by: module galacticus_nodes

subroutine: spinpresetoutputnames
Description: Return the names of properties to output for a preset implementation of the spin component.
Code lines: 37
Contained by: module galacticus_nodes

function: spinpresetspincount
Description: Return a count of the number of scalar properties in the spin property of an preset implementation of the spin component class.
Code lines: 12
Contained by: module galacticus_nodes

function: spinpresetspinget
Description: Get the spin property of an preset implementation of the spin component class.
Code lines: 10
Contained by: module galacticus_nodes

function: spinpresetspingrowthrateget
Description: Get the spinGrowthRate property of an preset implementation of the spin component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: spinpresetspingrowthrateset
Description: Set the spinGrowthRate property of an preset implementation of the spin component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: `spinpresetspinjcbnzr`
Description: Indicate that the `spin` property of an `preset` implementation of the `spin` component class is inactive for differential equation solving.
Code lines: 12
Contained by: module `galacticus_nodes`

subroutine: `spinpresetspinrate`
Description: Accumulate to the rate of change of the `spin` property of an `preset` implementation of the `spin` component class.
Code lines: 31
Contained by: module `galacticus_nodes`

function: `spinpresetspinrateget`
Description: Get the rate of change of the `spin` property of an `preset` implementation of the `spin` component class.
Code lines: 23
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

subroutine: `spinpresetspinscale`
Description: Set the absolute scale of the `spin` property of an `preset` implementation of the `spin` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

subroutine: `spinpresetspinset`
Description: Set the `spin` property of an `preset` implementation of the `spin` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `spinrandomoutputcount`
Description: Increment the count of properties to output for a `random` implementation of the `spin` component.
Code lines: 21
Contained by: module `galacticus_nodes`

subroutine: `spinrandomoutputnames`
Description: Return the names of properties to output for a `random` implementation of the `spin` component.
Code lines: 37
Contained by: module `galacticus_nodes`

function: `spinrandomspincount`
Description: Return a count of the number of scalar properties in the `spin` property of an `random` implementation of the `spin` component class.
Code lines: 12
Contained by: module `galacticus_nodes`

function: `spinrandomspinget`

Description: Get the `spin` property of an `random` implementation of the `spin` component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: `spinrandomspinjcbnzr`
Description: Indicate that the `spin` property of an `random` implementation of the `spin` component class is inactive for differential equation solving.
Code lines: 12
Contained by: module galacticus_nodes

subroutine: `spinrandomspinrate`
Description: Accumulate to the rate of change of the `spin` property of an `random` implementation of the `spin` component class.
Code lines: 31
Contained by: module galacticus_nodes

function: `spinrandomspinrateget`
Description: Get the rate of change of the `spin` property of an `random` implementation of the `spin` component class.
Code lines: 23
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: `spinrandomspinscale`
Description: Set the absolute scale of the `spin` property of an `random` implementation of the `spin` component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: `spinrandomspinset`
Description: Set the `spin` property of an `random` implementation of the `spin` component class.
Code lines: 10
Contained by: module galacticus_nodes

function: `spinspin`
Description: Returns the default value for the `spin` property for the `spin` component class.
Code lines: 13
Contained by: module galacticus_nodes

function: `spinspinattributematch`
Description: Return a text list of component implementations in the `spin` class that have the desired attributes for the `spin` property
Code lines: 55
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: `spinspingrowthrate`
Description: Returns the default value for the `spinGrowthRate` property for the `spin` component class.
Code lines: 13

Contained by: module galacticus_nodes

function: spinspingrowthrateattributematch
Description: Return a text list of component implementations in the spin class that have the desired attributes for the spinGrowthRate property
Code lines: 63
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: spinspingrowthrateisgettable
Description: Returns true if the spinGrowthRate property is gettable for the spin component class.
Code lines: 8
Contained by: module galacticus_nodes

function: spinspingrowthraterateget
Description: Returns a zero rate for the spinGrowthRate property for the spin component class.
Code lines: 13
Contained by: module galacticus_nodes

function: spinspinisgettable
Description: Returns true if the spin property is gettable for the spin component class.
Code lines: 8
Contained by: module galacticus_nodes

function: spinspinrateget
Description: Returns a zero rate for the spin property for the spin component class.
Code lines: 13
Contained by: module galacticus_nodes

function: spinspinvector
Description: Returns the default value for the spinVector property for the spin component class.
Code lines: 23
Contained by: module galacticus_nodes

function: spinspinvectorattributematch
Description: Return a text list of component implementations in the spin class that have the desired attributes for the spinVector property
Code lines: 37
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: spinspinvectorgrowthrate
Description: Returns the default value for the spinVectorGrowthRate property for the spin component class.
Code lines: 13
Contained by: module galacticus_nodes

function: spinspinvectorgrowthrateattributematch
Description: Return a text list of component implementations in the spin class that have the desired attributes for the spinVectorGrowthRate property

Code lines: 30
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: spinspinvectorgrowthrateisgettable
Description: Returns true if the spinVectorGrowthRate property is gettable for the spin component class.
Code lines: 8
Contained by: module galacticus_nodes

function: spinspinvectorgrowthraterateget
Description: Returns a zero rate for the spinVectorGrowthRate property for the spin component class.
Code lines: 13
Contained by: module galacticus_nodes

function: spinspinvectorisgettable
Description: Returns true if the spinVector property is gettable for the spin component class.
Code lines: 10
Contained by: module galacticus_nodes

function: spinspinvectorrateget
Description: Returns a zero rate for the spinVector property for the spin component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: spinvitvitskaoutputcount
Description: Increment the count of properties to output for a vitvitska implementation of the spin component.
Code lines: 21
Contained by: module galacticus_nodes

subroutine: spinvitvitskaoutputnames
Description: Return the names of properties to output for a vitvitska implementation of the spin component.
Code lines: 51
Contained by: module galacticus_nodes

function: spinvitvitskaspincount
Description: Return a count of the number of scalar properties in the spin property of an vitvitska implementation of the spin component class.
Code lines: 12
Contained by: module galacticus_nodes

function: spinvitvitskaspinget
Description: Get the value of the spin property of the vitvitska implementation of the spin component using a deferred function.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: spinvitvitskaspingetfunction

Description: Set the function to be used for the `get` method of the `spin` property of the `SpinVitvitska` component.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `spinvitvitskaspingetisattached`
Description: Return true if the deferred function used to get the `spin` property of the `SpinVitvitska` component class has been attached.
Code lines: 8
Contained by: module `galacticus_nodes`

function: `spinvitvitskaspingetvalue`
Description: Get the `spin` property of an `vitvitska` implementation of the `spin` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `spinvitvitskaspingrowthrateget`
Description: Get the value of the `spinGrowthRate` property of the `vitvitska` implementation of the `spin` component using a deferred function.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `spinvitvitskaspingrowthrategetfunction`
Description: Set the function to be used for the `get` method of the `spinGrowthRate` property of the `SpinVitvitska` component.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `spinvitvitskaspingrowthrategetisattached`
Description: Return true if the deferred function used to get the `spinGrowthRate` property of the `SpinVitvitska` component class has been attached.
Code lines: 8
Contained by: module `galacticus_nodes`

subroutine: `spinvitvitskaspinjcbnzr`
Description: Indicate that the `spin` property of an `vitvitska` implementation of the `spin` component class is inactive for differential equation solving.
Code lines: 12
Contained by: module `galacticus_nodes`

subroutine: `spinvitvitskaspinrate`
Description: Accumulate to the rate of change of the `spin` property of an `vitvitska` implementation of the `spin` component class.
Code lines: 31
Contained by: module `galacticus_nodes`

function: `spinvitvitskaspinrateget`
Description: Get the rate of change of the `spin` property of an `vitvitska` implementation of the `spin` component class.
Code lines: 23

Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: spinvitvitskaspinscale
Description: Set the absolute scale of the spin property of an vitvitska implementation of the spin component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: spinvitvitskaspinset
Description: Set the spin property of an vitvitska implementation of the spin component class.
Code lines: 10
Contained by: module galacticus_nodes

function: spinvitvitskaspinvectorcount
Description: Return a count of the number of scalar properties in the spinVector property of an vitvitska implementation of the spin component class.
Code lines: 13
Contained by: module galacticus_nodes

function: spinvitvitskaspinvectorget
Description: Get the value of the spinVector property of the vitvitska implementation of the spin component using a deferred function.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: spinvitvitskaspinvectorgetfunction
Description: Set the function to be used for the get method of the spinVector property of the SpinVitvitska component.
Code lines: 10
Contained by: module galacticus_nodes

function: spinvitvitskaspinvectorgetisattached
Description: Return true if the deferred function used to get the spinVector property of the SpinVitvitska component class has been attached.
Code lines: 8
Contained by: module galacticus_nodes

function: spinvitvitskaspinvectorgetvalue
Description: Get the spinVector property of an vitvitska implementation of the spin component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: spinvitvitskaspinvectorjcbnzr
Description: Indicate that the spinVector property of an vitvitska implementation of the spin component class is inactive for differential equation solving.
Code lines: 12
Contained by: module galacticus_nodes

subroutine: spinvitvitskaspinvectorrate

Description: Accumulate to the rate of change of the `spinVector` property of an `vitvitska` implementation of the `spin` component class.
Code lines: 33
Contained by: module `galacticus_nodes`

function: `spinvitvitskaspinvectorrateget`
Description: Get the rate of change of the `spinVector` property of an `vitvitska` implementation of the `spin` component class.
Code lines: 25
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

subroutine: `spinvitvitskaspinvectorscale`
Description: Set the absolute scale of the `spinVector` property of an `vitvitska` implementation of the `spin` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

subroutine: `spinvitvitskaspinvectorset`
Description: Set the `spinVector` property of an `vitvitska` implementation of the `spin` component class.
Code lines: 20
Contained by: module `galacticus_nodes`
Modules used: `memory_management`

subroutine: `tree_node_attach_event`
Description: Create a new event in a tree node.
Code lines: 21
Contained by: module `galacticus_nodes`

function: `tree_node_constructor`
Description: Return a pointer to a newly created and initialized `treeNode`.
Code lines: 16
Contained by: module `galacticus_nodes`

function: `tree_node_get_earliest_progenitor`
Description: Returns a pointer to the earliest progenitor of `self`.
Code lines: 18
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

function: `tree_node_get_last_satellite`
Description: Returns a pointer to the final satellite node associated with `self`.
Code lines: 11
Contained by: module `galacticus_nodes`

function: `tree_node_index`
Description: Returns the index of a `treeNode`.
Code lines: 21
Contained by: module `galacticus_nodes`

Modules used: galacticus_error

subroutine: tree_node_index_set
Description: Sets the index of a treeNode.
Code lines: 8
Contained by: module galacticus_nodes

function: tree_node_is_on_main_branch
Description: Returns true if self is on the main branch.
Code lines: 21
Contained by: module galacticus_nodes
Modules used: galacticus_error

function: tree_node_is_primary_progenitor
Description: Returns true if self is the primary progenitor of its parent node.
Code lines: 18
Contained by: module galacticus_nodes
Modules used: galacticus_error

function: tree_node_is_primary_progenitor_of_index
Description: Return true if self is a progenitor of the node with index targetNodeIndex.
Code lines: 25
Contained by: module galacticus_nodes
Modules used: galacticus_error

function: tree_node_is_primary_progenitor_of_node
Description: Return true if self is a progenitor of targetNode.
Code lines: 25
Contained by: module galacticus_nodes
Modules used: galacticus_error

function: tree_node_is_progenitor_of_index
Description: Return true if self is a progenitor of the node with index targetNodeIndex.
Code lines: 24
Contained by: module galacticus_nodes
Modules used: galacticus_error

function: tree_node_is_progenitor_of_node
Description: Return true if self is a progenitor of targetNode.
Code lines: 24
Contained by: module galacticus_nodes
Modules used: galacticus_error

function: tree_node_is_satellite
Description: Returns true if self is a satellite.
Code lines: 31
Contained by: module galacticus_nodes
Modules used: galacticus_error

function: `tree_node_merges_with_node`
Description: Returns a pointer to the node with which `thisNode` will merge.
Code lines: 15
Contained by: module `galacticus_nodes`

subroutine: `tree_node_remove_from_host`
Description: Remove `self` from the linked list of its host node's satellites.
Code lines: 42
Contained by: module `galacticus_nodes`
Modules used: `galacticus_display` `galacticus_error` `string_handling`

subroutine: `tree_node_remove_from_mergee`
Description: Remove `self` from the linked list of its host node's satellites.
Code lines: 42
Contained by: module `galacticus_nodes`
Modules used: `galacticus_display` `galacticus_error` `string_handling`

subroutine: `tree_node_remove_paired_event`
Description: Removed a paired event from `self`. Matching is done on the basis of event ID.
Code lines: 33
Contained by: module `galacticus_nodes`

function: `tree_node_time_step`
Description: Returns the time-step last used by a `treeNode`.
Code lines: 7
Contained by: module `galacticus_nodes`

subroutine: `tree_node_time_step_set`
Description: Sets the time-step used by a `treeNode`.
Code lines: 8
Contained by: module `galacticus_nodes`

function: `tree_node_type`
Description: Returns the name of a `treeNode` object.
Code lines: 9
Contained by: module `galacticus_nodes`

function: `tree_node_unique_id`
Description: Returns the unique ID of a `treeNode`.
Code lines: 21
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

subroutine: `tree_node_unique_id_set`
Description: Sets the index of a `treeNode`.
Code lines: 16

Contained by: module galacticus_nodes

type: `treeevent`
Description: Type for events attached to trees.
Code lines: 11
Contained by: module galacticus_nodes

type: `treenode`
Description: A class for nodes in merger trees.
Code lines: 1147
Contained by: module galacticus_nodes

function: `treenodeagestatisticscount`
Description: Returns the number of `ageStatistics` components in the node.
Code lines: 26
Contained by: module galacticus_nodes
Modules used: galacticus_error

function: `treenodeagestatisticsget`
Description: Return a `ageStatistics` component member of the node. If no `instance` is specified, return the first instance. If `autoCreate` is `true` then create a single instance of the component if none exists in the node.
Code lines: 29
Contained by: module galacticus_nodes

function: `treenodebasiccount`
Description: Returns the number of `basic` components in the node.
Code lines: 26
Contained by: module galacticus_nodes
Modules used: galacticus_error

function: `treenodebasicget`
Description: Return a `basic` component member of the node. If no `instance` is specified, return the first instance. If `autoCreate` is `true` then create a single instance of the component if none exists in the node.
Code lines: 29
Contained by: module galacticus_nodes

function: `treenodeblackholecount`
Description: Returns the number of `blackHole` components in the node.
Code lines: 26
Contained by: module galacticus_nodes
Modules used: galacticus_error

function: `treenodeblackholeget`
Description: Return a `blackHole` component member of the node. If no `instance` is specified, return the first instance. If `autoCreate` is `true` then create a single instance of the component if none exists in the node.
Code lines: 29
Contained by: module galacticus_nodes

subroutine: `treenodecomponentbuilder`

Description: Build components in a `treeNode` object given an XML definition.
Code lines: 423
Contained by: module galacticus_nodes
Modules used: `fox_dom` hashes

subroutine: `treenodecomponentsmove`
Description: Move components from `self` to `targetNode`.
Code lines: 226
Contained by: module galacticus_nodes

subroutine: `treenodecopynodeto`
Description: Make a copy of `self` in `targetNode`.
Code lines: 596
Contained by: module galacticus_nodes

function: `treenodedarkmatterprofilecount`
Description: Returns the number of `darkMatterProfile` components in the node.
Code lines: 26
Contained by: module galacticus_nodes
Modules used: galacticus_error

function: `treenodedarkmatterprofileget`
Description: Return a `darkMatterProfile` component member of the node. If no `instance` is specified, return the first instance. If `autoCreate` is `true` then create a single instance of the component if none exists in the node.
Code lines: 29
Contained by: module galacticus_nodes

subroutine: `treenodedeserializeratestoarray`
Description: Deserialize rates of evolvable properties of a node from an array.
Code lines: 21
Contained by: module galacticus_nodes

subroutine: `treenodedeserializeraw`
Description: Deserialize a tree node object from a raw (binary) file.
Code lines: 426
Contained by: module galacticus_nodes

subroutine: `treenodedeserializevaluesfromarray`
Description: Deserialize evolvable properties of a node from an array.
Code lines: 212
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: `treenodedestroy`
Description: Destroy a `treeNode` object.
Code lines: 64
Contained by: module galacticus_nodes

subroutine: `treenodedestroybranch`
Description: Destroy the tree branch rooted at this given node.
Code lines: 29
Contained by: module galacticus_nodes

function: `treenodediskcount`
Description: Returns the number of `disk` components in the node.
Code lines: 26
Contained by: module galacticus_nodes
Modules used: galacticus_error

function: `treenodediskget`
Description: Return a `disk` component member of the node. If no `instance` is specified, return the first instance. If `autoCreate` is `true` then create a single instance of the component if none exists in the node.
Code lines: 29
Contained by: module galacticus_nodes

function: `treenodedynamicsstatisticscount`
Description: Returns the number of `dynamicsStatistics` components in the node.
Code lines: 26
Contained by: module galacticus_nodes
Modules used: galacticus_error

function: `treenodedynamicsstatisticsget`
Description: Return a `dynamicsStatistics` component member of the node. If no `instance` is specified, return the first instance. If `autoCreate` is `true` then create a single instance of the component if none exists in the node.
Code lines: 29
Contained by: module galacticus_nodes

function: `treenodeformationtimecount`
Description: Returns the number of `formationTime` components in the node.
Code lines: 26
Contained by: module galacticus_nodes
Modules used: galacticus_error

function: `treenodeformationtimeget`
Description: Return a `formationTime` component member of the node. If no `instance` is specified, return the first instance. If `autoCreate` is `true` then create a single instance of the component if none exists in the node.
Code lines: 29
Contained by: module galacticus_nodes

function: `treenodehosthistorycount`
Description: Returns the number of `hostHistory` components in the node.
Code lines: 26
Contained by: module galacticus_nodes

Modules used: galacticus_error

function: `treenodehosthistoryget`
Description: Return a `hostHistory` component member of the node. If no `instance` is specified, return the first instance. If `autoCreate` is `true` then create a single instance of the component if none exists in the node.
Code lines: 29
Contained by: module galacticus_nodes

function: `treenodehothalocount`
Description: Returns the number of `hotHalo` components in the node.
Code lines: 26
Contained by: module galacticus_nodes
Modules used: galacticus_error

function: `treenodehothaloget`
Description: Return a `hotHalo` component member of the node. If no `instance` is specified, return the first instance. If `autoCreate` is `true` then create a single instance of the component if none exists in the node.
Code lines: 29
Contained by: module galacticus_nodes

function: `treenodeindicescount`
Description: Returns the number of `indices` components in the node.
Code lines: 26
Contained by: module galacticus_nodes
Modules used: galacticus_error

function: `treenodeindicesget`
Description: Return a `indices` component member of the node. If no `instance` is specified, return the first instance. If `autoCreate` is `true` then create a single instance of the component if none exists in the node.
Code lines: 29
Contained by: module galacticus_nodes

subroutine: `treenodeinitialize`
Description: Initialize a `treeNode` object.
Code lines: 80
Contained by: module galacticus_nodes
Modules used: galacticus_error

function: `treenodeinteroutputcount`
Description: Returns the number of `interOutput` components in the node.
Code lines: 26
Contained by: module galacticus_nodes
Modules used: galacticus_error

function: `treenodeinteroutputget`
Description: Return a `interOutput` component member of the node. If no `instance` is specified, return the first instance. If `autoCreate` is `true` then create a single instance of the component if none exists in the node.
Code lines: 29

Contained by: module galacticus_nodes

type: `treenodelinkedlist`
Description: Type to give a linked list of treeNodes.
Code lines: 4
Contained by: module galacticus_nodes

type: `treenodelist`
Description: Type to give a list of treeNodes.
Code lines: 3
Contained by: module galacticus_nodes

function: `treenodemapdouble0`
Description: Map a rank-0, double function over components of the node.
Code lines: 242
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: `treenodemapvoid`
Description: Map a void function over components of the node.
Code lines: 64
Contained by: module galacticus_nodes

function: `treenodemassflowstatisticscount`
Description: Returns the number of `massFlowStatistics` components in the node.
Code lines: 26
Contained by: module galacticus_nodes
Modules used: galacticus_error

function: `treenodemassflowstatisticsget`
Description: Return a `massFlowStatistics` component member of the node. If no `instance` is specified, return the first instance. If `autoCreate` is `true` then create a single instance of the component if none exists in the node.
Code lines: 29
Contained by: module galacticus_nodes

function: `treenodemergingstatisticscount`
Description: Returns the number of `mergingStatistics` components in the node.
Code lines: 26
Contained by: module galacticus_nodes
Modules used: galacticus_error

function: `treenodemergingstatisticsget`
Description: Return a `mergingStatistics` component member of the node. If no `instance` is specified, return the first instance. If `autoCreate` is `true` then create a single instance of the component if none exists in the node.
Code lines: 29
Contained by: module galacticus_nodes

function: `treenodenbodycount`

Description: Returns the number of `nBody` components in the node.
Code lines: 26
Contained by: module galacticus_nodes
Modules used: galacticus_error

function: `treenodenbodyget`
Description: Return a `nBody` component member of the node. If no `instance` is specified, return the first instance. If `autoCreate` is `true` then create a single instance of the component if none exists in the node.
Code lines: 29
Contained by: module galacticus_nodes

subroutine: `treenodeodestepinactivesinitialize`
Description: Initialize the inactives in components of tree node `self` in preparation for an ODE solver step.
Code lines: 12
Contained by: module galacticus_nodes

subroutine: `treenodeodestepratesinitialize`
Description: Initialize the rates in components of tree node `self` in preparation for an ODE solver step.
Code lines: 12
Contained by: module galacticus_nodes

subroutine: `treenodeodestepscalesinitialize`
Description: Initialize the scales in components of tree node `self` in preparation for an ODE solver step.
Code lines: 12
Contained by: module galacticus_nodes

subroutine: `treenodeoutput`
Description: Populate output buffers with properties to output for a `treeNode`.
Code lines: 107
Contained by: module galacticus_nodes
Modules used: multi_counters

subroutine: `treenodeoutputcount`
Description: Increment the count of properties to output for a `treeNode`.
Code lines: 101
Contained by: module galacticus_nodes

subroutine: `treenodeoutputnames`
Description: Establish the names of properties to output for a `treeNode`.
Code lines: 106
Contained by: module galacticus_nodes

function: `treenodepositioncount`
Description: Returns the number of `position` components in the node.
Code lines: 26
Contained by: module galacticus_nodes
Modules used: galacticus_error

function: `treenodepositionget`
Description: Return a `position` component member of the node. If no `instance` is specified, return the first instance. If `autoCreate` is `true` then create a single instance of the component if none exists in the node.
Code lines: 29
Contained by: module galacticus_nodes

subroutine: `treenodepostoutput`
Description: Perform post-output processing of a `treeNode`.
Code lines: 100
Contained by: module galacticus_nodes

function: `treenodepropertynamefromindex`
Description: Return the name of a property given its index within an array.
Code lines: 124
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: `treenodesatellitecount`
Description: Returns the number of `satellite` components in the node.
Code lines: 26
Contained by: module galacticus_nodes
Modules used: galacticus_error

function: `treenodesatelliteget`
Description: Return a `satellite` component member of the node. If no `instance` is specified, return the first instance. If `autoCreate` is `true` then create a single instance of the component if none exists in the node.
Code lines: 29
Contained by: module galacticus_nodes

subroutine: `treenodeserializeascii`
Description: Serialize node content to ASCII.
Code lines: 137
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string string_handling

function: `treenodeserializecount`
Description: Return a count of the size of the node when serialized to an array.
Code lines: 101
Contained by: module galacticus_nodes

subroutine: `treenodeserializeinactivetoarray`
Description: Serialize inactive statuses of evolvable properties of a node into an array.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: `treenodeserializeoffsets`
Description: Compute offsets into serialization arrays for `treeNode` object.
Code lines: 124
Contained by: module `galacticus_nodes`

subroutine: `treenodeserializeratestoarray`
Description: Serialize rates of evolvable properties of a node into an array.
Code lines: 21
Contained by: module `galacticus_nodes`

subroutine: `treenodeserializeraw`
Description: Serialize all content of a tree node to a raw (binary) file.
Code lines: 245
Contained by: module `galacticus_nodes`

subroutine: `treenodeserializescaletoarray`
Description: Serialize scales of evolvable properties of a node into an array.
Code lines: 21
Contained by: module `galacticus_nodes`

subroutine: `treenodeserializevaluestoarray`
Description: Serialize evolvable properties of a node into an array.
Code lines: 140
Contained by: module `galacticus_nodes`
Modules used: `memory_management`

subroutine: `treenodeserializexml`
Description: Serialize tree node content as XML.
Code lines: 129
Contained by: module `galacticus_nodes`
Modules used: `galacticus_display` `iso_varying_string` `string_handling`

function: `treenodesizeof`
Description: Compute the size (in bytes) of the tree node.
Code lines: 106
Contained by: module `galacticus_nodes`

function: `treenodespheroidcount`
Description: Returns the number of `spheroid` components in the node.
Code lines: 26
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

function: `treenodespheroidget`
Description: Return a `spheroid` component member of the node. If no `instance` is specified, return the first instance. If `autoCreate` is `true` then create a single instance of the component if none exists in the node.
Code lines: 29
Contained by: module `galacticus_nodes`

function: `treenodespincount`
Description: Returns the number of `spin` components in the node.
Code lines: 26
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

function: `treenodespinget`
Description: Return a `spin` component member of the node. If no `instance` is specified, return the first instance. If `autoCreate` is `true` then create a single instance of the component if none exists in the node.
Code lines: 29
Contained by: module `galacticus_nodes`

function: `treenodewalkbranchwithsatellites`
Description: This function provides a mechanism for walking through the branches of the merger tree. Given a pointer `self` to a branch of the tree, it will return the next node that should be visited in the tree. Thus, if `self` is initially set to the base of the merger tree and `Merger_Tree_Walk_Branch()` is called repeatedly it will walk through every node of the branch. Once the entire branch has been walked, a `null()` pointer will be returned, indicating that there are no more nodes to walk. Each node will be visited once and once only if the branch is walked in this way. Note that it is important that the walk descends to satellites before descending to children: the routines that destroy merger tree branches rely on this since child nodes are used in testing whether a node is a satellite—if they are destroyed prior to the test being made then problems with dangling pointers will occur.
Code lines: 55
Contained by: module `galacticus_nodes`

function: `treenodewalktreewithsatellites`
Description: Merger tree walk function which also descends through satellite nodes. Note that it is important that the walk descends to satellites before descending to children: the routines that destroy merger tree branches rely on this since child nodes are used in testing whether a node is a satellite—if they are destroyed prior to the test being made then problems with dangling pointers will occur.
Code lines: 46

Modules used: galacticus_nodes

subroutine: node_component_black_hole_standard_thread_initialize
Description: Initializes the tree node standard black hole module.
Code lines: 19
Contained by: module node_component_black_hole_standard
Modules used: galacticus_nodes input_parameters

subroutine: node_component_black_hole_standard_thread_uninitialize
Description: Uninitializes the tree node standard black hole module.
Code lines: 17
Contained by: module node_component_black_hole_standard
Modules used: galacticus_nodes

file: objects.nodes.components.black_hole.standard.structure_tasks.F90
Description: Contains a module which implements galactic structure tasks for the standard black hole node component.
Code lines: 138

module: node_component_black_hole_standard_structure_tasks
Description: Implements galactic structure tasks for the standard black hole tree node component.
Code lines: 114
Contained by: file objects.nodes.components.black_hole.standard.structure_tasks.F90
Used by: subroutine adiabaticgnedin2004computefactors function galactic_structure_potential function galactic_structure_rotation_curve function galactic_structure_rotation_curve_gradient

function: node_component_black_hole_standard_potential
Description: Compute the gravitational potential due to a black hole.
Code lines: 28

Contained by: module node_component_black_hole_standard_structure_tasks
Modules used: black_hole_fundamentals, galactic_structure_options, galacticus_nodes, numerical_constants_physical

function: node_component_black_hole_standard_rotation_curve
Description: Computes the rotation curve for the central black hole. Assumes a point mass black hole with a Keplerian rotation curve, *except* that the rotation speed is limited to never exceed the speed of light.
Code lines: 31
Contained by: module node_component_black_hole_standard_structure_tasks
Modules used: black_hole_fundamentals, galactic_structure_options, galacticus_nodes, numerical_constants_physical

function: node_component_black_hole_standard_rotation_curve_gradient
Description: Computes the rotation curve gradient for the central black hole. Assumes a point mass black hole with a Keplerian rotation curve, *except* that the rotation speed is limited to never exceed the speed of light.
Code lines: 32
Contained by: module node_component_black_hole_standard_structure_tasks
Modules used: black_hole_fundamentals, galactic_structure_options, galacticus_nodes, numerical_constants_physical

file: objects.nodes.components.dark_matter_profile.scale.F90
Description: Contains a module which implements a dark matter profile method that provides a scale radius.
Code lines: 378

module: node_component_dark_matter_profile_scale
Description: Implements a dark matter profile method that provides a scale radius.
Code lines: 356
Contained by: file objects.nodes.components.dark_matter_profile.scale.F90
Modules used: dark_matter_halo_scales, dark_matter_profile_scales, galacticus_nodes
Used by: subroutine equilibriumsolve; subroutine fixedsolve; subroutine linearsolve; subroutine simplesolve; subroutine halo_model_projected_-correlation; subroutine merger_tree_initialize; subroutine standardderivativescompute; subroutine standardevolve; subroutine standardpromote; subroutine merger_tree_structure_output; function projectedcorrelationfunctionconstructorinternal; subroutine node_components_initialize; subroutine node_components_thread_-initialize; subroutine node_components_thread_-uninitialize

subroutine: node_component_dark_matter_profile_scale_initialize
Description: Initializes the "scale" implementation of the dark matter halo profile component.
Code lines: 35
Contained by: module node_component_dark_matter_profile_scale
Modules used: input_parameters

subroutine: `node_component_dark_matter_profile_scale_plausibility`
Description: Determines whether the dark matter profile is physically plausible for radius solving tasks.
Code lines: 17
Contained by: module `node_component_dark_matter_profile_scale`
Modules used: `galacticus_nodes`

subroutine: `node_component_dark_matter_profile_scale_promote`
Description: Ensure that `node` is ready for promotion to its parent. In this case, we simply update the growth rate of `node` to be that of its parent.
Code lines: 25
Contained by: module `node_component_dark_matter_profile_scale`
Modules used: `galacticus_error` `galacticus_nodes`

subroutine: `node_component_dark_matter_profile_scale_rate_compute`
Description: Compute the rate of change of the scale radius.
Code lines: 29
Contained by: module `node_component_dark_matter_profile_scale`
Modules used: `galacticus_nodes`

function: `node_component_dark_matter_profile_scale_scale`
Description: Return the scale radius in the dark matter halo profile.
Code lines: 20
Contained by: module `node_component_dark_matter_profile_scale`
Modules used: `galacticus_nodes`

subroutine: `node_component_dark_matter_profile_scale_scale_set`
Description: Set scales for properties of `node`.
Code lines: 16
Contained by: module `node_component_dark_matter_profile_scale`
Modules used: `galacticus_nodes`

subroutine: `node_component_dark_matter_profile_scale_thread_initialize`
Description: Initializes the tree node scale dark matter profile module.
Code lines: 12
Contained by: module `node_component_dark_matter_profile_scale`
Modules used: `galacticus_nodes` `input_parameters`

subroutine: `node_component_dark_matter_profile_scale_thread_uninitialize`
Description: Uninitializes the tree node scale dark matter profile module.
Code lines: 10
Contained by: module `node_component_dark_matter_profile_scale`
Modules used: `galacticus_nodes`

subroutine: `node_component_dark_matter_profile_scale_tree_initialize`
Description: Initialize the scale radius of `node`.
Code lines: 52
Contained by: module `node_component_dark_matter_profile_scale`

Modules used: galacticus_error galacticus_nodes merger_tree_walkers

subroutine: node_component_dark_matter_profile_scale_tree_output
Description: Write the scale radius property to a full merger tree output.
Code lines: 37
Contained by: module node_component_dark_matter_profile_scale
Modules used: galacticus_nodes io_hdf5 merger_tree_walkers numerical_constants_astronomical

file: objects.nodes.components.dark_matter_profile.scale_preset.F90
Description: Contains a module which implements a dark matter profile method that provides a scale radius.
Code lines: 169

module: node_component_dark_matter_profile_scale_preset
Description: Implements a dark matter profile method that provides a scale radius.
Code lines: 147
Contained by: file objects.nodes.components.dark_matter_profile.scale_preset.F90
Used by: subroutine merger_tree_initialize subroutine standardderivativescompute subroutine standardevolve subroutine standardpromote

subroutine: node_component_dark_matter_profile_scale_preset_promote
Description: Ensure that node is ready for promotion to its parent. In this case, we simply update the growth rate of node to be that of its parent.
Code lines: 25
Contained by: module node_component_dark_matter_profile_scale_preset
Modules used: galacticus_error galacticus_nodes

subroutine: node_component_dark_matter_profile_scale_preset_rate_compute
Description: Compute the rate of change of the scale radius.
Code lines: 25
Contained by: module node_component_dark_matter_profile_scale_preset
Modules used: dark_matter_halo_scales galacticus_nodes

subroutine: node_component_dark_matter_profile_scale_preset_scale_set
Description: Set scales for properties of node.
Code lines: 16
Contained by: module node_component_dark_matter_profile_scale_preset
Modules used: galacticus_nodes

subroutine: node_component_dark_matter_profile_scale_preset_tree_initialize
Description: Initialize the scale radius of node.
Code lines: 30
Contained by: module node_component_dark_matter_profile_scale_preset
Modules used: galacticus_nodes

file: objects.nodes.components.dark_matter_profile.scale_shape.F90
Description: Contains a module which implements a dark matter profile method that provides a scale radius and a shape parameter.

Code lines: 295

module: `node_component_dark_matter_profile_scale_shape`

Description: Implements a dark matter profile method that provides a scale radius and a shape parameter.
Code lines: 273
Contained by: file objects.nodes.components.dark_matter_profile.scale_shape.F90
Modules used: dark_matter_profiles_shape, galacticus_nodes
Used by: subroutine merger_tree_initialize, subroutine standardderivativescompute, subroutine standardevolve, subroutine standardpromote, subroutine merger_tree_structure_output, subroutine node_components_initialize, subroutine node_components_thread_initialize, subroutine node_components_thread_uninitialize

subroutine: `node_component_dark_matter_profile_scale_shape_initialize`

Description: Initializes the "scale" implementation of the dark matter halo profile component.
Code lines: 18
Contained by: module node_component_dark_matter_profile_scale_shape
Modules used: input_parameters

subroutine: `node_component_dark_matter_profile_scale_shape_promote`

Description: Ensure that `node` is ready for promotion to its parent. In this case, we simply update the growth rate of `node` to be that of its parent.
Code lines: 25
Contained by: module node_component_dark_matter_profile_scale_shape
Modules used: galacticus_error, galacticus_nodes

subroutine: `node_component_dark_matter_profile_scale_shape_rate_compute`

Description: Compute the rate of change of the scale radius.
Code lines: 24
Contained by: module node_component_dark_matter_profile_scale_shape
Modules used: galacticus_nodes

subroutine: `node_component_dark_matter_profile_scale_shape_scale_set`

Description: Set scales for properties of `node`.
Code lines: 16
Contained by: module node_component_dark_matter_profile_scale_shape
Modules used: galacticus_nodes

function: `node_component_dark_matter_profile_scale_shape_shape`

Description: Return the shape parameter in the dark matter halo profile.
Code lines: 15
Contained by: module node_component_dark_matter_profile_scale_shape

subroutine: `node_component_dark_matter_profile_scale_shape_thread_init`

Description: Initializes the tree node random spin module.
Code lines: 11
Contained by: module node_component_dark_matter_profile_scale_shape
Modules used: galacticus_nodes, input_parameters

subroutine: `node_component_dark_matter_profile_scale_shape_thread_uninit`

Description: Uninitializes the tree node random spin module.
Code lines: 9
Contained by: module `node_component_dark_matter_profile_scale_shape`
Modules used: `galacticus_nodes`

subroutine: `node_component_dark_matter_profile_scale_shape_tree_initialize`

Description: Initialize the scale radius of `node`.
Code lines: 33
Contained by: module `node_component_dark_matter_profile_scale_shape`
Modules used: `galacticus_nodes`

subroutine: `node_component_dark_matter_profile_scale_shape_tree_output`

Description: Write the scale radius property to a full merger tree output.
Code lines: 33
Contained by: module `node_component_dark_matter_profile_scale_shape`
Modules used: `galacticus_nodes` `io_hdf5` `merger_tree_walkers`

file: `objects.nodes.components.disk.standard.F90`

Description: Contains a module which implements the standard disk node component.
Code lines: 1385

module: `node_component_disk_standard`

Description: Implements the standard disk node component.

subroutine: `node_component_hot_halo_very_simple_thread_initialize`
Description: Initializes the tree node very simple disk profile module.
Code lines: 13
Contained by: module `node_component_hot_halo_very_simple`
Modules used: `galacticus_nodes` `input_parameters`

subroutine: `node_component_hot_halo_very_simple_thread_uninitialize`
Description: Uninitializes the tree node very simple disk profile module.
Code lines: 11
Contained by: module `node_component_hot_halo_very_simple`
Modules used: `galacticus_nodes`

subroutine: `node_component_hot_halo_very_simple_tree_initialize`
Description: Initialize the contents of the very simple hot halo component.
Code lines: 48
Contained by: module `node_component_hot_halo_very_simple`
Modules used: `abundances_structure` `cosmology_parameters` `galacticus_nodes`

file: `objects.nodes.components.hot_halo.very_simple_delayed.F90`
Description: Contains a module which implements an extension to the very simple hot halo node component by including an outflowed reservoir with delayed reincorporation.
Code lines: 346

module: `node_component_hot_halo_vs_delayed`

Description: Implements an extension to the very simple hot halo node component by including an outflowed reservoir with delayed reincorporation.
Code lines: 323
Contained by: file `objects.nodes.components.hot_halo.very_simple_delayed.F90`
Used by: subroutine `satellitemergerprocess`, subroutine `merger_tree_initialize`, subroutine `standardderivativescompute`, subroutine `standardevolve`, subroutine `standardmerge`, subroutine `standardpromote`, subroutine `node_components_initialize`

subroutine: `node_component_hot_halo_vs_delayed_initialize`

Description: Initializes the very simple hot halo component module.
Code lines: 25
Contained by: module `node_component_hot_halo_vs_delayed`
Modules used: `galacticus_nodes`, `input_parameters`

subroutine: `node_component_hot_halo_vs_delayed_node_merger`

Description: Starve `node` by transferring its hot halo to its parent.
Code lines: 24
Contained by: module `node_component_hot_halo_vs_delayed`
Modules used: `abundances_structure`, `galacticus_nodes`

subroutine: `node_component_hot_halo_vs_delayed_outflowing_abundances_rate`

Description: Accept outflowing gas abundances from a galaxy and deposit them into very simple hot halo.
Code lines: 14
Contained by: module `node_component_hot_halo_vs_delayed`
Modules used: `abundances_structure`, `galacticus_nodes`

subroutine: `node_component_hot_halo_vs_delayed_outflowing_mass_rate`

Description: Accept outflowing gas from a galaxy and deposit it into very simple hot halo.
Code lines: 13
Contained by: module `node_component_hot_halo_vs_delayed`
Modules used: `galacticus_nodes`

subroutine: `node_component_hot_halo_vs_delayed_post_evolve`

Description: Do processing of the node required after evolution.
Code lines: 28
Contained by: module `node_component_hot_halo_vs_delayed`
Modules used: `abundances_structure`, `galacticus_nodes`

subroutine: `node_component_hot_halo_vs_delayed_promote`

Description: Ensure that `node` is ready for promotion to its parent. In this case, we simply update the hot halo mass of `node` to account for any hot halo already in the parent.
Code lines: 26
Contained by: module `node_component_hot_halo_vs_delayed`
Modules used: `galacticus_nodes`

subroutine: `node_component_hot_halo_vs_delayed_rate_compute`

Description: Compute the very simple hot halo component mass rate of change.
Code lines: 40
Contained by: module node_component_hot_halo_vs_delayed
Modules used: abundances_structure galacticus_nodes hot_halo_outflows_reincorporations

subroutine: node_component_hot_halo_vs_delayed_satellite_merging
Description: Remove any hot halo associated with node before it merges with its host halo.
Code lines: 24
Contained by: module node_component_hot_halo_vs_delayed
Modules used: abundances_structure galacticus_nodes

subroutine: node_component_hot_halo_vs_delayed_scale_set
Description: Set scales for properties of node.
Code lines: 24
Contained by: module node_component_hot_halo_vs_delayed

subroutine: node_component_satellite_orbiting_tree_initialize
Description: Initialize the orbiting satellite component.
Code lines: 8
Contained by: module node_component_satellite_orbiting
Modules used: galacticus_nodes

subroutine: node_component_satellite_orbiting_trigger_merger
Description: Trigger a merger of the satellite by setting the time until merging to zero.
Code lines: 10
Contained by: module node_component_satellite_orbiting
Modules used: galacticus_nodes

subroutine: node_component_satellite_orbiting_virial_orbit_set
Description: Set the orbit of the satellite at the virial radius.
Code lines: 28
Contained by: module node_component_satellite_orbiting
Modules used: coordinates galacticus_nodes

file: objects.nodes.components.satellite.preset.F90
Description: Contains a module which implements a preset satellite orbit component.
Code lines: 435

module: node_component_satellite_preset
Description: Implements a preset satellite orbit component.
Code lines: 411
Contained by: file objects.nodes.components.satellite.preset.F90
Used by: function node_branch_jump; function node_pull_from_tree; function node_subhalo_promotion; subroutine standardderivativescompute; subroutine standardpromote; subroutine satellite_move_to_new_host

subroutine: node_component_satellite_preset_inter_tree_attach
Description: A satellite node is being moved between trees and attached as the primary progenitor of an existing satellite node. Ensure that preset satellite properties are correctly handled.
Code lines: 54
Contained by: module node_component_satellite_preset
Modules used: galacticus_nodes histories

subroutine: node_component_satellite_preset_inter_tree_insert
Description: A satellite node is being moved between trees, and being added as a new satellite. Its (future-)histories will have been assigned to the replaceNode so must be transferred.
Code lines: 40
Contained by: module node_component_satellite_preset
Modules used: galacticus_nodes histories

subroutine: node_component_satellite_preset_inter_tree_postprocess

Description: For inter-tree node transfers, ensure that any orphaned mergees of the transferred node are transferred over to the new branch.
Code lines: 54
Contained by: module node_component_satellite_preset
Modules used: galacticus_display galacticus_nodes iso_varying_string string_handling

subroutine: node_component_satellite_preset_orphanize
Description: Handle orphanization of a preset satellite component. The satellite should be moved to the branch of its target node.
Code lines: 55
Contained by: module node_component_satellite_preset
Modules used: galacticus_display galacticus_nodes iso_varying_string string_handling

subroutine: node_component_satellite_preset_promote
Description: Ensure that thisNode is ready for promotion to its parent. In this case, we simply copy any preset satellite orbit from the parent.
Code lines: 12
Contained by: module node_component_satellite_preset
Modules used: galacticus_nodes

subroutine: node_component_satellite_preset_rate_compute
Description: Interrupt differential evolution when a preset satellite becomes an orphan.
Code lines: 33
Contained by: module node_component_satellite_preset
Modules used: galacticus_nodes histories

subroutine: node_component_satellite_preset_satellite_host_change
Description: For satellite host changes, if the satellite is an orphan with a merge target ensure it remains in the branch of its merge target.
Code lines: 49

Description: Contains a module which implements the preset 3-D spin component.
Code lines: 174

module: `node_component_spin_preset3d`
Description: Implements the preset spin component.
Code lines: 152
Contained by: file `objects.nodes.components.spin.preset3D.F90`
Used by: subroutine `merger_tree_initialize`; subroutine `standardderivativescompute`; subroutine `standardevolve`; subroutine `standardpromote`

subroutine: `node_component_spin_preset3d_initialize`
Description: Initialize the spin of `node`.
Code lines: 31
Contained by: module `node_component_spin_preset3d`
Modules used: `galacticus_nodes`

subroutine: `node_component_spin_preset3d_promote`
Description: Ensure that `node` is ready for promotion to its parent. In this case, we simply update the spin of `node` to be that of its parent.
Code lines: 25
Contained by: module `node_component_spin_preset3d`
Modules used: `galacticus_error`; `galacticus_nodes`

subroutine: `node_component_spin_preset3d_rate_compute`
Description: Compute rates of change of properties in the preset implementation of the spin component.
Code lines: 25
Contained by: module `node_component_spin_preset3d`
Modules used: `galacticus_nodes`

subroutine: `node_component_spin_preset3d_scale_set`
Description: Set scales for properties in the preset implementation of the spin component.
Code lines: 16
Contained by: module `node_component_spin_preset3d`
Modules used: `galacticus_nodes`

file: `objects.nodes.components.spin.random.F90`
Description: Contains a module of spin tree node methods.
Code lines: 189

module: `node_component_spin_random`
Description: Implement random spin tree node method.
Code lines: 167
Contained by: file `objects.nodes.components.spin.random.F90`
Modules used: `halo_spin_distributions`
Used by: subroutine `merger_tree_initialize`; subroutine `standardpromote`; subroutine `node_components_initialize`; subroutine `node_components_thread_initialize`

subroutine node_components_thread_-
uninitialize

subroutine: node_component_spin_random_initialize
Description: Initializes the random spin component module.
Code lines: 15
Contained by: module node_component_spin_random
Modules used: input_parameters

subroutine: node_component_spin_random_initialize_spins
Description: Initialize the spin of node.
Code lines: 43
Contained by: module node_component_spin_random
Modules used: galacticus_nodes

subroutine: node_component_spin_random_promote
Description: Ensure that node is ready for promotion to its parent. In this case, we simply update the spin of node to be that of its parent.
Code lines: 24
Contained by: module node_component_spin_random
Modules used: galacticus_error galacticus_nodes

subroutine: node_component_spin_random_thread_initialize
Description: Initializes the tree node random spin module.
Code lines: 11
Contained by: module node_component_spin_random
Modules used: galacticus_nodes input_parameters

subroutine: node_component_spin_random_thread_uninitialize
Description: Uninitializes the tree node random spin module.
Code lines: 9
Contained by: module node_component_spin_random
Modules used: galacticus_nodes

file: objects.stellar_luminosities.F90
Description: Contains a module which defines the stellar luminosities object.
Code lines: 1671

module: stellar_luminosities_structure
Description: Defines the stellar luminosities object.
Code lines: 1647

Contained by: module `stellar_luminosities_structure`

subroutine: `sortbyindexpostprocessor`
Description: Given an `array`, sort it in place using the supplied index.
Code lines: 14
Contained by: module `stellar_luminosities_structure`
Modules used: `iso_c_binding`

function: `stellar_luminosities_add`
Description: Add two stellar luminosities objects.
Code lines: 21
Contained by: module `stellar_luminosities_structure`

subroutine: `stellar_luminosities_builder`
Description: Build a `stellarLuminosities` object from the given XML `stellarLuminositiesDefinition`.
Code lines: 20
Contained by: module `stellar_luminosities_structure`
Modules used: `fox_dom` `galacticus_error`

subroutine: `stellar_luminosities_create`
Description: Ensure that the `luminosity` array in a `stellarLuminosities` is allocated.
Code lines: 8
Contained by: module `stellar_luminosities_structure`
Modules used: `memory_management`

subroutine: `stellar_luminosities_deserialize`
Description: Pack stellar luminosities from an array into a `stellarLuminosities` structure.
Code lines: 16
Contained by: module `stellar_luminosities_structure`

subroutine: `stellar_luminosities_destroy`
Description: Destroy an stellarLuminosities object.
Code lines: 7
Contained by: module `stellar_luminosities_structure`

function: `stellar_luminosities_divide`
Description: Divide a stellar luminosities object by a scalar.
Code lines: 11

Contained by: module stellar_luminosities_structure

subroutine: stellar_luminosities_dump
Description: Dump a stellar luminosities object.
Code lines: 24
Contained by: module stellar_luminosities_structure
Modules used: galacticus_display

subroutine: stellar_luminosities_dump_raw
Description: Dump an stellarLuminosities object to binary.
Code lines: 14
Contained by: module stellar_luminosities_structure

subroutine: stellar_luminosities_expand_filter_set
Description: Expand the filter set by removing the filter at index expandFrom by adding expandCount replicas of the filter at that point.
Code lines: 55
Contained by: module stellar_luminosities_structure
Modules used: iso_c_binding memory_management

subroutine: stellar_luminosities_increment
Description: Increment a stellar luminosities object.
Code lines: 17
Contained by: module stellar_luminosities_structure

function: stellar_luminosities_index_from_name
Description: Return the index of and specified entry in the luminosity list given its name.
Code lines: 17
Contained by: module stellar_luminosities_structure
Modules used: galacticus_error

function: stellar_luminosities_index_from_properties
Description: Return the index of and specified entry in the luminosity list given its properties.
Code lines: 46
Contained by: module stellar_luminosities_structure
Modules used: galacticus_error iso_varying_string
numerical_comparison string_handling

subroutine: stellar_luminosities_initialize
Description: Initialize the stellarLuminositiesStructure object module. Determines which stellar luminosities are to be tracked.
Code lines: 207
Contained by: module stellar_luminosities_structure
Modules used: array_utilities cosmology_functions
galacticus_error hii_region_emission_lines
input_parameters instruments_filters
iso_c_binding memory_management
sort

function: `stellar_luminosities_is_output`
Description: Return true or false depending on whether `luminosityIndex` should be output at `time`.
Code lines: 30
Contained by: module `stellar_luminosities_structure`
Modules used: `galacticus_error`

function: `stellar_luminosities_is_zero`
Description: Test whether an stellarLuminosities object is zero.
Code lines: 13
Contained by: module `stellar_luminosities_structure`

function: `stellar_luminosities_luminosity`
Description: Return the requested luminosity from a `stellarLuminosities` object.
Code lines: 21
Contained by: module `stellar_luminosities_structure`
Modules used: `galacticus_error`

function: `stellar_luminosities_multiply`
Description: Multiply a stellar luminosities object by a scalar.
Code lines: 11
Contained by: module `stellar_luminosities_structure`

function: `stellar_luminosities_multiply_switched`
Description: Multiply a stellar luminosities object by a scalar.
Code lines: 11
Contained by: module `stellar_luminosities_structure`

function: `stellar_luminosities_name`
Description: Return a name for the specified entry in the stellar luminosities structure.
Code lines: 16
Contained by: module `stellar_luminosities_structure`
Modules used: `galacticus_error`

function: `stellar_luminosities_non_static_size_of`
Description: Return the size of any non-static components of the object.
Code lines: 13
Contained by: module `stellar_luminosities_structure`
Modules used: `iso_c_binding`

subroutine: `stellar_luminosities_output`
Description: Store a `stellarLuminosities` object in the output buffers.
Code lines: 26
Contained by: module `stellar_luminosities_structure`
Modules used: `kind_numbers` `memory_management` `multi_counters`

subroutine: `stellar_luminosities_output_count`
Description: Increment the output count to account for a `stellarLuminosities` object.

Code lines: 12
Contained by: module stellar_luminosities_structure

function: stellar_luminosities_output_count_get
Description: Compute the number of luminosities to be output at a given time.
Code lines: 13
Contained by: module stellar_luminosities_structure

subroutine: stellar_luminosities_output_names
Description: Assign names to output buffers for a stellarLuminosities object.
Code lines: 26
Contained by: module stellar_luminosities_structure

interface: stellar_luminosities_parameter_map
Code lines: 2
Contained by: module stellar_luminosities_structure

subroutine: stellar_luminosities_parameter_map_double
Description: Map an array of luminosity-related input parameters into a new array accounting for special case processing.
Code lines: 20
Contained by: module stellar_luminosities_structure
Modules used: memory_management

subroutine: stellar_luminosities_post_output
Description: Clean up a stellarLuminosities object after output.
Code lines: 28
Contained by: module stellar_luminosities_structure

function: stellar_luminosities_property_count
Description: Return the number of properties required to track stellar luminosities.
Code lines: 14
Contained by: module stellar_luminosities_structure

subroutine: stellar_luminosities_read_raw
Description: Read an stellarLuminosities object from binary.
Code lines: 19
Contained by: module stellar_luminosities_structure
Modules used: memory_management

subroutine: stellar_luminosities_reset
Description: Reset an stellarLuminosities object.
Code lines: 12
Contained by: module stellar_luminosities_structure

subroutine: stellar_luminosities_sed_top_hat_step
Description: Given a top hat filter central wavelength and filter width, determine the position and width of the next top hat filter in the array.
Code lines: 43
Contained by: module stellar_luminosities_structure

Modules used: stellar_population_spectra

subroutine: `stellar_luminosities_serialize`
Description: Unpack stellar luminosities from a `stellarLuminosities` structure into an array.
Code lines: 15
Contained by: module stellar_luminosities_structure

function: `stellar_luminosities_serialize_count`
Description: Return the number of properties required to track stellar luminosities.
Code lines: 11
Contained by: module stellar_luminosities_structure

subroutine: `stellar_luminosities_set`
Description: Set the luminosity in each band for a single `stellarPopulation_` of given `mass` with the specified `abundancesStellar` and which formed at cosmological `time`.
Code lines: 32
Contained by: module stellar_luminosities_structure
Modules used: abundances_structure, stellar_population_luminosities, stellar_populations

subroutine: `stellar_luminosities_set_to_unity`
Description: Set an stellarLuminosities object to unity.
Code lines: 12
Contained by: module stellar_luminosities_structure

subroutine: `stellar_luminosities_special_cases`
Description: Modify the input list of luminosities for special cases.
Code lines: 232
Contained by: module stellar_luminosities_structure
Modules used: cosmology_functions, hii_region_emission_lines, iso_c_binding, memory_management, output_times, stellar_population_spectra, string_handling

subroutine: `stellar_luminosities_state_restore`
Description: Retrieve the luminosities state from the file.
Code lines: 63
Contained by: module stellar_luminosities_structure
Modules used: fgsl, galacticus_display, instruments_filters, iso_c_binding, iso_varying_string, stellar_population_spectra_postprocess, string_handling

subroutine: `stellar_luminosities_state_store`
Description: Write the luminosities state to file.
Code lines: 31
Contained by: module stellar_luminosities_structure
Modules used: fgsl, galacticus_display

iso_c_binding iso_varying_string
string_handling

function: stellar_luminosities_subtract
Description: Subtract two stellar luminosities objects.
Code lines: 21
Contained by: module stellar_luminosities_structure

subroutine: stellar_luminosities_truncate
Description: Truncate (or pad) the stellar luminosities to match the number in the given templateLuminosities.
Code lines: 32
Contained by: module stellar_luminosities_structure

type: stellarluminosities
Description: The stellar luminosities structure.
Code lines: 217
Contained by: module stellar_luminosities_structure

function: stellarluminositiesabs
Description: Return an element-by-element abs() on a stellar luminosity object.
Code lines: 8
Contained by: module stellar_luminosities_structure

function: stellarluminositiescountmaximum
Code lines: 12
Contained by: module stellar_luminosities_structure

function: stellarluminositiesmax
Description: Return an element-by-element max() on two stellar luminosity objects.
Code lines: 14
Contained by: module stellar_luminosities_structure

file: objects.tables.F90

type: `tensor`
Description: A generic tensor type.
Code lines: 2
Contained by: module tensors

function: `tensor_r2_d3_sym_add`
Description: Add two `tensorRank2Dimension3Symmetric` objects.
Code lines: 22
Contained by: module tensors

subroutine: `tensor_r2_d3_sym_assign_from`
Description: Assign a `tensorRank2Dimension3Symmetric` to a matrix.
Code lines: 16
Contained by: module tensors

subroutine: `tensor_r2_d3_sym_assign_to`
Description: Assign a matrix to a `tensorRank2Dimension3Symmetric` object.
Code lines: 9
Contained by: module tensors
Modules used: galacticus_error

subroutine: `tensor_r2_d3_sym_builder`
Description: Build a `tensorRank2Dimension3Symmetric` object from the given XML `tensorDefinition`.
Code lines: 34
Contained by: module tensors
Modules used: `fox_dom` galacticus_error

function: `tensor_r2_d3_sym_contract`
Description: Return the contraction (trace) of a `tensorRank2Dimension3Symmetric`.
Code lines: 7
Contained by: module tensors

subroutine: `tensor_r2_d3_sym_deserialize`
Description: Pack an array into a `tensorRank2Dimension3Symmetric` symmetric structure.
Code lines: 13
Contained by: module tensors

subroutine: `tensor_r2_d3_sym_destroy`
Description: Destroy a `tensorRank2Dimension3Symmetric` symmetric object.
Code lines: 8
Contained by: module tensors
Modules used: memory_management

function: `tensor_r2_d3_sym_double_contract`
Description: Find the double contraction of two `tensorRank2Dimension3Symmetric` objects, **A** : **B**.
Code lines: 7
Contained by: module tensors

subroutine: `tensor_r2_d3_sym_dump`
Description: Reset a `tensorRank2Dimension3Symmetric` symmetric object.
Code lines: 28
Contained by: module tensors
Modules used: galacticus_display iso_varying_string

subroutine: `tensor_r2_d3_sym_dump_raw`
Description: Dump a `tensorRank2Dimension3Symmetric` object to binary.
Code lines: 16
Contained by: module tensors
Modules used: galacticus_display iso_varying_string

subroutine: `tensor_r2_d3_sym_from_matrix`
Description: Construct a `tensorRank2Dimension3Symmetric` object from a matrix.
Code lines: 17
Contained by: module tensors
Modules used: galacticus_error

subroutine: `tensor_r2_d3_sym_increment`
Description: Increment a `tensorRank2Dimension3Symmetric` object.
Code lines: 13
Contained by: module tensors

function: `tensor_r2_d3_sym_is_zero`
Description: Test whether a `tensorRank2Dimension3Symmetric` object is zero.
Code lines: 8
Contained by: module tensors

function: `tensor_r2_d3_sym_matrix_equality`
Description: Return true if the supplied tensor and matrix are equal.
Code lines: 8
Contained by: module tensors

function: `tensor_r2_d3_sym_max`
Description: Return an element-by-element `max()` on two `tensorRank2Dimension3Symmetric` objects.
Code lines: 13
Contained by: module tensors

function: `tensor_r2_d3_sym_non_static_size_of`
Description: Return the size of any non-static components of the object.
Code lines: 10
Contained by: module tensors

Modules used: `iso_c_binding`

function: `tensor_r2_d3_sym_property_count`
Description: Return the number of properties required to track a rank 2, 3 dimensional, symmetric tensor. This is equal to 6.
Code lines: 7
Contained by: module tensors

subroutine: `tensor_r2_d3_sym_read_raw`
Description: Read a `tensorRank2Dimension3Symmetric` object from binary.
Code lines: 16
Contained by: module tensors
Modules used: galacticus_display iso_varying_string

subroutine: `tensor_r2_d3_sym_reset`
Description: Reset a `tensorRank2Dimension3Symmetric` object.
Code lines: 13
Contained by: module tensors

function: `tensor_r2_d3_sym_scalar_divide`
Description: Multiply a `tensorRank2Dimension3Symmetric` object by a scalar.
Code lines: 14
Contained by: module tensors

function: `tensor_r2_d3_sym_scalar_multiply`
Description: Multiply a `tensorRank2Dimension3Symmetric` object by a scalar.
Code lines: 14
Contained by: module tensors

function: `tensor_r2_d3_sym_scalar_multiply_switched`
Description: Multiply a scalar by a `tensorRank2Dimension3Symmetric` object.
Code lines: 9
Contained by: module tensors

subroutine: `tensor_r2_d3_sym_serialize`
Description: Pack a `tensorRank2Dimension3Symmetric` into an array.
Code lines: 14
Contained by: module tensors

subroutine: `tensor_r2_d3_sym_set_to_identity`
Description: Set a `tensorRank2Dimension3Symmetric` object to the identity matrix.
Code lines: 13
Contained by: module tensors

subroutine: `tensor_r2_d3_sym_set_to_unity`
Description: Set a `tensorRank2Dimension3Symmetric` object to unity.
Code lines: 13
Contained by: module tensors

function: `tensor_r2_d3_sym_subtract`
Description: Subtract two `tensorRank2Dimension3Symmetric` objects.
Code lines: 23
Contained by: module tensors

function: `tensor_r2_d3_sym_to_matrix`
Description: Construct a matrix from a `tensorRank2Dimension3Symmetric`.
Code lines: 16
Contained by: module tensors

type: `tensorrank2dimension3symmetric`
Description: A rank 2, three dimensional, symmetric tensor.
Code lines: 174
Contained by: module tensors

Code lines: 10
Contained by: file posterior_sampling.convergence.never.F90
Modules used: input_parameters

function: neverconvergedatstep
Description: Return the step at which the simulation converged.
Code lines: 8
Contained by: file posterior_sampling.convergence.never.F90

function: neverisconverged
Description: Returns true if the posterior sampling is converged (which it never is).
Code lines: 10
Contained by: file posterior_sampling.convergence.never.F90

subroutine: neverlogreport
Description: Write a convergence report to the given fileUnit.
Code lines: 9
Contained by: file posterior_sampling.convergence.never.F90

subroutine: neverreset
Description: Reset the convergence object.
Code lines: 7
Contained by: file posterior_sampling.convergence.never.F90

function: neverstateisoutlier
Description: Return true if the specified chain is deemed to be an outlier. In this case, chains are never outliers.
Code lines: 9
Contained by: file posterior_sampling.convergence.never.F90

interface: posteriorsampleconvergencenever
Description: Constructors for the never posterior sampling convergence class.
Code lines: 3
Contained by: file posterior_sampling.convergence.never.F90

file: posterior_sampling.differential_proposal_size.F90
Description: Contains a module which implements algorithms for the proposal size in differential evolution algorithms.
Code lines: 41

module: posterior_sample_differential_proposal_size

Description: Implements algorithms for the proposal size in differential evolution algorithms.
Code lines: 19
Contained by: file posterior_sampling.differential_proposal_size.F90
Modules used: posterior_sampling_convergence, posterior_sampling_state
Used by: subroutine galacticus_function_classes_destroy, subroutine galacticus_state_retrieve, subroutine galacticus_state_store, file posterior_sampling.simulation.differential_evolution.F90

file: posterior_sampling.differential_proposal_size.adaptive.F90
Description: Implementation of a posterior sampling differential evolution proposal size class in which the proposal size is adaptive.
Code lines: 165

function: adaptiveconstructorinternal
Description: Constructor for the "adaptive" differential evolution proposal size class.
Code lines: 11
Contained by: file posterior_sampling.differential_proposal_size.adaptive.F90

function: adaptiveconstructorparameters
Description: Constructor for the adaptive posterior sampling differential evolution random jump class which builds the object from a parameter set.
Code lines: 62
Contained by: file posterior_sampling.differential_proposal_size.adaptive.F90
Modules used: input_parameters

function: adaptivegamma
Description: Return the proposal size.
Code lines: 44
Contained by: file posterior_sampling.differential_proposal_size.adaptive.F90
Modules used: galacticus_display, iso_varying_string, mpi_utilities, string_handling

interface: posteriorsampledffrntlevltnproposalsizeadaptive
Description: Constructors for the adaptive posterior sampling differential evolution random jump class.
Code lines: 4
Contained by: file posterior_sampling.differential_proposal_size.adaptive.F90

file: posterior_sampling.differential_proposal_size.fixed.F90
Description: Implementation of a posterior sampling differential evolution proposal size class in which the proposal size is fixed.
Code lines: 82

function: fixedconstructorinternal
Description: Internal constructor for the fixed posterior sampling differential evolution random jump class.
Code lines: 8
Contained by: file posterior_sampling.differential_proposal_size.fixed.F90

function: `fixedconstructorparameters`
Description: Constructor for the `fixed` posterior sampling differential evolution random jump class which builds the object from a parameter set.
Code lines: 19
Contained by: file posterior_sampling.differential_proposal_size.fixed.F90
Modules used: input_parameters

function: `fixedgamma`
Description: Return the current state.
Code lines: 10
Contained by: file posterior_sampling.differential_proposal_size.fixed.F90

interface: `posteriorsampledffrntlevltnproposalsizefixed`
Description: Constructors for the `fixed` posterior sampling differential evolution random jump class.
Code lines: 4
Contained by: file posterior_sampling.differential_proposal_size.fixed.F90

file: `posterior_sampling.differential_proposal_size.temperature_exponent.F90`
Description: Contains a module which implements algorithms for the temperature exponent of proposal size in tempered differential evolution algorithms.
Code lines: 45

module: `posterior_sampling_prop_size_temp_exp`
Description: Implements algorithms for the temperature exponent of proposal size in tempered differential evolution algorithms.
Code lines: 22
Contained by: file posterior_sampling.differential_proposal_size.temperature_exponent.F90
Modules used: posterior_sampling_convergence, posterior_sampling_state
Used by: subroutine galacticus_function_classes_destroy; subroutine galacticus_state_retrieve; subroutine galacticus_state_store; file posterior_sampling.simulation.differential_evolution.F90

file: `posterior_sampling.differential_proposal_size.temperature_exponent.adaptive.F90`
Description: Implementation of a posterior sampling differential evolution proposal size temperature exponent class in which the exponent is adaptive.
Code lines: 192

function: `adaptiveconstructorinternal`
Description: Constructor for the "adaptive" differential evolution proposal size class.
Code lines: 11
Contained by: file posterior_sampling.differential_proposal_size.temperature_exponent.adaptive.F90

function: `adaptiveconstructorparameters`
Description: Constructor for the `adaptive` posterior sampling differential evolution random jump class which builds the object from a parameter set.
Code lines: 62
Contained by: file posterior_sampling.differential_proposal_size.temperature_exponent.adaptive.F90

Modules used: input_parameters

function: adaptiveexponent
Description: Return the adaptive differential evolution proposal size temperature exponent.
Code lines: 70
Contained by: file posterior_sampling.differential_proposal_size.temperature_exponent.adaptive.F90
Modules used: galacticus_display, iso_varying_string, mpi_utilities, string_handling

interface: posteriorsampledffrntlevltnprpslsztmpexpadaptive
Description: Constructors for the adaptive posterior sampling differential evolution random jump class.
Code lines: 4
Contained by: file posterior_sampling.differential_proposal_size.temperature_exponent.adaptive.F90

file: posterior_sampling.differential_proposal_size.temperature_exponent.fixed.F90
Description: Implementation of a posterior sampling differential evolution proposal size temperature exponent class in which the exponent is fixed.
Code lines: 87

function: fixedconstructorinternal
Description: Internal constructor for the fixed posterior sampling differential evolution proposal size temperature exponent class.
Code lines: 9
Contained by: file posterior_sampling.differential_proposal_size.temperature_exponent.fixed.F90

function: fixedconstructorparameters
Description: Constructor for the fixed posterior sampling differential evolution random jump class which builds the object from a parameter set.
Code lines: 19
Contained by: file posterior_sampling.differential_proposal_size.temperature_exponent.fixed.F90
Modules used: input_parameters

function: fixedexponent
Description: Return the fixed differential evolution proposal size temperature exponent.
Code lines: 12
Contained by: file posterior_sampling.differential_proposal_size.temperature_exponent.fixed.F90

interface: posteriorsampledffrntlevltnprpslsztmpexpfixed
Description: Constructors for the fixed posterior sampling differential evolution random jump class.
Code lines: 4
Contained by: file posterior_sampling.differential_proposal_size.temperature_exponent.fixed.F90

file: posterior_sampling.differential_random_jump.F90
Description: Contains a module which implements class for the random jump component in differential evolution algorithms.
Code lines: 41

module: posterior_sample_differential_random_jump
Description: Implements a class for the random jump component in differential evolution algorithms.

Code lines: 19
Contained by: file posterior_sampling.differential_random_jump.F90
Modules used: model_parameters, posterior_sampling_state
Used by: subroutine galacticus_function_classes_destroy, subroutine galacticus_state_retrieve, subroutine galacticus_state_store, file posterior_sampling.simulation.differential_evolution.F90

file: posterior_sampling.differential_random_jump.adaptive.F90
Description: Implementation of a posterior sampling differential evolution random jump class in which the jump is drawn from an adaptive distribution which scales with the range spanned by the sample states.
Code lines: 73

function: adaptiveconstructorparameters
Description: Constructor for the adaptive posterior sampling differential evolution random jump class which builds the object from a parameter set.
Code lines: 11
Contained by: file posterior_sampling.differential_random_jump.adaptive.F90
Modules used: input_parameters

function: adaptivesample
Description: Sample from the random jump distribution.
Code lines: 18
Contained by: file posterior_sampling.differential_random_jump.adaptive.F90
Modules used: mpi_utilities

interface: posteriorsampledffrntlevltnrandomjumpadaptive
Description: Constructors for the adaptive posterior sampling differential evolution random jump class.
Code lines: 3
Contained by: file posterior_sampling.differential_random_jump.adaptive.F90

file: posterior_sampling.differential_random_jump.simple.F90
Description: Implementation of a posterior sampling differential evolution random jump class in which the jump is drawn from a fixed distribution.
Code lines: 69

interface: posteriorsampledffrntlevltnrandomjumpsimple
Description: Constructors for the simple posterior sampling differential evolution random jump class.
Code lines: 3
Contained by: file posterior_sampling.differential_random_jump.simple.F90

function: simpleconstructorparameters
Description: Constructor for the simple posterior sampling differential evolution random jump class which builds the object from a parameter set.
Code lines: 11
Contained by: file posterior_sampling.differential_random_jump.simple.F90
Modules used: input_parameters

function: `simplesample`
Description: Sample from the random jump distribution.
Code lines: 15
Contained by: file posterior_sampling.differential_random_jump.simple.F90

file: `posterior_sampling.simulation.F90`
Description: Contains a module which implements a class of posterior sampling simulators.
Code lines: 38

module: `posterior_sampling_simulation`
Description: Implements a class of posterior sampling simulators.
Code lines: 16
Contained by: file posterior_sampling.simulation.F90
Used by: subroutine galacticus_function_classes_destroy; subroutine galacticus_state_retrieve; subroutine galacticus_state_store; file tasks.posterior_sample.F90

file: `posterior_sampling.simulation.annealed_differential_evolution.F90`
Description: Implementation of a posterior sampling simulation class which implements an annealed differential evolution algorithm.
Code lines: 200

function: `annealeddifferentialevolutionacceptproposal`
Description: Return whether or not to accept a proposal.
Code lines: 15
Contained by: file posterior_sampling.simulation.annealed_differential_evolution.F90
Modules used: mpi_utilities; pseudo_random

function: `annealeddifferentialevolutionconstructorinternal`
Description: Internal constructor for the "annealedDifferentialEvolution" simulation class.
Code lines: 20
Contained by: file posterior_sampling.simulation.annealed_differential_evolution.F90

function: `annealeddifferentialevolutionconstructorparameters`
Description: Constructor for the `annealedDifferentialEvolution` posterior sampling simulation class which builds the object from a parameter set.
Code lines: 29
Contained by: file posterior_sampling.simulation.annealed_differential_evolution.F90
Modules used: input_parameters

subroutine: `annealeddifferentialevolutioninitialize`
Description: Finished initialization of annealed differential evolution simulation objects during construction.
Code lines: 19
Contained by: file posterior_sampling.simulation.annealed_differential_evolution.F90

function: `annealeddifferentialevolutiontemperature`
Description: Return the temperature.
Code lines: 7

Contained by: file posterior_sampling.simulation.annealed_differential_evolution.F90

subroutine: annealeddifferentialevolutionupdate

Description: Update the differential evolution simulator state.
Code lines: 39
Contained by: file posterior_sampling.simulation.annealed_differential_evolution.F90
Modules used: galacticus_display, iso_varying_string, mpi_utilities, string_handling

interface: posteriorsamplesimulationannealeddffrntlevltn

Description: Constructors for the annealedDifferentialEvolution posterior sampling convergence class.
Code lines: 4
Contained by: file posterior_sampling.simulation.annealed_differential_evolution.F90

file: posterior_sampling.simulation.differential_evolution.F90

Description: Implementation of a posterior sampling simulation class which implements the differential evolution algorithm.
Code lines: 768
Modules used: model_parameters, models_likelihoods, posterior_sample_differential_-proposal_size, posterior_sample_differential_-random_jump, posterior_sampling_convergence, posterior_sampling_prop_size_temp_exp, posterior_sampling_state, posterior_sampling_state_initialize, posterior_sampling_stopping_criteria

function: differentialevolutionacceptproposal

Description: Return whether or not to accept a proposal.
Code lines: 15
Contained by: file posterior_sampling.simulation.differential_evolution.F90
Modules used: mpi_utilities, pseudo_random

function: differentialevolutionchainselect

Description: Select a chain at random, optionally excluding blocked chains.
Code lines: 18
Contained by: file posterior_sampling.simulation.differential_evolution.F90
Modules used: mpi_utilities, pseudo_random

function: differentialevolutionconstructorinternal

Description: Internal constructor for the “differentialEvolution” simulation class.
Code lines: 34
Contained by: file posterior_sampling.simulation.differential_evolution.F90

function: differentialevolutionconstructorparameters

Description: Constructor for the differentialEvolution posterior sampling simulation class which builds the object from a parameter set.
Code lines: 174
Contained by: file posterior_sampling.simulation.differential_evolution.F90
Modules used: galacticus_display, galacticus_error, input_parameters, mpi_utilities

string_handling

subroutine: differentialevolutiondestructor
Description: Destroy a differential evolution simulation object.
Code lines: 22
Contained by: file posterior_sampling.simulation.differential_evolution.F90

function: differentialevolutionlogging
Description: Specifies whether or not the current state should be logged to file during differential evolution.
Code lines: 8
Contained by: file posterior_sampling.simulation.differential_evolution.F90

subroutine: differentialevolutionposterior
Description: Return the log of the posterior for the current state.
Code lines: 157
Contained by: file posterior_sampling.simulation.differential_evolution.F90
Modules used: galacticus_display, galacticus_error, iso_c_binding, kind_numbers, mpi_utilities, sort

subroutine: differentialevolutionsimulate
Description: Perform a differential evolution simulation.
Code lines: 169
Contained by: file posterior_sampling.simulation.differential_evolution.F90
Modules used: file_utilities, galacticus_display, galacticus_error, kind_numbers, models_likelihoods_constants, mpi_utilities, pseudo_random, string_handling, system_command

function: differentialevolutionstepsize
Description: Return the step size parameter, γ, for a differential evolution step.
Code lines: 13
Contained by: file posterior_sampling.simulation.differential_evolution.F90

function: differentialevolutiontemperature
Description: Return the temperature.
Code lines: 8
Contained by: file posterior_sampling.simulation.differential_evolution.F90

subroutine: differentialevolutionupdate
Description: Update the differential evolution simulator state.
Code lines: 15
Contained by: file posterior_sampling.simulation.differential_evolution.F90
Modules used: mpi_utilities

interface: posteriorsamplesimulationdifferentialevolution
Description: Constructors for the differentialEvolution posterior sampling convergence class.

Code lines: 4
Contained by: file posterior_sampling.simulation.differential_evolution.F90

file: posterior_sampling.simulation.particle_swarm.F90
Description: Implementation of a posterior sampling simulation class which implements the differential evolution algorithm.
Code lines: 666
Modules used: model_parameters, models_likelihoods, posterior_sampling_convergence, posterior_sampling_state, posterior_sampling_state_initialize, posterior_sampling_stopping_criteria

function: particleswarmconstructorinternal
Description: Internal constructor for the "particleSwarm" simulation class.
Code lines: 31
Contained by: file posterior_sampling.simulation.particle_swarm.F90

function: particleswarmconstructorparameters
Description: Constructor for the particleSwarm posterior sampling simulation class which builds the object from a parameter set.
Code lines: 169
Contained by: file posterior_sampling.simulation.particle_swarm.F90
Modules used: galacticus_display, galacticus_error, input_parameters, mpi_utilities, string_handling

subroutine: particleswarmdestructor
Description: Destroy a differential evolution simulation object.
Code lines: 18
Contained by: file posterior_sampling.simulation.particle_swarm.F90

subroutine: particleswarmposterior
Description: Return the log of the posterior for the current state.
Code lines: 146
Contained by: file posterior_sampling.simulation.particle_swarm.F90
Modules used: galacticus_display, galacticus_error, iso_c_binding, kind_numbers, models_likelihoods_constants, mpi_utilities, sort

subroutine: particleswarmsimulate
Description: Perform a particle swarm simulation.
Code lines: 226
Contained by: file posterior_sampling.simulation.particle_swarm.F90
Modules used: error_functions, file_utilities, galacticus_display, galacticus_error, kind_numbers, models_likelihoods_constants, mpi_utilities, pseudo_random, string_handling, system_command

interface: `posteriorsamplesimulationparticleswarm`
Description: Constructors for the `particleSwarm` posterior sampling convergence class.
Code lines: 4
Contained by: file posterior_sampling.simulation.particle_swarm.F90

file: `posterior_sampling.simulation.stochastic_differential_evolution.F90`
Description: Implementation of a posterior sampling simulation class which implements a stochastic differential evolution algorithm.
Code lines: 138

interface: `posteriorsamplesimulationstochasticdffrntlevltn`
Description: Constructors for the `stochasticDifferentialEvolution` posterior sampling convergence class.
Code lines: 4
Contained by: file posterior_sampling.simulation.stochastic_differential_evolution.F90

function: `stochasticdifferentialevolutionacceptproposal`
Description: Return whether or not to accept a proposal.
Code lines: 33
Contained by: file posterior_sampling.simulation.stochastic_differential_evolution.F90
Modules used: galacticus_error mpi_utilities pseudo_random

function: `stochasticdifferentialevolutionconstructorinternal`
Description: Internal constructor for the "stochasticDifferentialEvolution" simulation class.
Code lines: 20
Contained by: file posterior_sampling.simulation.stochastic_differential_evolution.F90

function: `stochasticdifferentialevolutionconstructorparameters`
Description: Constructor for the `stochasticDifferentialEvolution` posterior sampling simulation class which builds the object from a parameter set.
Code lines: 20
Contained by: file posterior_sampling.simulation.stochastic_differential_evolution.F90
Modules used: input_parameters

subroutine: `stochasticdifferentialevolutioninitialize`
Description: Finished initialization of stochastic differential evolution simulation objects during construction.
Code lines: 8
Contained by: file posterior_sampling.simulation.stochastic_differential_evolution.F90

file: `posterior_sampling.simulation.tempered_differential_evolution.F90`
Description: Implementation of a posterior sampling simulation class which implements a tempered differential evolution algorithm.
Code lines: 327

interface: `posteriorsamplesimulationtempereddffrntlevltn`
Description: Constructors for the `temperedDifferentialEvolution` posterior sampling convergence class.
Code lines: 4

Contained by: file posterior_sampling.simulation.tempered_differential_evolution.F90

function: `temperedifferentialevolutionacceptproposal`
Description: Return whether or not to accept a proposal.
Code lines: 15
Contained by: file posterior_sampling.simulation.tempered_differential_evolution.F90
Modules used: mpi_utilities pseudo_random

function: `temperedifferentialevolutionconstructorinternal`
Description: Internal constructor for the "temperedDifferentialEvolution" simulation class.
Code lines: 21
Contained by: file posterior_sampling.simulation.tempered_differential_evolution.F90

function: `temperedifferentialevolutionconstructorparameters`
Description: Constructor for the `temperedDifferentialEvolution` posterior sampling simulation class which builds the object from a parameter set.
Code lines: 48
Contained by: file posterior_sampling.simulation.tempered_differential_evolution.F90
Modules used: input_parameters

subroutine: `temperedifferentialevolutiondestructor`
Description: Destroy a tempered differential evolution simulation object.
Code lines: 7
Contained by: file posterior_sampling.simulation.tempered_differential_evolution.F90

subroutine: `temperedifferentialevolutioninitialize`
Description: Finished initialization of tempered differential evolution simulation objects during construction.
Code lines: 25
Contained by: file posterior_sampling.simulation.tempered_differential_evolution.F90

function: `temperedifferentialevolutionlevel`
Description: Return the actual tempering level.
Code lines: 8
Contained by: file posterior_sampling.simulation.tempered_differential_evolution.F90

function: `temperedifferentialevolutionlogging`
Description: Specifies whether or not the current state should be logged to file during differential evolution.
Code lines: 7
Contained by: file posterior_sampling.simulation.tempered_differential_evolution.F90

function: `temperedifferentialevolutionstepsize`
Description: Return the step size parameter, γ, for a differential evolution step.
Code lines: 14
Contained by: file posterior_sampling.simulation.tempered_differential_evolution.F90

function: `temperedifferentialevolutiontemperature`
Description: Return the temperature.

Code lines: 11
Contained by: file posterior_sampling.simulation.tempered_differential_evolution.F90

subroutine: tempereddifferentialevolutionupdate
Description: Update the differential evolution simulator state.
Code lines: 85
Contained by: file posterior_sampling.simulation.tempered_differential_evolution.F90
Modules used: galacticus_display, iso_varying_string, mpi_utilities, string_handling

file: posterior_sampling.state.F90
Description: Contains a module which implements a class that maintains during posterior sampling.
Code lines: 117

module: posterior_sampling_state
Description: Implements a class that maintains during posterior sampling.
Code lines: 95
Contained by: file posterior_sampling.state.F90
Used by: subroutine galacticus_function_classes_destroy, subroutine galacticus_state_retrieve, subroutine galacticus_state_store, module models_likelihoods, function sedfitevaluate, function galaxypopulationevaluate, function galaxypopulationwillevaluate, function gaussianregressionevaluate, function gaussianregressionwillevaluate, function halomassfunctionevaluate, function massfunctionevaluate, function multivariatenormalevaluate, function multivariatenormalstochasticevaluate, function posteriorasprioreevaluate, function projectedcorrelationfunctionevaluate, function spindistributionevaluate, function modelparameterlistlogprior, module posterior_sampling_convergence, function gelmanrubinisconverged, module posterior_sample_differential_proposal_size, module posterior_sampling_prop_size_temp_exp, module posterior_sample_differential_random_jump, file posterior_sampling.simulation.differential_evolution.F90, file posterior_sampling.simulation.particle_swarm.F90, module posterior_sampling_state_initialize, subroutine resumeinitialize, module posterior_sampling_stopping_criteria

file: posterior_sampling.state.correlation.F90
Description: Implementation of a posterior sampling state class which computes correlation lengths.
Code lines: 269

function: correlationconstructorinternal
Description: Constructor for the correlation posterior sampling state class which builds the object from a parameter set.

Code lines: 17
Contained by: file posterior_sampling.state.correlation.F90
Modules used: mpi_utilities

function: correlationconstructorparameters
Description: Constructor for the correlation posterior sampling state class which builds the object from a parameter set.
Code lines: 20
Contained by: file posterior_sampling.state.correlation.F90
Modules used: input_parameters

function: correlationcorrelationlength
Description: Return the correlation length.
Code lines: 8
Contained by: file posterior_sampling.state.correlation.F90

subroutine: correlationcorrelationlengthcompute
Description: Compute correlation lengths.
Code lines: 39
Contained by: file posterior_sampling.state.correlation.F90
Modules used: galacticus_display iso_varying_string mpi_utilities string_handling

subroutine: correlationparametercountset
Description: Set the number of parameters in this state.
Code lines: 16
Contained by: file posterior_sampling.state.correlation.F90

function: correlationpostconvergencecorrelationcount
Description: Return the number of post-convergence correlation lengths that have accrued.
Code lines: 7
Contained by: file posterior_sampling.state.correlation.F90

subroutine: correlationreset
Description: Reset the state object.
Code lines: 10
Contained by: file posterior_sampling.state.correlation.F90

subroutine: correlationrestore
Description: Restore the state object from file.
Code lines: 23
Contained by: file posterior_sampling.state.correlation.F90
Modules used: iso_varying_string mpi_utilities

subroutine: correlationupdate
Description: Update the current state.
Code lines: 43
Contained by: file posterior_sampling.state.correlation.F90

interface: `posteriorsamplestatecorrelation`
Description: Constructors for the `correlation` posterior sampling state class.
Code lines: 4
Contained by: file `posterior_sampling.state.correlation.F90`

file: `posterior_sampling.state.history.F90`
Description: Implementation of a posterior sampling state class which stores history.
Code lines: 164

function: `historyconstructorinternal`
Description: Constructor for the `history` posterior sampling state class which builds the object from a parameter set.
Code lines: 14
Contained by: file `posterior_sampling.state.history.F90`
Modules used: `mpi_utilities`

function: `historyconstructorparameters`
Description: Constructor for the `history` posterior sampling state class which builds the object from a parameter set.
Code lines: 20
Contained by: file `posterior_sampling.state.history.F90`
Modules used: `input_parameters`

function: `historymean`
Description: Return the mean over state history.
Code lines: 9
Contained by: file `posterior_sampling.state.history.F90`
Modules used: `galacticus_error`

subroutine: `historyparametercountset`
Description: Set the number of parameters in this state.
Code lines: 11
Contained by: file `posterior_sampling.state.history.F90`

subroutine: `historyreset`
Description: Reset the state object.
Code lines: 9
Contained by: file `posterior_sampling.state.history.F90`

subroutine: `historyrestore`
Description: Restore the state object from file.
Code lines: 17
Contained by: file `posterior_sampling.state.history.F90`
Modules used: `iso_varying_string` `mpi_utilities`

subroutine: `historyupdate`
Description: Update the current state.
Code lines: 15

Contained by: file posterior_sampling.state.history.F90

function: historyvariance
Description: Return the mean over state history.
Code lines: 9
Contained by: file posterior_sampling.state.history.F90
Modules used: galacticus_error

interface: posteriorsamplestatehistory
Description: Constructors for the history posterior sampling state class.
Code lines: 4
Contained by: file posterior_sampling.state.history.F90

file: posterior_sampling.state.initialize.F90
Description: Contains a module which implements a class for posterior sampling state initialization.
Code lines: 45

module: posterior_sampling_state_initialize
Description: Implements a class for posterior sampling state initialization.
Code lines: 23
Contained by: file posterior_sampling.state.initialize.F90
Modules used: model_parameters, models_likelihoods, posterior_sampling_state
Used by: subroutine galacticus_function_classes_destroy; subroutine galacticus_state_retrieve; subroutine galacticus_state_store; file posterior_sampling.simulation.differential_evolution.F90; file posterior_sampling.simulation.particle_swarm.F90

file: posterior_sampling.state.initialize.latin_hypercube.F90
Description: Implementation of a posterior sampling convergence class which latinHypercube converges.
Code lines: 141

function: latinhypercubeconstructorinternal
Description: Constructor for the latinHypercube posterior sampling state initialization class.
Code lines: 8
Contained by: file posterior_sampling.state.initialize.latin_hypercube.F90

function: latinhypercubeconstructorparameters
Description: Constructor for the latinHypercube posterior sampling state initialization class.
Code lines: 19
Contained by: file posterior_sampling.state.initialize.latin_hypercube.F90
Modules used: input_parameters

subroutine: latinhypercubeinitialize
Description: Initialize simulation state by drawing at random from the parameter priors.

Code lines: 69
Contained by: file posterior_sampling.state.initialize.latin_hypercube.F90
Modules used: iso_c_binding, models_likelihoods_constants, mpi_utilities, pseudo_random, sort

interface: posteriorsamplestateinitializelatinhypercube
Description: Constructors for the latinHypercube posterior sampling state initialization class.
Code lines: 4
Contained by: file posterior_sampling.state.initialize.latin_hypercube.F90

file: posterior_sampling.state.initialize.prior_random.F90
Description: Implementation of a posterior sampling convergence class which priorRandom converges.
Code lines: 75

interface: posteriorsamplestateinitializepriorrandom
Description: Constructors for the priorRandom posterior sampling state initialization class.
Code lines: 3
Contained by: file posterior_sampling.state.initialize.prior_random.F90

function: priorrandomconstructorparameters
Description: Constructor for the priorRandom posterior sampling state initialization class.
Code lines: 10
Contained by: file posterior_sampling.state.initialize.prior_random.F90
Modules used: input_parameters

subroutine: priorrandominitialize
Description: Initialize simulation state by drawing at random from the parameter priors.
Code lines: 24
Contained by: file posterior_sampling.state.initialize.prior_random.F90
Modules used: models_likelihoods_constants

file: posterior_sampling.state.initialize.resume.F90
Description: Implementation of a posterior sampling convergence class which resume converges.
Code lines: 151
Modules used: iso_varying_string

interface: posteriorsamplestateinitializeresume
Description: Constructors for the resume posterior sampling state initialization class.
Code lines: 4
Contained by: file posterior_sampling.state.initialize.resume.F90

function: resumeconstructorinternal
Description: Constructor for the resume posterior sampling state initialization class.
Code lines: 9
Contained by: file posterior_sampling.state.initialize.resume.F90

function: resumeconstructorparameters
Description: Constructor for the resume posterior sampling state initialization class.

Code lines: 26
Contained by: file posterior_sampling.state.initialize.resume.F90
Modules used: input_parameters

subroutine: resumeinitialize
Description: Initialize simulation state by drawing at random from the parameter priors.
Code lines: 68
Contained by: file posterior_sampling.state.initialize.resume.F90
Modules used: galacticus_display, galacticus_error, models_likelihoods_constants, mpi_utilities, posterior_sampling_state, string_handling

file: posterior_sampling.state.initialize.switched.F90
Description: Implementation of a posterior sampling convergence class which switches between two other options.
Code lines: 197

interface: posteriorsamplestateinitializeswitched
Description: Constructors for the switched posterior sampling state initialization class.
Code lines: 4
Contained by: file posterior_sampling.state.initialize.switched.F90

function: switchedconstructorinternal
Description: Constructor for the switched posterior sampling state initialization class.
Code lines: 9
Contained by: file posterior_sampling.state.initialize.switched.F90

function: switchedconstructorparameters
Description: Constructor for the switched posterior sampling state initialization class.
Code lines: 32
Contained by: file posterior_sampling.state.initialize.switched.F90
Modules used: input_parameters

subroutine: switcheddestructor
Description: Destructor for the switched posterior sampling state initialization class.
Code lines: 8
Contained by: file posterior_sampling.state.initialize.switched.F90

subroutine: switchedinitialize
Description: Initialize simulation state by drawing at random from the parameter priors.
Code lines: 99
Contained by: file posterior_sampling.state.initialize.switched.F90
Modules used: galacticus_error, models_likelihoods_constants

file: posterior_sampling.state.simple.F90
Description: Implementation of a simple posterior sampling state class.
Code lines: 207

interface: posteriorsamplestatesimple
Description: Constructors for the simple posterior sampling state class.

Code lines: 4
Contained by: file posterior_sampling.state.simple.F90

function: simpleacceptancerate
Description: Return the acceptance rate for the state.
Code lines: 13
Contained by: file posterior_sampling.state.simple.F90

function: simpleconstructorinternal
Description: Constructor for the simple posterior sampling state class which builds the object from a parameter set.
Code lines: 14
Contained by: file posterior_sampling.state.simple.F90
Modules used: mpi_utilities

function: simpleconstructorparameters
Description: Constructor for the simple posterior sampling state class which builds the object from a parameter set.
Code lines: 20
Contained by: file posterior_sampling.state.simple.F90
Modules used: input_parameters

function: simpleget
Description: Return the current state.
Code lines: 8
Contained by: file posterior_sampling.state.simple.F90

function: simplemean
Description: Return the mean over state history.
Code lines: 10
Contained by: file posterior_sampling.state.simple.F90
Modules used: galacticus_error

subroutine: simpleparametercountset
Description: Set the number of parameters in this state.
Code lines: 9
Contained by: file posterior_sampling.state.simple.F90

subroutine: simplereset
Description: Reset the state object.
Code lines: 8
Contained by: file posterior_sampling.state.simple.F90

subroutine: simplerestore
Description: Restore the state object.
Code lines: 25
Contained by: file posterior_sampling.state.simple.F90
Modules used: galacticus_error iso_varying_string mpi_utilities

subroutine: `simpleupdate`
Description: Update the current state.
Code lines: 22
Contained by: file posterior_sampling.state.simple.F90

function: `simplevariance`
Description: Return the mean over state history.
Code lines: 10
Contained by: file posterior_sampling.state.simple.F90
Modules used: galacticus_error

file: `posterior_sampling.stopping_criteria.F90`
Description: Contains a module which implements a stopping criteria class for constraint simulations.
Code lines: 41

module: `posterior_sampling_stopping_criteria`
Description: Implements a stopping criteria class for constraint simulations.
Code lines: 19
Contained by: file posterior_sampling.stopping_criteria.F90
Modules used: posterior_sampling_convergence, posterior_sampling_state
Used by: subroutine galacticus_function_classes_destroy, subroutine galacticus_state_retrieve, subroutine galacticus_state_store, file posterior_sampling.simulation.differential_evolution.F90, file posterior_sampling.simulation.particle_swarm.F90

file: `posterior_sampling.stopping_criteria.correlation_length_count.F90`
Description: Implementation of a posterior sampling stopping class which stops after a given number of correlation legnths.
Code lines: 105
Modules used: posterior_sampling_convergence

function: `correlationlengthconstructorinternal`
Description: Internal constructor for the `correlationLength` posterior sampling stopping class.
Code lines: 10
Contained by: file posterior_sampling.stopping_criteria.correlation_length_count.F90
Modules used: input_parameters

function: `correlationlengthconstructorparameters`
Description: Constructor for the `correlationLength` posterior sampling stopping class which builds the object from a parameter set.
Code lines: 21
Contained by: file posterior_sampling.stopping_criteria.correlation_length_count.F90
Modules used: input_parameters

subroutine: `correlationlengthdestructor`
Description: Destructor for the `correlationLength` posterior sampling stopping class.
Code lines: 7
Contained by: file `posterior_sampling.stopping_criteria.correlation_length_count.F90`

function: `correlationlengthstop`
Description: Returns true if the posterior sampling should stop.
Code lines: 16
Contained by: file `posterior_sampling.stopping_criteria.correlation_length_count.F90`
Modules used: `galacticus_error`

interface: `posteriorsamplestoppingcriterioncorrelationlength`
Description: Constructors for the `correlationLength` posterior sampling stopping criterion class.
Code lines: 4
Contained by: file `posterior_sampling.stopping_criteria.correlation_length_count.F90`

file: `posterior_sampling.stopping_criteria.never.F90`
Description: Implementation of a posterior sampling stopping class which never stops.
Code lines: 60

function: `neverconstructorparameters`
Description: Constructor for the `never` posterior sampling stopping class which builds the object from a parameter set.
Code lines: 10
Contained by: file `posterior_sampling.stopping_criteria.never.F90`
Modules used: `input_parameters`

function: `neverstop`
Description: Returns true if the posterior sampling should stop (which it never should).
Code lines: 9
Contained by: file `posterior_sampling.stopping_criteria.never.F90`

interface: `posteriorsamplestoppingcriterionnever`
Description: Constructors for the `never` posterior sampling convergence class.
Code lines: 3
Contained by: file `posterior_sampling.stopping_criteria.never.F90`

file: `posterior_sampling.stopping_criteria.step_count.F90`
Description: Implementation of a posterior sampling stopping class which stepCount stops.
Code lines: 97
Modules used: `posterior_sampling_convergence`

interface: `posteriorsamplestoppingcriterionstepcount`
Description: Constructors for the `stepCount` posterior sampling convergence class.
Code lines: 4
Contained by: file `posterior_sampling.stopping_criteria.step_count.F90`

function: `stepcountconstructorinternal`
Description: Internal constructor for the `stepCount` posterior sampling stopping class.
Code lines: 10
Contained by: file posterior_sampling.stopping_criteria.step_count.F90
Modules used: input_parameters

function: `stepcountconstructorparameters`
Description: Constructor for the `stepCount` posterior sampling stopping class which builds the object from a parameter set.
Code lines: 21
Contained by: file posterior_sampling.stopping_criteria.step_count.F90
Modules used: input_parameters

subroutine: `stepcountdestructor`
Description: Destructor for the `stepCount` posterior sampling stopping class.
Code lines: 7
Contained by: file posterior_sampling.stopping_criteria.step_count.F90

function: `stepcountstop`
Description: Returns true if the posterior sampling should stop.
Code lines: 8
Contained by: file posterior_sampling.stopping_criteria.step_count.F90

file: `radiation.F90`
Description: Contains a module which implements a class to describe radiation fields.
Code lines: 104

module: `radiation_fields`
Description: Implements a class to describe radiation fields.
Code lines: 82
Contained by: file radiation.F90

Modules used: `input_parameters`

function: `blackbodyflux`
Description: Return the flux of a blackBody radiation field.
Code lines: 12
Contained by: file `radiation.black_body.F90`
Modules used: `numerical_constants_units` `thermodynamics_radiation`

function: `blackbodytemperature`
Description: Return the temperature of a black body radiation field.
Code lines: 7
Contained by: file `radiation.black_body.F90`

interface: `radiationfieldblackbody`
Description: Constructors for the `blackBody` radiation field class.
Code lines: 4
Contained by: file `radiation.black_body.F90`

file: `radiation.cosmic_microwave_background.F90`
Description: Implements a class for the cosmic microwave background radiation field.
Code lines: 98
Modules used: `cosmology_functions`

function: `cosmicmicrowavebackgroundconstructorinternal`
Description: Internal constructor for the `cosmicMicrowaveBackground` radiation field class.
Code lines: 9
Contained by: file `radiation.cosmic_microwave_background.F90`

function: `cosmicmicrowavebackgroundconstructorparameters`
Description: Constructor for the `cosmicMicrowaveBackground` radiation field class which takes a parameter list as input.
Code lines: 13
Contained by: file `radiation.cosmic_microwave_background.F90`
Modules used: `input_parameters`

subroutine: `cosmicmicrowavebackgrounddestructor`
Description: Destructor for the `cosmicMicrowaveBackground` radiation field class.
Code lines: 7
Contained by: file radiation.cosmic_microwave_background.F90

subroutine: `cosmicmicrowavebackgroundtimeset`
Description: Set the time (and temperature) of the cosmic microwave background radiation field.
Code lines: 9
Contained by: file radiation.cosmic_microwave_background.F90

interface: `radiationfieldcosmicmicrowavebackground`
Description: Constructors for the `cosmicMicrowaveBackground` radiation field class.
Code lines: 4
Contained by: file radiation.cosmic_microwave_background.F90

file: `radiation.intergalactic_background.F90`
Description: Implements a class for intergalactic background light.
Code lines: 49

type: `radiationfieldintergalacticbackground`
Description: A radiation field class for intergalactic background light.
Code lines: 14
Contained by: file radiation.intergalactic_background.F90

file: `radiation.intergalactic_background.file.F90`
Description: Implements a class for intergalactic background light.
Code lines: 209
Modules used: cosmology_functions, fgsl, iso_c_binding

function: `intergalacticbackgroundfileconstructorinternal`
Description: Internal constructor for the `intergalacticBackgroundFile` radiation field class.
Code lines: 70
Contained by: file radiation.intergalactic_background.file.F90
Modules used: array_utilities, fox_dom, galacticus_error, galacticus_paths, io_xml, memory_management

function: `intergalacticbackgroundfileconstructorparameters`
Description: Constructor for the `intergalacticBackgroundFile` radiation field class which takes a parameter list as input.
Code lines: 21
Contained by: file radiation.intergalactic_background.file.F90
Modules used: input_parameters

subroutine: `intergalacticbackgroundfiledestructor`
Description: Destructor for the `intergalacticBackgroundFile` radiation field class.
Code lines: 7

Contained by: file radiation.intergalactic_background.file.F90

function: intergalacticbackgroundfileflux
Description: Return the flux in the intergalactic background radiation field.
Code lines: 23
Contained by: file radiation.intergalactic_background.file.F90
Modules used: numerical_interpolation

subroutine: intergalacticbackgroundfiletimeset
Description: Set the time of the intergalactic backgroun radiation field.
Code lines: 12
Contained by: file radiation.intergalactic_background.file.F90
Modules used: numerical_interpolation

interface: radiationfieldintergalacticbackgroundfile
Description: Constructors for the intergalacticBackgroundFile radiation field class.
Code lines: 4
Contained by: file radiation.intergalactic_background.file.F90

file: radiation.intergalactic_background.internal.F90
Description: Implements a class for intergalactic background light which computes the background internally.
Code lines: 571
Modules used:

accretion_disk_spectra	atomic_cross_sections_ionization_photo
cosmology_functions	cosmology_parameters

Description: Constructors for the `intergalacticBackgroundInternal` radiation field class.
Code lines: 4
Contained by: file `radiation.intergalactic_background.internal.F90`

file: `radiation.null.F90`
Description: Implements a class for null radiation fields.
Code lines: 61

function: `nullconstructorparameters`
Description: Constructor for the `null` radiation field class which takes a parameter list as input.
Code lines: 10
Contained by: file `radiation.null.F90`
Modules used: `input_parameters`

function: `nullflux`
Description: Return the flux of a null radiation field.
Code lines: 10
Contained by: file `radiation.null.F90`

interface: `radiationfieldnull`
Description: Constructors for the `null` radiation field class.
Code lines: 3
Contained by: file `radiation.null.F90`

file: `radiation.summation.F90`
Description: Implements a radiation field class which sums over other radiation fields.
Code lines: 174

type: `radiationfieldlist`
Code lines: 3
Contained by: file `radiation.summation.F90`

interface: `radiationfieldsummation`
Description: Constructors for the "summation" radiation field class.
Code lines: 4
Contained by: file `radiation.summation.F90`

function: `summationconstructorinternal`
Description: Internal constructor for the summation radiation field class.
Code lines: 14
Contained by: file `radiation.summation.F90`

function: `summationconstructorparameters`
Description: Constructor for the "summation" radiation field class which takes a parameter set as input.
Code lines: 22
Contained by: file `radiation.summation.F90`
Modules used: `input_parameters`

subroutine: `summationdeepcopy`
Description: Perform a deep copy for the `summation` radiation field class.
Code lines: 31
Contained by: file `radiation.summation.F90`
Modules used: `galacticus_error`

subroutine: `summationdestructor`
Description: Destructor for the summation radiation field class.
Code lines: 16
Contained by: file `radiation.summation.F90`

function: `summationflux`
Description: Implement a summation radiation field.
Code lines: 15
Contained by: file `radiation.summation.F90`

function: `summationlist`
Description: Return a list of all components for the `summation` radiation field class.
Code lines: 8
Contained by: file `radiation.summation.F90`

file: `ram_pressure_stripping.mass_loss_rate.disks.F90`
Description: Contains a module which provides a class that implements ram pressure stripping in disks.
Code lines: 40

module: `ram_pressure_stripping_mass_loss_rate_disks`
Description: Provides a class that implements calculations of ram pressure stripping in disks.
Code lines: 18
Contained by: file `ram_pressure_stripping.mass_loss_rate.disks.F90`
Modules used: `galacticus_nodes`
Used by:

Code lines: 23
Contained by: file `ram_pressure_stripping.mass_loss_rate.disks.simple.F90`
Modules used: `input_parameters`

subroutine: `simpledestructor`
Description: Destructor for the `simple` model of ram pressure stripping of disks class.
Code lines: 7
Contained by: file `ram_pressure_stripping.mass_loss_rate.disks.simple.F90`

function: `simpleratemassloss`

Description: Computes the mass loss rate from disks due to ram pressure stripping assuming a simple model. Specifically, the mass loss rate is

$$\dot{M}_{\rm gas} = -\alpha M_{\rm gas}/\tau_{\rm disk}, \tag{18.34}$$

where

$$\alpha = F_{\rm ram}/F_{\rm gravity}, \tag{18.35}$$

$F_{\rm ram}$ is the ram pressure force from the hot halo (see §12.23), and

$$F_{\rm gravity} = 2\pi {\rm G}\Sigma_{\rm gas}(r_{1/2})\Sigma_{\rm total}(r_{1/2}) \tag{18.36}$$

is the gravitational restoring force in the disk at the half-mass radius, $r_{1/2}$.

Description: Internal constructor for the chandrasekhar1943 satellite dynamical friction class.
Code lines: 10
Contained by: file satellites.dynamical_friction.acceleration.Chandrasekhar1943.F90

function: chandrasekhar1943constructorparameters
Description: Constructor for the chandrasekhar1943 satellite dynamical friction class which builds the object from a parameter set.
Code lines: 25
Contained by: file satellites.dynamical_friction.acceleration.Chandrasekhar1943.F90
Modules used: input_parameters

subroutine: chandrasekhar1943destructor
Description: Destructor for the simple cooling radius class.
Code lines: 8
Contained by: file satellites.dynamical_friction.acceleration.Chandrasekhar1943.F90

interface: satellitedynamicalfrictionchandrasekhar1943
Description: Constructors for the chandrasekhar1943 satellite dynamical friction class.
Code lines: 4
Contained by: file satellites.dynamical_friction.acceleration.Chandrasekhar1943.F90

file: satellites.dynamical_friction.acceleration.F90
Description: Contains a module that implements calculations of the acceleration due to dynamical friction for satellites.
Code lines: 42

module: satellite_dynamical_friction
Description: Implements calculations of dynamical friction for satellites.
Code lines: 18
Contained by: file satellites.dynamical_friction.acceleration.F90
Modules used: galacticus_nodes
Used by: subroutine galacticus_function_classes_destroy, subroutine galacticus_state_retrieve, subroutine galacticus_state_store, module node_component_satellite_orbiting

file: satellites.dynamical_friction.acceleration.zero.F90
Description: Implementation of a zero acceleration satellite dynamical friction class.
Code lines: 61

interface: satellitedynamicalfrictionzero
Description: Constructors for the zero satellite dynamical friction class.

Code lines: 3
Contained by: file satellites.dynamical_friction.acceleration.zero.F90

function: zeroacceleration
Description: Return a zero acceleration for satellites due to dynamical friction.
Code lines: 10
Contained by: file satellites.dynamical_friction.acceleration.zero.F90

function: zeroconstructorparameters
Description: Constructor for the zero satellite dynamical friction class which builds the object from a parameter set.
Code lines: 10
Contained by: file satellites.dynamical_friction.acceleration.zero.F90
Modules used: input_parameters

file: satellites.merging.mass_movements.Baugh2005.F90
Description: Implements a merger mass movements class using the Baugh et al. [2005] model.
Code lines: 140

function: baugh2005constructorinternal
Description: Internal constructor for the baugh2005 merger mass movements.
Code lines: 9
Contained by: file satellites.merging.mass_movements.Baugh2005.F90

function: baugh2005constructorparameters
Description: Constructor for the baugh2005 merger mass movements class which takes a parameter list as input.
Code lines: 44
Contained by: file satellites.merging.mass_movements.Baugh2005.F90
Modules used: input_parameters

subroutine: baugh2005get
Description: Determine how different mass components should be redistributed as the result of a merger according to the model of Baugh et al. [2005].
Code lines: 41
Contained by: file satellites.merging.mass_movements.Baugh2005.F90
Modules used: galactic_structure_enclosed_masses galactic_structure_options

interface: mergermassmovementsbaugh2005
Description: Constructors for the baugh2005 merger mass movements class.
Code lines: 4
Contained by: file satellites.merging.mass_movements.Baugh2005.F90

file: satellites.merging.mass_movements.F90
Description: Contains a module which implements a class for determining how mass is moved around as a consequence of a satellite merging event.
Code lines: 53

module: satellite_merging_mass_movements

Description: Implements a class for determining how mass is moved around as a consequence of a satellite merging event.
Code lines: 30
Contained by: file satellites.merging.mass_movements.F90
Modules used: galacticus_nodes
Used by: subroutine satellite_merging_remnant_compute; subroutine galacticus_function_classes_destroy; subroutine galacticus_state_retrieve; subroutine galacticus_state_store; subroutine node_component_age_statistics_standard_satellite_merging; subroutine node_component_disk_standard_satellite_merging; subroutine node_component_disk_very_simple_satellite_merging; subroutine node_component_inter_output_standard_satellite_merging; subroutine node_component_merging_statistics_major_satellite_merging; subroutine node_component_spheroid_standard_satellite_merging; subroutine node_component_spheroid_very_simple_satellite_merging; file satellites.merging.progenitor_properties.Cole2000.F90; function cole2000halfmassradiusroot; file satellites.merging.progenitor_properties.simple.F90; file satellites.merging.progenitor_properties.standard.F90

file: satellites.merging.mass_movements.simple.F90
Description: Implements a merger mass movements class which uses a simple calculation.
Code lines: 111

interface: mergermassmovementssimple
Description: Constructors for the simple merger mass movements class.
Code lines: 4
Contained by: file satellites.merging.mass_movements.simple.F90

function: simpleconstructorinternal
Description: Internal constructor for the simple merger mass movements class.
Code lines: 9
Contained by: file satellites.merging.mass_movements.simple.F90

function: simpleconstructorparameters
Description: Constructor for the simple merger mass movements class which takes a parameter list as input.
Code lines: 28
Contained by: file satellites.merging.mass_movements.simple.F90
Modules used: input_parameters

subroutine: simpleget
Description: Determine where stars and gas move as the result of a merger event using a simple algorithm.
Code lines: 28
Contained by: file satellites.merging.mass_movements.simple.F90
Modules used: galactic_structure_enclosed_masses; galactic_structure_options

file: satellites.merging.mass_movements.very_simple.F90
Description: Implements a merger mass movements class which uses a simple calculation.
Code lines: 99

interface: mergermassmovementsverysimple
Description: Constructors for the verySimple merger mass movements class.
Code lines: 4
Contained by: file satellites.merging.mass_movements.very_simple.F90

function: verysimpleconstructorinternal
Description: Internal constructor for the verySimple merger mass movements.
Code lines: 8
Contained by: file satellites.merging.mass_movements.very_simple.F90

function: verysimpleconstructorparameters
Description: Constructor for the verySimple merger mass movements class which takes a parameter list as input.
Code lines: 19
Contained by: file satellites.merging.mass_movements.very_simple.F90
Modules used: input_parameters

subroutine: verysimpleget
Description: Determine where stars and gas move as the result of a merger event using a very simple algorithm.
Code lines: 27
Contained by: file satellites.merging.mass_movements.very_simple.F90
Modules used: galactic_structure_enclosed_masses galactic_structure_options

file: satellites.merging.output.F90
Description: Contains a module which outputs data on all merging events which occur.
Code lines: 103

module: satellites_merging_output
Description: Implement outputting of all merging events.
Code lines: 81
Contained by: file satellites.merging.output.F90
Used by: subroutine satellitemergerprocess

subroutine: satellite_merging_output
Description: Outputs properties of merging nodes.
Code lines: 62
Contained by: module satellites_merging_output
Modules used: galacticus_hdf5 galacticus_nodes
input_parameters io_hdf5

file: satellites.merging.progenitor_properties.Cole2000.F90
Description: Implements a merger progenitor properties class which uses the algorithm of Cole et al. [2000].
Code lines: 292

Modules used: satellite_merging_mass_movements

function: cole2000constructorinternal
Description: Internal constructor for the cole2000 merger progenitor properties class.
Code lines: 8
Contained by: file satellites.merging.progenitor_properties.Cole2000.F90

function: cole2000constructorparameters
Description: Constructor for the cole2000 merger progenitor properties class which takes a parameter list as input.
Code lines: 19
Contained by: file satellites.merging.progenitor_properties.Cole2000.F90
Modules used: array_utilities, galacticus_error, galacticus_nodes, input_parameters

subroutine: cole2000destructor
Description: Destructor for the cole2000 merger progenitor properties class.
Code lines: 7
Contained by: file satellites.merging.progenitor_properties.Cole2000.F90

subroutine: cole2000get
Description: Computes various properties of the progenitor galaxies useful for calculations of merger remnant sizes.
Code lines: 175
Contained by: file satellites.merging.progenitor_properties.Cole2000.F90
Modules used: galactic_structure_enclosed_masses, galactic_structure_options, galacticus_error, galacticus_nodes, numerical_constants_physical, root_finder

function: cole2000halfmassradiusroot
Description: Function used in root finding for progenitor galaxy half-mass radii.
Code lines: 25
Contained by: file satellites.merging.progenitor_properties.Cole2000.F90
Modules used: galactic_structure_enclosed_masses, galactic_structure_options, satellite_merging_mass_movements

interface: mergerprogenitorpropertiescole2000
Description: Constructors for the cole2000 merger progenitor properties class.
Code lines: 4
Contained by: file satellites.merging.progenitor_properties.Cole2000.F90

file: satellites.merging.progenitor_properties.F90
Description: Contains a module which implements a class for calculations for progenitor properties for mergers.
Code lines: 46

module: satellite_merging_progenitor_properties
Description: Implements a class for calculations for progenitor properties for mergers.
Code lines: 24
Contained by: file satellites.merging.progenitor_properties.F90

Modules used: galacticus_nodes
Used by: subroutine galacticus_function_classes_destroy; subroutine galacticus_state_retrieve; subroutine galacticus_state_store; file satellites.merging.remnant_sizes.Cole2000.F90; file satellites.merging.remnant_sizes.Covington2008.F90

file: satellites.merging.progenitor_properties.simple.F90
Description: Implements a merger progenitor properties class which uses a simple calculation.
Code lines: 181
Modules used: satellite_merging_mass_movements

interface: mergerprogenitorpropertiessimple
Description: Constructors for the simple merger progenitor properties class.
Code lines: 4
Contained by: file satellites.merging.progenitor_properties.simple.F90

function: simpleconstructorinternal
Description: Internal constructor for the simple merger progenitor properties class.
Code lines: 8
Contained by: file satellites.merging.progenitor_properties.simple.F90

function: simpleconstructorparameters
Description: Constructor for the simple merger progenitor properties class which takes a parameter list as input.
Code lines: 19
Contained by: file satellites.merging.progenitor_properties.simple.F90
Modules used: array_utilities; galacticus_error; galacticus_nodes; input_parameters

subroutine: simpledestructor
Description: Destructor for the simple merger progenitor properties class.
Code lines: 7
Contained by: file satellites.merging.progenitor_properties.simple.F90

subroutine: simpleget
Description: Computes various properties of the progenitor galaxies useful for calculations of merger remnant sizes.
Code lines: 97
Contained by: file satellites.merging.progenitor_properties.simple.F90
Modules used: galactic_structure_enclosed_masses; galactic_structure_options; galacticus_error; galacticus_nodes; numerical_constants_physical

file: satellites.merging.progenitor_properties.standard.F90
Description: Implements a merger progenitor properties class which uses a standard calculation.
Code lines: 236
Modules used: satellite_merging_mass_movements

interface: `mergerprogenitorpropertiesstandard`
Description: Constructors for the `standard` merger progenitor properties class.
Code lines: 4
Contained by: file `satellites.merging.progenitor_properties.standard.F90`

function: `standardconstructorinternal`
Description: Internal constructor for the `standard` merger progenitor properties class.
Code lines: 8
Contained by: file `satellites.merging.progenitor_properties.standard.F90`

function: `standardconstructorparameters`
Description: Constructor for the `standard` merger progenitor properties class which takes a parameter list as input.
Code lines: 18
Contained by: file `satellites.merging.progenitor_properties.standard.F90`
Modules used: `array_utilities` `galacticus_error` `galacticus_nodes` `input_parameters`

subroutine: `standarddestructor`
Description: Destructor for the `standard` merger progenitor properties class.
Code lines: 7
Contained by: file `satellites.merging.progenitor_properties.standard.F90`

subroutine: `standardget`
Description: Computes various properties of the progenitor galaxies useful for calculations of merger remnant sizes.
Code lines: 153
Contained by: file `satellites.merging.progenitor_properties.standard.F90`
Modules used: `galactic_structure_enclosed_masses` `galactic_structure_options` `galacticus_error` `galacticus_nodes` `numerical_constants_physical`

file: `satellites.merging.remnant_sizes.Cole2000.F90`
Description: Implements a merger remnant size class which uses the Cole et al. [2000] algorithm.
Code lines: 191
Modules used: `satellite_merging_progenitor_-properties`

function: `cole2000constructorinternal`
Description: Internal constructor for the `cole2000` merger remnant size class.
Code lines: 9
Contained by: file `satellites.merging.remnant_sizes.Cole2000.F90`

function: `cole2000constructorparameters`
Description: Constructor for the `cole2000` merger remnant size class which takes a parameter list as input.
Code lines: 22
Contained by: file `satellites.merging.remnant_sizes.Cole2000.F90`
Modules used: `input_parameters`

subroutine: `cole2000destructor`
Description: Destructor for the `cole2000` merger remnant size class.
Code lines: 7
Contained by: file `satellites.merging.remnant_sizes.Cole2000.F90`

subroutine: `cole2000get`
Description: Compute the size of the merger remnant for `node` using the Cole et al. [2000] algorithm.
Code lines: 102
Contained by: file `satellites.merging.remnant_sizes.Cole2000.F90`
Modules used: `galactic_structure_enclosed_masses` `galactic_structure_options` `galacticus_display` `galacticus_error` `numerical_comparison` `numerical_constants_physical` `string_handling`

interface: `mergerremnantsizecole2000`
Description: Constructors for the `cole2000` merger remnant size class.
Code lines: 4
Contained by: file `satellites.merging.remnant_sizes.Cole2000.F90`

file: `satellites.merging.remnant_sizes.Covington2008.F90`
Description: Implements a merger remnant size class which uses the Cole et al. [2000] algorithm.
Code lines: 229
Modules used: `dark_matter_halo_scales` `satellite_merging_progenitor_properties`

function: `covington2008constructorinternal`
Description: Internal constructor for the `covington2008` merger remnant size class.
Code lines: 11
Contained by: file `satellites.merging.remnant_sizes.Covington2008.F90`

function: `covington2008constructorparameters`
Description: Constructor for the `covington2008` merger remnant size class which takes a parameter list as input.
Code lines: 34
Contained by: file `satellites.merging.remnant_sizes.Covington2008.F90`
Modules used: `input_parameters`

subroutine: `covington2008destructor`
Description: Destructor for the `covington2008` merger remnant size class.
Code lines: 8
Contained by: file `satellites.merging.remnant_sizes.Covington2008.F90`

subroutine: `covington2008get`
Description: Compute the size of the merger remnant for `node` using the Covington et al. [2008] algorithm.
Code lines: 122
Contained by: file `satellites.merging.remnant_sizes.Covington2008.F90`
Modules used: `galacticus_display` `galacticus_error` `numerical_comparison` `numerical_constants_physical`

string_handling

interface: `mergerremnantsizecovington2008`
Description: Constructors for the `covington2008` merger remnant size class.
Code lines: 4
Contained by: file satellites.merging.remnant_sizes.Covington2008.F90

file: `satellites.merging.remnant_sizes.F90`
Description: Contains a module which implements a class for calculations of merger remnant sizes.
Code lines: 45

module: `satellite_merging_remnant_sizes`
Description: Implements a class for calculations of merger remnant sizes.
Code lines: 23
Contained by: file satellites.merging.remnant_sizes.F90
Modules used: galacticus_nodes
Used by: subroutine satellite_merging_remnant_compute; subroutine galacticus_function_classes_destroy; subroutine galacticus_state_retrieve; subroutine galacticus_state_store; subroutine node_component_spheroid_standard_satellite_merging

file: `satellites.merging.remnant_sizes.null.F90`
Description: Implements a merger remnant size class which takes no action.
Code lines: 60

interface: `mergerremnantsizenull`
Description: Constructors for the `null` merger remnant size class.
Code lines: 3
Contained by: file satellites.merging.remnant_sizes.null.F90

function: `nullconstructorparameters`
Description: Constructor for the `null` merger remnant size class which takes a parameter list as input.
Code lines: 10
Contained by: file satellites.merging.remnant_sizes.null.F90
Modules used: input_parameters

subroutine: `nullget`
Description: Do not compute the size of the merger remnant for `node`.
Code lines: 9
Contained by: file satellites.merging.remnant_sizes.null.F90

file: `satellites.merging.timescale.Boylan-Kolchin2008.F90`
Description: Implements calculations of satellite merging times using the Boylan-Kolchin et al. [2008] method.
Code lines: 154
Modules used: dark_matter_halo_scales; dark_matter_profiles_dmo

function: `boylankolchin2008constructorinternal`

Description: Default constructor for the boylanKolchin2008 satellite merging timescale class.
Code lines: 10
Contained by: file satellites.merging.timescale.Boylan-Kolchin2008.F90

function: boylankolchin2008constructorparameters
Description: A constructor for the boylanKolchin2008 satellite merging timescale class which builds the object from a parameter set.
Code lines: 26
Contained by: file satellites.merging.timescale.Boylan-Kolchin2008.F90
Modules used: input_parameters

subroutine: boylankolchin2008destructor
Description: Destructor for the boylanKolchin2008 satellite merging timescale class.
Code lines: 8
Contained by: file satellites.merging.timescale.Boylan-Kolchin2008.F90

function: boylankolchin2008timeuntilmerging
Description: Return the timescale for merging satellites using the Boylan-Kolchin et al. [2008] method.
Code lines: 57
Contained by: file satellites.merging.timescale.Boylan-Kolchin2008.F90
Modules used: galacticus_error, galacticus_nodes, kepler_orbits, satellite_orbits

interface: satellitemergingtimescalesboylankolchin2008
Description: Constructors for the boylanKolchin2008 satellite merging timescale class.
Code lines: 4
Contained by: file satellites.merging.timescale.Boylan-Kolchin2008.F90

file: satellites.merging.timescale.F90
Description: Contains a module that provides and object that implements satellite merging timescales.
Code lines: 46

module: satellite_merging_timescales
Description: Provides and object that implements satellite merging timescales.
Code lines: 24
Contained by: file satellites.merging.timescale.F90
Modules used: galacticus_nodes, kepler_orbits
Used by: subroutine galacticus_function_classes_destroy; subroutine galacticus_state_retrieve; subroutine galacticus_state_store; file merger_trees.construct.read.F90; file merger_trees.operators.assign_orbits.F90; subroutine node_component_satellite_orbiting_create; module node_component_satellite_standard; module node_component_satellite_very_simple

file: satellites.merging.timescale.Jiang2008.F90
Description: Implements calculations of satellite merging times using the Jiang et al. [2008] method.
Code lines: 165
Modules used: dark_matter_halo_scales, dark_matter_profiles_dmo

function: `jiang2008constructorinternal`
Description: Constructor for the Jiang et al. [2008] merging timescale class.
Code lines: 10
Contained by: file `satellites.merging.timescale.Jiang2008.F90`

function: `jiang2008constructorparameters`
Description: Constructor for the Jiang et al. [2008] merging timescale class which builds the object from a parameter set.
Code lines: 38
Contained by: file `satellites.merging.timescale.Jiang2008.F90`
Modules used: `galacticus_display` `galacticus_error` `galacticus_nodes` `input_parameters`

subroutine: `jiang2008destructor`
Description: Destructor for the `jiang2008` satellite merging timescale class.
Code lines: 8
Contained by: file `satellites.merging.timescale.Jiang2008.F90`

function: `jiang2008timeuntilmerging`
Description: Return the timescale for merging satellites using the Jiang et al. [2008] method.
Code lines: 54
Contained by: file `satellites.merging.timescale.Jiang2008.F90`
Modules used: `galacticus_error` `galacticus_nodes` `satellite_orbits`

interface: `satellitemergingtimescalesjiang2008`
Description: Constructors for the Jiang et al. [2008] merging timescale class.
Code lines: 4
Contained by: file `satellites.merging.timescale.Jiang2008.F90`

file: `satellites.merging.timescale.Lacey-Cole.F90`
Description: Implements a satellite merging timescale class which uses the Lacey and Cole [1993] method.
Code lines: 150
Modules used: `dark_matter_halo_scales`

function: `laceycole1993constructorinternal`
Description: Constructor for the Lacey and Cole [1993] merging timescale class.
Code lines: 9
Contained by: file `satellites.merging.timescale.Lacey-Cole.F90`

function: `laceycole1993constructorparameters`
Description: Constructor for the Lacey and Cole [1993] merging timescale class which builds the object from a parameter set.
Code lines: 22
Contained by: file `satellites.merging.timescale.Lacey-Cole.F90`
Modules used: `input_parameters`

subroutine: `laceycole1993destructor`

Description: Destructor for the `laceyCole1993` satellite merging timescale class.
Code lines: 7
Contained by: file `satellites.merging.timescale.Lacey-Cole.F90`

function: `laceycole1993timeuntilmerging`
Description: Return the timescale for merging satellites using the Lacey and Cole [1993] method.
Code lines: 22
Contained by: file `satellites.merging.timescale.Lacey-Cole.F90`
Modules used: `kepler_orbits`

function: `laceycole1993timeuntilmergingmassdependence`
Description: Return the mass-dependent part of the timescale for merging satellites using the Lacey and Cole [1993] method.
Code lines: 27
Contained by: file `satellites.merging.timescale.Lacey-Cole.F90`
Modules used: `galacticus_nodes`

interface: `satellitemergingtimescaleslaceycole1993`
Description: Constructors for the Lacey and Cole [1993] merging timescale class.
Code lines: 4
Contained by: file `satellites.merging.timescale.Lacey-Cole.F90`

file: `satellites.merging.timescale.Lacey-Cole_Tormen.F90`
Description: Implements calculations of satellite merging times using the Lacey and Cole [1993] method with a parameterization of orbital parameters designed to fit the results of Tormen [1997] as described by Cole et al. [2000].
Code lines: 85

function: `laceycole1993tormenconstructorinternal`
Description: Constructor for the Cole et al. [2000] merging timescale class.
Code lines: 9
Contained by: file `satellites.merging.timescale.Lacey-Cole_Tormen.F90`

function: `laceycole1993tormenconstructorparameters`
Description: Constructor for the Cole et al. [2000] merging timescale class which builds the object from a parameter set.
Code lines: 9
Contained by: file `satellites.merging.timescale.Lacey-Cole_Tormen.F90`
Modules used: `input_parameters`

function: `laceycole1993tormentimeuntilmerging`
Description: Return the timescale for merging satellites using the Lacey and Cole [1993] method with a parameterization of orbital parameters designed to fit the results of Tormen [1997] as described by Cole et al. [2000].
Code lines: 22
Contained by: file `satellites.merging.timescale.Lacey-Cole_Tormen.F90`

interface: `satellitemergingtimescaleslaceycole1993tormen`
Description: Constructors for the Cole et al. [2000] merging timescale class.

Code lines: 4
Contained by: file satellites.merging.timescale.Lacey-Cole_Tormen.F90

file: satellites.merging.timescale.Villalobos_2013.F90
Description: Implements a satellite merging timescale class which applies the Villalobos et al. [2013] modifier to another selected satellite merging time class.
Code lines: 117
Modules used: cosmology_functions

interface: satellitemergingtimescalesvillalobos2013
Description: Constructors for the Lacey and Cole [1993] merging timescale class.
Code lines: 4
Contained by: file satellites.merging.timescale.Villalobos_2013.F90

function: villalobos2013constructorinternal
Description: Constructor for the Lacey and Cole [1993] merging timescale class.
Code lines: 10
Contained by: file satellites.merging.timescale.Villalobos_2013.F90

function: villalobos2013constructorparameters
Description: Constructor for the Lacey and Cole [1993] merging timescale class which builds the object from a parameter set.
Code lines: 27
Contained by: file satellites.merging.timescale.Villalobos_2013.F90
Modules used: input_parameters

subroutine: villalobos2013destructor
Description: Destructor for the villalobos2013 satellite merging timescale class.
Code lines: 8
Contained by: file satellites.merging.timescale.Villalobos_2013.F90

function: villalobos2013timeuntilmerging
Description: Return the timescale for merging satellites using the Villalobos et al. [2013] method.
Code lines: 18
Contained by: file satellites.merging.timescale.Villalobos_2013.F90
Modules used: cosmology_functions galacticus_nodes kepler_orbits

file: satellites.merging.timescale.Wetzel-White.F90
Description: Implements a satellite merging timescale class which uses the Wetzel and White [2010] method.
Code lines: 114
Modules used: cosmology_functions

interface: satellitemergingtimescaleswetzelwhite2010
Description: Constructors for the Lacey and Cole [1993] merging timescale class.
Code lines: 4
Contained by: file satellites.merging.timescale.Wetzel-White.F90

function: `wetzelwhite2010constructorinternal`
Description: Constructor for the Wetzel and White [2010] merging timescale class.
Code lines: 9
Contained by: file `satellites.merging.timescale.Wetzel-White.F90`

function: `wetzelwhite2010constructorparameters`
Description: Constructor for the Wetzel and White [2010] merging timescale class which builds the object from a parameter set.
Code lines: 22
Contained by: file `satellites.merging.timescale.Wetzel-White.F90`
Modules used: `input_parameters`

subroutine: `wetzelwhite2010destructor`
Description: Destructor for the `wetzelWhite2010` satellite merging timescale class.
Code lines: 7
Contained by: file `satellites.merging.timescale.Wetzel-White.F90`

function: `wetzelwhite2010timeuntilmerging`
Description: Return the timescale for merging satellites using the Wetzel and White [2010] method.
Code lines: 23
Contained by: file `satellites.merging.timescale.Wetzel-White.F90`
Modules used: `galacticus_nodes` `kepler_orbits`

file: `satellites.merging.timescale.infinite.F90`
Description: Implements a satellite merging timescale class in which merging timescales are always infinite.
Code lines: 65

function: `infiniteconstructorparameters`
Description: A constructor for the `infinite` satellite merging timescale class which builds the object from a parameter set.
Code lines: 11
Contained by: file `satellites.merging.timescale.infinite.F90`
Modules used: `input_parameters`

function: `infinitetimeuntilmerging`
Description: Return a infinite timescale for satellite merging.
Code lines: 10
Contained by: file `satellites.merging.timescale.infinite.F90`

interface: `satellitemergingtimescalesinfinite`
Description: Constructors for the `infinite` satellite merging timescale class.
Code lines: 3
Contained by: file `satellites.merging.timescale.infinite.F90`

file: `satellites.merging.timescale.preset.F90`
Description: Implements a satellite merging timescale class which uses preset values for the timescale.
Code lines: 67

function: `presetconstructorparameters`
Description: A constructor for the `preset` satellite merging timescale class which builds the object from a parameter set.
Code lines: 11
Contained by: file `satellites.merging.timescale.preset.F90`
Modules used: `input_parameters`

function: `presettimeuntilmerging`
Description: Return the timescale for merging satellites using the preset value.
Code lines: 15
Contained by: file `satellites.merging.timescale.preset.F90`
Modules used: `galacticus_nodes` `kepler_orbits`

interface: `satellitemergingtimescalespreset`
Description: Constructors for the `preset` satellite merging timescale class.
Code lines: 3
Contained by: file `satellites.merging.timescale.preset.F90`

file: `satellites.merging.timescale.random.F90`
Description: Implements calculations of satellite merging times that are chosen to occur randomly between snapshots.
Code lines: 81

function: `randomconstructorparameters`
Description: A constructor for the `random` satellite merging timescale class which builds the object from a parameter set.
Code lines: 11
Contained by: file `satellites.merging.timescale.random.F90`
Modules used: `input_parameters`

function: `randomtimeuntilmerging`
Description: Return a randomly chosen timescale for merging satellites.
Code lines: 26
Contained by: file `satellites.merging.timescale.random.F90`
Modules used: `galacticus_nodes` `kepler_orbits` `pseudo_random` `satellite_orbits`

interface: `satellitemergingtimescalesrandom`
Description: Constructors for the `random` satellite merging timescale class.
Code lines: 3
Contained by: file `satellites.merging.timescale.random.F90`

file: `satellites.merging.timescale.zero.F90`
Description: Implements a satellite merging timescale class in which merging timescales are always zero.
Code lines: 62

interface: `satellitemergingtimescaleszero`
Description: Constructors for the `zero` satellite merging timescale class.

Code lines: 3
Contained by: file satellites.merging.timescale.zero.F90

function: zeroconstructorparameters
Description: A constructor for the zero satellite merging timescale class which builds the object from a parameter set.
Code lines: 11
Contained by: file satellites.merging.timescale.zero.F90
Modules used: input_parameters

function: zerotimeuntilmerging
Description: Return a zero timescale for satellite merging.
Code lines: 10
Contained by: file satellites.merging.timescale.zero.F90

file: satellites.merging.virial_orbits.Benson2005.F90
Description: An implementation of virial orbits using the Benson [2005] orbital parameter distribution.
Code lines: 222
Modules used: cosmology_functions dark_matter_halo_scales

function: benson2005constructorinternal
Description: Internal constructor for the benson2005 virial orbits class.
Code lines: 11
Contained by: file satellites.merging.virial_orbits.Benson2005.F90

function: benson2005constructorparameters
Description: Constructor for the benson2005 virial orbits class which takes a parameter set as input.
Code lines: 16
Contained by: file satellites.merging.virial_orbits.Benson2005.F90
Modules used: input_parameters

function: benson2005densitycontrastdefinition
Description: Return a virial density contrast object defining that used in the definition of Benson [2005] virial orbits.
Code lines: 8
Contained by: file satellites.merging.virial_orbits.Benson2005.F90

subroutine: benson2005destructor
Description: Destructor for the benson2005 virial orbits class.
Code lines: 9
Contained by: file satellites.merging.virial_orbits.Benson2005.F90

function: benson2005orbit
Description: Return benson2005 orbital parameters for a satellite.
Code lines: 61
Contained by: file satellites.merging.virial_orbits.Benson2005.F90
Modules used: dark_matter_profile_mass_definitions galacticus_error galacticus_nodes

function: `benson2005velocitytangentialmagnitudemean`
Description: Return the mean magnitude of the tangential velocity.
Code lines: 17
Contained by: file satellites.merging.virial_orbits.Benson2005.F90
Modules used: dark_matter_profile_mass_definitions galacticus_nodes

function: `benson2005velocitytangentialvectormean`
Description: Return the mean of the vector tangential velocity.
Code lines: 12
Contained by: file satellites.merging.virial_orbits.Benson2005.F90
Modules used: galacticus_error

function: `benson2005velocitytotalrootmeansquared`
Description: Return the mean magnitude of the tangential velocity.
Code lines: 17
Contained by: file satellites.merging.virial_orbits.Benson2005.F90
Modules used: dark_matter_profile_mass_definitions galacticus_nodes

interface: `virialorbitbenson2005`
Description: Constructors for the `benson2005` virial orbit class.
Code lines: 4
Contained by: file satellites.merging.virial_orbits.Benson2005.F90

file: `satellites.merging.virial_orbits.F90`
Description: Contains a module which provides a class implementing satellite orbital parameters at virial radius crossing.
Code lines: 67

module: `virial_orbits`
Description: Provides a class implementing satellite orbital parameters at virial radius crossing.
Code lines: 45
Contained by: file satellites.merging.virial_orbits.F90
Modules used: galacticus_nodes kepler_orbits virial_density_contrast
Used by: subroutine galacticus_function_classes_destroy; subroutine galacticus_state_retrieve; subroutine galacticus_state_store; file merger_trees.construct.read.F90; file merger_trees.operators.assign_orbits.F90; module node_component_satellite_orbiting; module node_component_satellite_standard; module node_component_satellite_very_simple; module node_component_spin_vitvitska

file: `satellites.merging.virial_orbits.Jiang2014.F90`
Description: An implementation of virial orbits using the Jiang et al. [2014] orbital parameter distribution.
Code lines: 547
Modules used: cosmology_functions cosmology_parameters dark_matter_halo_scales statistics_distributions

tables

function: jiang2014constructorinternal
Description: Internal constructor for the jiang2014 virial orbits class.
Code lines: 134
Contained by: file satellites.merging.virial_orbits.Jiang2014.F90
Modules used: fgsl numerical_integration

function: jiang2014distributionvelocitytangential
Description: The integrand used to average the tangential velocity over the distribution function for total velocity.
Code lines: 10
Contained by: function jiang2014constructorinternal
Modules used: bessel_functions numerical_constants_math struve_functions

function: jiang2014distributionvelocitytotalsquared
Description: The integrand used to average the squared total velocity over the distribution function for total velocity.
Code lines: 7
Contained by: function jiang2014constructorinternal

function: jiang2014constructorparameters
Description: Generic constructor for the jiang2014 virial orbits class.
Code lines: 116
Contained by: file satellites.merging.virial_orbits.Jiang2014.F90
Modules used: input_parameters

function: jiang2014densitycontrastdefinition
Description: Return a virial density contrast object defining that used in the definition of Jiang et al. [2014] virial orbits.
Code lines: 8
Contained by: file satellites.merging.virial_orbits.Jiang2014.F90

subroutine: jiang2014destructor
Description: Destructor for the jiang2014 virial orbits class.
Code lines: 10
Contained by: file satellites.merging.virial_orbits.Jiang2014.F90

function: jiang2014orbit
Description: Return jiang2014 orbital parameters for a satellite.
Code lines: 89
Contained by: file satellites.merging.virial_orbits.Jiang2014.F90
Modules used: dark_matter_profile_mass_definitions galacticus_error galacticus_nodes root_finder

subroutine: jiang2014parametersselect
Description: Select the parameter set to use for this satellite/host pairing.
Code lines: 23

Contained by: file satellites.merging.virial_orbits.Jiang2014.F90

function: jiang2014radialvelocitycdf
Description: Cumulative distribution function for the radial velocity.
Code lines: 7
Contained by: file satellites.merging.virial_orbits.Jiang2014.F90

function: jiang2014totalvelocitycdf
Description: Cumulative distribution function for the total velocity.
Code lines: 7
Contained by: file satellites.merging.virial_orbits.Jiang2014.F90

function: jiang2014velocitytangentialmagnitudemean
Description: Return the mean magnitude of the tangential velocity.
Code lines: 21
Contained by: file satellites.merging.virial_orbits.Jiang2014.F90
Modules used: dark_matter_profile_mass_definitions galacticus_nodes

function: jiang2014velocitytangentialvectormean
Description: Return the mean of the vector tangential velocity.
Code lines: 12
Contained by: file satellites.merging.virial_orbits.Jiang2014.F90
Modules used: galacticus_error

function: jiang2014velocitytotalrootmeansquared
Description: Return the root mean squared total velocity.
Code lines: 21
Contained by: file satellites.merging.virial_orbits.Jiang2014.F90
Modules used: dark_matter_profile_mass_definitions galacticus_nodes

interface: virialorbitjiang2014
Description: Constructors for the jiang2014 virial orbit class.
Code lines: 4
Contained by: file satellites.merging.virial_orbits.Jiang2014.F90

file: satellites.merging.virial_orbits.Wetzel2010.F90
Description: An implementation of virial orbits using the Wetzel [2010] orbital parameter distribution.
Code lines: 299
Modules used: cosmological_density_field cosmology_functions
dark_matter_halo_scales root_finder
tables

interface: virialorbitwetzel2010
Description: Constructors for the wetzel2010 virial orbit class.
Code lines: 4
Contained by: file satellites.merging.virial_orbits.Wetzel2010.F90

function: wetzel2010circularitycumulativeprobability
Description: The cumulative probability distribution for orbital circularity.

Code lines: 8
Contained by: file satellites.merging.virial_orbits.Wetzel2010.F90
Modules used: hypergeometric_functions

function: wetzel2010circularityroot
Description: Function used in finding the circularity corresponding to a given cumulative probability.
Code lines: 8
Contained by: file satellites.merging.virial_orbits.Wetzel2010.F90

function: wetzel2010constructorinternal
Description: Internal constructor for the wetzel2010 virial orbits class.
Code lines: 36
Contained by: file satellites.merging.virial_orbits.Wetzel2010.F90
Modules used: hypergeometric_functions

function: wetzel2010constructorparameters
Description: Constructor for the wetzel2010 virial orbits class which takes a parameter set as input.
Code lines: 19
Contained by: file satellites.merging.virial_orbits.Wetzel2010.F90
Modules used: input_parameters

function: wetzel2010densitycontrastdefinition
Description: Return a virial density contrast object defining that used in the definition of Wetzel [2010] virial orbits.
Code lines: 8
Contained by: file satellites.merging.virial_orbits.Wetzel2010.F90

subroutine: wetzel2010destructor
Description: Destructor for the wetzel2010 virial orbits class.
Code lines: 10
Contained by: file satellites.merging.virial_orbits.Wetzel2010.F90

function: wetzel2010orbit
Description: Return wetzel2010 orbital parameters for a satellite.
Code lines: 80
Contained by: file satellites.merging.virial_orbits.Wetzel2010.F90
Modules used: dark_matter_profile_mass_definitions galacticus_error galacticus_nodes

function: wetzel2010velocitytangentialmagnitudemean
Description: Return the mean magnitude of the tangential velocity.
Code lines: 11
Contained by: file satellites.merging.virial_orbits.Wetzel2010.F90
Modules used: galacticus_error

function: wetzel2010velocitytangentialvectormean
Description: Return the mean of the vector tangential velocity.
Code lines: 12
Contained by: file satellites.merging.virial_orbits.Wetzel2010.F90

Modules used: galacticus_error

function: wetzel2010velocitytotalrootmeansquared
Description: Return the root mean squared total velocity.
Code lines: 11
Contained by: file satellites.merging.virial_orbits.Wetzel2010.F90
Modules used: galacticus_error

file: satellites.merging.virial_orbits.fixed.F90
Description: An implementation of virial orbits which assumes fixed orbital parameters.
Code lines: 223
Modules used: dark_matter_halo_scales

function: fixedconstructorinternal
Description: Internal constructor for the fixed virial orbits class.
Code lines: 11
Contained by: file satellites.merging.virial_orbits.fixed.F90
Modules used: galacticus_error

function: fixedconstructorparameters
Description: Constructor for the fixed satellite virial orbit class which takes a parameter set as input.
Code lines: 33
Contained by: file satellites.merging.virial_orbits.fixed.F90
Modules used: input_parameters

function: fixeddensitycontrastdefinition
Description: Return a virial density contrast object defining that used in the definition of fixed virial orbits.
Code lines: 8
Contained by: file satellites.merging.virial_orbits.fixed.F90

subroutine: fixeddestructor
Description: Destructor for the fixed virial orbits class.
Code lines: 8
Contained by: file satellites.merging.virial_orbits.fixed.F90

function: fixedorbit
Description: Return fixed orbital parameters for a satellite.
Code lines: 57
Contained by: file satellites.merging.virial_orbits.fixed.F90
Modules used: dark_matter_profile_mass_definitions galacticus_display galacticus_error galacticus_nodes iso_varying_string

function: fixedvelocitytangentialmagnitudemean
Description: Return the mean magnitude of the tangential velocity.
Code lines: 15
Contained by: file satellites.merging.virial_orbits.fixed.F90
Modules used: dark_matter_profile_mass_definitions galacticus_nodes

function: `fixedvelocitytangentialvectormean`
Description: Return the mean of the vector tangential velocity.
Code lines: 12
Contained by: file satellites.merging.virial_orbits.fixed.F90
Modules used: galacticus_error

function: `fixedvelocitytotalrootmeansquared`
Description: Return the root mean squared of the total velocity.
Code lines: 15
Contained by: file satellites.merging.virial_orbits.fixed.F90
Modules used: dark_matter_profile_mass_definitions galacticus_nodes

interface: `virialorbitfixed`
Description: Constructors for the `fixed` virial orbit class.
Code lines: 4
Contained by: file satellites.merging.virial_orbits.fixed.F90

file: `satellites.merging.virial_orbits.isotropic.F90`
Description: An implementation of virial orbits which assumes an isotropic distribution of infall directions and tangential velocities applied to another virial orbit class.
Code lines: 142

function: `isotropicconstructorinternal`
Description: Internal constructor for the `isotropic` virial orbits class.
Code lines: 8
Contained by: file satellites.merging.virial_orbits.isotropic.F90

function: `isotropicconstructorparameters`
Description: Constructor for the `isotropic` satellite virial orbit class which takes a parameter set as input.
Code lines: 13
Contained by: file satellites.merging.virial_orbits.isotropic.F90
Modules used: input_parameters

function: `isotropicdensitycontrastdefinition`
Description: Return a virial density contrast object defining that used in the definition of virial orbits.
Code lines: 8
Contained by: file satellites.merging.virial_orbits.isotropic.F90

subroutine: `isotropicdestructor`
Description: Destructor for the `isotropic` virial orbits class.
Code lines: 7
Contained by: file satellites.merging.virial_orbits.isotropic.F90

function: `isotropicorbit`
Description: Return isotropic orbital parameters for a satellite.
Code lines: 16
Contained by: file satellites.merging.virial_orbits.isotropic.F90

Modules used: numerical_constants_math

function: isotropicvelocitytangentialmagnitudemean
Description: Return the mean magnitude of the tangential velocity.
Code lines: 8
Contained by: file satellites.merging.virial_orbits.isotropic.F90

function: isotropicvelocitytangentialvectormean
Description: Return the mean of the vector tangential velocity.
Code lines: 12
Contained by: file satellites.merging.virial_orbits.isotropic.F90
Modules used: galacticus_error

function: isotropicvelocitytotalrootmeansquared
Description: Return the root mean squared of the total velocity.
Code lines: 8
Contained by: file satellites.merging.virial_orbits.isotropic.F90

interface: virialorbitisotropic
Description: Constructors for the isotropic virial orbit class.
Code lines: 4
Contained by: file satellites.merging.virial_orbits.isotropic.F90

file: satellites.merging.virial_orbits.spin_correlated.F90
Description: An implementation of virial orbits which assumes that the orbital angular momentum is correlated with the spin vector of the host halo.
Code lines: 189

function: spincorrelatedconstructorinternal
Description: Internal constructor for the spinCorrelated virial orbits class.
Code lines: 9
Contained by: file satellites.merging.virial_orbits.spin_correlated.F90

function: spincorrelatedconstructorparameters
Description: Constructor for the spinCorrelated satellite virial orbit class which takes a parameter set as input.
Code lines: 22
Contained by: file satellites.merging.virial_orbits.spin_correlated.F90
Modules used: input_parameters

function: spincorrelateddensitycontrastdefinition
Description: Return a virial density contrast object defining that used in the definition of virial orbits.
Code lines: 8
Contained by: file satellites.merging.virial_orbits.spin_correlated.F90

subroutine: spincorrelateddestructor
Description: Destructor for the spinCorrelated virial orbits class.
Code lines: 7
Contained by: file satellites.merging.virial_orbits.spin_correlated.F90

function: `spincorrelatedorbit`
Description: Return spinCorrelated orbital parameters for a satellite.
Code lines: 53
Contained by: file satellites.merging.virial_orbits.spin_correlated.F90
Modules used: coordinates, galacticus_error, galacticus_nodes, numerical_constants_math, vectors

function: `spincorrelatedvelocitytangentialmagnitudemean`
Description: Return the mean magnitude of the tangential velocity.
Code lines: 8
Contained by: file satellites.merging.virial_orbits.spin_correlated.F90

function: `spincorrelatedvelocitytangentialvectormean`
Description: Return the mean of the vector tangential velocity.
Code lines: 12
Contained by: file satellites.merging.virial_orbits.spin_correlated.F90
Modules used: galacticus_nodes

function: `spincorrelatedvelocitytotalrootmeansquared`
Description: Return the root mean squared of the total velocity.
Code lines: 8
Contained by: file satellites.merging.virial_orbits.spin_correlated.F90

interface: `virialorbitspincorrelated`
Description: Constructors for the `spinCorrelated` virial orbit class.
Code lines: 4
Contained by: file satellites.merging.virial_orbits.spin_correlated.F90

file: `satellites.orbits.F90`
Description: Contains a module which implements calculations related to satellite orbits.
Code lines: 292

module: `satellite_orbits`
Description: Implements calculations related to satellite orbits.
Code lines: 270
Contained by: file satellites.orbits.F90
Modules used: dark_matter_profiles_dmo, galacticus_nodes, kind_numbers
Used by: function font2008force; function satelliteorbitalextremaextract; subroutine node_component_dynamics_-statistics_bars_record; function boylankolchin2008timeuntilmerging; function jiang2008timeuntilmerging; function randomtimeuntilmerging; function sphericalsymmetrytidaltensorradial

function: `equivalent_circular_orbit_solver`
Description: Root function used in finding equivalent circular orbits.

Code lines: 25
Contained by: module satellite_orbits
Modules used: galactic_structure_options, galactic_structure_potentials, galacticus_error

function: `extremum_solver`
Description: Root function used in finding orbital extremum radius.
Code lines: 10
Contained by: module satellite_orbits
Modules used: galactic_structure_potentials

function: `satellite_orbit_convert_to_current_potential`
Description: Takes a virial orbit and adjusts the energy to account for the change in the definition of potential between the original halo in which the orbit was defined and the current halo. Since the potential at the virial radius of halos is always defined to be $\Phi(r_{\rm vir}) = -V_{\rm vir}^2$ then the specific energy transforms as:

$$e \rightarrow e + V_{\rm vir,0}^2 + \Phi(r_{\rm vir,0}), \tag{18.40}$$

where subscript 0 refers to the original halo in which the orbit was defined and $\Phi(r)$ is the potential of the current halo.
Code lines: 26
Contained by: module satellite_orbits
Modules used: galactic_structure_potentials, kepler_orbits, numerical_constants_physical

function: `satellite_orbit_equivalent_circular_orbit_radius`
Description: Solves for the equivalent circular orbit radius for `orbit` in `nodeHost`.
Code lines: 40
Contained by: module satellite_orbits
Modules used: dark_matter_halo_scales, kepler_orbits, root_finder

subroutine: `satellite_orbit_extremum_phase_space_coordinates`
Description: Solves for the pericentric radius and velocity of `orbit` in `nodeHost`.
Code lines: 107
Contained by: module satellite_orbits
Modules used: galactic_structure_options, galactic_structure_potentials, galacticus_error, galacticus_nodes, kepler_orbits, numerical_constants_physical, numerical_constants_prefixes, root_finder

subroutine: `satellite_orbit_reset`
Description: Reset the satellite orbit calculations.
Code lines: 9
Contained by: module satellite_orbits

file: `satellites.orphans.distributions.F90`
Description: Contains a module that provides a class for distributions of orphan satellites.

Code lines: 52

module: `satellite_oprhan_distributions`

Description: Provides a class for dark matter halo spin distributions.
Code lines: 30
Contained by: file satellites.orphans.distributions.F90
Modules used: galacticus_nodes
Used by: subroutine galacticus_function_classes_destroy; subroutine galacticus_state_retrieve; subroutine galacticus_state_store; file merger_trees.operators.prune_lightcone.F90; module node_component_position_preset_orphans; subroutine node_component_position_trace_dark_matter_assign

file: `satellites.orphans.distributions.random_isotropic.F90`

Description: An abstract implementation of the orphan satellite distribution which assumes an isotropic distribution with randomly assigned positions.
Code lines: 131
Modules used: statistics_distributions

function: `randomisotropicposition`

Description: Return the position of an orphan satellite in a random isotropic distribution.
Code lines: 24
Contained by: file satellites.orphans.distributions.random_isotropic.F90
Modules used: coordinates; galacticus_nodes; numerical_constants_math; pseudo_random

function: `randomisotropicvelocity`

Description: Return the velocity of an orphan satellite in a random isotropic distribution.
Code lines: 29
Contained by: file satellites.orphans.distributions.random_isotropic.F90
Modules used: coordinates; galacticus_nodes; numerical_constants_math; pseudo_random

type: `satelliteorphandistributionrandomisotropic`

Description: An abstract orphan satellite distribution which assumes an isotropic, random distribution.
Code lines: 23
Contained by: file satellites.orphans.distributions.random_isotropic.F90

file: `satellites.orphans.distributions.trace_dark_matter.F90`

Description: An abstract implementation of the orphan satellite distribution which assumes an isotropic distribution with randomly assigned positions.
Code lines: 121
Modules used: dark_matter_halo_scales

interface: `satelliteorphandistributiontracedarkmatter`

Description: Constructors for the `traceDarkMatter` orphan satellite distribution class.
Code lines: 4
Contained by: file satellites.orphans.distributions.trace_dark_matter.F90

function: `tracedarkmatterconstructorinternal`
Description: Internal constructor for the `traceDarkMatter` orphan satellite distribution class.
Code lines: 8
Contained by: file satellites.orphans.distributions.trace_dark_matter.F90

function: `tracedarkmatterconstructorparameters`
Description: Constructor for the `traceDarkMatter` orphan satellite distribution class which takes a parameter list as input.
Code lines: 15
Contained by: file satellites.orphans.distributions.trace_dark_matter.F90
Modules used: input_parameters

subroutine: `tracedarkmatterdestructor`
Description: Destructor for the `traceDarkMatter` orphan satellite distribution class.
Code lines: 7
Contained by: file satellites.orphans.distributions.trace_dark_matter.F90

function: `tracedarkmatterextent`
Description: Return the maximum extent of the orphan satellite population for the `traceDarkMatter` orphan satellite distribution class.
Code lines: 10
Contained by: file satellites.orphans.distributions.trace_dark_matter.F90

function: `tracedarkmatterinversecmfradial`
Description: Return the radial coordinate within which the given `fraction` of orphan satellites are found.
Code lines: 14
Contained by: file satellites.orphans.distributions.trace_dark_matter.F90
Modules used: galactic_structure_enclosed_masses galactic_structure_options

function: `tracedarkmattervelocitydispersion`
Description: Return the velocity dispersion of the orphan satellite population.
Code lines: 10
Contained by: file satellites.orphans.distributions.trace_dark_matter.F90

file: `satellites.promotion.F90`
Description: Contains a module which handles events where a satellite is moved to a new host halo.
Code lines: 104

module: `satellite_promotion`
Description: Handles events where a satellite is moved to a new host halo.
Code lines: 82
Contained by: file satellites.promotion.F90
Used by: subroutine singlelevelhierarchyprocess

subroutine: `satellite_move_to_new_host`
Description: Move `satelliteNode` to be a satellite of `newHostNode`.
Code lines: 72
Contained by: module satellite_promotion

Modules used: galacticus_display, galacticus_nodes, iso_varying_string, node_component_position_preset, node_component_position_trace_dark_matter, node_component_satellite_preset, node_component_satellite_standard, node_component_satellite_very_simple, string_handling

file: satellites.tidal_fields.F90
Description: Contains a module that implements calculations of tidal fields acting on satellites.
Code lines: 40

module: satellites_tidal_fields
Description: Implements calculations of tidal fields acting on satellites.
Code lines: 18
Contained by: file satellites.tidal_fields.F90
Modules used: galacticus_nodes
Used by: file galactic_dynamics.bar_instability.Efstathiou1982Tidal.F90, subroutine galacticus_function_classes_destroy, subroutine galacticus_state_retrieve, subroutine galacticus_state_store, module node_component_spheroid_standard, file tidal_stripping.mass_loss_rate.disks.simple.F90, file tidal_stripping.mass_loss_rate.spheroids.simple.F90

file: satellites.tidal_fields.null.F90
Description: Implements a satellite tidal field class which assumes zero tidal field.
Code lines: 60

function: nullconstructorparameters
Description: Constructor for the null satellite tidal field class which builds the object from a parameter set.
Code lines: 10
Contained by: file satellites.tidal_fields.null.F90
Modules used: input_parameters

function: nulltidaltensorradial
Description: Return the radial part of the tidal tensor for satellite halos assumed to be zero.
Code lines: 9
Contained by: file satellites.tidal_fields.null.F90

interface: satellitetidalfieldnull
Description: Constructors for the null satellite tidal field class.
Code lines: 3
Contained by: file satellites.tidal_fields.null.F90

file: satellites.tidal_fields.spherical_symmetry.F90
Description: Contains a module which implements a model of the tidal field acting on a satellite assuming spherical symmetry in the host.
Code lines: 111

interface: `satellitetidalfieldsphericalsymmetry`
Description: Constructors for the sphericalSymmetry satellite tidal field class.
Code lines: 4
Contained by: file `satellites.tidal_fields.spherical_symmetry.F90`

function: `sphericalsymmetryconstructorinternal`
Description: Internal constructor for the `sphericalSymmetry` satellite tidal field class.
Code lines: 8
Contained by: file `satellites.tidal_fields.spherical_symmetry.F90`

function: `sphericalsymmetryconstructorparameters`
Description: Constructor for the `sphericalSymmetry` satellite tidal field class which builds the object from a parameter set.
Code lines: 19
Contained by: file `satellites.tidal_fields.spherical_symmetry.F90`
Modules used: `input_parameters`

function: `sphericalsymmetrytidaltensorradial`
Description: Return the radial part of the tidal tensor for satellite halos assuming spherical symmetry of the host.
Code lines: 39
Contained by: file `satellites.tidal_fields.spherical_symmetry.F90`
Modules used:

`galactic_structure_densities`	`galactic_structure_enclosed_masses`
`galactic_structure_options`	`galacticus_nodes`
`kepler_orbits`	`numerical_constants_math`
`numerical_constants_physical`	`satellite_orbits`

file: `satellites.tidal_heating.rate.F90`
Description: Contains a module that implements a class for computing tidal heating rates for satellites.
Code lines: 42

module: `satellite_tidal_heating`
Description: Implements a class for calculations of tidal heating for satellites.
Code lines: 18
Contained by: file `satellites.tidal_heating.rate.F90`
Modules used: `galacticus_nodes`
Used by:

subroutine `galacticus_function_-classes_destroy`	subroutine `galacticus_state_retrieve`
subroutine `galacticus_state_store`	module `node_component_satellite_-orbiting`

file: `satellites.tidal_heating.rate.Gnedin1999.F90`
Description: Contains a class which implements the tidal heating rate model of Gnedin et al. [1999].
Code lines: 169
Modules used:

`cosmology_parameters`	`dark_matter_halo_scales`

function: `gnedin1999constructorinternal`
Description: Internal constructor for the `gnedin1999` satellite tidal heating rate class.

Code lines: 10
Contained by: file satellites.tidal_heating.rate.Gnedin1999.F90

function: gnedin1999constructorparameters
Description: Constructor for the gnedin1999 satellite tidal heating rate class which builds the object from a parameter set.
Code lines: 35
Contained by: file satellites.tidal_heating.rate.Gnedin1999.F90
Modules used: input_parameters

subroutine: gnedin1999destructor
Description: Default constructor for the gnedin1999 satellite tidal heating rate class.
Code lines: 8
Contained by: file satellites.tidal_heating.rate.Gnedin1999.F90

function: gnedin1999heatingrate
Description: Return the tidal heating rate for satellite halos assuming the model of Gnedin et al. [1999].
Code lines: 59
Contained by: file satellites.tidal_heating.rate.Gnedin1999.F90
Modules used: error_functions, galactic_structure_densities, galactic_structure_enclosed_masses, galactic_structure_options, galactic_structure_rotation_curves, galacticus_nodes, numerical_constants_astronomical, numerical_constants_math, numerical_constants_physical, numerical_constants_prefixes, tensors, vectors

interface: satellitetidalheatingrategnedin1999
Description: Constructors for the gnedin1999 satellite tidal heating rate class.
Code lines: 4
Contained by: file satellites.tidal_heating.rate.Gnedin1999.F90

file: satellites.tidal_heating.rate.zero.F90
Description: Contains a class which implements a tidal heating rate model in which the heating rate is always zero.
Code lines: 62

interface: satellitetidalheatingratezero
Description: Constructors for the zero satellite tidal heating rate class.
Code lines: 3
Contained by: file satellites.tidal_heating.rate.zero.F90

function: zeroconstructorparameters
Description: Constructor for the zero satellite tidal heating rate class which builds the object from a parameter set.
Code lines: 10
Contained by: file satellites.tidal_heating.rate.zero.F90
Modules used: input_parameters

function: zeroheatingrate

Description: Return the the tidal heating rate for the given node.
Code lines: 9
Contained by: file satellites.tidal_heating.rate.zero.F90

file: satellites.tidal_stripping.rate.F90
Description: Contains a module that provides a class to perform calculations of the mass loss rate due to tidal stripping for satellites.
Code lines: 43

module: satellite_tidal_stripping
Description: Provides a class to perform calculations of the mass loss rate due to tidal stripping for satellites.
Code lines: 19
Contained by: file satellites.tidal_stripping.rate.F90
Modules used: galacticus_nodes
Used by: subroutine galacticus_function_classes_destroy; subroutine galacticus_state_retrieve; subroutine galacticus_state_store; module node_component_satellite_orbiting

file: satellites.tidal_stripping.rate.Zentner2005.F90
Description: Implementation of a satellite tidal stripping class which follows the model of Zentner et al. [2005].
Code lines: 234
Modules used: dark_matter_halo_scales; kind_numbers

interface: satellitetidalstrippingzentner2005
Description: Constructors for the zentner2005 satellite tidal stripping class.
Code lines: 4
Contained by: file satellites.tidal_stripping.rate.Zentner2005.F90

subroutine: zentner2005autohook
Description: Attach to the calculation reset event.
Code lines: 8
Contained by: file satellites.tidal_stripping.rate.Zentner2005.F90
Modules used: events_hooks

subroutine: zentner2005calculationreset
Description: Reset the stored tidal radii.
Code lines: 9
Contained by: file satellites.tidal_stripping.rate.Zentner2005.F90

function: zentner2005constructorinternal
Description: Internal constructor for the zentner2005 satellite tidal stripping class.
Code lines: 10
Contained by: file satellites.tidal_stripping.rate.Zentner2005.F90

function: zentner2005constructorparameters
Description: Constructor for the zentner2005 satellite tidaql stripping class which builds the object from a parameter set.
Code lines: 23

Contained by: file satellites.tidal_stripping.rate.Zentner2005.F90
Modules used: input_parameters

subroutine: zentner2005destructor
Description: Destructor for the zentner2005 satellite tidal stripping class.
Code lines: 9
Contained by: file satellites.tidal_stripping.rate.Zentner2005.F90
Modules used: events_hooks

function: zentner2005masslossrate
Description: Return a mass loss rate for satellites due to tidal stripping using the formulation of Zentner et al. [2005].
Code lines: 84
Contained by: file satellites.tidal_stripping.rate.Zentner2005.F90
Modules used: dark_matter_halo_scales, error_functions, galactic_structure_densities, galactic_structure_enclosed_masses, galactic_structure_options, galacticus_nodes, numerical_constants_astronomical, numerical_constants_math, numerical_constants_physical, numerical_constants_prefixes, root_finder, vectors

function: zentner2005tidalradiussolver
Description: Root function used to find the tidal radius within a subhalo.
Code lines: 14
Contained by: file satellites.tidal_stripping.rate.Zentner2005.F90
Modules used: galactic_structure_enclosed_masses, numerical_constants_astronomical, numerical_constants_physical, numerical_constants_prefixes

file: satellites.tidal_stripping.rate.zero.F90
Description: Implementation of a satellite tidal stripping class in which the stripping rate is always zero.
Code lines: 65
Modules used: dark_matter_halo_scales

interface: satellitetidalstrippingzero
Description: Constructors for the zero satellite tidal stripping class.
Code lines: 3
Contained by: file satellites.tidal_stripping.rate.zero.F90

function: zeroconstructorparameters
Description: Constructor for the zero satellite tidal stripping class which builds the object from a parameter set.
Code lines: 10
Contained by: file satellites.tidal_stripping.rate.zero.F90
Modules used: input_parameters

function: zeromasslossrate
Description: Return a mass loss rate for satellites due to tidal stripping which is always zero.
Code lines: 9
Contained by: file satellites.tidal_stripping.rate.zero.F90

file: `shocks.one_dimensional.F90`
Description: Contains a module which implements calculations of one-dimensional shocks.
Code lines: 45

module: `shocks_1d`
Description: iImplements calculations of one-dimensional shocks.
Code lines: 23
Contained by: file `shocks.one_dimensional.F90`
Used by: function `coldmodecoldmodefraction`

function: `shocks_1d_density_jump`
Description: Computes the density jump across a one-dimensional shock.
Code lines: 11
Contained by: module `shocks_1d`

file: `star_formation.feedback.disks.Creasey2012.F90`
Description: Implementation of the Creasey et al. [2012] outflow rate due to star formation feedback in galactic disks.
Code lines: 177
Modules used: `star_formation_rate_surface_density_-disks`

function: `creasey2012constructorinternal`
Description: Internal constructor for the `creasey2012` star formation feedback from disks class.
Code lines: 9
Contained by: file `star_formation.feedback.disks.Creasey2012.F90`

function: `creasey2012constructorparameters`
Description: Constructor for the Creasey et al. [2012] star formation feedback in disks class which takes a parameter set as input.
Code lines: 41
Contained by: file `star_formation.feedback.disks.Creasey2012.F90`
Modules used: `galacticus_error`

subroutine: `creasey2012destructor`
Description: Destructor for the `creasey2012` feedback in disks class.
Code lines: 7
Contained by: file `star_formation.feedback.disks.Creasey2012.F90`

function: `creasey2012outflowrate`

Description: Returns the outflow rate (in $M_\odot$ Gyr^{-1}) for star formation in the galactic disk of `thisNode` using the model of Creasey et al. [2012]. The outflow rate is given by

$$\dot{M}_\mathrm{outflow} = \int_0^\infty \beta_0 \Sigma_{g,1}^{-\mu}(r) f_\mathrm{g}^\nu(r) \dot{\Sigma}_\star(r) 2\pi r \mathrm{d}r, \tag{18.41}$$

where $\Sigma_{g,1}(r)$ is the surface density of gas in units of $M_\odot$ pc^{-2}, $f_\mathrm{g}(r)$ is the gas fraction, $\dot{\Sigma}_\star(r)$ is the surface density of star formation rate, $\beta_0 =$`[beta0]`, $\mu =$`[mu]`, and $\nu =$`[nu]`.

Code lines: 68

Contained by: file `star_formation.feedback.disks.Creasey2012.F90`

Modules used: `fgsl` `galacticus_nodes` `numerical_constants_math` `numerical_integration` `stellar_feedback`

function: `outflowrateintegrand`

Description: Integrand function for the "Creasey et al. (2012)" supernovae feedback calculation.
Code lines: 22
Contained by: function creasey2012outflowrate
Modules used: galactic_structure_options galactic_structure_surface_densities numerical_constants_prefixes

interface: starformationfeedbackdiskscreasey2012
Description: Constructors for the creasey2012 fraction star formation feedback in disks class.
Code lines: 4
Contained by: file star_formation.feedback.disks.Creasey2012.F90

file: star_formation.feedback.disks.F90
Description: Contains a module which provides an object that implements feedback from star formation in disks.
Code lines: 41

module: star_formation_feedback_disks
Description: Provides an object that implements calculations of feedback from star formation in disks.
Code lines: 19
Contained by: file star_formation.feedback.disks.F90
Modules used: galacticus_nodes
Used by: subroutine galacticus_function_classes_destroy; subroutine galacticus_state_retrieve; subroutine galacticus_state_store; module node_component_disk_standard; module node_component_disk_very_simple; subroutine node_component_disk_very_simple_rate_compute

file: star_formation.feedback.disks.fixed.F90
Description: Implementation of a fixed fraction outflow rate due to star formation feedback in galactic disks.
Code lines: 85

function: fixedconstructorinternal
Description: Internal constructor for the fixed star formation feedback from disks class.
Code lines: 8
Contained by: file star_formation.feedback.disks.fixed.F90

function: fixedconstructorparameters
Description: Constructor for the fixed fraction star formation feedback in disks class which takes a parameter set as input.
Code lines: 20
Contained by: file star_formation.feedback.disks.fixed.F90
Modules used: galacticus_error input_parameters

function: fixedoutflowrate
Description: Returns the outflow rate (in $M_\odot$ Gyr^{-1}) for star formation in the galactic disk of node. Assumes a fixed ratio of outflow rate to star formation rate.
Code lines: 12
Contained by: file star_formation.feedback.disks.fixed.F90
Modules used: stellar_feedback

interface: `starformationfeedbackdisksfixed`
Description: Constructors for the fixed fraction star formation feedback in disks class.
Code lines: 4
Contained by: file `star_formation.feedback.disks.fixed.F90`

file: `star_formation.feedback.disks.halo_scaling.F90`
Description: Implementation of an outflow rate due to star formation feedback in galactic disks which scales with halo velocity.
Code lines: 150
Modules used: `cosmology_functions` `dark_matter_halo_scales`

function: `haloscalingconstructorinternal`
Description: Internal constructor for the halo scaling star formation feedback from disks class.
Code lines: 19
Contained by: file `star_formation.feedback.disks.halo_scaling.F90`
Modules used: `stellar_feedback`

function: `haloscalingconstructorparameters`
Description: Constructor for the halo scaling fraction star formation feedback in disks class which takes a parameter set as input.
Code lines: 41
Contained by: file `star_formation.feedback.disks.halo_scaling.F90`
Modules used: `galacticus_error`

subroutine: `haloscalingdestructor`
Description: Destructor for the halo scaling feedback from star formation in disks class.
Code lines: 8
Contained by: file `star_formation.feedback.disks.halo_scaling.F90`

function: `haloscalingoutflowrate`
Description: Returns the outflow rate (in $M_\odot$ Gyr^{-1}) for star formation in the galactic disk of `node`.
Code lines: 29
Contained by: file `star_formation.feedback.disks.halo_scaling.F90`
Modules used: `galacticus_nodes`

interface: `starformationfeedbackdiskshaloscaling`
Description: Constructors for the halo scaling fraction star formation feedback in disks class.
Code lines: 4
Contained by: file `star_formation.feedback.disks.halo_scaling.F90`

file: `star_formation.feedback.disks.power_law.F90`
Description: Implementation of a power-law outflow rate due to star formation feedback in galactic disks.
Code lines: 136

function: `powerlawconstructorinternal`
Description: Internal constructor for the power-law star formation feedback from disks class.
Code lines: 14
Contained by: file `star_formation.feedback.disks.power_law.F90`

Modules used: galacticus_error

function: powerlawconstructorparameters
Description: Constructor for the power-law star formation feedback in disks class which takes a parameter set as input.
Code lines: 26
Contained by: file star_formation.feedback.disks.power_law.F90

function: powerlawoutflowrate
Description: Returns the outflow rate (in $M_\odot$ Gyr^{-1}) for star formation in the galactic disk of thisNode. The outflow rate is given by

$$\dot{M}_\mathrm{outflow} = \left(\frac{V_\mathrm{disk,outflow}}{V_\mathrm{disk}} \right)^{\alpha_\mathrm{disk,outflow}}, \tag{18.42}$$

where $V_\mathrm{disk,outflow}$(=diskOutflowVelocity) is the velocity scale at which outflow rate equals star formation rate and $\alpha_{disk,outflow}$(=diskOutflowExponent) controls the scaling with velocity. Note that the velocity V_disk is whatever characteristic value returned by the disk method. This scaling is functionally similar to that adopted by Cole et al. [2000], except that they specifically used the circular velocity at half-mass radius.
Code lines: 29
Contained by: file star_formation.feedback.disks.power_law.F90
Modules used: galacticus_nodes stellar_feedback

function: powerlawvelocitycharacteristic
Description: Return the characteristic velocity for power-law feedback models in disks. In this case the characteristic velocity is a constant.
Code lines: 10
Contained by: file star_formation.feedback.disks.power_law.F90

interface: starformationfeedbackdiskspowerlaw
Description: Constructors for the power-law star formation feedback in disks class.
Code lines: 4
Contained by: file star_formation.feedback.disks.power_law.F90

file: star_formation.feedback.disks.power_law.redshift_scaling.F90
Description: Implementation of a power-law outflow rate due to star formation feedback in galactic disks in which the characteristic velocity scales as a power of $(1+z)$.
Code lines: 100
Modules used: cosmology_functions

function: powerlawredshiftscalingconstructorinternal
Description: Internal constructor for the power-law redshift-scaling star formation feedback from disks class.
Code lines: 10
Contained by: file star_formation.feedback.disks.power_law.redshift_scaling.F90

function: powerlawredshiftscalingconstructorparameters
Description: Constructor for the power-law redshift-scaling star formation feedback in disks class which takes a parameter set as input.
Code lines: 20

Contained by: file star_formation.feedback.disks.power_law.redshift_scaling.F90

subroutine: powerlawredshiftscalingdestructor
Description: Destructor for the power-law redshift-scaling feedback from star formation in disks class.
Code lines: 7
Contained by: file star_formation.feedback.disks.power_law.redshift_scaling.F90

function: powerlawredshiftscalingvelocitycharacteristic
Description: Return the characteristic velocity for power-law feedback models in disks. In this case the characteristic velocity is a constant.
Code lines: 12
Contained by: file star_formation.feedback.disks.power_law.redshift_scaling.F90
Modules used: galacticus_nodes

interface: starformationfeedbackdiskspowerlawredshiftscaling
Description: Constructors for the power-law redshift-scaling star formation feedback in disks class.
Code lines: 4
Contained by: file star_formation.feedback.disks.power_law.redshift_scaling.F90

file: star_formation.feedback.disks.velocity_maximum_scaling.F90
Description: Implementation of an outflow rate due to star formation feedback in galactic disks which scales with peak halo velocity.
Code lines: 156
Modules used: cosmology_functions dark_matter_profiles_dmo math_exponentiation

interface: starformationfeedbackdisksvlctymxsclng
Description: Constructors for the velocity maximum scaling fraction star formation feedback in disks class.
Code lines: 4
Contained by: file star_formation.feedback.disks.velocity_maximum_scaling.F90

function: vlctymxsclngconstructorinternal
Description: Internal constructor for the halo scaling star formation feedback from disks class.
Code lines: 22
Contained by: file star_formation.feedback.disks.velocity_maximum_scaling.F90
Modules used: stellar_feedback

function: vlctymxsclngconstructorparameters
Description: Constructor for the velocity maximum scaling fraction star formation feedback in disks class which takes a parameter set as input.
Code lines: 42
Contained by: file star_formation.feedback.disks.velocity_maximum_scaling.F90
Modules used: galacticus_error

subroutine: vlctymxsclngdestructor
Description: Destructor for the velocity maximum scaling feedback from star formation in disks class.
Code lines: 8
Contained by: file star_formation.feedback.disks.velocity_maximum_scaling.F90

function: `vlctymxsclngoutflowrate`
Description: Returns the outflow rate (in $M_\odot$ Gyr^{-1}) for star formation in the galactic disk of `node`.
Code lines: 29
Contained by: file star_formation.feedback.disks.velocity_maximum_scaling.F90
Modules used: galacticus_nodes

file: `star_formation.feedback.spheroids.F90`
Description: Contains a module which provides an object that implements cosmological parameters.
Code lines: 41

module: `star_formation_feedback_spheroids`
Description: Provides an object that implements calculations of feedback from star formation in spheroids.
Code lines: 19
Contained by: file star_formation.feedback.spheroids.F90
Modules used: galacticus_nodes
Used by: subroutine galacticus_function_classes_destroy; subroutine galacticus_state_retrieve; subroutine galacticus_state_store; module node_component_spheroid_standard; module node_component_spheroid_very_simple

file: `star_formation.feedback.spheroids.fixed.F90`
Description: Implementation of a fixed fraction outflow rate due to star formation feedback in galactic spheroids.
Code lines: 85

function: `fixedconstructorinternal`
Description: Internal constructor for the fixed star formation feedback from spheroids class.
Code lines: 8
Contained by: file star_formation.feedback.spheroids.fixed.F90

function: `fixedconstructorparameters`
Description: Constructor for the fixed fraction star formation feedback in spheroids class which takes a parameter set as input.
Code lines: 20
Contained by: file star_formation.feedback.spheroids.fixed.F90
Modules used: galacticus_error; input_parameters

function: `fixedoutflowrate`
Description: Returns the outflow rate (in $M_\odot$ Gyr^{-1}) for star formation in the galactic spheroid of `node`. Assumes a fixed ratio of outflow rate to star formation rate.
Code lines: 12
Contained by: file star_formation.feedback.spheroids.fixed.F90
Modules used: stellar_feedback

interface: `starformationfeedbackspheroidsfixed`
Description: Constructors for the fixed fraction star formation feedback in spheroids class.

Code lines: 4
Contained by: file star_formation.feedback.spheroids.fixed.F90

file: star_formation.feedback.spheroids.power_law.F90
Description: Implementation of a power-law outflow rate due to star formation feedback in galactic spheroids.
Code lines: 137

function: powerlawconstructorinternal
Description: Internal constructor for the power-law star formation feedback from spheroids class.
Code lines: 14
Contained by: file star_formation.feedback.spheroids.power_law.F90
Modules used: galacticus_error

function: powerlawconstructorparameters
Description: Constructor for the power-law star formation feedback in spheroids class which takes a parameter set as input.
Code lines: 27
Contained by: file star_formation.feedback.spheroids.power_law.F90
Modules used: galacticus_error

function: powerlawoutflowrate
Description: Returns the outflow rate (in $M_\odot$ Gyr^{-1}) for star formation in the galactic spheroid of thisNode. The outflow rate is given by

$$\dot{M}_\mathrm{outflow} = \left(\frac{V_\mathrm{spheroid,outflow}}{V_\mathrm{spheroid}} \right)^{\alpha_\mathrm{spheroid,outflow}}, \tag{18.43}$$

where $V_\mathrm{spheroid,outflow}$(=velocityCharacteristic) is the velocity scale at which outflow rate equals star formation rate and $\alpha_{spheroid,outflow}$(=exponent) controls the scaling with velocity. Note that the velocity V_spheroid is whatever characteristic value returned by the spheroid method. This scaling is functionally similar to that adopted by Cole et al. [2000], but that they specifically used the circular velocity at half-mass radius.

subroutine: kennicuttschmidtdestructor
Description: Destructor for the kennicuttSchmidt cooling radius class.
Code lines: 8
Contained by: file star_formation.rate_surface_density.disks.Kennicutt-Schmidt.F90
Modules used: events_hooks

function: kennicuttschmidtrate
Description: Returns the star formation rate surface density (in $M_\odot$ Gyr^{-1} Mpc^{-2}) for star formation in the galactic disk of node. The disk is assumed to obey the Kennicutt-Schmidt law:

$$\Sigma_\star = A \left(x_\mathrm{H} \frac{\Sigma_\mathrm{gas}}{M_\odot \mathrm{pc}^{-2}} \right)^N, \tag{18.46}$$

where $A =$[normalization] and $N =$[exponent]. Optionally, star formation is truncated for gas surface densities below a critical density of:

$$\Sigma_\mathrm{crit} = \frac{q_\mathrm{crit} \kappa \sigma_\mathrm{gas}}{\pi \mathrm{G}}, \tag{18.47}$$

where κ is the epicyclic frequency in the disk, σ_gas is the velocity dispersion of gas in the disk and $q_\mathrm{crit} =$[toomreParameterCritical] is a dimensionless constant of order unity which controls where the critical density occurs. σ_gas is assumed to be a constant equal to [velocityDispersionDiskGas] and the disk is assumed to have a flat rotation curve such that $\kappa = \sqrt{2} V / R$.

function: `dynamicaltimetimescale`
Description: Returns the timescale (in Gyr) for star formation in the galactic disk of `node`. The timescale is given by

$$\tau_\star = \epsilon_\star^{-1} \tau_{\rm dynamical,disk} \left(\frac{V_{\rm disk}}{200{\rm km/s}} \right)^{\alpha_\star}, \tag{18.49}$$

where $\epsilon_\star$(=`effiency`) is a star formation efficiency and $\alpha_\star$(=`exponentVelocity`) controls the scaling with velocity. Note that $\tau_{\rm dynamical,disk} = R_{\rm disk}/V_{\rm disk}$ where the radius and velocity are whatever characteristic values returned by the disk method. This scaling is functionally similar to that adopted by Cole et al. [2000], but that they specifically used the half-mass radius and circular velocity at that radius.

file: `statistics.Nbody.halos.mass_errors.Trenti2010.F90`
Description: Contains a module which implements an N-body dark matter halo mass error class using the model of Trenti et al. [2010].
Code lines: 166
Modules used: `cosmology_functions`

interface: `nbodyhalomasserrortrenti2010`
Description: Constructors for the `trenti2010` N-body halo mass error class.
Code lines: 4
Contained by: file `statistics.Nbody.halos.mass_errors.Trenti2010.F90`

function: `nbodyhalomasserrortrenti2010internal`
Description: Internal constructor for the `trenti2010` N-body halo mass error class. Trenti et al. [2010] report a normalization of the fractional error in particle number of 0.15 at $N = 1000$ particles. Since this is based on comparisons of halos in simulations differing in number of particles by a factor 8 this actually overestimates the normalization by a factor $\sqrt{5/4}$. Therefore, we use a normalization of 0.135 here.

Modules used: beta_functions

function: betainverse
Description: Return the inverse of a beta distribution.
Code lines: 24
Contained by: file statistics.distributions.beta.F90
Modules used: galacticus_error root_finder

function: betamaximum
Description: Return the minimum value of a beta distribution.
Code lines: 8
Contained by: file statistics.distributions.beta.F90

function: betaminimum
Description: Return the minimum value of a beta distribution.
Code lines: 8
Contained by: file statistics.distributions.beta.F90

function: betaroot
Description: Root function used in finding the inverse of the beta distribution.
Code lines: 7
Contained by: file statistics.distributions.beta.F90

interface: distributionfunction1dbeta
Description: Constructors for the beta 1D distribution function class.
Code lines: 4
Contained by: file statistics.distributions.beta.F90

file: statistics.distributions.discrete.F90
Description: Contains a module that implements a class of discrete distributions.
Code lines: 106

module: statistics_distributions_discrete
Code lines: 84
Contained by: file statistics.distributions.discrete.F90
Modules used: pseudo_random
Used by: function localgroupmassfunctionloglikelihood

file: `statistics.distributions.discrete.binomial.F90`
Description: Implementation of a binomial 1D discrete distibution function.
Code lines: 170

function: `binomialconstructorinternal`
Description: Constructor for "binomial" 1D distribution function class.
Code lines: 23
Contained by: file `statistics.distributions.discrete.binomial.F90`
Modules used: `galacticus_error`

function: `binomialconstructorparameters`
Description: Constructor for the `binomial` 1D discrete distribution function class which builds the object from a parameter set.
Code lines: 27
Contained by: file `statistics.distributions.discrete.binomial.F90`
Modules used: `input_parameters`

function: `binomialcumulative`
Description: Return the cumulative probability of a binomial discrete distribution.
Code lines: 10
Contained by: file `statistics.distributions.discrete.binomial.F90`
Modules used: `galacticus_error`

function: `binomialinverse`
Description: Return the inverse of a binomial discrete distribution.
Code lines: 13
Contained by: file `statistics.distributions.discrete.binomial.F90`
Modules used: `galacticus_error`

function: `binomialmass`
Description: Return the mass of a binomial discrete distribution.
Code lines: 11
Contained by: file `statistics.distributions.discrete.binomial.F90`
Modules used: `factorials` `galacticus_error`

function: `binomialmasslogarithmic`
Description: Return the logarithmic mass of a binomial discrete distribution.
Code lines: 8
Contained by: file `statistics.distributions.discrete.binomial.F90`

function: `binomialmaximum`
Description: Return the maximum possible value in a binomial discrete distribution.
Code lines: 8
Contained by: file `statistics.distributions.discrete.binomial.F90`

function: `binomialminimum`
Description: Return the minimum possible value in a binomial discrete distribution.
Code lines: 8
Contained by: file `statistics.distributions.discrete.binomial.F90`

interface: `distributionfunctiondiscrete1dbinomial`
Description: Constructors for the `binomial` 1D discrete distribution function class.
Code lines: 4
Contained by: file `statistics.distributions.discrete.binomial.F90`

file: `statistics.distributions.discrete.negative_binomial.F90`
Description: Implementation of a negative binomial 1D discrete distibution function.
Code lines: 158

interface: `distributionfunctiondiscrete1dnegativebinomial`
Description: Constructors for the `negativeBinomial` 1D discrete distribution function class.
Code lines: 4
Contained by: file `statistics.distributions.discrete.negative_binomial.F90`

function: `negativebinomialconstructorinternal`
Description: Constructor for "negativeBinomial" 1D distribution function class.
Code lines: 12
Contained by: file `statistics.distributions.discrete.negative_binomial.F90`
Modules used: `galacticus_error`

function: `negativebinomialconstructorparameters`
Description: Constructor for the `negativeBinomial` 1D discrete distribution function class which builds the object from a parameter set.
Code lines: 26
Contained by: file `statistics.distributions.discrete.negative_binomial.F90`
Modules used: `input_parameters`

function: `negativebinomialcumulative`
Description: Return the cumulative probability of a negativeBinomial discrete distribution.
Code lines: 11
Contained by: file `statistics.distributions.discrete.negative_binomial.F90`
Modules used: `galacticus_error`

function: `negativebinomialinverse`
Description: Return the inverse of a negative binomial discrete distribution.
Code lines: 11
Contained by: file `statistics.distributions.discrete.negative_binomial.F90`
Modules used: `galacticus_error`

function: `negativebinomialmass`
Description: Return the mass of a negative binomial discrete distribution.
Code lines: 11
Contained by: file `statistics.distributions.discrete.negative_binomial.F90`
Modules used: `galacticus_error` `gamma_functions`

function: `negativebinomialmasslogarithmic`
Description: Return the logarithmic mass of a negative binomial discrete distribution.
Code lines: 11

Contained by: file statistics.distributions.discrete.negative_binomial.F90
Modules used: galacticus_error gamma_functions

function: negativebinomialmaximum
Description: Return the maximum possible value in a negative binomial discrete distribution.
Code lines: 8
Contained by: file statistics.distributions.discrete.negative_binomial.F90

function: negativebinomialminimum
Description: Return the minimum possible value in a negative binomial discrete distribution.
Code lines: 8
Contained by: file statistics.distributions.discrete.negative_binomial.F90

file: statistics.distributions.lognormal.F90
Description: Implementation of a normal 1D distibution function.
Code lines: 158

interface: distributionfunction1dlognormal
Description: Constructors for the normal 1D distribution function class.
Code lines: 4
Contained by: file statistics.distributions.lognormal.F90

function: lognormalconstructorinternal
Description: Constructor for "normal" 1D distribution function class.
Code lines: 24
Contained by: file statistics.distributions.lognormal.F90

function: lognormalconstructorparameters
Description: Constructor for the normal 1D distribution function class which builds the object from a parameter set.
Code lines: 40
Contained by: file statistics.distributions.lognormal.F90
Modules used: input_parameters

function: lognormalcumulative
Description: Return the cumulative probability of a normal distribution.
Code lines: 8
Contained by: file statistics.distributions.lognormal.F90

function: lognormaldensity
Description: Return the density of a normal distribution.
Code lines: 8
Contained by: file statistics.distributions.lognormal.F90

function: lognormalinverse
Description: Return the inverse of a normal distribution.
Code lines: 8
Contained by: file statistics.distributions.lognormal.F90

function: `lognormalmaximum`
Description: Return the maximum possible value of a uniform distribution.
Code lines: 7
Contained by: file `statistics.distributions.lognormal.F90`

function: `lognormalminimum`
Description: Return the minimum possible value of a uniform distribution.
Code lines: 7
Contained by: file `statistics.distributions.lognormal.F90`

file: `statistics.distributions.loguniform.F90`
Description: Implementation of a 1D distibution function which is uniform in the logarithm of the variable.
Code lines: 121

interface: `distributionfunction1dloguniform`
Description: Constructors for the `logUniform` 1D distribution function class.
Code lines: 4
Contained by: file `statistics.distributions.loguniform.F90`

function: `loguniformconstructorinternal`
Description: Constructor for "logUniform" 1D distribution function class.
Code lines: 8
Contained by: file `statistics.distributions.loguniform.F90`

function: `loguniformconstructorparameters`
Description: Constructor for the `logUniform` 1D distribution function class which builds the object from a parameter set.
Code lines: 26
Contained by: file `statistics.distributions.loguniform.F90`
Modules used: `input_parameters`

function: `loguniformcumulative`
Description: Return the cumulative probability of a uniform distribution.
Code lines: 14
Contained by: file `statistics.distributions.loguniform.F90`

function: `loguniformdensity`
Description: Return the density of a uniform distribution.
Code lines: 12
Contained by: file `statistics.distributions.loguniform.F90`

function: `loguniforminverse`
Description: Return the inverse of a uniform distribution.
Code lines: 10
Contained by: file `statistics.distributions.loguniform.F90`
Modules used: `galacticus_error`

file: `statistics.distributions.negative_exponential.F90`
Description: Implementation of a negative exponential density 1D distibution function.
Code lines: 119

interface: `distributionfunction1dnegativeexponential`
Description: Constructors for the `negativeExponential` 1D distribution function class.
Code lines: 4
Contained by: file `statistics.distributions.negative_exponential.F90`

function: `negativeexponentialconstructorinternal`
Description: Constructor for "negativeExponential" 1D distribution function class.
Code lines: 8
Contained by: file `statistics.distributions.negative_exponential.F90`

function: `negativeexponentialconstructorparameters`
Description: Constructor for the `negativeExponential` 1D distribution function class which builds the object from a parameter set.
Code lines: 19
Contained by: file `statistics.distributions.negative_exponential.F90`
Modules used: `input_parameters`

function: `negativeexponentialcumulative`
Description: Return the cumulative probability of a negative exponential distribution.
Code lines: 12
Contained by: file `statistics.distributions.negative_exponential.F90`

function: `negativeexponentialdensity`
Description: Return the density of a negative exponential distribution.
Code lines: 12
Contained by: file `statistics.distributions.negative_exponential.F90`

function: `negativeexponentialinverse`
Description: Return the inverse of a negative exponential distribution.
Code lines: 17
Contained by: file `statistics.distributions.negative_exponential.F90`
Modules used: `galacticus_error`

file: `statistics.distributions.normal.F90`
Description: Implementation of a normal 1D distibution function.
Code lines: 272

interface: `distributionfunction1dnormal`
Description: Constructors for the `normal` 1D distribution function class.
Code lines: 4
Contained by: file `statistics.distributions.normal.F90`

function: `normalconstructorinternal`
Description: Constructor for "normal" 1D distribution function class.

Code lines: 27
Contained by: file statistics.distributions.normal.F90
Modules used: error_functions

function: normalconstructorparameters
Description: Constructor for the normal 1D distribution function class which builds the object from a parameter set.
Code lines: 48
Contained by: file statistics.distributions.normal.F90
Modules used: input_parameters

function: normalcumulative
Description: Return the cumulative probability of a normal distribution.
Code lines: 15
Contained by: file statistics.distributions.normal.F90
Modules used: error_functions

function: normaldensity
Description: Return the density of a normal distribution.
Code lines: 13
Contained by: file statistics.distributions.normal.F90
Modules used: numerical_constants_math

function: normalinverse
Description: Return the inverse of a normal distribution.
Code lines: 10
Contained by: file statistics.distributions.normal.F90
Modules used: galacticus_error

function: normalmaximum
Description: Return the maximum possible value of a uniform distribution.
Code lines: 13
Contained by: file statistics.distributions.normal.F90
Modules used: galacticus_error

function: normalminimum
Description: Return the minimum possible value of a uniform distribution.
Code lines: 13
Contained by: file statistics.distributions.normal.F90
Modules used: galacticus_error

function: normalpolynomialevaluate

Description: Evaluates a polynomial based on the implementation by John Burkardt. For sanity's sake, the value of N indicates the *number* of coefficients, or more precisely, the *order* of the polynomial, rather than the *degree* of the polynomial. The two quantities differ by 1, but cause a great deal of confusion. Given `n` and `a`, the form of the polynomial is:

$$p(x) = a(1) + a(2) * x + \ldots + a(n-1) * x^{n-2} + a(n) * x^{n-1}. \tag{18.51}$$

Code lines: 19

Contained by: file `statistics.distributions.normal.F90`

function: `normalstandardinverse`

Description: Evaluates the inverse of the standard normal cumulative distribution function. Based on the Fortran90 version by John Burkardt (itself based on the original Fortran 77 version by Michael Wichura), using the alogorithm of Wichura [1988].
Code lines: 52
Contained by: file statistics.distributions.normal.F90
Modules used: galacticus_error

file: statistics.distributions.peak_background.F90
Description: Implementation of a peak-background split density 1D distibution function.
Code lines: 191
Modules used: tables

interface: distributionfunction1dpeakbackground
Description: Constructors for the peakBackground 1D distribution function class.
Code lines: 4
Contained by: file statistics.distributions.peak_background.F90

function: peakbackgroundconstructorinternal
Description: Constructor for "peakBackground" 1D distribution function class.
Code lines: 33
Contained by: file statistics.distributions.peak_background.F90
Modules used: error_functions

function: cdfintegrand
Description: The integrand for the cumulative distribution function.
Code lines: 7
Contained by: function peakbackgroundconstructorinternal

function: peakbackgroundconstructorparameters
Description: Constructor for the peakBackground 1D distribution function class which builds the object from a parameter set.
Code lines: 26
Contained by: file statistics.distributions.peak_background.F90
Modules used: input_parameters

function: peakbackgroundcumulative
Description: Return the cumulative probability of a normal distribution.
Code lines: 14
Contained by: file statistics.distributions.peak_background.F90

function: peakbackgrounddensity
Description: Return the density of a normal distribution.
Code lines: 13
Contained by: file statistics.distributions.peak_background.F90
Modules used: numerical_constants_math

subroutine: peakbackgrounddestructor
Description: Destructor for "peakBackground" 1D distribution function class.
Code lines: 11

Contained by: file statistics.distributions.peak_background.F90

function: peakbackgroundinverse
Description: Return the inverse of a normal distribution.
Code lines: 10
Contained by: file statistics.distributions.peak_background.F90
Modules used: galacticus_error

function: peakbackgroundmaximum
Description: Return the maximum possible value of a peak-background split distribution.
Code lines: 10
Contained by: file statistics.distributions.peak_background.F90
Modules used: galacticus_error

function: peakbackgroundminimum
Description: Return the minimum possible value of a peak-background split distribution.
Code lines: 10
Contained by: file statistics.distributions.peak_background.F90
Modules used: galacticus_error

file: statistics.distributions.uniform.F90
Description: Implementation of a uniform 1D distibution function.
Code lines: 141

interface: distributionfunction1duniform
Description: Constructors for the uniform 1D distribution function class.
Code lines: 4
Contained by: file statistics.distributions.uniform.F90

function: uniformconstructorinternal
Description: Constructor for "uniform" 1D distribution function class.
Code lines: 8
Contained by: file statistics.distributions.uniform.F90

function: uniformconstructorparameters
Description: Constructor for the uniform 1D distribution function class which builds the object from a parameter set.
Code lines: 26
Contained by: file statistics.distributions.uniform.F90
Modules used: input_parameters

function: uniformcumulative
Description: Return the cumulative probability of a uniform distribution.
Code lines: 14
Contained by: file statistics.distributions.uniform.F90

function: uniformdensity
Description: Return the density of a uniform distribution.
Code lines: 12
Contained by: file statistics.distributions.uniform.F90

function: `uniforminverse`
Description: Return the inverse of a uniform distribution.
Code lines: 10
Contained by: file `statistics.distributions.uniform.F90`
Modules used: `galacticus_error`

function: `uniformmaximum`
Description: Return the maximum possible value of a uniform distribution.
Code lines: 7
Contained by: file `statistics.distributions.uniform.F90`

function: `uniformminimum`
Description: Return the minimum possible value of a uniform distribution.
Code lines: 7
Contained by: file `statistics.distributions.uniform.F90`

file: `statistics.mass_function.incompleteness.F90`
Description: Contains a module that provides an object that implements incompleteness calculations for observed mass functions.
Code lines: 39

module: `mass_function_incompletenesses`
Description: Provides a class that implements incompleteness calculations for observed mass functions.
Code lines: 17
Contained by: file `statistics.mass_function.incompleteness.F90`
Used by: subroutine `galacticus_function_classes_destroy`; subroutine `galacticus_state_retrieve`; subroutine `galacticus_state_store`; function `massfunctionevaluate`; file `tasks.conditional_mass_function.F90`

file: `statistics.mass_function.incompleteness.complete.F90`
Description: Implements calculations of incompleteness assuming a complete sample.
Code lines: 60

function: `completecompleteness`
Description: Return the completeness.
Code lines: 9
Contained by: file `statistics.mass_function.incompleteness.complete.F90`

function: `completeconstructorparameters`
Description: Constructor for the `complete` incompleteness class which takes a parameter set as input.
Code lines: 10
Contained by: file `statistics.mass_function.incompleteness.complete.F90`
Modules used: `input_parameters`

interface: `massfunctionincompletenesscomplete`
Description: Constructors for the `complete` incompleteness class.

Code lines: 3
Contained by: file statistics.mass_function.incompleteness.complete.F90

file: statistics.mass_function.incompleteness.surface_brightness.F90
Description: Implements calculations of incompleteness assuming a normal distribution of surface brightnesses.
Code lines: 111

interface: massfunctionincompletenesssurfacebrightness
Description: Constructors for the "surface brightness" incompleteness class.
Code lines: 4
Contained by: file statistics.mass_function.incompleteness.surface_brightness.F90

function: surfacebrightnesscompleteness
Description: Return the completeness.
Code lines: 12
Contained by: file statistics.mass_function.incompleteness.surface_brightness.F90
Modules used: error_functions

function: surfacebrightnessconstructorinternal
Description: Internal constructor for the "surface brightness" incompleteness class.
Code lines: 8
Contained by: file statistics.mass_function.incompleteness.surface_brightness.F90

function: surfacebrightnessconstructorparameters
Description: Constructor for the surfaceBrightness incompleteness class which takes a parameter set as input.
Code lines: 46
Contained by: file statistics.mass_function.incompleteness.surface_brightness.F90
Modules used: input_parameters

file: statistics.points.correlation.F90
Description: Contains a module which computes correlation statistics from point distributions.
Code lines: 232

module: statistics_points_correlations
Description: Compute correlation statistics from point distributions.
Code lines: 210
Contained by: file statistics.points.correlation.F90
Used by: subroutine catalogprojectedcorrelationfunctionperform

subroutine: statistics_points_correlation
Description: Compute the correlation function from a set of points.
Code lines: 201
Contained by: module statistics_points_correlations
Modules used: galacticus_display, galacticus_error, kind_numbers, memory_management, nearest_neighbors, numerical_ranges

vectors

file: statistics.points.power_spectrum.F90
Description: Contains a module which computes power spectra from point distributions.
Code lines: 122

module: statistics_points_power_spectra
Description: Compute power spectra from point distributions.
Code lines: 100
Contained by: file statistics.points.power_spectrum.F90

subroutine: statistics_points_power_spectrum
Description: Compute the power spectrum from a set of points in a periodic cube.
Code lines: 91
Contained by: module statistics_points_power_spectra
Modules used: fftw3, galacticus_display, galacticus_error, iso_c_binding, iso_varying_string, memory_management, meshes, numerical_constants_math, numerical_ranges, string_handling

file: stellar_astrophysics.F90
Description: Contains a module which implements a class for calculations of stellar astrophysics.
Code lines: 59

module: stellar_astrophysics
Description: Implements a class for calculations of stellar astrophysics.
Code lines: 37
Contained by: file stellar_astrophysics.F90
Modules used: iso_varying_string
Used by: program benchmark_stellar_populations_luminosities, subroutine galacticus_function_classes_destroy, subroutine galacticus_state_retrieve, subroutine galacticus_state_store, file stellar_astrophysics.feedback.standard.F90, file stellar_astrophysics.supernovae_PopulationIII.HegerWoosley2002.F90, file stellar_astrophysics.supernovae_type_Ia.Nagashima2005.F90, file stellar_populations.standard.F90, program test_stellar_populations, program test_stellar_populations_luminosities

file: stellar_astrophysics.feedback.F90
Description: Contains a module which implements a class that performs calculations of stellar feedback.
Code lines: 46

module: stellar_feedback
Description: Implements a class that performs calculations of stellar feedback.
Code lines: 24
Contained by: file stellar_astrophysics.feedback.F90

Used by: program benchmark_stellar_populations_luminosities; subroutine galacticus_function_classes_destroy; subroutine galacticus_state_retrieve; subroutine galacticus_state_store; subroutine node_component_disk_very_simple_rate_compute; subroutine node_component_disk_very_simple_rates; subroutine node_component_spheroid_very_simple_rate_compute; subroutine node_component_spheroid_very_simple_rates; function creasey2012outflowrate; function fixedoutflowrate; function haloscalingconstructorinternal; function powerlawoutflowrate; function vlctymxsclngconstructorinternal; function fixedoutflowrate; function powerlawoutflowrate; function vlctymxsclngconstructorinternal; function superwindoutflowrate; function superwindoutflowrate; subroutine instantaneousrates; subroutine noninstantaneousscales; file stellar_populations.standard.F90; program test_stellar_populations; program test_stellar_populations_luminosities

file: `stellar_astrophysics.feedback.standard.F90`

Description: Implements a stellar feedback class which performs a simple calculation of energy feedback from stellar populations.

Code lines: 177

Modules used: stellar_astrophysics; stellar_astrophysics_winds; supernovae_population_iii; supernovae_type_ia

function: `standardconstructorinternal`

Description: Constructor for the `standard` stellar feedback class which takes a parameter list as input.

Code lines: 12

Contained by: file stellar_astrophysics.feedback.standard.F90

function: `standardconstructorparameters`

Description: Constructor for the `standard` stellar feedback class which takes a parameter list as input.

Code lines: 44

Contained by: file stellar_astrophysics.feedback.standard.F90

Modules used: input_parameters; numerical_constants_astronomical; numerical_constants_prefixes; numerical_constants_units

subroutine: `standarddestructor`

Description: Destructor for the `standard` stellar feedback class.

Code lines: 10

Contained by: file stellar_astrophysics.feedback.standard.F90

function: `standardenergyinputcumulative`

Description: Compute the cumulative energy input from a star of given `initialMass`, `age` and `metallicity`.

Code lines: 40

Contained by: file stellar_astrophysics.feedback.standard.F90

Modules used: `fgsl`; numerical_constants_astronomical; numerical_integration

function: `standardwindenergyintegrand`
Description: Integrand used in evaluating cumulative energy input from winds.
Code lines: 7
Contained by: file `stellar_astrophysics.feedback.standard.F90`

interface: `stellarfeedbackstandard`
Description: Constructors for the `standard` stellar feedback class.
Code lines: 4
Contained by: file `stellar_astrophysics.feedback.standard.F90`

file: `stellar_astrophysics.file.F90`
Description: Implements a stellar astrophysics class in which the stellar properties are read from file and interpolated.
Code lines: 311
Modules used: `numerical_interpolation_2d_irregular`

function: `fileconstructorinternal`
Description: Internal constructor for the `file` stellar astrophysics class.
Code lines: 18
Contained by: file `stellar_astrophysics.file.F90`
Modules used: `atomic_data` `memory_management`

function: `fileconstructorparameters`
Description: Constructor for the `file` stellar astrophysics class which takes a parameter list as input.
Code lines: 20
Contained by: file `stellar_astrophysics.file.F90`
Modules used: `galacticus_paths` `input_parameters`

function: `filelifetime`
Description: Return the lifetime of a star (in Gyr) given an `massInitial` and `metallicity`.
Code lines: 9
Contained by: file `stellar_astrophysics.file.F90`

function: `filemassejected`
Description: Return the mass ejected during the lifetime of a star of given `massInitial` and `metallicity`.
Code lines: 9
Contained by: file `stellar_astrophysics.file.F90`

function: `filemassinitial`
Description: Return the initial mass of a star of given `lifetime` and `metallicity`.
Code lines: 9
Contained by: file `stellar_astrophysics.file.F90`

function: `filemassyield`
Description: Return the mass of metals yielded by a star of given `massInitial` and `metallicity`.
Code lines: 18
Contained by: file `stellar_astrophysics.file.F90`

subroutine: `fileread`

Description: Read stellar astrophysics data. This is not done during object construction since it can be slow—we only perform the read if the data is actually needed.
Code lines: 149
Contained by: file `stellar_astrophysics.file.F90`
Modules used: `atomic_data`, `fox_dom`, `galacticus_error`, `io_xml`, `iso_varying_string`, `memory_management`

interface: `stellarastrophysicsfile`

Description: Constructors for the `file` stellar astrophysics class.
Code lines: 4
Contained by: file `stellar_astrophysics.file.F90`

file: `stellar_astrophysics.supernovae_PopulationIII.F90`

Description: Contains a module which implements a class for calculations of Population III supernovae.
Code lines: 40

module: `supernovae_population_iii`

Description: Implements a class for calculations of Population III supernovae.
Code lines: 18
Contained by: file `stellar_astrophysics.supernovae_PopulationIII.F90`
Used by: program `benchmark_stellar_populations_luminosities`, subroutine `galacticus_function_classes_destroy`, subroutine `galacticus_state_retrieve`, subroutine `galacticus_state_store`, file `stellar_astrophysics.feedback.standard.F90`, program `test_stellar_populations`, program `test_stellar_populations_luminosities`

file: `stellar_astrophysics.supernovae_PopulationIII.HegerWoosley2002.F90`

Description: Implements a Population III supernovae class based on Heger and Woosley [2002].
Code lines: 136
Modules used: `fgsl`, `stellar_astrophysics`

function: `hegerwoosley2002constructorinternal`

Description: Internal constructor for the `hegerWoosley2002` Population III supernovae class.
Code lines: 34
Contained by: file `stellar_astrophysics.supernovae_PopulationIII.HegerWoosley2002.F90`
Modules used: `fox_dom`, `galacticus_error`, `galacticus_paths`, `io_xml`, `iso_varying_string`, `numerical_constants_astronomical`

function: `hegerwoosley2002constructorparameters`

Description: Constructor for the `hegerWoosley2002` Population III supernovae class which takes a parameter list as input.
Code lines: 13
Contained by: file `stellar_astrophysics.supernovae_PopulationIII.HegerWoosley2002.F90`
Modules used: `input_parameters`

subroutine: `hegerwoosley2002destructor`
Description: Destructor for the `hegerWoosley2002` Population III supernovae class.
Code lines: 7
Contained by: file `stellar_astrophysics.supernovae_PopulationIII.HegerWoosley2002.F90`

function: `hegerwoosley2002energycumulative`
Description: Compute the cumulative energy input from Population III star pair instability supernovae using the results of Heger and Woosley [2002].
Code lines: 26
Contained by: file `stellar_astrophysics.supernovae_PopulationIII.HegerWoosley2002.F90`
Modules used: `numerical_interpolation`

interface: `supernovaepopulationiiihegerwoosley2002`
Description: Constructors for the `hegerWoosley2002` Population III supernovae class.
Code lines: 4
Contained by: file `stellar_astrophysics.supernovae_PopulationIII.HegerWoosley2002.F90`

file: `stellar_astrophysics.supernovae_type_Ia.F90`
Description: Contains a module which implements a class for calculations of Type Ia supernovae.
Code lines: 47

module: `supernovae_type_ia`
Description: Implements a class for calculations of Type Ia supernovae.
Code lines: 25
Contained by: file `stellar_astrophysics.supernovae_type_Ia.F90`
Used by:
- program `benchmark_stellar_populations_luminosities`
- subroutine `galacticus_function_classes_destroy`
- subroutine `galacticus_state_retrieve`
- subroutine `galacticus_state_store`
- file `stellar_astrophysics.feedback.standard.F90`
- file `stellar_populations.standard.F90`
- program `test_stellar_populations`
- program `test_stellar_populations_luminosities`

file: `stellar_astrophysics.supernovae_type_Ia.Nagashima2005.F90`
Description: Implements a supernovae type Ia class based on Nagashima et al. [2005].
Code lines: 168
Modules used: `stellar_astrophysics`

function: `nagashima2005constructorinternal`
Description: Internal constructor for the `nagashima2005` supernovae type Ia class.
Code lines: 43
Contained by: file `stellar_astrophysics.supernovae_type_Ia.Nagashima2005.F90`
Modules used:
- `atomic_data`
- `fox_dom`
- `galacticus_error`
- `galacticus_paths`
- `io_xml`
- `memory_management`

function: `nagashima2005constructorparameters`

Description: Constructor for the `nagashima2005` supernovae type Ia class which takes a parameter list as input.
Code lines: 13
Contained by: file `stellar_astrophysics.supernovae_type_Ia.Nagashima2005.F90`
Modules used: `input_parameters`

subroutine: `nagashima2005destructor`
Description: Destructor for the `nagashima2005` supernovae type Ia class.
Code lines: 7
Contained by: file `stellar_astrophysics.supernovae_type_Ia.Nagashima2005.F90`

function: `nagashima2005number`
Description: Compute the cumulative number of Type Ia supernovae originating per unit mass of stars that form with given `initialMass` and `metallicity` after a time `age`. The calculation is based on that of Nagashima et al. [2005]. The number returned here assumes a distribution of binary mass ratios and so only makes sense once it is integrated over an initial mass function.
Code lines: 29
Contained by: file `stellar_astrophysics.supernovae_type_Ia.Nagashima2005.F90`

function: `nagashima2005yield`
Description: Compute the cumulative yield from Type Ia supernovae originating per unit mass of stars that form with given `initialMass` and `metallicity` after a time `age`. The calculation is based on the Type Ia rate calculation of Nagashima et al. [2005] and the Type Ia yields from Nomoto et al. [1997]. The number returned here assumes a distribution of binary mass ratios and so only makes sense once it is integrated over an initial mass function.
Code lines: 21
Contained by: file `stellar_astrophysics.supernovae_type_Ia.Nagashima2005.F90`

interface: `supernovaetypeianagashima2005`
Description: Constructors for the `nagashima2005` supernovae type Ia class.
Code lines: 4
Contained by: file `stellar_astrophysics.supernovae_type_Ia.Nagashima2005.F90`

file: `stellar_astrophysics.tracks.F90`
Description: Contains a module which implements a class for calculation of stellar tracks.
Code lines: 46

module: `stellar_astrophysics_tracks`
Description: Implements a class for stellar tracks.
Code lines: 24
Contained by: file `stellar_astrophysics.tracks.F90`
Used by:
- program `benchmark_stellar_populations_luminosities`
- subroutine `galacticus_state_retrieve`
- file `stellar_astrophysics.winds.Leitherer1992.F90`
- program `test_stellar_populations_luminosities`
- subroutine `galacticus_function_classes_destroy`
- subroutine `galacticus_state_store`
- program `test_stellar_populations`

file: `stellar_astrophysics.tracks.file.F90`
Description: Implements a stellar tracks class in which the tracks are read from file and interpolated.
Code lines: 367
Modules used: `fgsl`

function: `fileconstructorinternal`
Description: Internal constructor for the `file` stellar tracks class.
Code lines: 109
Contained by: file `stellar_astrophysics.tracks.file.F90`
Modules used: `galacticus_error`, `io_hdf5`, `iso_varying_string`, `memory_management`, `string_handling`

function: `fileconstructorparameters`
Description: Constructor for the `file` stellar tracks class which takes a parameter list as input.
Code lines: 20
Contained by: file `stellar_astrophysics.tracks.file.F90`
Modules used: `galacticus_paths`, `input_parameters`

function: `fileinterpolate`
Description: Using precomputed factors, interpolate in metallicity, mass and age in the given `stellarTracks`.
Code lines: 28
Contained by: file `stellar_astrophysics.tracks.file.F90`
Modules used: `iso_c_binding`

subroutine: `fileinterpolationcompute`
Description: Get interpolating factors for stellar tracks.
Code lines: 82
Contained by: file `stellar_astrophysics.tracks.file.F90`
Modules used: `iso_c_binding`, `numerical_interpolation`

function: `fileluminosity`
Description: Return the bolometric luminosity (in $L_\odot$) for a star of given `initialMass`, `metallicity` and `age`.
Code lines: 23
Contained by: file `stellar_astrophysics.tracks.file.F90`
Modules used: `iso_c_binding`

function: `filetemperatureeffective`
Description: Return the effective temperature (in Kelvin) for a star of given `initialMass`, `metallicity` and `age`.
Code lines: 23
Contained by: file `stellar_astrophysics.tracks.file.F90`
Modules used: `iso_c_binding`

interface: `stellartracksfile`
Description: Constructors for the `file` stellar tracks class.

Code lines: 4
Contained by: file stellar_astrophysics.tracks.file.F90

file: stellar_astrophysics.winds.F90
Description: Contains a module which implements a class for calculations of stellar winds.
Code lines: 46

module: stellar_astrophysics_winds
Description: Implements a class for calculations of stellar winds.
Code lines: 24
Contained by: file stellar_astrophysics.winds.F90
Used by: program benchmark_stellar_populations_luminosities; subroutine galacticus_function_classes_destroy; subroutine galacticus_state_retrieve; subroutine galacticus_state_store; file stellar_astrophysics.feedback.standard.F90; program test_stellar_populations; program test_stellar_populations_luminosities

file: stellar_astrophysics.winds.Leitherer1992.F90
Description: Implements a stellar winds class based on Leitherer et al. [1992].
Code lines: 123
Modules used: numerical_constants_astronomical; stellar_astrophysics_tracks

function: leitherer1992constructorinternal
Description: Internal constructor for the leitherer1992 stellar winds class.
Code lines: 8
Contained by: file stellar_astrophysics.winds.Leitherer1992.F90

function: leitherer1992constructorparameters
Description: Constructor for the leitherer1992 stellar winds class which takes a parameter list as input.
Code lines: 13
Contained by: file stellar_astrophysics.winds.Leitherer1992.F90
Modules used: input_parameters

subroutine: leitherer1992destructor
Description: Destructor for the leitherer1992 stellar winds class.
Code lines: 7
Contained by: file stellar_astrophysics.winds.Leitherer1992.F90

function: leitherer1992ratemassloss
Description: Compute the mass loss rate (in $M_\odot$/Gyr) from a star of given initialMass, age and metallicity using the fitting formula of Leitherer et al. [1992].
Code lines: 19
Contained by: file stellar_astrophysics.winds.Leitherer1992.F90

function: leitherer1992velocityterminal
Description: Compute the terminal velocity (in km/s) from a star of given initialMass, age and metallicity using the fitting formula of Leitherer et al. [1992].
Code lines: 19

Contained by: file stellar_astrophysics.winds.Leitherer1992.F90

interface: stellarwindsleitherer1992
Description: Constructors for the leitherer1992 stellar winds class.
Code lines: 4
Contained by: file stellar_astrophysics.winds.Leitherer1992.F90

file: stellar_populations.F90
Description: Contains a module which implements a class for stellar populations.
Code lines: 114

module: stellar_populations
Description: Implements a class for stellar populations.
Code lines: 92
Contained by: file stellar_populations.F90
Modules used: abundances_structure, hashes, stellar_population_spectra
Used by: program benchmark_stellar_populations_luminosities; subroutine galacticus_function_classes_destroy; subroutine galacticus_state_retrieve; subroutine galacticus_state_store; function sedfitevaluate; subroutine stellar_luminosities_set; function intergalacticbackgroundinternalupdate; function stellar_population_luminosity; subroutine stellar_population_luminosity_tabulate; subroutine stellar_population_luminosity_track; subroutine instantaneousrates; subroutine noninstantaneousrates; module stellar_population_selectors; function diskspheroidconstructorparameters; function fixedconstructorparameters; program test_stellar_populations; program test_stellar_populations_luminosities

subroutine: stellarpopulationuniqueidassign
Description: Assign a unique ID to a stellar population. Populations are distinguished based on the hash of their descriptor.
Code lines: 21
Contained by: module stellar_populations
Modules used: galacticus_error

file: stellar_populations.initial_mass_functions.BPASS.F90
Description: Implements a stellar initial mass function class used by the BPASS library.
Code lines: 70

function: bpassconstructorinternal
Description: Internal constructor for the bpass initial mass function.
Code lines: 7
Contained by: file stellar_populations.initial_mass_functions.BPASS.F90

function: bpassconstructorparameters

Description: Constructor for the `bpass` initial mass function class which takes a parameter list as input.
Code lines: 10
Contained by: file `stellar_populations.initial_mass_functions.BPASS.F90`
Modules used: `input_parameters`

function: `bpasslabel`
Description: Return a label for this IMF.
Code lines: 9
Contained by: file `stellar_populations.initial_mass_functions.BPASS.F90`

interface: `initialmassfunctionbpass`
Description: Constructors for the `bpass` initial mass function class.
Code lines: 4
Contained by: file `stellar_populations.initial_mass_functions.BPASS.F90`

file: `stellar_populations.initial_mass_functions.Baugh2005TopHeavy.F90`
Description: Implements a stellar initial mass function class for the top-heavy stellar initial mass function from Baugh et al. [2005].
Code lines: 70

function: `baugh2005topheavyconstructorinternal`
Description: Internal constructor for the `baugh2005TopHeavy` initial mass function.
Code lines: 7
Contained by: file `stellar_populations.initial_mass_functions.Baugh2005TopHeavy.F90`

function: `baugh2005topheavyconstructorparameters`
Description: Constructor for the `baugh2005TopHeavy` initial mass function class which takes a parameter list as input.
Code lines: 10
Contained by: file `stellar_populations.initial_mass_functions.Baugh2005TopHeavy.F90`
Modules used: `input_parameters`

function: `baugh2005topheavylabel`
Description: Return a label for this IMF.
Code lines: 9
Contained by: file `stellar_populations.initial_mass_functions.Baugh2005TopHeavy.F90`

interface: `initialmassfunctionbaugh2005topheavy`
Description: Constructors for the `baugh2005TopHeavy` initial mass function class.
Code lines: 4
Contained by: file `stellar_populations.initial_mass_functions.Baugh2005TopHeavy.F90`

file: `stellar_populations.initial_mass_functions.Chabrier2001.F90`
Description: Implements a stellar initial mass function class based on Chabrier [2001].
Code lines: 186

function: `chabrier2001constructorinternal`
Description: Internal constructor for the `chabrier2001` initial mass function.
Code lines: 16

Contained by: file stellar_populations.initial_mass_functions.Chabrier2001.F90
Modules used: error_functions numerical_constants_math

function: chabrier2001constructorparameters
Description: Constructor for the chabrier2001 initial mass function class which takes a parameter list as input.
Code lines: 59
Contained by: file stellar_populations.initial_mass_functions.Chabrier2001.F90
Modules used: input_parameters

function: chabrier2001label
Description: Return a label for this IMF.
Code lines: 9
Contained by: file stellar_populations.initial_mass_functions.Chabrier2001.F90

function: chabrier2001massmaximum
Description: Return the maximum mass of stars in the Chabrier [2001] IMF.
Code lines: 7
Contained by: file stellar_populations.initial_mass_functions.Chabrier2001.F90

function: chabrier2001massminimum
Description: Return the minimum mass of stars in the Chabrier [2001] IMF.
Code lines: 7
Contained by: file stellar_populations.initial_mass_functions.Chabrier2001.F90

function: chabrier2001phi
Description: Evaluate the Chabrier [2001] stellar initial mass function.
Code lines: 14
Contained by: file stellar_populations.initial_mass_functions.Chabrier2001.F90

subroutine: chabrier2001tabulate
Description: Construct and return a tabulation of the Chabrier [2001] IMF.
Code lines: 17
Contained by: file stellar_populations.initial_mass_functions.Chabrier2001.F90

interface: initialmassfunctionchabrier2001
Description: Constructors for the chabrier2001 initial mass function class.
Code lines: 4
Contained by: file stellar_populations.initial_mass_functions.Chabrier2001.F90

file: stellar_populations.initial_mass_functions.F90
Description: Contains a module which implements a class for stellar initial mass functions.
Code lines: 62

module: stellar_populations_initial_mass_functions
Description: Implements a class for stellar initial mass functions.
Code lines: 40
Contained by: file stellar_populations.initial_mass_functions.F90
Modules used: tables
Used by: program benchmark_stellar_populations_luminosities subroutine galacticus_function_classes_destroy

subroutine galacticus_state_retrieve
file stellar_-populations.spectra.FSPS.F90
program test_initial_mass_functions
program test_stellar_populations_-luminosities
subroutine galacticus_state_store
file stellar_populations.standard.F90
program test_stellar_populations

file: stellar_populations.initial_mass_functions.Kennicutt1983.F90
Description: Implements a stellar initial mass function class for the Kennicutt [1983] IMF.
Code lines: 70

interface: initialmassfunctionkennicutt1983
Description: Constructors for the kennicutt1983 initial mass function class.
Code lines: 4
Contained by: file stellar_populations.initial_mass_functions.Kennicutt1983.F90

function: kennicutt1983constructorinternal
Description: Internal constructor for the kennicutt1983 initial mass function.
Code lines: 7
Contained by: file stellar_populations.initial_mass_functions.Kennicutt1983.F90

function: kennicutt1983constructorparameters
Description: Constructor for the kennicutt1983 initial mass function class which takes a parameter list as input.
Code lines: 10
Contained by: file stellar_populations.initial_mass_functions.Kennicutt1983.F90
Modules used: input_parameters

function: kennicutt1983label
Description: Return a label for this IMF.
Code lines: 9
Contained by: file stellar_populations.initial_mass_functions.Kennicutt1983.F90

file: stellar_populations.initial_mass_functions.Kroupa2001.F90
Description: Implements a stellar initial mass function class for the Kroupa [2001] IMF.
Code lines: 70

interface: initialmassfunctionkroupa2001
Description: Constructors for the kroupa2001 initial mass function class.
Code lines: 4
Contained by: file stellar_populations.initial_mass_functions.Kroupa2001.F90

function: kroupa2001constructorinternal
Description: Internal constructor for the kroupa2001 initial mass function.
Code lines: 7
Contained by: file stellar_populations.initial_mass_functions.Kroupa2001.F90

function: kroupa2001constructorparameters
Description: Constructor for the kroupa2001 initial mass function class which takes a parameter list as input.

Code lines: 10
Contained by: file stellar_populations.initial_mass_functions.Kroupa2001.F90
Modules used: input_parameters

function: kroupa2001label
Description: Return a label for this IMF.
Code lines: 9
Contained by: file stellar_populations.initial_mass_functions.Kroupa2001.F90

file: stellar_populations.initial_mass_functions.MillerScalo1979.F90
Description: Implements a stellar initial mass function class for the Miller and Scalo [1979] IMF.
Code lines: 70

interface: initialmassfunctionmillerscalo1979
Description: Constructors for the millerScalo1979 initial mass function class.
Code lines: 4
Contained by: file stellar_populations.initial_mass_functions.MillerScalo1979.F90

function: millerscalo1979constructorinternal
Description: Internal constructor for the millerScalo1979 initial mass function.
Code lines: 7
Contained by: file stellar_populations.initial_mass_functions.MillerScalo1979.F90

function: millerscalo1979constructorparameters
Description: Constructor for the millerScalo1979 initial mass function class which takes a parameter list as input.
Code lines: 10
Contained by: file stellar_populations.initial_mass_functions.MillerScalo1979.F90
Modules used: input_parameters

function: millerscalo1979label
Description: Return a label for this IMF.
Code lines: 9
Contained by: file stellar_populations.initial_mass_functions.MillerScalo1979.F90

file: stellar_populations.initial_mass_functions.Salpeter1955.F90
Description: Implements a stellar initial mass function class for the Salpeter [1955] IMF.
Code lines: 70

interface: initialmassfunctionsalpeter1955
Description: Constructors for the salpeter1955 initial mass function class.
Code lines: 4
Contained by: file stellar_populations.initial_mass_functions.Salpeter1955.F90

function: salpeter1955constructorinternal
Description: Internal constructor for the salpeter1955 initial mass function.
Code lines: 7
Contained by: file stellar_populations.initial_mass_functions.Salpeter1955.F90

function: `salpeter1955constructorparameters`
Description: Constructor for the `salpeter1955` initial mass function class which takes a parameter list as input.
Code lines: 10
Contained by: file `stellar_populations.initial_mass_functions.Salpeter1955.F90`
Modules used: `input_parameters`

function: `salpeter1955label`
Description: Return a label for this IMF.
Code lines: 9
Contained by: file `stellar_populations.initial_mass_functions.Salpeter1955.F90`

file: `stellar_populations.initial_mass_functions.Scalo1986.F90`
Description: Implements a stellar initial mass function class for the Scalo [1986] IMF.
Code lines: 70

interface: `initialmassfunctionscalo1986`
Description: Constructors for the `scalo1986` initial mass function class.
Code lines: 4
Contained by: file `stellar_populations.initial_mass_functions.Scalo1986.F90`

function: `scalo1986constructorinternal`
Description: Internal constructor for the `scalo1986` initial mass function.
Code lines: 7
Contained by: file `stellar_populations.initial_mass_functions.Scalo1986.F90`

function: `scalo1986constructorparameters`
Description: Constructor for the `scalo1986` initial mass function class which takes a parameter list as input.
Code lines: 10
Contained by: file `stellar_populations.initial_mass_functions.Scalo1986.F90`
Modules used: `input_parameters`

function: `scalo1986label`
Description: Return a label for this IMF.
Code lines: 9
Contained by: file `stellar_populations.initial_mass_functions.Scalo1986.F90`

file: `stellar_populations.initial_mass_functions.piecewise_power_law.F90`
Description: Implements a stellar initial mass function class for piecewise power-law IMFs.
Code lines: 191

interface: `initialmassfunctionpiecewisepowerlaw`
Description: Constructors for the `piecewisePowerLaw` initial mass function class.
Code lines: 4
Contained by: file `stellar_populations.initial_mass_functions.piecewise_power_law.F90`

function: `piecewisepowerlawconstructorinternal`

Description: Internal constructor for the `piecewisePowerLaw` initial mass function.
Code lines: 46
Contained by: file stellar_populations.initial_mass_functions.piecewise_power_law.F90
Modules used: array_utilities galacticus_error

function: `piecewisepowerlawconstructorparameters`
Description: Constructor for the `piecewisePowerLaw` initial mass function class which takes a parameter list as input.
Code lines: 32
Contained by: file stellar_populations.initial_mass_functions.piecewise_power_law.F90
Modules used: input_parameters

function: `piecewisepowerlawlabel`
Description: Return a label for this IMF.
Code lines: 9
Contained by: file stellar_populations.initial_mass_functions.piecewise_power_law.F90

function: `piecewisepowerlawmassmaximum`
Description: Return the maximum mass of stars in a piecewise power-law IMF.
Code lines: 7
Contained by: file stellar_populations.initial_mass_functions.piecewise_power_law.F90

function: `piecewisepowerlawmassminimum`
Description: Return the minimum mass of stars in the Chabrier [2001] IMF.
Code lines: 7
Contained by: file stellar_populations.initial_mass_functions.piecewise_power_law.F90

function: `piecewisepowerlawphi`
Description: Evaluate a piecewise power-law stellar initial mass function.
Code lines: 15
Contained by: file stellar_populations.initial_mass_functions.piecewise_power_law.F90

subroutine: `piecewisepowerlawtabulate`
Description: Construct and return a tabulation of a piecewise power-law IMF.
Code lines: 17
Contained by: file stellar_populations.initial_mass_functions.piecewise_power_law.F90

file: `stellar_populations.luminosities.F90`
Description: Contains a module which implements calculations of stellar population luminosities in the AB magnitude system.
Code lines: 551

module: `stellar_population_luminosities`
Description: Implements calculations of stellar population luminosities in the AB magnitude system.
Code lines: 529
Contained by: file stellar_populations.luminosities.F90
Modules used: abundances_structure fgsl iso_c_binding iso_varying_string locks stellar_population_spectra_postprocess

Used by: program benchmark_stellar_populations_luminosities; function luminosityintegrand; program test_stellar_populations_luminosities; function sedfitevaluate; subroutine stellar_luminosities_set

type: `luminositytable`

Description: Structure for holding tables of simple stellar population luminosities.
Code lines: 10
Contained by: module stellar_population_luminosities

function: `stellar_population_luminosity`

Description: Returns the luminosity for a $1M_\odot$ simple `stellarPopulation_` of given `abundances` and `age` and observed through the filter specified by `filterIndex`.
Code lines: 72
Contained by: module stellar_population_luminosities
Modules used: galacticus_error; iso_c_binding; numerical_interpolation; stellar_populations

subroutine: `stellar_population_luminosity_tabulate`

Description: Tabulate stellar population luminosity in the given filters.
Code lines: 342
Contained by: module stellar_population_luminosities
Modules used: file_utilities; galacticus_display; galacticus_error; galacticus_paths; input_parameters; instruments_filters; io_hdf5; iso_c_binding; memory_management; numerical_constants_astronomical; numerical_integration; stellar_population_spectra; stellar_populations; string_handling

function: `filter_luminosity_integrand`

Description: Integrand for the luminosity through a given filter.
Code lines: 17
Contained by: subroutine stellar_population_luminosity_tabulate
Modules used: instruments_filters

function: `filter_luminosity_integrand_ab`

Description: Integrand for the luminosity of a zeroth magnitude (AB) source through a given filter.
Code lines: 11
Contained by: subroutine stellar_population_luminosity_tabulate
Modules used: instruments_filters; numerical_constants_astronomical

subroutine: `stellar_population_luminosity_track`

Description: Returns the luminosity for a $1M_\odot$ simple stellar population of given `abundances` drawn from the given `stellarPopulation` and observed through the filter specified by `filterIndex`, for all available ages.
Code lines: 55
Contained by: module stellar_population_luminosities
Modules used: galacticus_error; iso_c_binding

memory_management numerical_interpolation
stellar_populations

file: `stellar_populations.properties.F90`
Description: Contains a module which implements a class for computing properties of stellar populations.
Code lines: 71

module: `stellar_population_properties`
Description: Implements a class for computing properties of stellar populations.
Code lines: 49
Contained by: file stellar_populations.properties.F90
Modules used: abundances_structure galacticus_nodes histories
Used by: subroutine galacticus_function_classes_destroy; subroutine galacticus_state_retrieve; subroutine galacticus_state_store; module node_component_disk_standard; module node_component_disk_very_simple; module node_component_spheroid_standard; module node_component_spheroid_very_simple

file: `stellar_populations.properties.instantaneous.F90`
Description: Implements a stellar population properties class based on the instantaneous recycling approximation.
Code lines: 200
Modules used: iso_c_binding stellar_luminosities_structure stellar_population_selectors

function: `instantaneousconstructorinternal`
Description: Internal constructor for the `instantaneous` stellar population properties class.
Code lines: 16
Contained by: file stellar_populations.properties.instantaneous.F90
Modules used: atomic_data

function: `instantaneousconstructorparameters`
Description: Constructor for the `instantaneous` stellar population properties class which takes a parameter list as input.
Code lines: 14
Contained by: file stellar_populations.properties.instantaneous.F90
Modules used: input_parameters

subroutine: `instantaneousdestructor`
Description: Destructor for the `instantaneous` stellar population properties class.
Code lines: 7
Contained by: file stellar_populations.properties.instantaneous.F90

function: `instantaneoushistorycount`
Description: Returns the number of histories required by the instantaneous stellar populations properties class.
Code lines: 8

Contained by: file stellar_populations.properties.instantaneous.F90

subroutine: instantaneoushistorycreate

Description: Create any history required for storing stellar population properties. The instantaneous method requires none, so don't create one.
Code lines: 10
Contained by: file stellar_populations.properties.instantaneous.F90

subroutine: instantaneousrates

Description: Return stellar population property rates of change given a star formation rate and fuel abundances.
Code lines: 69
Contained by: file stellar_populations.properties.instantaneous.F90
Modules used: galactic_structure_options galacticus_nodes stellar_feedback stellar_populations

subroutine: instantaneousscales

Description: Set the scalings for error control on the absolute values of stellar population properties. The instantaneous method requires none, so just return.
Code lines: 11
Contained by: file stellar_populations.properties.instantaneous.F90

interface: stellarpopulationpropertiesinstantaneous

Description: Constructors for the instantaneous stellar population class.
Code lines: 4
Contained by: file stellar_populations.properties.instantaneous.F90

file: stellar_populations.properties.noninstantaneous.F90

Description: Implements a stellar population properties class based on the noninstantaneous recycling approximation.
Code lines: 262
Modules used: output_times stellar_population_selectors

function: noninstantaneousconstructorinternal

Description: Internal constructor for the noninstantaneous stellar population properties class.
Code lines: 22
Contained by: file stellar_populations.properties.noninstantaneous.F90

function: noninstantaneousconstructorparameters

Description: Constructor for the noninstantaneous stellar population properties class which takes a parameter list as input.
Code lines: 26
Contained by: file stellar_populations.properties.noninstantaneous.F90
Modules used: input_parameters

subroutine: noninstantaneousdestructor

Description: Destructor for the noninstantaneous stellar population properties class.
Code lines: 8
Contained by: file stellar_populations.properties.noninstantaneous.F90

function: `noninstantaneoushistorycount`

Description: Returns the number of histories required by the noninstantaneous stellar populations properties class.
Code lines: 7
Contained by: file stellar_populations.properties.noninstantaneous.F90

subroutine: `noninstantaneoushistorycreate`

Description: Create any history required for storing stellar population properties.
Code lines: 18
Contained by: file stellar_populations.properties.noninstantaneous.F90
Modules used: galacticus_nodes, numerical_ranges

subroutine: `noninstantaneousrates`

Description: Return an array of stellar population property rates of change given a star formation rate and fuel abundances.
Code lines: 78
Contained by: file stellar_populations.properties.noninstantaneous.F90
Modules used: fgsl, galacticus_nodes, iso_c_binding, numerical_interpolation, stellar_luminosities_structure, stellar_populations

subroutine: `noninstantaneousscales`

Description: Set the scalings for error control on the absolute values of stellar population properties.
Code lines: 34
Contained by: file stellar_populations.properties.noninstantaneous.F90
Modules used: memory_management, stellar_feedback

interface: `stellarpopulationpropertiesnoninstantaneous`

Description: Constructors for the `noninstantaneous` stellar population class.
Code lines: 4
Contained by: file stellar_populations.properties.noninstantaneous.F90

file: `stellar_populations.selectors.F90`

Description: Contains a module which implements a class for selecting stellar populations.
Code lines: 50

module: `stellar_population_selectors`

Description: Implements a class for selecting stellar populations.
Code lines: 28
Contained by: file stellar_populations.selectors.F90
Modules used: abundances_structure, galacticus_nodes, stellar_populations
Used by: subroutine galacticus_function_classes_destroy, subroutine galacticus_state_retrieve, subroutine galacticus_state_store, file models.likelihoods.SED_fit.F90, file radiation.intergalactic_background.internal.F90, file stellar_populations.properties.instantaneous.F90

file stellar_-
populations.properties.noninstantaneous.F90

file: stellar_populations.selectors.disk_spheroid.F90
Description: Implements a stellar population selector class which returns a different population for disks and spheroids.
Code lines: 113

function: diskspheroidconstructorinternal
Description: Internal constructor for the diskSpheroid stellar population selector class.
Code lines: 8
Contained by: file stellar_populations.selectors.disk_spheroid.F90

function: diskspheroidconstructorparameters
Description: Constructor for the diskSpheroid stellar population class which takes a parameter list as input.
Code lines: 16
Contained by: file stellar_populations.selectors.disk_spheroid.F90
Modules used: input_parameters stellar_populations

subroutine: diskspheroiddestructor
Description: Destructor for the diskSpheroid stellar population selector class.
Code lines: 8
Contained by: file stellar_populations.selectors.disk_spheroid.F90

function: diskspheroidisstarformationratedependent
Description: Return false indicating that stellar population selection is not dependent on star formation rate.
Code lines: 8
Contained by: file stellar_populations.selectors.disk_spheroid.F90

function: diskspheroidselect
Description: Return a diskSpheroid stellar population.
Code lines: 21
Contained by: file stellar_populations.selectors.disk_spheroid.F90
Modules used: galacticus_error galacticus_nodes

interface: stellarpopulationselectordiskspheroid
Description: Constructors for the diskSpheroid stellar population selector class.
Code lines: 4
Contained by: file stellar_populations.selectors.disk_spheroid.F90

file: stellar_populations.selectors.fixed.F90
Description: Implements a stellar population selector class which returns a fixed population.
Code lines: 101

function: fixedconstructorinternal
Description: Internal constructor for the fixed stellar population selector class.
Code lines: 8

Contained by: file stellar_populations.selectors.fixed.F90

function: fixedconstructorparameters
Description: Constructor for the fixed stellar population class which takes a parameter list as input.
Code lines: 14
Contained by: file stellar_populations.selectors.fixed.F90
Modules used: input_parameters stellar_populations

subroutine: fixeddestructor
Description: Destructor for the fixed stellar population selector class.
Code lines: 7
Contained by: file stellar_populations.selectors.fixed.F90

function: fixedisstarformationratedependent
Description: Return false indicating that stellar population selection is not dependent on star formation rate.
Code lines: 8
Contained by: file stellar_populations.selectors.fixed.F90

function: fixedselect
Description: Return a fixed stellar population.
Code lines: 12
Contained by: file stellar_populations.selectors.fixed.F90

interface: stellarpopulationselectorfixed
Description: Constructors for the fixed stellar population selector class.
Code lines: 4
Contained by: file stellar_populations.selectors.fixed.F90

file: stellar_populations.spectra.F90
Description: Contains a module that provides a class implementing stellar population spectra.
Code lines: 64

module: stellar_population_spectra
Description: Provides a class implementing stellar population spectra.
Code lines: 40
Contained by: file stellar_populations.spectra.F90
Modules used: abundances_structure
Used by:
program benchmark_stellar_populations_luminosities
subroutine galacticus_function_classes_destroy
subroutine galacticus_state_retrieve
subroutine galacticus_state_store
subroutine stellar_luminosities_sed_top_hat_step
subroutine stellar_luminosities_special_cases
function intergalacticbackgroundinternalupdate
module stellar_populations
subroutine stellar_population_luminosity_tabulate
file stellar_populations.standard.F90
program test_stellar_populations
program test_stellar_populations_luminosities

file: `stellar_populations.spectra.FSPS.F90`
Description: Implements a stellar population spectra class which utilizes the FSPS package [Conroy et al., 2009].
Code lines: 128
Modules used: `stellar_populations_initial_mass_functions`

function: `fspsconstructorinternal`
Description: Internal constructor for the FSPS stellar spectra class.
Code lines: 11
Contained by: file `stellar_populations.spectra.FSPS.F90`
Modules used: `galacticus_paths`

function: `fspsconstructorparameters`
Description: Constructor for the FSPS stellar spectra class which takes a parameter set as input.
Code lines: 21
Contained by: file `stellar_populations.spectra.FSPS.F90`

subroutine: `fspsdestructor`
Description: Destructor for the `FSPS` stellar population class.
Code lines: 7
Contained by: file `stellar_populations.spectra.FSPS.F90`

subroutine: `fspsreadfile`
Description: Ensure that the requested stellar population has been generated.
Code lines: 39
Contained by: file `stellar_populations.spectra.FSPS.F90`
Modules used: `file_utilities` `interfaces_fsps` `io_hdf5` `tables`

interface: `stellarpopulationspectrafsps`
Description: Constructors for the FSPS stellar spectra class.
Code lines: 4
Contained by: file `stellar_populations.spectra.FSPS.F90`

file: `stellar_populations.spectra.dust_attenuation.Calzetti2000.F90`
Description: Implements calculations of attenuation of stellar spectra using the model of Calzetti et al. [2000].
Code lines: 74

function: `calzetti2000attenuation`
Description: Return attenuation of stellar spectra according to the model of Calzetti et al. [2000].
Code lines: 22
Contained by: file `stellar_populations.spectra.dust_attenuation.Calzetti2000.F90`
Modules used: `numerical_constants_units`

function: `calzetti2000constructorparameters`
Description: Constructor for the `calzetti2000` stellar spectra dust attenuation class which takes a parameter set as input.

Code lines: 11
Contained by: file stellar_populations.spectra.dust_attenuation.Calzetti2000.F90
Modules used: input_parameters

interface: stellarspectradustattenuationcalzetti2000
Description: Constructors for the "calzetti2000" stellar spectra dust attenuation class.
Code lines: 3
Contained by: file stellar_populations.spectra.dust_attenuation.Calzetti2000.F90

file: stellar_populations.spectra.dust_attenuation.Cardelli1989.F90
Description: Implements calculations of attenuation of stellar spectra using the model of Cardelli et al. [1989].
Code lines: 152

function: cardelli1989a
Description: Return fitting function $a(x)$ for the dust attenuation model of Cardelli et al. [1989].
Code lines: 23
Contained by: file stellar_populations.spectra.dust_attenuation.Cardelli1989.F90

function: cardelli1989attenuation
Description: Return attenuation of stellar spectra according to the model of Cardelli et al. [1989].
Code lines: 12
Contained by: file stellar_populations.spectra.dust_attenuation.Cardelli1989.F90
Modules used: numerical_constants_units

function: cardelli1989b
Description: Return fitting function $a(x)$ for the dust attenuation model of Cardelli et al. [1989].
Code lines: 23
Contained by: file stellar_populations.spectra.dust_attenuation.Cardelli1989.F90

function: cardelli1989constructorinternal
Description: Constructor for the "cardelli1989" stellar spectra dust attenuation class.
Code lines: 8
Contained by: file stellar_populations.spectra.dust_attenuation.Cardelli1989.F90

function: cardelli1989constructorparameters
Description: Constructor for the cardelli1989 stellar spectra dust attenuation class which takes a parameter set as input.
Code lines: 20
Contained by: file stellar_populations.spectra.dust_attenuation.Cardelli1989.F90
Modules used: input_parameters

interface: stellarspectradustattenuationcardelli1989
Description: Constructors for the "cardelli1989" stellar spectra dust attenuation class.
Code lines: 4
Contained by: file stellar_populations.spectra.dust_attenuation.Cardelli1989.F90

file: stellar_populations.spectra.dust_attenuation.CharlotFall2000.F90
Description: Implements calculations of attenuation of stellar spectra using the model of Charlot and Fall [2000].
Code lines: 123

function: `charlotfall2000attenuation`
Description: Return attenuation of stellar spectra according to the model of Charlot and Fall [2000]. Note that the V-band attenuation is taken to be that due to the ISM alone (i.e. not including birthclouds).
Code lines: 17
Contained by: file `stellar_populations.spectra.dust_attenuation.CharlotFall2000.F90`

function: `charlotfall2000constructorinternal`
Description: Constructor for the `charlotFall2000` stellar spectra dust attenuation class.
Code lines: 8
Contained by: file `stellar_populations.spectra.dust_attenuation.CharlotFall2000.F90`

function: `charlotfall2000constructorparameters`
Description: Default constructor for the `charlotFall2000` stellar spectra dust attenuatio class.
Code lines: 42
Contained by: file `stellar_populations.spectra.dust_attenuation.CharlotFall2000.F90`

function: `charlotfall2000isagedependent`
Description: Return true since attenuation is age-dependent in the Charlot and Fall [2000] dust attenuation model.
Code lines: 8
Contained by: file `stellar_populations.spectra.dust_attenuation.CharlotFall2000.F90`

interface: `stellarspectradustattenuationcharlotfall2000`
Description: Constructors for the `charlotFall2000` stellar spectra dust attenuation class.
Code lines: 4
Contained by: file `stellar_populations.spectra.dust_attenuation.CharlotFall2000.F90`

file: `stellar_populations.spectra.dust_attenuation.F90`
Description: Contains a module that provides a class implementing dust attenuation of stellar spectra.
Code lines: 57

module: `stellar_spectra_dust_attenuations`
Description: Provides a class implementing dust attenuation of stellar spectra.
Code lines: 35
Contained by: file `stellar_populations.spectra.dust_attenuation.F90`
Used by:

subroutine `galacticus_function_classes_destroy`	file `galacticus.output.analyses.luminosity_function.Halpha.F90`
subroutine `galacticus_state_retrieve`	subroutine `galacticus_state_store`
function `sedfitevaluate`	file `nodes.property_extractor.luminosity_emission_line.F90`

file: `stellar_populations.spectra.dust_attenuation.Gordon2003.F90`
Description: Implements calculations of attenuation of stellar spectra using the model of Gordon et al. [2003].
Code lines: 90

function: `gordon2003constructorinternal`
Description: Constructor for the "gordon2003" stellar spectra dust attenuation class.
Code lines: 19
Contained by: file `stellar_populations.spectra.dust_attenuation.Gordon2003.F90`
Modules used: `galacticus_error` `table_labels`

function: `gordon2003constructorparameters`
Description: Default constructor for the "gordon2003" stellar spectra dust attenuation class.
Code lines: 19
Contained by: file `stellar_populations.spectra.dust_attenuation.Gordon2003.F90`
Modules used: `input_parameters`

interface: `stellarspectradustattenuationgordon2003`
Description: Constructors for the "gordon2003" stellar spectra dust attenuation class.
Code lines: 4
Contained by: file `stellar_populations.spectra.dust_attenuation.Gordon2003.F90`

file: `stellar_populations.spectra.dust_attenuation.Prevot-Bouchet.F90`
Description: Implements calculations of attenuation of stellar spectra using the model of Prevot et al. [1984] and Bouchet et al. [1985].
Code lines: 74

function: `prevotbouchetconstructorinternal`
Description: Constructor for the "prevotBouchet" stellar spectra dust attenuation class. Data read directly from Table 3 of Bouchet et al. [1985].
Code lines: 12
Contained by: file `stellar_populations.spectra.dust_attenuation.Prevot-Bouchet.F90`
Modules used: `galacticus_error` `table_labels`

function: `prevotbouchetconstructorparameters`
Description: Constructor for the "prevotBouchet" stellar spectra dust attenuation class which takes a parameter set as input.
Code lines: 21
Contained by: file `stellar_populations.spectra.dust_attenuation.Prevot-Bouchet.F90`
Modules used: `galacticus_error` `input_parameters` `table_labels`

interface: `stellarspectradustattenuationprevotbouchet`
Description: Constructors for the "prevotBouchet" stellar spectra dust attenuation class.
Code lines: 4
Contained by: file `stellar_populations.spectra.dust_attenuation.Prevot-Bouchet.F90`

file: `stellar_populations.spectra.dust_attenuation.WittGordon2000.F90`
Description: Implements calculations of attenuation of stellar spectra using the model of Witt and Gordon [2000].
Code lines: 91

interface: `stellarspectradustattenuationwittgordon2000`

Description: Constructors for the “wittGordon2003” stellar spectra dust attenuation class.
Code lines: 4
Contained by: file stellar_populations.spectra.dust_attenuation.WittGordon2000.F90

function: wittgordon2003constructorinternal
Description: Constructor for the “wittGordon2003” stellar spectra dust attenuation class.
Code lines: 21
Contained by: file stellar_populations.spectra.dust_attenuation.WittGordon2000.F90
Modules used: array_utilities galacticus_error numerical_constants_astronomical numerical_constants_units table_labels

function: wittgordon2003constructorparameters
Description: Default constructor for the “wittGordon2003” stellar spectra dust attenuation class.
Code lines: 19
Contained by: file stellar_populations.spectra.dust_attenuation.WittGordon2000.F90
Modules used: input_parameters

file: stellar_populations.spectra.dust_attenuation.null.F90
Description: Implements calculations of zero dust attenuation of stellar spectra.
Code lines: 60

interface: stellarspectradustattenuationzero
Description: Constructors for the “zero” stellar spectra dust attenuation class.
Code lines: 3
Contained by: file stellar_populations.spectra.dust_attenuation.null.F90

function: zeroattenuation
Description: Return a zero attenuation.
Code lines: 9
Contained by: file stellar_populations.spectra.dust_attenuation.null.F90

function: zeroconstructorparameters
Description: Default constructor for the “zero” stellar spectra dust attenuation class.
Code lines: 10
Contained by: file stellar_populations.spectra.dust_attenuation.null.F90
Modules used: input_parameters

file: stellar_populations.spectra.dust_attenuation.tabulated.F90
Description: Implements calculations of attenuation of stellar spectra using a tabulation.
Code lines: 62
Modules used: tables

type: stellarspectradustattenuationtabulated
Description: A class implementing calculations of attenuation of stellar spectra using a tabulated relation.
Code lines: 7
Contained by: file stellar_populations.spectra.dust_attenuation.tabulated.F90

function: tabulatedattenuation

Description: Return attenuation of stellar spectra according to the model of Gordon et al. [2003].
Code lines: 13
Contained by: file stellar_populations.spectra.dust_attenuation.tabulated.F90
Modules used: numerical_constants_units

subroutine: tabulateddestructor
Description: Destructor for the "tabulated" stellar spectra dust attenuation class.
Code lines: 8
Contained by: file stellar_populations.spectra.dust_attenuation.tabulated.F90
Modules used: input_parameters

file: stellar_populations.spectra.file.F90
Description: Implements a file-based stellar population spectra class.
Code lines: 370
Modules used: fgsl

function: fileconstructorinternal
Description: Internal constructor for the file stellar spectra class.
Code lines: 11
Contained by: file stellar_populations.spectra.file.F90
Modules used: galacticus_error

function: fileconstructorparameters
Description: Constructor for the file stellar spectra class which takes a parameter set as input.
Code lines: 27
Contained by: file stellar_populations.spectra.file.F90
Modules used: galacticus_paths

function: fileluminosity
Description: Return the luminosity (in units of $L_\odot$ Hz^{-1}) for a stellar population with composition abundances, of the given age (in Gyr) and the specified wavelength (in Angstroms). This is found by interpolating in tabulated spectra.
Code lines: 82
Contained by: file stellar_populations.spectra.file.F90
Modules used: abundances_structure, galacticus_error, iso_c_binding, numerical_interpolation

subroutine: filereadfile
Description: Read a file of simple stellar population spectra.
Code lines: 40
Contained by: file stellar_populations.spectra.file.F90
Modules used: file_utilities, galacticus_error, io_hdf5, memory_management

subroutine: filetabulation
Description: Return a tabulation of ages and metallicities at which stellar spectra should be tabulated.
Code lines: 19
Contained by: file stellar_populations.spectra.file.F90
Modules used: memory_management, numerical_constants_astronomical

function: `filewavelengthinterval`
Description: Return a tabulation of wavelengths at which stellar spectra should be tabulated.
Code lines: 28
Contained by: file stellar_populations.spectra.file.F90
Modules used: memory_management numerical_constants_astronomical

subroutine: `filewavelengths`
Description: Return a tabulation of wavelengths at which stellar spectra should be tabulated.
Code lines: 16
Contained by: file stellar_populations.spectra.file.F90
Modules used: memory_management numerical_constants_astronomical

type: `spectraltable`
Description: Structure to hold tabulated stellar population data.
Code lines: 11
Contained by: file stellar_populations.spectra.file.F90

subroutine: `spectraltabledestructor1d`
Description: Destructor for the stellar spectra table class.
Code lines: 11
Contained by: file stellar_populations.spectra.file.F90
Modules used: numerical_interpolation

subroutine: `spectraltabledestructorscalar`
Description: Destructor for the stellar spectra table class.
Code lines: 11
Contained by: file stellar_populations.spectra.file.F90
Modules used: numerical_interpolation

interface: `stellarpopulationspectrafile`
Description: Constructors for the file stellar spectra class.
Code lines: 4
Contained by: file stellar_populations.spectra.file.F90

file: `stellar_populations.spectra.postprocess.F90`
Description: Contains a module which implements a class for stellar spectra postprocessors.
Code lines: 71

module: `stellar_population_spectra_postprocess`
Description: Implements a class for stellar spectra postprocessors.
Code lines: 49
Contained by: file stellar_populations.spectra.postprocess.F90
Used by: program benchmark_stellar_populations_luminosities; subroutine galacticus_function_classes_destroy; subroutine galacticus_state_retrieve; subroutine galacticus_state_store; file models.likelihoods.SED_fit.F90; module stellar_luminosities_structure; subroutine stellar_luminosities_state_restore; module stellar_population_luminosities

program test_inoue2014

program test_stellar_populations_-luminosities

type: stellarpopulationspectrapostprocessorlist
Description: Type used to build linked list of stellar population spectra postprocessors.
Code lines: 5
Contained by: module stellar_population_spectra_postprocess

subroutine: stellarpopulationspectrapostprocessorlistdestructor
Description: Destructor for elements of stellar population spectra postprocessor lists.
Code lines: 7
Contained by: module stellar_population_spectra_postprocess

file: stellar_populations.spectra.postprocess.Inoue2014.F90
Description: An implementation of a spectrum postprocessor that applies the Inoue et al. [2014] calculation of the attenuation of spectra by the intergalactic medium.
Code lines: 131

function: inoue2014constructorparameters
Description: Constructor for the inoue2014 stellar population spectra postprocessor class which takes a parameter list as input.
Code lines: 11
Contained by: file stellar_populations.spectra.postprocess.Inoue2014.F90
Modules used: input_parameters

function: inoue2014multiplier
Description: Apply the Inoue et al. [2014] calculation of the attenuation of spectra by the intergalactic medium.
Code lines: 74
Contained by: file stellar_populations.spectra.postprocess.Inoue2014.F90
Modules used: factorials gamma_functions numerical_constants_atomic

interface: stellarpopulationspectrapostprocessorinoue2014
Description: Constructors for the inoue2014 stellar population spectra postprocessor class.
Code lines: 3
Contained by: file stellar_populations.spectra.postprocess.Inoue2014.F90

file: stellar_populations.spectra.postprocess.Lyman_continuum_suppress.F90
Description: An implementation of a spectrum postprocessor that suppresses the Lyman continuum.
Code lines: 66

function: lycsuppressconstructorparameters
Description: Constructor for the lycSuppress stellar population spectra postprocessor class which takes a parameter list as input.
Code lines: 11
Contained by: file stellar_populations.spectra.postprocess.Lyman_continuum_suppress.F90
Modules used: input_parameters

function: lycsuppressmultiplier

Description: Suppress the Lyman continuum in a spectrum.
Code lines: 14
Contained by: file stellar_populations.spectra.postprocess.Lyman_continuum_suppress.F90
Modules used: numerical_constants_atomic

interface: stellarpopulationspectrapostprocessorlycsuppress
Description: Constructors for the lycSuppress stellar population spectra postprocessor class.
Code lines: 3
Contained by: file stellar_populations.spectra.postprocess.Lyman_continuum_suppress.F90

file: stellar_populations.spectra.postprocess.Madau1995.F90
Description: An implementation of a spectrum postprocessor that applies the Madau [1995] calculation of the attenuation of spectra by the intergalactic medium.
Code lines: 92

function: madau1995constructorparameters
Description: Constructor for the madau1995 stellar population spectra postprocessor class which takes a parameter list as input.
Code lines: 11
Contained by: file stellar_populations.spectra.postprocess.Madau1995.F90
Modules used: input_parameters

function: madau1995multiplier
Description: Suppress the Lyman continuum in a spectrum.
Code lines: 39
Contained by: file stellar_populations.spectra.postprocess.Madau1995.F90
Modules used: numerical_constants_atomic

interface: stellarpopulationspectrapostprocessormadau1995
Description: Constructors for the madau1995 stellar population spectra postprocessor class.
Code lines: 3
Contained by: file stellar_populations.spectra.postprocess.Madau1995.F90

file: stellar_populations.spectra.postprocess.Meiksin2006.F90
Description: An implementation of a spectrum postprocessor that applies the Meiksin [2006] calculation of the attenuation of spectra by the intergalactic medium.
Code lines: 139

function: meiksin2006constructorparameters
Description: Constructor for the meiksin2006 stellar population spectra postprocessor class which takes a parameter list as input.
Code lines: 11
Contained by: file stellar_populations.spectra.postprocess.Meiksin2006.F90
Modules used: input_parameters

function: meiksin2006multiplier
Description: Suppress the Lyman continuum in a spectrum.
Code lines: 86
Contained by: file stellar_populations.spectra.postprocess.Meiksin2006.F90

Modules used: factorials gamma_functions numerical_constants_atomic

interface: stellarpopulationspectrapostprocessormeiksin2006
Description: Constructors for the meiksin2006 stellar population spectra postprocessor class.
Code lines: 3
Contained by: file stellar_populations.spectra.postprocess.Meiksin2006.F90

file: stellar_populations.spectra.postprocess.builder.lookup.F90
Description: Implements a stellar population spectra postprocessor builder which simply looks up postprocessors by name.
Code lines: 121

function: lookupbuild
Description: Return a stellar population spectra postprocessor by lookup via name.
Code lines: 15
Contained by: file stellar_populations.spectra.postprocess.builder.lookup.F90
Modules used: galacticus_error

function: lookupconstructorinternal
Description: Internal constructor for the lookup stellar population spectra postprocessor builder.
Code lines: 15
Contained by: file stellar_populations.spectra.postprocess.builder.lookup.F90
Modules used: galacticus_error

function: lookupconstructorparameters
Description: Constructor for the lookup stellar population spectra postprocessor builder class which takes a parameter list as input.
Code lines: 32
Contained by: file stellar_populations.spectra.postprocess.builder.lookup.F90
Modules used: galacticus_error input_parameters

subroutine: lookupdestructor
Description: Destructor for the lookup stellar population spectra postprocessor builder.
Code lines: 10
Contained by: file stellar_populations.spectra.postprocess.builder.lookup.F90

interface: stellarpopulationspectrapostprocessorbuilderlookup
Description: Constructors for the lookup stellar population spectra postprocessor builder class.
Code lines: 4
Contained by: file stellar_populations.spectra.postprocess.builder.lookup.F90

file: stellar_populations.spectra.postprocess.identity.F90
Description: An implementation of a spectrum postprocessor that does nothing.
Code lines: 61

function: identityconstructorparameters
Description: Constructor for the identity stellar population spectra postprocessor class which takes a parameter list as input.
Code lines: 11

Contained by: file stellar_populations.spectra.postprocess.identity.F90
Modules used: input_parameters

function: identitymultiplier
Description: Perform an identity postprocessing on a spectrum.
Code lines: 9
Contained by: file stellar_populations.spectra.postprocess.identity.F90

interface: stellarpopulationspectrapostprocessoridentity
Description: Constructors for the identity stellar population spectra postprocessor class.
Code lines: 3
Contained by: file stellar_populations.spectra.postprocess.identity.F90

file: stellar_populations.spectra.postprocess.recent.F90
Description: An implementation of a spectrum postprocessor that keeps only recent populations.
Code lines: 84

function: recentconstructorinternal
Description: Generic constructor for the recent spectrum postprocessor class.
Code lines: 8
Contained by: file stellar_populations.spectra.postprocess.recent.F90

function: recentconstructorparameters
Description: Default constructor for the recent spectrum postprocessor class.
Code lines: 18
Contained by: file stellar_populations.spectra.postprocess.recent.F90
Modules used: input_parameters

function: recentmultiplier
Description: Perform a recent postprocessing on a spectrum.
Code lines: 13
Contained by: file stellar_populations.spectra.postprocess.recent.F90

interface: stellarpopulationspectrapostprocessorrecent
Description: Constructors for the recent spectrum postprocessor class.
Code lines: 4
Contained by: file stellar_populations.spectra.postprocess.recent.F90

file: stellar_populations.spectra.postprocess.sequence.F90
Description: Implements a stellar population spectra postprocessor class which applies a sequence of other postprocessors.
Code lines: 174

type: postprocessorlist
Code lines: 3
Contained by: file stellar_populations.spectra.postprocess.sequence.F90

function: sequenceconstructorinternal
Description: Internal constructor for the sequence mstellar population spectra postprocessor class.

Code lines: 14
Contained by: file stellar_populations.spectra.postprocess.sequence.F90

function: sequenceconstructorparameters
Description: Constructor for the "sequence" stellar population spectra postprocessor class which takes a parameter set as input.
Code lines: 22
Contained by: file stellar_populations.spectra.postprocess.sequence.F90
Modules used: input_parameters

subroutine: sequencedeepcopy
Description: Perform a deep copy for the sequence stellar population spectra postprocessor class.
Code lines: 31
Contained by: file stellar_populations.spectra.postprocess.sequence.F90
Modules used: galacticus_error

subroutine: sequencedescriptor
Description: Return an input parameter list descriptor which could be used to recreate this object.
Code lines: 18
Contained by: file stellar_populations.spectra.postprocess.sequence.F90
Modules used: input_parameters

subroutine: sequencedestructor
Description: Destructor for the sequence stellar population spectra postprocessor class.
Code lines: 16
Contained by: file stellar_populations.spectra.postprocess.sequence.F90

function: sequencemultiplier
Description: Implement an sequence stellar population spectra postprocessor.
Code lines: 14
Contained by: file stellar_populations.spectra.postprocess.sequence.F90

interface: stellarpopulationspectrapostprocessorsequence
Description: Constructors for the "sequence" stellar population spectra postprocessor class.
Code lines: 4
Contained by: file stellar_populations.spectra.postprocess.sequence.F90

file: stellar_populations.spectra.postprocess.unescaped.F90
Description: An implementation of a spectrum postprocessor that keeps only unescaped populations.
Code lines: 80

interface: stellarpopulationspectrapostprocessorunescaped
Description: Constructors for the unescaped spectrum postprocessor class.
Code lines: 4
Contained by: file stellar_populations.spectra.postprocess.unescaped.F90

function: unescapedconstructorinternal
Description: Generic constructor for the unescaped spectrum postprocessor class.
Code lines: 8

Contained by: file stellar_populations.spectra.postprocess.unescaped.F90

function: unescapedconstructorparameters
Description: Constructor for the unescaped spectrum postprocessor class which accepts a parameter set as input.
Code lines: 18
Contained by: file stellar_populations.spectra.postprocess.unescaped.F90
Modules used: input_parameters

function: unescapedmultiplier
Description: Perform an unescaped postprocessing on a spectrum.
Code lines: 9
Contained by: file stellar_populations.spectra.postprocess.unescaped.F90

file: stellar_populations.standard.F90
Description: Implements a standard stellar population class.
Code lines: 648
Modules used: fgsl, stellar_astrophysics, stellar_feedback, stellar_population_spectra, stellar_populations_initial_mass_functions, supernovae_type_ia

interface: populationtable
Description: Constructors for the populationTable class.
Code lines: 3
Contained by: file stellar_populations.standard.F90

function: populationtableconstructor
Description: Constructor for the standard stellar population class which takes a parameter list as input.
Code lines: 13
Contained by: file stellar_populations.standard.F90

function: standardconstructorinternal
Description: Internal constructor for the standard stellar population.
Code lines: 39
Contained by: file stellar_populations.standard.F90

function: standardconstructorparameters
Description: Constructor for the standard stellar population class which takes a parameter list as input.
Code lines: 84
Contained by: file stellar_populations.standard.F90
Modules used: input_parameters

subroutine: standarddestructor
Description: Destructor for the standard stellar population class.
Code lines: 11
Contained by: file stellar_populations.standard.F90

function: standardintegrandenergyoutput

Description: Integrand used in evaluating energy output.
Code lines: 21
Contained by: file stellar_populations.standard.F90

function: standardintegrandrecycledfraction
Description: Integrand used in evaluating recycled fractions.
Code lines: 11
Contained by: file stellar_populations.standard.F90

function: standardintegrandyield
Description: Integrand used in evaluating metal yields.
Code lines: 37
Contained by: file stellar_populations.standard.F90

function: standardinterpolate
Description: Return the rate at which at cumulative property is being produced from this stellar population. The cumulative property is computed on a grid of age and metallicity. This is stored to file and will be read back in on subsequent runs. This is useful as computation of the table is relatively slow.
Code lines: 193
Contained by: file stellar_populations.standard.F90
Modules used: dates_and_times, file_utilities, galacticus_display, galacticus_error, galacticus_paths, input_parameters, io_hdf5, iso_c_binding, memory_management, numerical_constants_astronomical, numerical_integration2, numerical_interpolation, numerical_ranges, system_command, table_labels

function: standardrateenergy
Description: Return the rate at which energy is being output by this stellar population in $(\mathrm{km/s})^2$ Gyr^{-1}. The mean energy output rate per Gyr is computed between the given ageMinimum and ageMaximum (in Gyr).
Code lines: 11
Contained by: file stellar_populations.standard.F90

function: standardraterecycling
Description: Return the rate at which mass is being recycled from this stellar population. The mean recycling rate (i.e. the fraction of the population's mass returned to the ISM per Gyr) is computed between the given ageMinimum and ageMaximum (in Gyr).
Code lines: 11
Contained by: file stellar_populations.standard.F90

function: standardrateyield
Description: Return the rate at which mass is being recycled from this stellar population. The mean recycling rate (i.e. the fraction of the population's mass returned to the ISM per Gyr) is computed between the given ageMinimum and ageMaximum (in Gyr).
Code lines: 14
Contained by: file stellar_populations.standard.F90

function: `standardrecycledfractioninstantaneous`
Description: Return the recycled fraction from the stellar population in the instantaneous approximation.
Code lines: 14
Contained by: file stellar_populations.standard.F90
Modules used: numerical_constants_astronomical

function: `standardspectra`
Description: Return the stellar spectra associated with this population.
Code lines: 8
Contained by: file stellar_populations.standard.F90

function: `standardstarisevolved`
Description: Returns true if the specified star is evolved by the given `age`.
Code lines: 14
Contained by: file stellar_populations.standard.F90

function: `standardyieldinstantaneous`
Description: Return the metal yield from the stellar population in the instantaneous approximation.
Code lines: 14
Contained by: file stellar_populations.standard.F90
Modules used: numerical_constants_astronomical

interface: `stellarpopulationstandard`
Description: Constructors for the `standard` stellar population class.
Code lines: 4
Contained by: file stellar_populations.standard.F90

file: `structure_formation.cosmological_density_field.F90`
Description: Contains a module which provides a class that implements critical overdensity.
Code lines: 305

module: `cosmological_density_field`
Description: Provides an object that implements critical overdensities and halo environments.
Code lines: 283
Contained by: file structure_formation.cosmological_density_field.F90
Modules used: cosmology_functions, galacticus_nodes
Used by: subroutine dark_matter_halo_-correa2015_fit_parameters; file dark_matter_halos.mass_accretion_-history.Correa2015.F90; file dark_matter_halos.mass_accretion_-history.Wechsler2002.F90; file dark_matter_halos.mass_accretion_-history.Zhao2009.F90; file dark_matter_-profiles.structure.concentration.Bullock2001.F90; file dark_matter_-profiles.structure.concentration.Correa2015.F90; file dark_matter_-profiles.structure.concentration.Diemer-Kravtsov2014.F90; file dark_matter_-profiles.structure.concentration.Klypin2015.F90; file dark_matter_-profiles.structure.concentration.Ludlow2016-fit.F90; file dark_matter_-profiles.structure.concentration.NFW.F90

file universe.operators.intergalactic_-
medium_state_evolve.F90

function: collapsetimeroot
Description: Function used in root finding for the collapse time at a given critical overdensity.
Code lines: 19
Contained by: module cosmological_density_field

function: collapsingmassroot
Description: Function used in root finding for the collapsing mass at a given time.
Code lines: 11
Contained by: module cosmological_density_field

file: structure_formation.cosmological_mass_variance.filtered_power_spectrum.F90
Description: An implementation of cosmological density field mass variance computed using a filtered power spectrum.
Code lines: 452
Modules used: cosmology_parameters, power_spectra_primordial_transferred, power_spectrum_window_functions, tables

interface: cosmologicalmassvariancefilteredpower
Description: Constructors for the filteredPower cosmological mass variance class.
Code lines: 4
Contained by: file structure_formation.cosmological_mass_variance.filtered_power_spectrum.F90

function: filteredpowerconstructorinternal
Description: Internal constructor for the filteredPower linear growth class.
Code lines: 18
Contained by: file structure_formation.cosmological_mass_variance.filtered_power_spectrum.F90

function: filteredpowerconstructorparameters
Description: Constructor for the filteredPower cosmological mass variance class which takes a parameter set as input.
Code lines: 57
Contained by: file structure_formation.cosmological_mass_variance.filtered_power_spectrum.F90
Modules used: input_parameters

subroutine: filteredpowerdestructor
Description: Destructor for the filteredPower linear growth class.
Code lines: 13
Contained by: file structure_formation.cosmological_mass_variance.filtered_power_spectrum.F90

function: filteredpowermass
Description: Return the mass corrresponding to the given root-variance of the cosmological density field.
Code lines: 34
Contained by: file structure_formation.cosmological_mass_variance.filtered_power_spectrum.F90

function: filteredpowerpowernormalization
Description: Return the normalization of the power spectrum.

Code lines: 8
Contained by: file structure_formation.cosmological_mass_variance.filtered_power_spectrum.F90

subroutine: filteredpowerretabulate
Description: Tabulate the cosmological mass variance.
Code lines: 143
Contained by: file structure_formation.cosmological_mass_variance.filtered_power_spectrum.F90
Modules used: galacticus_error numerical_constants_math

function: rootvariance
Description: Compute the root-variance of mass in spheres enclosing the given mass from the power spectrum.
Code lines: 24
Contained by: subroutine filteredpowerretabulate
Modules used: fgsl iso_c_binding numerical_constants_math numerical_integration

function: varianceintegrand
Description: Integrand function used in compute the variance in (real space) top-hat spheres from the power spectrum.
Code lines: 9
Contained by: subroutine filteredpowerretabulate

function: varianceintegrandtophat
Description: Integrand function used in compute the variance in (real space) top-hat spheres from the power spectrum.
Code lines: 9
Contained by: subroutine filteredpowerretabulate

function: filteredpowerrootvariance
Description: Return the root-variance of the cosmological density field in a spherical region containing the given mass on average.
Code lines: 10
Contained by: file structure_formation.cosmological_mass_variance.filtered_power_spectrum.F90

subroutine: filteredpowerrootvarianceandlogarithmicgradient
Description: Return the value and logairhtmic gradient with respect to mass of the root-variance of the cosmological density field in a spherical region containing the given mass on average.
Code lines: 21
Contained by: file structure_formation.cosmological_mass_variance.filtered_power_spectrum.F90
Modules used: numerical_constants_math

function: filteredpowerrootvariancelogarithmicgradient
Description: Return the logairhtmic gradient with respect to mass of the root-variance of the cosmological density field in a spherical region containing the given mass on average.
Code lines: 19
Contained by: file structure_formation.cosmological_mass_variance.filtered_power_spectrum.F90
Modules used: numerical_constants_math

function: filteredpowersigma8

Description: Return the value of σ_8.
Code lines: 7
Contained by: file structure_formation.cosmological_mass_variance.filtered_power_spectrum.F90

file: structure_formation.cosmological_mass_variance.peak_background_split.F90
Description: An implementation of cosmological density field mass variance which modifies another member of the class by offsetting for the peak-background split.
Code lines: 199
Modules used: cosmology_parameters

interface: cosmologicalmassvariancepeakbackgroundsplit
Description: Constructors for the peakBackgroundSplit cosmological mass variance class.
Code lines: 4
Contained by: file structure_formation.cosmological_mass_variance.peak_background_split.F90

function: variancepeakbackgroundsplitconstructorinternal
Description: Internal constructor for the peakBackgroundSplit linear growth class.
Code lines: 17
Contained by: file structure_formation.cosmological_mass_variance.peak_background_split.F90

function: variancepeakbackgroundsplitconstructorparameters
Description: Constructor for the peakBackgroundSplit cosmological mass variance class which takes a parameter set as input.
Code lines: 20
Contained by: file structure_formation.cosmological_mass_variance.peak_background_split.F90
Modules used: input_parameters

subroutine: variancepeakbackgroundsplitdestructor
Description: Destructor for the peakBackgroundSplit linear growth class.
Code lines: 9
Contained by: file structure_formation.cosmological_mass_variance.peak_background_split.F90

function: variancepeakbackgroundsplitmass
Description: Return the mass corrresponding to the given root-variance of the cosmological density field.
Code lines: 8
Contained by: file structure_formation.cosmological_mass_variance.peak_background_split.F90

function: variancepeakbackgroundsplitpowernormalization
Description: Return the normalization of the power spectrum.
Code lines: 10
Contained by: file structure_formation.cosmological_mass_variance.peak_background_split.F90
Modules used: galacticus_error

function: variancepeakbackgroundsplitrootvariance
Description: Return the root-variance of the cosmological density field in a spherical region containing the given mass on average.
Code lines: 15
Contained by: file structure_formation.cosmological_mass_variance.peak_background_split.F90

subroutine: variancepeakbackgroundsplitrootvarianceandlogarithmicgradient

Description: Return the value and logarithmic gradient with respect to mass of the root-variance of the cosmological density field in a spherical region containing the given `mass` on average.
Code lines: 19
Contained by: file `structure_formation.cosmological_mass_variance.peak_background_split.F90`
Modules used: `numerical_constants_math`

function: `variancepeakbackgroundsplitrootvariancelogarithmicgradient`
Description: Return the logairhtmic gradient with respect to mass of the root-variance of the cosmological density field in a spherical region containing the given `mass` on average.
Code lines: 16
Contained by: file `structure_formation.cosmological_mass_variance.peak_background_split.F90`
Modules used: `numerical_constants_math`

function: `variancepeakbackgroundsplitsigma8`
Description: Return the value of σ_8.
Code lines: 10
Contained by: file `structure_formation.cosmological_mass_variance.peak_background_split.F90`
Modules used: `numerical_constants_math`

file: `structure_formation.critical_overdensity.Kitayama_Suto1996.F90`
Description: Contains a module which implements a critical overdensity class based on the fitting functions of Kitayama and Suto [1996].
Code lines: 170
Modules used: `cosmology_functions` `dark_matter_particles` `linear_growth`

interface: `criticaloverdensitykitayamasuto1996`
Description: Constructors for the `kitayamaSuto1996` critical overdensity class.
Code lines: 4
Contained by: file `structure_formation.critical_overdensity.Kitayama_Suto1996.F90`

function: `kitayamasuto1996constructorinternal`
Description: Internal constructor for the `kitayamaSuto1996` critical overdensity class.
Code lines: 21
Contained by: file `structure_formation.critical_overdensity.Kitayama_Suto1996.F90`
Modules used: `dark_matter_particles` `galacticus_error`

function: `kitayamasuto1996constructorparameters`
Description: Constructor for the `kitayamaSuto1996` critical overdensity class which takes a parameter set as input.
Code lines: 24
Contained by: file `structure_formation.critical_overdensity.Kitayama_Suto1996.F90`
Modules used: `galacticus_error` `input_parameters`

subroutine: `kitayamasuto1996destructor`
Description: Destructor for the `kitayamaSuto1996` critical overdensity class.
Code lines: 10
Contained by: file `structure_formation.critical_overdensity.Kitayama_Suto1996.F90`

function: `kitayamasuto1996gradientmass`
Description: Return the gradient with respect to mass of critical overdensity at the given time and mass.
Code lines: 12
Contained by: file `structure_formation.critical_overdensity.Kitayama_Suto1996.F90`

function: `kitayamasuto1996gradienttime`
Description: Return the gradient with respect to time of critical overdensity at the given time and mass.
Code lines: 15
Contained by: file `structure_formation.critical_overdensity.Kitayama_Suto1996.F90`
Modules used: `numerical_constants_math`

function: `kitayamasuto1996ismassdependent`
Description: Return whether the critical overdensity is mass dependent.
Code lines: 8
Contained by: file `structure_formation.critical_overdensity.Kitayama_Suto1996.F90`

function: `kitayamasuto1996value`
Description: Return the critical overdensity at the given time and mass.
Code lines: 16
Contained by: file `structure_formation.critical_overdensity.Kitayama_Suto1996.F90`
Modules used: `numerical_constants_math`

file: `structure_formation.critical_overdensity.environmental.F90`
Description: Contains a module which implements an environmental critical overdensity class.
Code lines: 184
Modules used: `linear_growth`

interface: `criticaloverdensityenvironmental`
Description: Constructors for the `environmental` critical overdensity class.
Code lines: 4
Contained by: file `structure_formation.critical_overdensity.environmental.F90`

function: `environmentalconstructorinternal`
Description: Internal constructor for the `environmental` critical overdensity class.
Code lines: 14
Contained by: file `structure_formation.critical_overdensity.environmental.F90`

function: `environmentalconstructorparameters`
Description: Constructor for the `environmental` critical overdensity class which takes a parameter set as input.
Code lines: 35
Contained by: file `structure_formation.critical_overdensity.environmental.F90`
Modules used: `input_parameters`

subroutine: `environmentaldestructor`
Description: Destructor for the `environmental` critical overdensity class.
Code lines: 11
Contained by: file `structure_formation.critical_overdensity.environmental.F90`

function: `environmentalgradientmass`
Description: Return the gradient with respect to mass of critical overdensity at the given time and mass.
Code lines: 18
Contained by: file `structure_formation.critical_overdensity.environmental.F90`
Modules used: `galacticus_nodes`

function: `environmentalgradienttime`
Description: Return the gradient with respect to time of critical overdensity at the given time and mass.
Code lines: 19
Contained by: file `structure_formation.critical_overdensity.environmental.F90`
Modules used: `galacticus_nodes`

function: `environmentalismassdependent`
Description: Return whether the critical overdensity is mass dependent.
Code lines: 7
Contained by: file `structure_formation.critical_overdensity.environmental.F90`

function: `environmentalvalue`
Description: Return the critical overdensity for collapse at the given time and mass.
Code lines: 18
Contained by: file `structure_formation.critical_overdensity.environmental.F90`
Modules used: `galacticus_nodes`

file: `structure_formation.critical_overdensity.fixed.F90`
Description: Contains a module which implements an fixed critical overdensity class.
Code lines: 159
Modules used: `cosmology_functions` `linear_growth`

interface: `criticaloverdensityfixed`
Description: Constructors for the fixed critical overdensity class.
Code lines: 4
Contained by: file `structure_formation.critical_overdensity.fixed.F90`

function: `fixedconstructorinternal`
Description: Internal constructor for the fixed critical overdensity class.
Code lines: 11
Contained by: file `structure_formation.critical_overdensity.fixed.F90`

function: `fixedconstructorparameters`
Description: Constructor for the fixed critical overdensity class which takes a parameter set as input.
Code lines: 31
Contained by: file `structure_formation.critical_overdensity.fixed.F90`
Modules used: `input_parameters` `numerical_constants_math`

subroutine: `fixeddestructor`
Description: Destructor for the fixed critical overdensity class.
Code lines: 9
Contained by: file `structure_formation.critical_overdensity.fixed.F90`

function: `fixedgradientmass`
Description: Return the gradient with respect to mass of critical overdensity at the given time and mass.
Code lines: 12
Contained by: file `structure_formation.critical_overdensity.fixed.F90`

function: `fixedgradienttime`
Description: Return the gradient with respect to time of critical overdensity at the given time and mass.
Code lines: 14
Contained by: file `structure_formation.critical_overdensity.fixed.F90`

function: `fixedismassdependent`
Description: Return whether the critical overdensity is mass dependent.
Code lines: 8
Contained by: file `structure_formation.critical_overdensity.fixed.F90`

function: `fixedvalue`
Description: Return the critical overdensity at the given time and mass.
Code lines: 14
Contained by: file `structure_formation.critical_overdensity.fixed.F90`

file: `structure_formation.critical_overdensity.peak_background_split.F90`
Description: Contains a module which implements an peak-background split critical overdensity class.
Code lines: 149

interface: `criticaloverdensitypeakbackgroundsplit`
Description: Constructors for the `peakBackgroundSplit` critical overdensity class.
Code lines: 4
Contained by: file `structure_formation.critical_overdensity.peak_background_split.F90`

function: `peakbackgroundsplitconstructorinternal`
Description: Internal constructor for the `peakBackgroundSplit` critical overdensity class.
Code lines: 11
Contained by: file `structure_formation.critical_overdensity.peak_background_split.F90`

function: `peakbackgroundsplitconstructorparameters`
Description: Constructor for the `peakBackgroundSplit` critical overdensity class which takes a parameter set as input.
Code lines: 23
Contained by: file `structure_formation.critical_overdensity.peak_background_split.F90`
Modules used: `input_parameters`

subroutine: `peakbackgroundsplitdestructor`
Description: Destructor for the `peakBackgroundSplit` critical overdensity class.
Code lines: 10
Contained by: file `structure_formation.critical_overdensity.peak_background_split.F90`

function: `peakbackgroundsplitgradientmass`
Description: Return the gradient with respect to mass of critical overdensity at the given time and mass.

Code lines: 11
Contained by: file structure_formation.critical_overdensity.peak_background_split.F90

function: peakbackgroundsplitgradienttime
Description: Return the gradient with respect to time of critical overdensity at the given time and mass.
Code lines: 11
Contained by: file structure_formation.critical_overdensity.peak_background_split.F90

function: peakbackgroundsplitismassdependent
Description: Return whether the critical overdensity is mass dependent.
Code lines: 7
Contained by: file structure_formation.critical_overdensity.peak_background_split.F90

function: peakbackgroundsplitvalue
Description: Return the critical overdensity for collapse at the given time and mass.
Code lines: 18
Contained by: file structure_formation.critical_overdensity.peak_background_split.F90

file: structure_formation.critical_overdensity.spherical_collapse_matter_dark_energy.F90
Description: An implementation of critical overdensity for collapse based on spherical collapse in a matter plus dark energy universe.
Code lines: 123

interface: criticaloverdensitysphericalcollapsematterde
Description: Constructors for the sphericalCollapseMatterDE critical overdensity for collapse class.
Code lines: 4
Contained by: file structure_formation.critical_overdensity.spherical_collapse_matter_dark_energy.F90

function: sphericalcollapsematterdeconstructorinternal
Description: Internal constructor for the sphericalCollapseMatterDE critical overdensity class.
Code lines: 23
Contained by: file structure_formation.critical_overdensity.spherical_collapse_matter_dark_energy.F90
Modules used: dark_matter_particles galacticus_error

function: sphericalcollapsematterdeconstructorparameters
Description: Constructor for the sphericalCollapseMatterDE critical overdensity class which takes a parameter set as input.
Code lines: 34
Contained by: file structure_formation.critical_overdensity.spherical_collapse_matter_dark_energy.F90
Modules used: dark_matter_particles galacticus_error input_parameters

subroutine: sphericalcollapsematterderetabulate
Description: Recompute the look-up tables for critical overdensity for collapse.
Code lines: 21
Contained by: file structure_formation.critical_overdensity.spherical_collapse_matter_dark_energy.F90
Modules used: spherical_collapse_matter_dark_energy

file: structure_formation.critical_overdensity.spherical_collapse_matter_lambda.F90

Description: An implementation of critical overdensity for collapse based on spherical collapse in a matter plus cosmological constant universe.
Code lines: 239
Modules used: cosmology_functions, dark_matter_particles, linear_growth, tables

interface: criticaloverdensitysphericalcollapsematterlambda
Description: Constructors for the sphericalCollapseMatterLambda critical overdensity for collapse class.
Code lines: 4
Contained by: file structure_formation.critical_overdensity.spherical_collapse_matter_lambda.F90

function: sphericalcollapsematterlambdaconstructorinternal
Description: Internal constructor for the sphericalCollapseMatterLambda critical overdensity class.
Code lines: 24
Contained by: file structure_formation.critical_overdensity.spherical_collapse_matter_lambda.F90
Modules used: dark_matter_particles, galacticus_error

function: sphericalcollapsematterlambdaconstructorparameters
Description: Constructor for the sphericalCollapseMatterLambda critical overdensity class which takes a parameter set as input.
Code lines: 41
Contained by: file structure_formation.critical_overdensity.spherical_collapse_matter_lambda.F90
Modules used: input_parameters

subroutine: sphericalcollapsematterlambdadestructor
Description: Destructor for the sphericalCollapseMatterLambda critical overdensity for collapse class.
Code lines: 14
Contained by: file structure_formation.critical_overdensity.spherical_collapse_matter_lambda.F90

function: sphericalcollapsematterlambdagradientmass
Description: Return the gradient with respect to mass of critical overdensity at the given time and mass.
Code lines: 14
Contained by: file structure_formation.critical_overdensity.spherical_collapse_matter_lambda.F90
Modules used: cosmology_functions, linear_growth

function: sphericalcollapsematterlambdagradienttime
Description: Return the time derivative of the critical overdensity at the given epoch, based spherical collapse in a matter plus cosmological constant universe.
Code lines: 18
Contained by: file structure_formation.critical_overdensity.spherical_collapse_matter_lambda.F90

function: sphericalcollapsematterlambdaismassdependent
Description: Return whether the critical overdensity is mass dependent.
Code lines: 8
Contained by: file structure_formation.critical_overdensity.spherical_collapse_matter_lambda.F90

subroutine: sphericalcollapsematterlambdaretabulate
Description: Recompute the look-up tables for critical overdensity for collapse.

Code lines: 21
Contained by: file structure_formation.critical_overdensity.spherical_collapse_matter_lambda.F90
Modules used: spherical_collapse_matter_lambda

function: sphericalcollapsematterlambdavalue
Description: Return the critical overdensity at the given epoch, based spherical collapse in a matter plus cosmological constant universe.
Code lines: 18
Contained by: file structure_formation.critical_overdensity.spherical_collapse_matter_lambda.F90
Modules used: galacticus_error

file: structure_formation.critical_overdensity.warm_dark_matter.F90
Description: Contains a module which implements a critical overdensity for collapse the WDM modifier of Barkana et al. [2001].
Code lines: 279
Modules used: cosmology_parameters dark_matter_particles fgsl

function: barkana2001wdmconstructorinternal
Description: Internal constructor for the "barkana2001WDM" critical overdensity for collapse class.
Code lines: 44
Contained by: file structure_formation.critical_overdensity.warm_dark_matter.F90
Modules used: fox_dom galacticus_error galacticus_paths io_xml iso_varying_string

function: barkana2001wdmconstructorparameters
Description: Constructor for the "barkana2001WDM" critical overdensity for collapse class which takes a parameter set as input.
Code lines: 35
Contained by: file structure_formation.critical_overdensity.warm_dark_matter.F90
Modules used: input_parameters

subroutine: barkana2001wdmdestructor
Description: Destructor for the barkana2001WDM critical overdensity for collapse class.
Code lines: 11
Contained by: file structure_formation.critical_overdensity.warm_dark_matter.F90

function: barkana2001wdmgradientmass
Description: Return the gradient with respect to mass of critical overdensity at the given time and mass.
Code lines: 40
Contained by: file structure_formation.critical_overdensity.warm_dark_matter.F90
Modules used: fgsl galacticus_error numerical_interpolation table_labels

function: barkana2001wdmgradienttime
Description: Return the gradient with respect to time of critical overdensity at the given time and mass.
Code lines: 12
Contained by: file structure_formation.critical_overdensity.warm_dark_matter.F90

function: barkana2001wdmismassdependent
Description: Return whether the critical overdensity is mass dependent.
Code lines: 8
Contained by: file structure_formation.critical_overdensity.warm_dark_matter.F90

function: barkana2001wdmvalue
Description: Returns a mass scaling for critical overdensities based on the results of Barkana et al. [2001]. This method assumes that their results for the original collapse barrier (i.e. the critical overdensity, and which they call B_0) scale with the effective Jeans mass of the warm dark matter particle as computed using their eqn. (10).
Code lines: 51
Contained by: file structure_formation.critical_overdensity.warm_dark_matter.F90
Modules used: fgsl, galacticus_error, numerical_interpolation, table_labels

interface: criticaloverdensitybarkana2001wdm
Description: Constructors for the "barkana2001WDM" critical overdensity for collapse class.
Code lines: 4
Contained by: file structure_formation.critical_overdensity.warm_dark_matter.F90

file: structure_formation.excursion_sets.barrier.F90
Description: Contains a module which provides a class that implements barriers for the excursion set problem.
Code lines: 61

module: excursion_sets_barriers
Description: Provides a class that implements barriers for the excursion set problem.
Code lines: 39
Contained by: file structure_formation.excursion_sets.barrier.F90
Modules used: galacticus_nodes
Used by: subroutine galacticus_function_classes_destroy; subroutine galacticus_state_retrieve; subroutine galacticus_state_store; file structure_formation.excursion_sets.first_crossing_distribution.Farahi.F90; file structure_formation.excursion_sets.first_crossing_distribution.Zhang_Hui.F90; file structure_formation.excursion_sets.first_crossing_distribution.linear_barrier.F90; file tasks.excursion_sets.F90

file: structure_formation.excursion_sets.barrier.critical_overdensity.F90
Description: Contains a module which implements a critical overdensity excursion set barrier class.
Code lines: 130
Modules used: cosmological_density_field

function: criticaloverdensitybarrier
Description: Return the excursion set barrier at the given variance and time.
Code lines: 20

Contained by: file structure_formation.excursion_sets.barrier.critical_overdensity.F90

function: criticaloverdensitybarriergradient
Description: Return the gradient with respect to variance of the excursion set barrier at the given variance and time.
Code lines: 22
Contained by: file structure_formation.excursion_sets.barrier.critical_overdensity.F90

function: criticaloverdensityconstructorinternal
Description: Internal constructor for the critical overdensity excursion set class.
Code lines: 9
Contained by: file structure_formation.excursion_sets.barrier.critical_overdensity.F90

function: criticaloverdensityconstructorparameters
Description: Constructor for the critical overdensity excursion set class which takes a parameter set as input.
Code lines: 17
Contained by: file structure_formation.excursion_sets.barrier.critical_overdensity.F90
Modules used: input_parameters

subroutine: criticaloverdensitydestructor
Description: Destructor for the critical overdensity excursion set barrier class.
Code lines: 8
Contained by: file structure_formation.excursion_sets.barrier.critical_overdensity.F90

interface: excursionsetbarriercriticaloverdensity
Description: Constructors for the critical overdensity excursion set barrier class.
Code lines: 4
Contained by: file structure_formation.excursion_sets.barrier.critical_overdensity.F90

file: structure_formation.excursion_sets.barrier.linear.F90
Description: Contains a module which implements a linear excursion set barrier class.
Code lines: 108

interface: excursionsetbarrierlinear
Description: Constructors for the linear excursion set barrier class.
Code lines: 4
Contained by: file structure_formation.excursion_sets.barrier.linear.F90

function: linearbarrier
Description: Return the excursion set barrier at the given variance and time.
Code lines: 11
Contained by: file structure_formation.excursion_sets.barrier.linear.F90

function: linearbarriergradient
Description: Return the gradient with respect to variance of the excursion set barrier at the given variance and time.
Code lines: 11
Contained by: file structure_formation.excursion_sets.barrier.linear.F90

function: `linearconstructorinternal`
Description: Internal constructor for the linear excursion set class.
Code lines: 8
Contained by: file `structure_formation.excursion_sets.barrier.linear.F90`

function: `linearconstructorparameters`
Description: Constructor for the linear excursion set class which takes a parameter set as input.
Code lines: 30
Contained by: file `structure_formation.excursion_sets.barrier.linear.F90`
Modules used: `input_parameters`

file: `structure_formation.excursion_sets.barrier.quadratic.F90`
Description: Contains a module which implements a quadratic excursion set barrier class.
Code lines: 117

interface: `excursionsetbarrierquadratic`
Description: Constructors for the quadratic excursion set barrier class.
Code lines: 4
Contained by: file `structure_formation.excursion_sets.barrier.quadratic.F90`

function: `quadraticbarrier`
Description: Return the excursion set barrier at the given variance and time.
Code lines: 11
Contained by: file `structure_formation.excursion_sets.barrier.quadratic.F90`

function: `quadraticbarriergradient`
Description: Return the gradient with respect to variance of the excursion set barrier at the given variance and time.
Code lines: 11
Contained by: file `structure_formation.excursion_sets.barrier.quadratic.F90`

function: `quadraticconstructorinternal`
Description: Internal constructor for the quadratic excursion set class.
Code lines: 8
Contained by: file `structure_formation.excursion_sets.barrier.quadratic.F90`

function: `quadraticconstructorparameters`
Description: Constructor for the quadratic excursion set class which takes a parameter set as input.
Code lines: 39
Contained by: file `structure_formation.excursion_sets.barrier.quadratic.F90`
Modules used: `input_parameters`

file: `structure_formation.excursion_sets.barrier.remap.Sheth-Mo-Tormen.F90`
Description: Contains a module which implements an excursion set barrier class which remaps another class using the Sheth et al. [2001] ellipsoidal collapse parameterization.
Code lines: 158

interface: `excursionsetbarrierremapshethmotormen`

Description: Constructors for the remap scale excursion set barrier class.
Code lines: 4
Contained by: file structure_formation.excursion_sets.barrier.remap.Sheth-Mo-Tormen.F90

function: remapshethmotormenbarrier
Description: Return the excursion set barrier at the given variance and time.
Code lines: 11
Contained by: file structure_formation.excursion_sets.barrier.remap.Sheth-Mo-Tormen.F90

function: remapshethmotormenbarriergradient
Description: Return the gradient with respect to variance of the excursion set barrier at the given variance and time.
Code lines: 21
Contained by: file structure_formation.excursion_sets.barrier.remap.Sheth-Mo-Tormen.F90

function: remapshethmotormenconstructorinternal
Description: Internal constructor for the critical overdensity excursion set class.
Code lines: 13
Contained by: file structure_formation.excursion_sets.barrier.remap.Sheth-Mo-Tormen.F90
Modules used: galacticus_error

function: remapshethmotormenconstructorparameters
Description: Constructor for the critical overdensity excursion set class which takes a parameter set as input.
Code lines: 51
Contained by: file structure_formation.excursion_sets.barrier.remap.Sheth-Mo-Tormen.F90
Modules used: input_parameters

subroutine: remapshethmotormendestructor
Description: Destructor for the critical overdensity excursion set barrier class.
Code lines: 8
Contained by: file structure_formation.excursion_sets.barrier.remap.Sheth-Mo-Tormen.F90

file: structure_formation.excursion_sets.barrier.remap.null.F90
Description: Contains a module which implements a null remapping of excursion set barriers.
Code lines: 89

module: excursion_sets_barriers_remap_null
Description: Implements a null remapping of excursion set barriers.
Code lines: 67
Contained by: file structure_formation.excursion_sets.barrier.remap.null.F90

subroutine: excursion_sets_barrier_gradient_remap_null
Description: Return the gradient of the barrier for excursion set calculations unmodified.
Code lines: 10
Contained by: module excursion_sets_barriers_remap_null

subroutine: excursion_sets_barrier_remap_null
Description: Return the barrier for excursion set calculations unmodified.

Code lines: 10
Contained by: module excursion_sets_barriers_remap_null

subroutine: excursion_sets_barriers_remap_null_initialize
Description: Initialize the null excursion set barrier remapping module.
Code lines: 22
Contained by: module excursion_sets_barriers_remap_null
Modules used: iso_varying_string

file: structure_formation.excursion_sets.barrier.remap.scale.F90
Description: Contains a module which implements an excursion set barrier class which remaps another class by multiplying by a constant.
Code lines: 129

interface: excursionsetbarrierremapscale
Description: Constructors for the remap scale excursion set barrier class.
Code lines: 4
Contained by: file structure_formation.excursion_sets.barrier.remap.scale.F90

function: remapscalebarrier
Description: Return the excursion set barrier at the given variance and time.
Code lines: 11
Contained by: file structure_formation.excursion_sets.barrier.remap.scale.F90

function: remapscalebarriergradient
Description: Return the gradient with respect to variance of the excursion set barrier at the given variance and time.
Code lines: 11
Contained by: file structure_formation.excursion_sets.barrier.remap.scale.F90

function: remapscaleconstructorinternal
Description: Internal constructor for the critical overdensity excursion set class.
Code lines: 13
Contained by: file structure_formation.excursion_sets.barrier.remap.scale.F90
Modules used: galacticus_error

function: remapscaleconstructorparameters
Description: Constructor for the critical overdensity excursion set class which takes a parameter set as input.
Code lines: 33
Contained by: file structure_formation.excursion_sets.barrier.remap.scale.F90
Modules used: input_parameters

subroutine: remapscaledestructor
Description: Destructor for the critical overdensity excursion set barrier class.
Code lines: 7
Contained by: file structure_formation.excursion_sets.barrier.remap.scale.F90

file: structure_formation.excursion_sets.first_crossing_distribution.F90

Description: Contains a module which provides a class for first crossing distributions for excursion set calculations.
Code lines: 66

module: `excursion_sets_first_crossings`
Description: Provides a class for first crossing distributions for excursion set calculations.
Code lines: 43
Contained by: file `structure_formation.excursion_sets.first_crossing_distribution.F90`
Modules used: `galacticus_nodes`
Used by: subroutine `galacticus_function_-classes_destroy`; subroutine `galacticus_state_retrieve`; subroutine `galacticus_state_store`; file `merger_trees.branching_-probability.generalized_Press_-Schechter.F90`; file `structure_formation.halo_mass_-function.Press-Schechter.F90`; file `tasks.excursion_sets.F90`

file: `structure_formation.excursion_sets.first_crossing_distribution.Farahi.F90`
Description: Contains a module which implements a excursion set first crossing statistics class using the algorithm of Benson et al. [2012].
Code lines: 968
Modules used: `cosmology_functions`; `excursion_sets_barriers`; `fgsl`; `file_utilities`; `iso_c_binding`

interface: `excursionsetfirstcrossingfarahi`
Description: Constructors for the Farahi excursion set barrier class.
Code lines: 4
Contained by: file `structure_formation.excursion_sets.first_crossing_distribution.Farahi.F90`

function: `farahiconstructorinternal`
Description: Internal constructor for the Farahi excursion set class first crossing class.
Code lines: 50
Contained by: file `structure_formation.excursion_sets.first_crossing_distribution.Farahi.F90`
Modules used: `file_utilities`; `galacticus_display`; `galacticus_paths`; `input_parameters`; `system_command`

function: `farahiconstructorparameters`
Description: Constructor for the Farahi excursion set class first crossing class which takes a parameter set as input.
Code lines: 34
Contained by: file `structure_formation.excursion_sets.first_crossing_distribution.Farahi.F90`
Modules used: `input_parameters`

subroutine: `farahidestructor`
Description: Destructor for the Farahi excursion set first crossing class.
Code lines: 14
Contained by: file `structure_formation.excursion_sets.first_crossing_distribution.Farahi.F90`

Modules used: numerical_interpolation

subroutine: farahifileread
Description: Read tabulated data on excursion set first crossing probabilities from file.
Code lines: 129
Contained by: file structure_formation.excursion_sets.first_crossing_distribution.Farahi.F90
Modules used: file_utilities, galacticus_display, io_hdf5, iso_varying_string, memory_management, numerical_interpolation

subroutine: farahifilewrite
Description: Write tabulated data on excursion set first crossing probabilities to file.
Code lines: 35
Contained by: file structure_formation.excursion_sets.first_crossing_distribution.Farahi.F90
Modules used: hdf5, io_hdf5

function: farahiprobability
Description: Return the excursion set barrier at the given variance and time.
Code lines: 191
Contained by: file structure_formation.excursion_sets.first_crossing_distribution.Farahi.F90
Modules used: error_functions, galacticus_display, kind_numbers, memory_management, mpi_utilities, numerical_interpolation, numerical_ranges

function: farahirate
Description: Return the excursion set barrier at the given variance and time.
Code lines: 56
Contained by: file structure_formation.excursion_sets.first_crossing_distribution.Farahi.F90
Modules used: numerical_interpolation

function: farahiratenoncrossing
Description: Return the rate for excursion set non-crossing.
Code lines: 31
Contained by: file structure_formation.excursion_sets.first_crossing_distribution.Farahi.F90
Modules used: numerical_interpolation

subroutine: farahiratetabulate
Description: Tabulate the excursion set crossing rate.
Code lines: 256
Contained by: file structure_formation.excursion_sets.first_crossing_distribution.Farahi.F90
Modules used: error_functions, galacticus_display, kind_numbers, memory_management, mpi_utilities, numerical_interpolation, numerical_ranges

function: farahivariancerange

Description: Builds a numerical range between `rangeMinimum` and `rangeMaximum` using `rangeNumber` points with spacing that varies from logarithmic to linear spacing with the transition point controlled by `exponent`. Specifically, suppose we have $N =$`rangeNumber` points in the range, from $S_{\min} =$`rangeMinimum` to $S_{\max} =$`rangeMaximum`. We define $f_i = (i-1)/(N-1)$ where i runs from 1 to N. We then define:

$$f_i = \frac{\int_{S_{\min}}^{S_i} x^{n_i} \mathrm{d}x}{\int_{S_{\min}}^{S_{\max}} x^{n_i} \mathrm{d}x}, \tag{18.52}$$

and solve for S_i to find the i^{th} range value. If $n_i = 0$ then this will give S_i linearly spaced between $S_{\min}$ and $S_{\max}$, while if $n_i = -1$ this will give S_i logarithmically spaced between $S_{\min}$ and $S_{\max}$. Therefore, if we make n_i vary from -1 to 0 at i ranges from 1 to N we will get a smooth transition from logarithmic to linear spacing. We choose to use $n_i = -1 + f_i^{\alpha}$ where $\alpha =$`exponent` is a supplied argument.

Description: The distribution function for gravitational lensing convergence [Takahashi et al., 2011, eqn. 8].
Code lines: 14
Contained by: file structure_formation.gravitational_lensing.Takahashi_2011.F90

subroutine: takahashi2011destructor
Description: Destructor for the takahasi2011 gravitational lensing class.
Code lines: 9
Contained by: file structure_formation.gravitational_lensing.Takahashi_2011.F90

subroutine: takahashi2011lensingdistributionconstruct
Description: Construct the lensing distribution function for the Takahashi et al. [2011] formalism.
Code lines: 289
Contained by: file structure_formation.gravitational_lensing.Takahashi_2011.F90
Modules used: fgsl, file_utilities, galacticus_error, galacticus_paths, io_hdf5, iso_c_binding, numerical_comparison, numerical_integration, numerical_ranges, root_finder

system_command table_labels

function: convergencedistributionmoment0integrand
Description: Integral over scaled convergence distribution.
Code lines: 7
Contained by: subroutine takahashi2011lensingdistributionconstruct

function: convergencedistributionmoment1integrand
Description: Integral of first moment over scaled convergence distribution.
Code lines: 7
Contained by: subroutine takahashi2011lensingdistributionconstruct

function: convergencedistributionmoment2integrand
Description: Integral of second moment over scaled convergence distribution.
Code lines: 7
Contained by: subroutine takahashi2011lensingdistributionconstruct

function: convergencepdfparametersolver
Description: Root function used in finding equivalent circular orbits.
Code lines: 18
Contained by: subroutine takahashi2011lensingdistributionconstruct

function: convergencevarianceintegrand
Description: Integral for variance in the gravitational lensing convergence.
Code lines: 26
Contained by: subroutine takahashi2011lensingdistributionconstruct
Modules used: numerical_constants_math numerical_constants_physical numerical_constants_prefixes

function: convergencevariancepowerspectrumintegrand
Description: Integral over power spectrum used in computing the variance in the gravitational lensing convergence.
Code lines: 10
Contained by: subroutine takahashi2011lensingdistributionconstruct

function: emptybeamconvergenceintegrand
Description: Integral for gravitational lensing convergence in an empty beam.
Code lines: 15
Contained by: subroutine takahashi2011lensingdistributionconstruct
Modules used: numerical_constants_physical numerical_constants_prefixes

function: magnificationpdfintegrand
Description: Integral for the magnification probability distribution function.
Code lines: 7
Contained by: subroutine takahashi2011lensingdistributionconstruct

function: takahashi2011magnificationcdf
Description: Compute the magnification probability density function at the given `magnification` and `redshift` using the Takahashi et al. [2011] formalism.
Code lines: 52

Contained by: file structure_formation.gravitational_lensing.Takahashi_2011.F90

function: magnificationpdfintegrand
Description: Integral for the magnification probability distribution function.
Code lines: 7
Contained by: function takahashi2011magnificationcdf

function: takahashi2011magnificationdistribution
Description: The gravitational lensing magnification distribution from [Takahashi et al., 2011, eq. 11].
Code lines: 17
Contained by: file structure_formation.gravitational_lensing.Takahashi_2011.F90

function: takahashi2011magnificationpdf
Description: Compute the magnification probability density function at the given **magnification** and **redshift** using the Takahashi et al. [2011] formalism.
Code lines: 34
Contained by: file structure_formation.gravitational_lensing.Takahashi_2011.F90

file: structure_formation.gravitational_lensing.baryonic_modifier.F90
Description: Implements the gravitational lensing distribution by modifying another distribution for the effects of baryons.
Code lines: 194

function: baryonicmodifierconstructorinternal
Description: Generic constructor for the "baryonic modifier" gravitational lensing class.
Code lines: 12
Contained by: file structure_formation.gravitational_lensing.baryonic_modifier.F90

function: baryonicmodifierconstructorparameters
Description: Default constructor for the "baryonic modifier" gravitational lensing class.
Code lines: 32
Contained by: file structure_formation.gravitational_lensing.baryonic_modifier.F90
Modules used: input_parameters

subroutine: baryonicmodifierdestructor
Description: Destructor for the "baryonic modifier" gravitational lensing class.
Code lines: 7
Contained by: file structure_formation.gravitational_lensing.baryonic_modifier.F90

function: baryonicmodifiermagnificationcdf
Description: Compute the magnification probability density function at the given **magnification** and **redshift** by modifying another distribution for the effects of baryons.
Code lines: 16
Contained by: file structure_formation.gravitational_lensing.baryonic_modifier.F90

function: baryonicmodifiermagnificationpdf
Description: Compute the magnification probability density function at the given **magnification** and **redshift** by modifying another distribution for the effects of baryons.
Code lines: 16
Contained by: file structure_formation.gravitational_lensing.baryonic_modifier.F90

subroutine: `baryonicmodifierrenormalize`
Description: Renormlize for PDF for baryonic modification.
Code lines: 48
Contained by: file `structure_formation.gravitational_lensing.baryonic_modifier.F90`
Modules used: `root_finder`

function: `magnificationtransition`
Description: Root finding function used in the "baryonic modifier" gravitational lensing class.
Code lines: 7
Contained by: subroutine `baryonicmodifierrenormalize`

interface: `gravitationallensingbaryonicmodifier`
Description: Constructors for the "baryonic modifier" gravitational lensing class.
Code lines: 4
Contained by: file `structure_formation.gravitational_lensing.baryonic_modifier.F90`

file: `structure_formation.halo_bias.F90`
Description: Contains a module which implements a dark matter halo bias class.
Code lines: 56

module: `dark_matter_halo_biases`
Description: Implements a dark matter halo bias class.
Code lines: 34
Contained by: file `structure_formation.halo_bias.F90`
Modules used: `galacticus_nodes`
Used by:

subroutine `galacticus_function_-classes_destroy`	file `galacticus.output.analyses.correlation_-function.F90`
subroutine `galacticus_state_retrieve`	subroutine `galacticus_state_store`
subroutine `halo_model_projected_-correlation`	file `models.likelihoods.projected_-correlation_function.F90`
file `nodes.property_extractor.halo_-bias.F90`	file `tasks.halo_mass_function.F90`
file `tasks.halo_model.projected_-correlation_function.F90`	file `tasks.mass_function_covariance.F90`

file: `structure_formation.halo_bias.Press-Schechter.F90`
Description: Implementation of halo bias using the Press-Schechter algorithm [Mo and White, 1996].
Code lines: 100
Modules used: `cosmological_density_field`

interface: `darkmatterhalobiaspressschechter`
Description: Constructors for the `pressSchechter` dark matter halo bias class.
Code lines: 4
Contained by: file `structure_formation.halo_bias.Press-Schechter.F90`

function: `pressschechterbiasbymass`
Description: Returns the bias of a dark matter halo given the mass and time.

Code lines: 14
Contained by: file structure_formation.halo_bias.Press-Schechter.F90

function: pressschechterconstructorinternal
Description: Internal constructor for the pressSchechter dark matter halo bias class.
Code lines: 9
Contained by: file structure_formation.halo_bias.Press-Schechter.F90

function: pressschechterconstructorparameters
Description: Constructor for the pressSchechter dark matter halo mass bias which builds the object from a parameter set.
Code lines: 16
Contained by: file structure_formation.halo_bias.Press-Schechter.F90
Modules used: input_parameters

subroutine: pressschechterdestructor
Description: Destructor for the pressSchechter dark matter halo bias class.
Code lines: 8
Contained by: file structure_formation.halo_bias.Press-Schechter.F90

file: structure_formation.halo_bias.Sheth2001.F90
Description: Implementation of halo bias using the algorithm of Sheth et al. [2001].
Code lines: 101
Modules used: cosmological_density_field

interface: darkmatterhalobiassheth2001
Description: Constructors for the sheth2001 dark matter halo bias class.
Code lines: 4
Contained by: file structure_formation.halo_bias.Sheth2001.F90

function: sheth2001biasbymass
Description: Returns the bias of a dark matter halo given the mass and time.
Code lines: 15
Contained by: file structure_formation.halo_bias.Sheth2001.F90

function: sheth2001constructorinternal
Description: Internal constructor for the sheth2001 dark matter halo bias class.
Code lines: 9
Contained by: file structure_formation.halo_bias.Sheth2001.F90

function: sheth2001constructorparameters
Description: Constructor for the sheth2001 dark matter halo mass bias which builds the object from a parameter set.
Code lines: 16
Contained by: file structure_formation.halo_bias.Sheth2001.F90
Modules used: input_parameters

subroutine: sheth2001destructor
Description: Destructor for the sheth2001 dark matter halo bias class.
Code lines: 8

Contained by: file structure_formation.halo_bias.Sheth2001.F90

file: structure_formation.halo_bias.Tinker2010.F90
Description: Implementation of halo bias using the algorithm of Tinker et al. [2010].
Code lines: 123
Modules used: cosmological_density_field virial_density_contrast

interface: darkmatterhalobiastinker2010
Description: Constructors for the tinker2010 dark matter halo bias class.
Code lines: 4
Contained by: file structure_formation.halo_bias.Tinker2010.F90

function: tinker2010biasbymass
Description: Returns the bias of a dark matter halo given the mass and time.
Code lines: 27
Contained by: file structure_formation.halo_bias.Tinker2010.F90

function: tinker2010constructorinternal
Description: Internal constructor for the tinker2010 dark matter halo bias class.
Code lines: 12
Contained by: file structure_formation.halo_bias.Tinker2010.F90

function: tinker2010constructorparameters
Description: Constructor for the tinker2010 dark matter halo mass bias which builds the object from a parameter set.
Code lines: 19
Contained by: file structure_formation.halo_bias.Tinker2010.F90
Modules used: input_parameters

subroutine: tinker2010destructor
Description: Destructor for the tinker2010 dark matter halo bias class.
Code lines: 9
Contained by: file structure_formation.halo_bias.Tinker2010.F90

file: structure_formation.halo_environment.lognormal.F90
Description: Contains a module which implements a log-normal halo environment.
Code lines: 238
Modules used: cosmology_functions cosmology_parameters
linear_growth statistics_distributions

interface: haloenvironmentlognormal
Description: Constructors for the logNormal halo environment class.
Code lines: 4
Contained by: file structure_formation.halo_environment.lognormal.F90

function: lognormalcdf
Description: Return the CDF of the environmental overdensity.
Code lines: 8
Contained by: file structure_formation.halo_environment.lognormal.F90

function: `lognormalconstructorinternal`
Description: Internal constructor for the `logNormal` halo mass function class.
Code lines: 20
Contained by: file `structure_formation.halo_environment.lognormal.F90`
Modules used: `numerical_constants_math`

function: `lognormalconstructorparameters`
Description: Constructor for the `logNormal` halo environment class which takes a parameter set as input.
Code lines: 35
Contained by: file `structure_formation.halo_environment.lognormal.F90`
Modules used: `input_parameters`

subroutine: `lognormaldestructor`
Description: Destructor for the `logNormal` halo mass function class.
Code lines: 11
Contained by: file `structure_formation.halo_environment.lognormal.F90`

function: `lognormalenvironmentmass`
Description: Return the mass of the environment.
Code lines: 8
Contained by: file `structure_formation.halo_environment.lognormal.F90`
Modules used: `numerical_constants_math`

function: `lognormalenvironmentradius`
Description: Return the radius of the environment.
Code lines: 7
Contained by: file `structure_formation.halo_environment.lognormal.F90`

function: `lognormaloverdensitylinear`
Description: Return the environment of the given `node`.
Code lines: 30
Contained by: file `structure_formation.halo_environment.lognormal.F90`
Modules used: `galacticus_nodes` `kind_numbers`

function: `lognormaloverdensitylinearminimum`
Description: Return the minimum overdensity for which the PDF is non-zero.
Code lines: 8
Contained by: file `structure_formation.halo_environment.lognormal.F90`

subroutine: `lognormaloverdensitylinearset`
Description: Return the CDF of the environmental overdensity.
Code lines: 12
Contained by: file `structure_formation.halo_environment.lognormal.F90`
Modules used: `galacticus_error`

function: `lognormaloverdensitynonlinear`
Description: Return the environment of the given `node`.
Code lines: 10

Contained by: file structure_formation.halo_environment.lognormal.F90
Modules used: galacticus_error

function: lognormalpdf
Description: Return the PDF of the environmental overdensity.
Code lines: 8
Contained by: file structure_formation.halo_environment.lognormal.F90

file: structure_formation.halo_environment.normal.F90
Description: Contains a module which implements a normally-distributed halo environment.
Code lines: 282
Modules used: cosmology_functions, cosmology_parameters, kind_numbers, linear_growth, statistics_distributions, tables

interface: haloenvironmentnormal
Description: Constructors for the normal halo environment class.
Code lines: 4
Contained by: file structure_formation.halo_environment.normal.F90

function: normalcdf
Description: Return the CDF of the environmental overdensity.
Code lines: 8
Contained by: file structure_formation.halo_environment.normal.F90

function: normalconstructorinternal
Description: Internal constructor for the normal halo mass function class.
Code lines: 37
Contained by: file structure_formation.halo_environment.normal.F90
Modules used: error_functions, numerical_constants_math

function: normalconstructorparameters
Description: Constructor for the normal halo environment class which takes a parameter set as input.
Code lines: 35
Contained by: file structure_formation.halo_environment.normal.F90
Modules used: input_parameters

subroutine: normaldestructor
Description: Destructor for the normal halo mass function class.
Code lines: 11
Contained by: file structure_formation.halo_environment.normal.F90

function: normalenvironmentmass
Description: Return the mass of the environment.
Code lines: 8
Contained by: file structure_formation.halo_environment.normal.F90
Modules used: numerical_constants_math

function: normalenvironmentradius
Description: Return the radius of the environment.

Code lines: 7
Contained by: file structure_formation.halo_environment.normal.F90

function: normaloverdensitylinear
Description: Return the environment of the given node.
Code lines: 40
Contained by: file structure_formation.halo_environment.normal.F90
Modules used: galacticus_nodes kind_numbers

function: normaloverdensitylinearmaximum
Description: Return the maximum overdensity for which the PDF is non-zero.
Code lines: 7
Contained by: file structure_formation.halo_environment.normal.F90

subroutine: normaloverdensitylinearset
Description: Return the CDF of the environmental overdensity.
Code lines: 14
Contained by: file structure_formation.halo_environment.normal.F90
Modules used: galacticus_error

function: normaloverdensitynonlinear
Description: Return the environment of the given node.
Code lines: 18
Contained by: file structure_formation.halo_environment.normal.F90
Modules used: galacticus_nodes spherical_collapse_matter_lambda

function: normalpdf
Description: Return the PDF of the environmental overdensity.
Code lines: 11
Contained by: file structure_formation.halo_environment.normal.F90

file: structure_formation.halo_environment.uniform.F90
Description: Contains a module which implements a uniform halo environment.
Code lines: 140

interface: haloenvironmentuniform
Description: Constructors for the uniform halo environment class.
Code lines: 3
Contained by: file structure_formation.halo_environment.uniform.F90

function: uniformcdf
Description: Return the CDF of the environmental overdensity.
Code lines: 13
Contained by: file structure_formation.halo_environment.uniform.F90

function: uniformconstructorparameters
Description: Constructor for the uniform halo environment class which takes a parameter set as input.
Code lines: 10
Contained by: file structure_formation.halo_environment.uniform.F90

Modules used: input_parameters

function: uniformenvironmentmass
Description: Return the mass of the environment.
Code lines: 8
Contained by: file structure_formation.halo_environment.uniform.F90

function: uniformenvironmentradius
Description: Return the radius of the environment.
Code lines: 8
Contained by: file structure_formation.halo_environment.uniform.F90

function: uniformoverdensitylinear
Description: Return the environment of the given node.
Code lines: 10
Contained by: file structure_formation.halo_environment.uniform.F90

subroutine: uniformoverdensitylinearset
Description: Return the CDF of the environmental overdensity.
Code lines: 11
Contained by: file structure_formation.halo_environment.uniform.F90
Modules used: galacticus_error

function: uniformoverdensitynonlinear
Description: Return the environment of the given node.
Code lines: 9
Contained by: file structure_formation.halo_environment.uniform.F90

function: uniformpdf
Description: Return the PDF of the environmental overdensity.
Code lines: 11
Contained by: file structure_formation.halo_environment.uniform.F90
Modules used: galacticus_error

file: structure_formation.halo_mass_function.Bhattacharya2011.F90
Description: Contains a module which implements a Bhattacharya et al. [2011] dark matter halo mass function class.
Code lines: 231
Modules used: cosmological_density_field

function: bhattacharya2011a
Description: Return the parameter $\bar{a}$ in the bhattacharya2011 halo mass function at the given time and mass.
Code lines: 9
Contained by: file structure_formation.halo_mass_function.Bhattacharya2011.F90

function: bhattacharya2011constructorinternal
Description: Internal constructor for the bhattacharya2011 halo mass function class.
Code lines: 15
Contained by: file structure_formation.halo_mass_function.Bhattacharya2011.F90

function: `bhattacharya2011constructorparameters`
Description: Constructor for the `bhattacharya2011` halo mass function class which takes a parameter set as input.
Code lines: 57
Contained by: file `structure_formation.halo_mass_function.Bhattacharya2011.F90`
Modules used: `input_parameters`

subroutine: `bhattacharya2011destructor`
Description: Destructor for the `bhattacharya2011` halo mass function class.
Code lines: 9
Contained by: file `structure_formation.halo_mass_function.Bhattacharya2011.F90`

function: `bhattacharya2011differential`
Description: Return the differential halo mass function at the given time and mass.
Code lines: 21
Contained by: file `structure_formation.halo_mass_function.Bhattacharya2011.F90`
Modules used: `numerical_constants_math`

function: `bhattacharya2011normalization`
Description: Return the normalization, $\bar{A}$, in the `bhattacharya2011` halo mass function at the given time and mass.
Code lines: 10
Contained by: file `structure_formation.halo_mass_function.Bhattacharya2011.F90`
Modules used: `numerical_constants_math`

function: `bhattacharya2011p`
Description: Return the parameter $\bar{p}$ in the `bhattacharya2011` halo mass function at the given time and mass.
Code lines: 9
Contained by: file `structure_formation.halo_mass_function.Bhattacharya2011.F90`

function: `bhattacharya2011q`
Description: Return the parameter $\bar{q}$ in the `bhattacharya2011` halo mass function at the given time and mass.
Code lines: 9
Contained by: file `structure_formation.halo_mass_function.Bhattacharya2011.F90`

interface: `halomassfunctionbhattacharya2011`
Description: Constructors for the `bhattacharya2011` halo mass function class.
Code lines: 4
Contained by: file `structure_formation.halo_mass_function.Bhattacharya2011.F90`

file: `structure_formation.halo_mass_function.Despali_2015.F90`
Description: Contains a module which implements a Despali et al. [2015] dark matter halo mass function class.
Code lines: 170
Modules used: `cosmological_density_field` `cosmology_functions` `virial_density_contrast`

function: despali2015a
Description: Return the parameter a in the despali2015 halo mass function at the given time and mass.
Code lines: 11
Contained by: file structure_formation.halo_mass_function.Despali_2015.F90
Modules used: numerical_constants_math

function: despali2015constructorinternal
Description: Internal constructor for the despali2015 halo mass function class.
Code lines: 14
Contained by: file structure_formation.halo_mass_function.Despali_2015.F90

function: despali2015constructorparameters
Description: Constructor for the despali2015 halo mass function class which takes a parameter set as input.
Code lines: 26
Contained by: file structure_formation.halo_mass_function.Despali_2015.F90
Modules used: input_parameters

subroutine: despali2015destructor
Description: Destructor for the despali2015 halo mass function class.
Code lines: 9
Contained by: file structure_formation.halo_mass_function.Despali_2015.F90

function: despali2015normalization
Description: Return the normalization, A, in the despali2015 halo mass function at the given time and mass.
Code lines: 11
Contained by: file structure_formation.halo_mass_function.Despali_2015.F90
Modules used: numerical_constants_math

function: despali2015p
Description: Return the parameter p in the despali2015 halo mass function at the given time and mass.
Code lines: 11
Contained by: file structure_formation.halo_mass_function.Despali_2015.F90
Modules used: numerical_constants_math

function: despali2015x
Description: Return the parameter x in the despali2015 halo mass function at the given time and mass.
Code lines: 9
Contained by: file structure_formation.halo_mass_function.Despali_2015.F90
Modules used: numerical_constants_math

interface: halomassfunctiondespali2015
Description: Constructors for the despali2015 halo mass function class.
Code lines: 4
Contained by: file structure_formation.halo_mass_function.Despali_2015.F90

file: structure_formation.halo_mass_function.F90

Description: Contains a module which provides a class that implements halo mass functions.
Code lines: 163

module: `halo_mass_functions`

Code lines: 141
Contained by: file structure_formation.halo_mass_function.F90
Modules used: cosmology_parameters, galacticus_nodes, fgsl, iso_c_binding
Used by:
- file dark_matter_halos.spins.distributions.N-body_errors.F90
- subroutine galacticus_function_classes_destroy
- file galacticus.output.analyses.spin_distribution.Bett2007.F90

- file tasks.excursion_sets.F90
- file tasks.halo_mass_function.F90
- file tasks.halo_model.projected_correlation_function.F90
- file tasks.mass_function_covariance.F90
- program tests_halo_mass_function_tinker

function: `integratedintegrand`

Description: Integrand function used to integrate the dark matter halo mass function.
Code lines: 15
Contained by: module halo_mass_functions

function: `massfractionintegrand`

Description: Integrand function used in computing the halo mass fraction.
Code lines: 16
Contained by: module halo_mass_functions

file: `structure_formation.halo_mass_function.Press-Schechter.F90`

Description: Contains a module which implements a Press and Schechter [1974] dark matter halo mass function class.
Code lines: 107
Modules used: cosmological_density_field, excursion_sets_first_crossings

interface: `halomassfunctionpressschechter`

Description: Constructors for the `pressSchechter` halo mass function class.
Code lines: 4
Contained by: file `structure_formation.halo_mass_function.Press-Schechter.F90`

function: `pressschechterconstructorinternal`
Description: Internal constructor for the `pressSchechter` halo mass function class.
Code lines: 10
Contained by: file `structure_formation.halo_mass_function.Press-Schechter.F90`

function: `pressschechterconstructorparameters`
Description: Constructor for the `pressSchechter` halo mass function class which takes a parameter set as input.
Code lines: 19
Contained by: file `structure_formation.halo_mass_function.Press-Schechter.F90`
Modules used: `input_parameters`

subroutine: `pressschechterdestructor`
Description: Destructor for the `pressSchechter` halo mass function class.
Code lines: 9
Contained by: file `structure_formation.halo_mass_function.Press-Schechter.F90`

function: `pressschechterdifferential`
Description: Return the differential halo mass function at the given time and mass.
Code lines: 18
Contained by: file `structure_formation.halo_mass_function.Press-Schechter.F90`
Modules used: `galacticus_error`

file: `structure_formation.halo_mass_function.Rodriguez-Puebla2016.F90`
Description: Contains a module which implements a Tinker et al. [2008] dark matter halo mass function class.
Code lines: 161

interface: `halomassfunctionrodriguezpuebla2016`
Description: Constructors for the `rodriguezPuebla2016` halo mass function class.
Code lines: 4
Contained by: file `structure_formation.halo_mass_function.Rodriguez-Puebla2016.F90`

function: `rodriguezpuebla2016a`
Description: Return the normalization for the `rodriguezPuebla2016` halo mass function class.
Code lines: 13
Contained by: file `structure_formation.halo_mass_function.Rodriguez-Puebla2016.F90`

function: `rodriguezpuebla2016b`
Description: Return the normalization for the `rodriguezPuebla2016` halo mass function class.
Code lines: 13
Contained by: file `structure_formation.halo_mass_function.Rodriguez-Puebla2016.F90`

function: `rodriguezpuebla2016c`
Description: Return the normalization for the `rodriguezPuebla2016` halo mass function class.

Code lines: 13
Contained by: file structure_formation.halo_mass_function.Rodriguez-Puebla2016.F90

function: rodriguezpuebla2016constructorinternal
Description: Internal constructor for the rodriguezPuebla2016 halo mass function class.
Code lines: 20
Contained by: file structure_formation.halo_mass_function.Rodriguez-Puebla2016.F90
Modules used: file_utilities, fox_dom, galacticus_error, galacticus_paths, io_xml, iso_varying_string, table_labels

function: rodriguezpuebla2016constructorparameters
Description: Constructor for the rodriguezPuebla2016 halo mass function class which takes a parameter set as input.
Code lines: 23
Contained by: file structure_formation.halo_mass_function.Rodriguez-Puebla2016.F90
Modules used: input_parameters

subroutine: rodriguezpuebla2016destructor
Description: Destructor for the rodriguezPuebla2016 halo mass function class.
Code lines: 10
Contained by: file structure_formation.halo_mass_function.Rodriguez-Puebla2016.F90

function: rodriguezpuebla2016normalization
Description: Return the normalization for the rodriguezPuebla2016 halo mass function class.
Code lines: 12
Contained by: file structure_formation.halo_mass_function.Rodriguez-Puebla2016.F90

file: structure_formation.halo_mass_function.Sheth-Tormen.F90
Description: Contains a module which implements a Sheth et al. [2001] dark matter halo mass function class.
Code lines: 201
Modules used: cosmological_density_field

interface: halomassfunctionshethtormen
Description: Constructors for the shethTormen halo mass function class.
Code lines: 4
Contained by: file structure_formation.halo_mass_function.Sheth-Tormen.F90

function: shethtormena
Description: Return the parameter a in the shethTormen halo mass function at the given time and mass.
Code lines: 10
Contained by: file structure_formation.halo_mass_function.Sheth-Tormen.F90
Modules used: numerical_constants_math

function: shethtormenconstructorinternal
Description: Internal constructor for the shethTormen halo mass function class.
Code lines: 14
Contained by: file structure_formation.halo_mass_function.Sheth-Tormen.F90

function: `shethtormenconstructorparameters`
Description: Constructor for the `shethTormen` halo mass function class which takes a parameter set as input.
Code lines: 45
Contained by: file `structure_formation.halo_mass_function.Sheth-Tormen.F90`
Modules used: `input_parameters`

subroutine: `shethtormendestructor`
Description: Destructor for the `shethTormen` halo mass function class.
Code lines: 9
Contained by: file `structure_formation.halo_mass_function.Sheth-Tormen.F90`

function: `shethtormendifferential`
Description: Return the differential halo mass function at the given time and mass.
Code lines: 21
Contained by: file `structure_formation.halo_mass_function.Sheth-Tormen.F90`
Modules used: `numerical_constants_math`

function: `shethtormennormalization`
Description: Return the normalization, A, in the `shethTormen` halo mass function at the given time and mass.
Code lines: 10
Contained by: file `structure_formation.halo_mass_function.Sheth-Tormen.F90`
Modules used: `numerical_constants_math`

function: `shethtormenp`
Description: Return the parameter p in the `shethTormen` halo mass function at the given time and mass.
Code lines: 10
Contained by: file `structure_formation.halo_mass_function.Sheth-Tormen.F90`
Modules used: `numerical_constants_math`

file: `structure_formation.halo_mass_function.Tinker2008.F90`
Description: Contains a module which implements a Tinker et al. [2008] dark matter halo mass function class.
Code lines: 237
Modules used: `tables` `virial_density_contrast`

interface: `halomassfunctiontinker2008`
Description: Constructors for the `tinker2008` halo mass function class.
Code lines: 4
Contained by: file `structure_formation.halo_mass_function.Tinker2008.F90`

function: `tinker2008a`
Description: Return the normalization for the `tinker2008` halo mass function class.
Code lines: 11
Contained by: file `structure_formation.halo_mass_function.Tinker2008.F90`

function: `tinker2008b`
Description: Return the normalization for the `tinker2008` halo mass function class.

Code lines: 11
Contained by: file structure_formation.halo_mass_function.Tinker2008.F90

function: tinker2008c
Description: Return the normalization for the tinker2008 halo mass function class.
Code lines: 11
Contained by: file structure_formation.halo_mass_function.Tinker2008.F90

function: tinker2008constructorinternal
Description: Internal constructor for the tinker2008 halo mass function class.
Code lines: 46
Contained by: file structure_formation.halo_mass_function.Tinker2008.F90
Modules used: file_utilities, fox_dom, galacticus_error, galacticus_paths, io_xml, iso_varying_string, table_labels

function: tinker2008constructorparameters
Description: Constructor for the tinker2008 halo mass function class which takes a parameter set as input.
Code lines: 26
Contained by: file structure_formation.halo_mass_function.Tinker2008.F90
Modules used: input_parameters

subroutine: tinker2008destructor
Description: Destructor for the tinker2008 halo mass function class.
Code lines: 12
Contained by: file structure_formation.halo_mass_function.Tinker2008.F90

function: tinker2008normalization
Description: Return the normalization for the tinker2008 halo mass function class.
Code lines: 11
Contained by: file structure_formation.halo_mass_function.Tinker2008.F90

subroutine: tinker2008parametersevaluate
Description: Evaluate interpolating parametersn for the tinker2008 halo mass function class.
Code lines: 20
Contained by: file structure_formation.halo_mass_function.Tinker2008.F90

file: structure_formation.halo_mass_function.Tinker2008Form.F90
Description: Contains a module which implements a Tinker et al. [2008] dark matter halo mass function class.
Code lines: 105
Modules used: cosmological_density_field, cosmology_functions, linear_growth

type: halomassfunctiontinker2008form
Description: A halo mass function class using the fitting function of Tinker et al. [2008].
Code lines: 40
Contained by: file structure_formation.halo_mass_function.Tinker2008Form.F90

function: `tinker2008formdifferential`
Description: Return the differential halo mass function at the given time and mass.
Code lines: 24
Contained by: file `structure_formation.halo_mass_function.Tinker2008Form.F90`
Modules used: `numerical_interpolation` `table_labels`

file: `structure_formation.halo_mass_function.Tinker2008Generic.F90`
Description: Contains a module which implements a Tinker et al. [2008] dark matter halo mass function class with user-specified parameters.
Code lines: 181

interface: `halomassfunctiontinker2008generic`
Description: Constructors for the `tinker2008Generic` halo mass function class.
Code lines: 4
Contained by: file `structure_formation.halo_mass_function.Tinker2008Generic.F90`

function: `tinker2008generica`
Description: Return the a parameter for the `tinker2008Generic` halo mass function class.
Code lines: 9
Contained by: file `structure_formation.halo_mass_function.Tinker2008Generic.F90`

function: `tinker2008genericb`
Description: Return the b parameter for the `tinker2008Generic` halo mass function class.
Code lines: 9
Contained by: file `structure_formation.halo_mass_function.Tinker2008Generic.F90`

function: `tinker2008genericc`
Description: Return the c parameter for the `tinker2008Generic` halo mass function class.
Code lines: 9
Contained by: file `structure_formation.halo_mass_function.Tinker2008Generic.F90`

function: `tinker2008genericconstructorinternal`
Description: Internal constructor for the `tinker2008Generic` halo mass function class.
Code lines: 18
Contained by: file `structure_formation.halo_mass_function.Tinker2008Generic.F90`

function: `tinker2008genericconstructorparameters`
Description: Constructor for the `tinker2008Generic` halo mass function class which takes a parameter set as input.
Code lines: 59
Contained by: file `structure_formation.halo_mass_function.Tinker2008Generic.F90`
Modules used: `input_parameters`

subroutine: `tinker2008genericdestructor`
Description: Destructor for the `tinker2008Generic` halo mass function class.
Code lines: 10
Contained by: file `structure_formation.halo_mass_function.Tinker2008Generic.F90`

function: `tinker2008genericnormalization`
Description: Return the normalization for the `tinker2008Generic` halo mass function class.
Code lines: 9
Contained by: file structure_formation.halo_mass_function.Tinker2008Generic.F90

file: `structure_formation.halo_mass_function.environment_averaged.F90`
Description: Contains a module which implements a dark matter halo mass function class which averages another (presumably environment-dependent) mass function over environment.
Code lines: 182
Modules used: cosmological_density_field

function: `environmentaveragedconstructorinternal`
Description: Internal constructor for the `environmentAveraged` halo mass function class.
Code lines: 11
Contained by: file structure_formation.halo_mass_function.environment_averaged.F90

function: `environmentaveragedconstructorparameters`
Description: Constructor for the `environmentAveraged` halo mass function class which takes a parameter set as input.
Code lines: 22
Contained by: file structure_formation.halo_mass_function.environment_averaged.F90
Modules used: input_parameters

subroutine: `environmentaverageddestructor`
Description: Destructor for the `environmentAveraged` halo mass function class.
Code lines: 10
Contained by: file structure_formation.halo_mass_function.environment_averaged.F90

function: `environmentaverageddifferential`
Description: Return the differential halo mass function at the given time and mass.
Code lines: 84
Contained by: file structure_formation.halo_mass_function.environment_averaged.F90
Modules used: galacticus_nodes, iso_c_binding, numerical_integration, root_finder

function: `environmentaveragedintegrand`
Description: Integrand function used in averging the dark matter halo mass function over environment.
Code lines: 8
Contained by: function environmentaverageddifferential

function: `environmentaveragedroot`
Description: Root function used in determining the range of overdensity over which to integrate.
Code lines: 7
Contained by: function environmentaverageddifferential

interface: `halomassfunctionenvironmentaveraged`
Description: Constructors for the `environmentAveraged` halo mass function class.
Code lines: 4

Contained by: file structure_formation.halo_mass_function.environment_averaged.F90

file: structure_formation.halo_mass_function.environmental.F90
Description: Contains a module which implements a dark matter halo mass function class which handles the transition through the environment mass scale.
Code lines: 100
Modules used: cosmological_density_field

function: environmentalconstructorinternal
Description: Internal constructor for the environmental halo mass function class.
Code lines: 11
Contained by: file structure_formation.halo_mass_function.environmental.F90

function: environmentalconstructorparameters
Description: Constructor for the environmental halo mass function class which takes a parameter set as input.
Code lines: 22
Contained by: file structure_formation.halo_mass_function.environmental.F90
Modules used: input_parameters

function: environmentaldifferential
Description: Return the differential halo mass function at the given time and mass.
Code lines: 17
Contained by: file structure_formation.halo_mass_function.environmental.F90

interface: halomassfunctionenvironmental
Description: Constructors for the environmental halo mass function class.
Code lines: 4
Contained by: file structure_formation.halo_mass_function.environmental.F90

file: structure_formation.halo_mass_function.error_convolved.F90
Description: Contains a module which implements a dark matter halo mass function class which modifies another mass function by convolving with a mass-dependent error.
Code lines: 163
Modules used: statistics_nbody_halo_mass_errors

function: errorconvolvedconstructorinternal
Description: Internal constructor for the errorConvolved halo mass function class.
Code lines: 11
Contained by: file structure_formation.halo_mass_function.error_convolved.F90

function: errorconvolvedconstructorparameters
Description: Constructor for the errorConvolved halo mass function class which takes a parameter set as input.
Code lines: 28
Contained by: file structure_formation.halo_mass_function.error_convolved.F90
Modules used: input_parameters

subroutine: errorconvolveddestructor
Description: Destructor for the errorConvolved halo mass function class.

Code lines: 9
Contained by: file structure_formation.halo_mass_function.error_convolved.F90

function: errorconvolveddifferential
Description: Return the differential halo mass function at the given time and mass.
Code lines: 53
Contained by: file structure_formation.halo_mass_function.error_convolved.F90
Modules used: galacticus_nodes iso_c_binding numerical_integration

function: errorconvolvedconvolution
Description: Integrand function used in convolving the dark matter halo mass function.
Code lines: 12
Contained by: function errorconvolveddifferential
Modules used: numerical_constants_math

interface: halomassfunctionerrorconvolved
Description: Constructors for the errorConvolved halo mass function class.
Code lines: 4
Contained by: file structure_formation.halo_mass_function.error_convolved.F90

file: structure_formation.halo_mass_function.friends_of_friends_bias.F90
Description: Contains a module which implements a dark matter halo mass function class which modifies another mass function to mimic systematic errors arising in the friends-of-friends halo finding algorithm.
Code lines: 229
Modules used: dark_matter_halo_scales dark_matter_profiles_dmo

function: fofbiasconstructorinternal
Description: Internal constructor for the fofBias halo mass function class.
Code lines: 14
Contained by: file structure_formation.halo_mass_function.friends_of_friends_bias.F90

function: fofbiasconstructorparameters
Description: Constructor for the fofBias halo mass function class which takes a parameter set as input.
Code lines: 57
Contained by: file structure_formation.halo_mass_function.friends_of_friends_bias.F90
Modules used: input_parameters

subroutine: fofbiasdestructor
Description: Destructor for the fofBias halo mass function class.
Code lines: 11
Contained by: file structure_formation.halo_mass_function.friends_of_friends_bias.F90

function: fofbiasdifferential
Description: Return the differential halo mass function at the given time and mass.
Code lines: 83
Contained by: file structure_formation.halo_mass_function.friends_of_friends_bias.F90
Modules used: galacticus_error galacticus_nodes numerical_constants_math

interface: `halomassfunctionfofbias`
Description: Constructors for the `fofBias` halo mass function class.
Code lines: 4
Contained by: file structure_formation.halo_mass_function.friends_of_friends_bias.F90

file: `structure_formation.halo_mass_function.simple_systematic.F90`
Description: Contains a module which implements a dark matter halo mass function class which modifies another mass function using a simple model for systematics.
Code lines: 112

interface: `halomassfunctionsimplesystematic`
Description: Constructors for the `simpleSystematic` halo mass function class.
Code lines: 4
Contained by: file structure_formation.halo_mass_function.simple_systematic.F90

function: `simplesystematicconstructorinternal`
Description: Internal constructor for the `simpleSystematic` halo mass function class.
Code lines: 10
Contained by: file structure_formation.halo_mass_function.simple_systematic.F90

function: `simplesystematicconstructorparameters`
Description: Constructor for the `simpleSystematic` halo mass function class which takes a parameter set as input.
Code lines: 34
Contained by: file structure_formation.halo_mass_function.simple_systematic.F90
Modules used: input_parameters

subroutine: `simplesystematicdestructor`
Description: Destructor for the `simpleSystematic` halo mass function class.
Code lines: 8
Contained by: file structure_formation.halo_mass_function.simple_systematic.F90

function: `simplesystematicdifferential`
Description: Return the differential halo mass function at the given time and mass.
Code lines: 11
Contained by: file structure_formation.halo_mass_function.simple_systematic.F90

file: `structure_formation.linear_growth.F90`
Description: Contains a module which provides a class that implements linear growth of cosmological structure.
Code lines: 68

module: `linear_growth`
Description: Provides an object that implements linear growth of cosmological structure.
Code lines: 46
Contained by: file structure_formation.linear_growth.F90
Used by: subroutine dark_matter_halo_-correa2015_fit_parameters file dark_matter_halos.mass_accretion_-history.Correa2015.F90

file: `structure_formation.linear_growth.simple.F90`

Description: An implementation of linear growth of cosmological structure in simple cosomologies. Ignores pressure terms for the growth of baryons and has no wavenumber dependence. Also assumes no growth of radiation perturbations.

Code lines: 259

Modules used: cosmology_functions cosmology_parameters tables

interface: `lineargrowthsimple`

Description: Constructors for the `simple` linear growth class.
Code lines: 4
Contained by: file structure_formation.linear_growth.simple.F90

function: `simpleconstructorinternal`
Description: Internal constructor for the `simple` linear growth class.
Code lines: 19
Contained by: file structure_formation.linear_growth.simple.F90

function: `simpleconstructorparameters`
Description: Constructor for the `simple` linear growth class which takes a parameter set as input.
Code lines: 16
Contained by: file structure_formation.linear_growth.simple.F90
Modules used: input_parameters

subroutine: `simpledestructor`
Description: Destructor for the `simple` linear growth class.
Code lines: 12
Contained by: file structure_formation.linear_growth.simple.F90

function: `simplelogarithmicderivativeexpansionfactor`
Description: Return the logarithmic gradient of linear growth factor with respect to expansion factor at the given epoch.
Code lines: 19
Contained by: file structure_formation.linear_growth.simple.F90
Modules used: galacticus_error

subroutine: `simpleretabulate`
Description: Returns the linear growth factor $D(a)$ for expansion factor `aExpansion`, normalized such that $D(1) = 1$ for a simple matter plus cosmological constant cosmology.
Code lines: 94
Contained by: file structure_formation.linear_growth.simple.F90
Modules used: `fgsl` ode_solver table_labels tables

function: `growthfactorodes`
Description: System of differential equations to solve for the growth factor.
Code lines: 11
Contained by: subroutine simpleretabulate

function: `simplevalue`
Description: Return the linear growth factor at the given epoch.
Code lines: 24
Contained by: file structure_formation.linear_growth.simple.F90

file: `structure_formation.power_spectrum.F90`
Description: Contains a module which implements a cosmological power spectra class.
Code lines: 51

module: `power_spectra`

Description: Implements linear-theory power spectra.
Code lines: 29
Contained by: file structure_formation.power_spectrum.F90
Used by:

- power_spectra_primordial

function: `cosmicemuconstructorinternal`

Description: Internal constructor for the `CosmicEmu` nonlinear power spectrum class.
Code lines: 21
Contained by: file structure_formation.power_spectrum.nonlinear.CosmicEmu.F90
Modules used:
- galacticus_error
- numerical_comparison

function: `cosmicemuconstructorparameters`

Description: Constructor for the cosmicEmu nonlinear power spectrum class which takes a parameter set as input.
Code lines: 25
Contained by: file structure_formation.power_spectrum.nonlinear.CosmicEmu.F90
Modules used: input_parameters

subroutine: `cosmicemudestructor`

Description: Destructor for the `CosmicEmu` nonlinear power spectrum class.
Code lines: 10
Contained by: file structure_formation.power_spectrum.nonlinear.CosmicEmu.F90

function: `cosmicemuvalue`

Description: Return a nonlinear power spectrum equal using the code of Lawrence et al. [2010].

Code lines: 120
Contained by: file structure_formation.power_spectrum.nonlinear.CosmicEmu.F90
Modules used: galacticus_display, galacticus_error, galacticus_paths, iso_varying_string, memory_management, numerical_comparison, numerical_interpolation, system_command, table_labels

interface: powerspectrumnonlinearcosmicemu
Description: Constructors for the CosmicEmu nonlinear power spectrum class.
Code lines: 4
Contained by: file structure_formation.power_spectrum.nonlinear.CosmicEmu.F90

file: structure_formation.power_spectrum.nonlinear.F90
Description: Contains a module which implements the nonlinear power spectrum.
Code lines: 39

module: power_spectra_nonlinear
Description: Implements the nonlinear power spectrum.
Code lines: 17
Contained by: file structure_formation.power_spectrum.nonlinear.F90
Used by: subroutine galacticus_function_classes_destroy, subroutine galacticus_state_retrieve, subroutine galacticus_state_store, file structure_formation.gravitational_lensing.Takahashi_2011.F90, file tasks.mass_function_covariance.F90, file tasks.power_spectrum.F90

file: structure_formation.power_spectrum.nonlinear.PeacockDodds1996.F90
Description: Contains a module which implements a nonlinear power spectrum class in which the nonlinear power spectrum is computed using the algorithm of Peacock and Dodds [1996].
Code lines: 174
Modules used: cosmology_functions, linear_growth, power_spectra

function: peacockdodds1996constructorinternal
Description: Internal constructor for the PeacockDodds1996 nonlinear power spectrum class.
Code lines: 13
Contained by: file structure_formation.power_spectrum.nonlinear.PeacockDodds1996.F90

function: peacockdodds1996constructorparameters
Description: Constructor for the peacockDodds1996 nonlinear power spectrum class which takes a parameter set as input.
Code lines: 22
Contained by: file structure_formation.power_spectrum.nonlinear.PeacockDodds1996.F90
Modules used: input_parameters

subroutine: peacockdodds1996destructor
Description: Destructor for the PeacockDodds1996 nonlinear power spectrum class.

Code lines: 9
Contained by: file structure_formation.power_spectrum.nonlinear.PeacockDodds1996.F90

function: peacockdodds1996value
Description: Return a nonlinear power spectrum equal using the algorithm of Peacock and Dodds [1996].
Code lines: 73
Contained by: file structure_formation.power_spectrum.nonlinear.PeacockDodds1996.F90
Modules used: cosmology_functions galacticus_error linear_growth numerical_constants_math

interface: powerspectrumnonlinearpeacockdodds1996
Description: Constructors for the PeacockDodds1996 nonlinear power spectrum class.
Code lines: 4
Contained by: file structure_formation.power_spectrum.nonlinear.PeacockDodds1996.F90

file: structure_formation.power_spectrum.nonlinear.linear.F90
Description: Contains a module which implements a nonlinear power spectrum class in which the nonlinear power spectrum is just the linear power spectrum. Intended primarily for testing purposes.
Code lines: 94
Modules used: linear_growth power_spectra

function: linearconstructorinternal
Description: Internal constructor for the linear nonlinear power spectrum class.
Code lines: 9
Contained by: file structure_formation.power_spectrum.nonlinear.linear.F90

function: linearconstructorparameters
Description: Constructor for the linear nonlinear power spectrum class which takes a parameter set as input.
Code lines: 16
Contained by: file structure_formation.power_spectrum.nonlinear.linear.F90
Modules used: input_parameters

subroutine: lineardestructor
Description: Destructor for the linear nonlinear power spectrum class.
Code lines: 8
Contained by: file structure_formation.power_spectrum.nonlinear.linear.F90

function: linearvalue
Description: Return the nonlinear power spectrum at the given wavenumber.
Code lines: 8
Contained by: file structure_formation.power_spectrum.nonlinear.linear.F90

interface: powerspectrumnonlinearlinear
Description: Constructors for the linear nonlinear power spectrum class.
Code lines: 4
Contained by: file structure_formation.power_spectrum.nonlinear.linear.F90

file: `structure_formation.power_spectrum.primordial.F90`
Description: Contains a module which provides a class that implements the primordial power spectrum.
Code lines: 45

module: `power_spectra_primordial`
Description: Provides a class that implements the primordial power spectrum.
Code lines: 23
Contained by: file structure_formation.power_spectrum.primordial.F90
Used by: subroutine galacticus_function_classes_destroy; subroutine galacticus_state_retrieve; subroutine galacticus_state_store; file structure_formation.power_spectrum.nonlinear.CosmicEmu.F90; file structure_formation.power_spectrum.primordial.transferred.simple.F90; file tasks.merger_tree_file_builder.F90; program tests_power_spectrum; program tests_sigma

file: `structure_formation.power_spectrum.primordial.power_law.F90`
Description: A primordial power spectrum class which provides a power-law power spectrum.
Code lines: 128

function: `powerlawconstructorinternal`
Description: Internal constructor for the "power-law" primordial power spectrum class.
Code lines: 10
Contained by: file structure_formation.power_spectrum.primordial.power_law.F90

function: `powerlawconstructorparameters`
Description: Constructor for the "power-law" primordial power spectrum class which takes a parameter set as input.
Code lines: 37
Contained by: file structure_formation.power_spectrum.primordial.power_law.F90
Modules used: galacticus_display

subroutine: `powerlawdestructor`
Description: Destructor for the "power-law" primordial power spectrum class.
Code lines: 8
Contained by: file structure_formation.power_spectrum.primordial.power_law.F90

function: `powerlawlogarithmicderivative`
Description: Return the logarithmic derivative of the primordial power spectrum at the given `wavenumber`.
Code lines: 8
Contained by: file structure_formation.power_spectrum.primordial.power_law.F90

function: `powerlawpower`
Description: Return the primordial power spectrum at the given `wavenumber`.
Code lines: 8
Contained by: file structure_formation.power_spectrum.primordial.power_law.F90

interface: `powerspectrumprimordialpowerlaw`
Description: Constructors for the "power-law" primordial power spectrum class.
Code lines: 4
Contained by: file `structure_formation.power_spectrum.primordial.power_law.F90`

file: `structure_formation.power_spectrum.primordial.transferred.F90`
Description: Contains a module which provides a class that implements the transferred primordial power spectrum.
Code lines: 45

module: `power_spectra_primordial_transferred`
Description: Provides a class that implements the transferred primordial power spectrum.
Code lines: 23
Contained by: file `structure_formation.power_spectrum.primordial.transferred.F90`
Used by:
- subroutine `galacticus_function_classes_destroy`
- subroutine `galacticus_state_retrieve`
- subroutine `galacticus_state_store`
- file `structure_formation.cosmological_mass_variance.filtered_power_spectrum.F90`
- file `structure_formation.power_spectrum.standard.F90`
- program `tests_power_spectrum`
- program `tests_sigma`

file: `structure_formation.power_spectrum.primordial.transferred.simple.F90`
Description: A simple transferred primordial power spectrum class.
Code lines: 107
Modules used: `power_spectra_primordial`, `transfer_functions`

interface: `powerspectrumprimordialtransferredsimple`
Description: Constructors for the "simple" transferred primordial power spectrum class.
Code lines: 4
Contained by: file `structure_formation.power_spectrum.primordial.transferred.simple.F90`

function: `simpleconstructorinternal`
Description: Internal constructor for the "simple" transferred primordial power spectrum class.
Code lines: 9
Contained by: file `structure_formation.power_spectrum.primordial.transferred.simple.F90`

function: `simpleconstructorparameters`
Description: Constructor for the "simple" transferred primordial power spectrum class which takes a parameter set as input.
Code lines: 17
Contained by: file `structure_formation.power_spectrum.primordial.transferred.simple.F90`
Modules used: `input_parameters`

subroutine: `simpledestructor`
Description: Destructor for the "simple" transferred primordial power spectrum class.
Code lines: 8

Contained by: file structure_formation.power_spectrum.primordial.transferred.simple.F90

function: simplelogarithmicderivative
Description: Return the logarithmic derivative of the transferred primordial power spectrum at the given wavenumber.
Code lines: 9
Contained by: file structure_formation.power_spectrum.primordial.transferred.simple.F90

function: simplepower
Description: Return the transferred primordial power spectrum at the given wavenumber.
Code lines: 9
Contained by: file structure_formation.power_spectrum.primordial.transferred.simple.F90

file: structure_formation.power_spectrum.standard.F90
Description: Contains a module which implements a linear theory power spectrum class in which the power spectrum is just the transferred primordial power spectrum correctly normalized to $z = 0$.
Code lines: 120
Modules used: cosmological_density_field power_spectra_primordial_transferred

interface: powerspectrumstandard
Description: Constructors for the standard power spectrum class.
Code lines: 4
Contained by: file structure_formation.power_spectrum.standard.F90

function: standardconstructorinternal
Description: Internal constructor for the standard nonstandard power spectrum class.
Code lines: 9
Contained by: file structure_formation.power_spectrum.standard.F90

function: standardconstructorparameters
Description: Constructor for the standard nonstandard power spectrum class which takes a parameter set as input.
Code lines: 16
Contained by: file structure_formation.power_spectrum.standard.F90
Modules used: input_parameters

subroutine: standarddestructor
Description: Destructor for the standard nonstandard power spectrum class.
Code lines: 8
Contained by: file structure_formation.power_spectrum.standard.F90

function: standardpower
Description: Return the cosmological power spectrum for $k =$wavenumber [Mpc^{-1}].
Code lines: 9
Contained by: file structure_formation.power_spectrum.standard.F90

function: standardpowerdimensionless
Description: Return the dimensionless power spectrum, $\Delta^2(k)$, for $k =$wavenumber [Mpc^{-1}].
Code lines: 9

Contained by: file structure_formation.power_spectrum.standard.F90
Modules used: numerical_constants_math

function: standardpowerlogarithmicderivative
Description: Return the logarithmic derivative of the power spectrum, $\mathrm{d}\ln P(k)/\mathrm{d}\ln k$, for $k =$wavenumber [Mpc^{-1}].
Code lines: 9
Contained by: file structure_formation.power_spectrum.standard.F90

file: structure_formation.power_spectrum.variance.window_function.F90
Description: Contains a module which provides a class that implements window functions for computing the variance of the power spectrum.
Code lines: 57

module: power_spectrum_window_functions
Description: Provides a class which implements window functions for computing the variance of the power spectrum.
Code lines: 34
Contained by: file structure_formation.power_spectrum.variance.window_function.F90
Used by: subroutine galacticus_function_classes_destroy; subroutine galacticus_state_retrieve; subroutine galacticus_state_store; file structure_formation.cosmological_mass_variance.filtered_power_spectrum.F90; file tasks.power_spectrum.F90; program tests_sigma

file: structure_formation.power_spectrum.variance.window_function.Lagrangian_Chan2017.F90
Description: Contains a module which provides a power spectrum window function class that implements the Lagrangian filter of Chan et al. [2017].
Code lines: 133
Modules used: cosmology_parameters

function: lagrangianchan2017constructorinternal
Description: Internal constructor for the lagrangianChan2017 power spectrum window function class.
Code lines: 11
Contained by: file structure_formation.power_spectrum.variance.window_function.Lagrangian_Chan2017.F90
Modules used: numerical_constants_math

function: lagrangianchan2017constructorparameters
Description: Constructor for the lagrangianChan2017 power spectrum window function class which takes a parameter set as input.
Code lines: 22
Contained by: file structure_formation.power_spectrum.variance.window_function.Lagrangian_Chan2017.F90
Modules used: input_parameters

subroutine: lagrangianchan2017destructor
Description: Destructor for the lagrangianChan2017 power spectrum window function class.
Code lines: 7
Contained by: file structure_formation.power_spectrum.variance.window_function.Lagrangian_Chan2017.F90

function: `lagrangianchan2017value`
Description: Smooth-k space power spectrum window function proposed in Leo et al. [2018]. spectrum.
Code lines: 27
Contained by: file `structure_formation.power_spectrum.variance.window_function.Lagrangian_Chan2017.F90`
Modules used: `cosmology_parameters` `numerical_constants_math`

function: `lagrangianchan2017wavenumbermaximum`
Description: Maximum wavenumber for a top hat in real space window function Fourier transformed into k-space used in computing the variance of the power spectrum.
Code lines: 11
Contained by: file `structure_formation.power_spectrum.variance.window_function.Lagrangian_Chan2017.F90`

interface: `powerspectrumwindowfunctionlagrangianchan2017`
Description: Constructors for the `lagrangianChan2017` power spectrum window function class.
Code lines: 4
Contained by: file `structure_formation.power_spectrum.variance.window_function.Lagrangian_Chan2017.F90`

file: `structure_formation.power_spectrum.variance.window_function.sharp_kSpace.F90`
Description: Contains a module which implements a sharp k-space power spectrum window function class.
Code lines: 156
Modules used: `cosmology_parameters`

interface: `powerspectrumwindowfunctionsharpkspace`
Description: Constructors for the `sharpKSpace` power spectrum window function class.
Code lines: 4
Contained by: file `structure_formation.power_spectrum.variance.window_function.sharp_kSpace.F90`

function: `sharpkspaceamplitudeismassindependent`
Description: Indicate the the sharp k-space power spectrum window function has constant amplitude below the maximum wavenumber.
Code lines: 8
Contained by: file `structure_formation.power_spectrum.variance.window_function.sharp_kSpace.F90`

function: `sharpkspaceconstructorinternal`
Description: Internal constructor for the `sharpKSpace` power spectrum window function class.
Code lines: 22
Contained by: file `structure_formation.power_spectrum.variance.window_function.sharp_kSpace.F90`
Modules used: `numerical_constants_math`

function: `sharpkspaceconstructorparameters`
Description: Constructor for the `sharpKSpace` power spectrum window function class which takes a parameter set as input.
Code lines: 37
Contained by: file `structure_formation.power_spectrum.variance.window_function.sharp_kSpace.F90`
Modules used: `input_parameters`

subroutine: `sharpkspacedestructor`

Description: Destructor for the `sharpKSpace` power spectrum window function class.
Code lines: 7
Contained by: file `structure_formation.power_spectrum.variance.window_function.sharp_kSpace.F90`

function: `sharpkspacevalue`
Description: Sharp k-space window function used in computing the variance of the power spectrum.
Code lines: 16
Contained by: file `structure_formation.power_spectrum.variance.window_function.sharp_kSpace.F90`

function: `sharpkspacewavenumbermaximum`
Description: Sharp k-space window function used in computing the variance of the power spectrum.
Code lines: 8
Contained by: file `structure_formation.power_spectrum.variance.window_function.sharp_kSpace.F90`

file: `structure_formation.power_spectrum.variance.window_function.smooth_k_space.F90`
Description: Contains a module which provides a power spectrum window function class that implements the smooth-k space filter of Leo et al. [2018].
Code lines: 138
Modules used: `cosmology_parameters`

interface: `powerspectrumwindowfunctionsmoothkspace`
Description: Constructors for the `smoothKSpace` power spectrum window function class.
Code lines: 4
Contained by: file `structure_formation.power_spectrum.variance.window_function.smooth_k_space.F90`

function: `smoothkspaceconstructorinternal`
Description: Internal constructor for the `smoothKSpace` power spectrum window function class.
Code lines: 10
Contained by: file `structure_formation.power_spectrum.variance.window_function.smooth_k_space.F90`
Modules used: `numerical_constants_math`

function: `smoothkspaceconstructorparameters`
Description: Constructor for the `smoothKSpace` power spectrum window function class which takes a parameter set as input.
Code lines: 34
Contained by: file `structure_formation.power_spectrum.variance.window_function.smooth_k_space.F90`
Modules used: `input_parameters`

subroutine: `smoothkspacedestructor`
Description: Destructor for the `smoothKSpace` power spectrum window function class.
Code lines: 7
Contained by: file `structure_formation.power_spectrum.variance.window_function.smooth_k_space.F90`

function: `smoothkspacevalue`
Description: Smooth-k space power spectrum window function proposed in Leo et al. [2018]. spectrum.
Code lines: 19
Contained by: file `structure_formation.power_spectrum.variance.window_function.smooth_k_space.F90`
Modules used: `cosmology_parameters` `numerical_constants_math`

function: `smoothkspacewavenumbermaximum`
Description: Maximum wavenumber for a top hat in real space window function Fourier transformed into k-space used in computing the variance of the power spectrum.
Code lines: 11
Contained by: file `structure_formation.power_spectrum.variance.window_function.smooth_k_space.F90`

file: `structure_formation.power_spectrum.variance.window_function.top_hat.F90`
Description: Contains a module which implements a top-hat power spectrum window function class.
Code lines: 115
Modules used: `cosmology_parameters`

interface: `powerspectrumwindowfunctiontophat`
Description: Constructors for the `topHat` power spectrum window function class.
Code lines: 4
Contained by: file `structure_formation.power_spectrum.variance.window_function.top_hat.F90`

function: `tophatconstructorinternal`
Description: Internal constructor for the `topHat` power spectrum window function class.
Code lines: 8
Contained by: file `structure_formation.power_spectrum.variance.window_function.top_hat.F90`

function: `tophatconstructorparameters`
Description: Constructor for the `topHat` power spectrum window function class which takes a parameter set as input.
Code lines: 13
Contained by: file `structure_formation.power_spectrum.variance.window_function.top_hat.F90`
Modules used: `input_parameters`

subroutine: `tophatdestructor`
Description: Destructor for the `topHat` power spectrum window function class.
Code lines: 7
Contained by: file `structure_formation.power_spectrum.variance.window_function.top_hat.F90`

function: `tophatvalue`
Description: Top hat in real space window function Fourier transformed into k-space used in computing the variance of the power spectrum.
Code lines: 24
Contained by: file `structure_formation.power_spectrum.variance.window_function.top_hat.F90`
Modules used: `cosmology_parameters` `numerical_constants_math`

function: `tophatwavenumbermaximum`
Description: Maximum wavenumber for a top hat in real space window function Fourier transformed into k-space used in computing the variance of the power spectrum.
Code lines: 11
Contained by: file `structure_formation.power_spectrum.variance.window_function.top_hat.F90`

file: `structure_formation.power_spectrum.variance.window_function.top_hat_kspace_sharp_-hybrid.F90`

Description: Contains a module which implements a hybrid top-hat/sharp k-space power spectrum window function class.
Code lines: 214
Modules used: cosmology_parameters

interface: powerspectrumwindowfunctiontophatsharpkhybrid
Description: Constructors for the topHatSharpKHybrid power spectrum window function class.
Code lines: 4
Contained by: file structure_formation.power_spectrum.variance.window_function.top_hat_kspace_sharp_hybri

function: tophatsharpkhybridconstructorinternal
Description: Internal constructor for the topHatSharpKHybrid power spectrum window function class.
Code lines: 22
Contained by: file structure_formation.power_spectrum.variance.window_function.top_hat_kspace_sharp_hybri
Modules used: numerical_constants_math

function: tophatsharpkhybridconstructorparameters
Description: Constructor for the topHatSharpKHybrid power spectrum window function class which takes a parameter set as input.
Code lines: 48
Contained by: file structure_formation.power_spectrum.variance.window_function.top_hat_kspace_sharp_hybri
Modules used: input_parameters

subroutine: tophatsharpkhybriddestructor
Description: Destructor for the topHatSharpKHybrid power spectrum window function class.
Code lines: 7
Contained by: file structure_formation.power_spectrum.variance.window_function.top_hat_kspace_sharp_hybri

subroutine: tophatsharpkhybridradii
Description: Computes the radii of the top-hat and sharp k-space filters. Specifically, uses a convolution of top-hat real-space and sharp k-space window functions. The top-hat radius is $r_{\rm th}$, while the k-space cut-off wavenumber is $k_{\rm s} = a/r_{\rm s}$, where $a =$[normalization]. The two radii are chosen such that $r_{\rm th}^2 + r_{\rm s}^2 = (3M/4\pi\bar{rho})^{1/3}$ and $r_{\rm s} = \beta r_{\rm th}$ where $\beta =$[radiiRatio].
Code lines: 18
Contained by: file structure_formation.power_spectrum.variance.window_function.top_hat_kspace_sharp_hybri
Modules used: numerical_constants_math

function: tophatsharpkhybridvalue
Description: Computes a window function for calculations of the variance in the power spectrum. Specifically, uses a convolution of top-hat real-space and sharp k-space window functions. The top-hat radius is $r_{\rm th}$, while the k-space cut-off wavenumber is $k_{\rm s} = a/r_{\rm s}$, where $a =$[normalization]. The two radii are chosen such that $r_{\rm th}^2 + r_{\rm s}^2 = (3M/4\pi\bar{rho})^{1/3}$ and $r_{\rm s} = \beta r_{th}$ where $\beta =$[pradiiRatio].
Code lines: 38
Contained by: file structure_formation.power_spectrum.variance.window_function.top_hat_kspace_sharp_hybri

function: tophatsharpkhybridwavenumbermaximum

Description: Computes the maximum wavenumber at which the window function for calculations of the variance in the power spectrum is non-zero. Specifically, uses a convolution of top-hat real-space and sharp k-space window functions. The top-hat radius is $r_{\rm th}$, while the k-space cut-off wavenumber is $k_{\rm s} = a/r_{\rm s}$, where $a =$`[normalization]`. The two radii are chosen such that $r_{\rm th}^2 + r_{\rm s}^2 = (3M/4\pi r\bar{h}o)^{1/3}$ and $r_{\rm s} = \beta r_{\rm th}$ where $\beta =$`[radiiRatio]`.

Code lines: 14

Contained by: file structure_formation.power_spectrum.variance.window_function.top_hat_kspace_sharp_hybri

file: structure_formation.spherical_collapse.matter_dark_energy.F90

Description: Contains a module which implements calculations of spherical top hat collapse in cosmologies containing matter and dark energy.

Code lines: 347

module: spherical_collapse_matter_dark_energy

Description: Implements calculations of spherical top hat collapse in cosmologies containing matter and dark energy.

Code lines: 325

Contained by: file structure_formation.spherical_collapse.matter_dark_energy.F90

Modules used: cosmology_functions, fgsl, iso_varying_string

Used by: subroutine node_component_basic_-extended_bindings, subroutine sphericalcollapsematterderetabulate, function sphericalcollapsematterdeconstructorparameters, subroutine sphericalcollapsematterderetabulate, function sphericalcollapsematterdeturnaroundovervirialradii

function: expansionrateperturbation

Description: Return the expansion rate of a spherical top-hat perturbation in a dark energy universe given an initial perturbation amplitude epsilonPerturbation.

Code lines: 8

Contained by: module spherical_collapse_matter_dark_energy

subroutine: make_table

Description: Tabulate $\delta_{\rm crit}$ or $\Delta_{\rm vir}$ vs. time.

Code lines: 159

Contained by: module spherical_collapse_matter_dark_energy

Modules used: galacticus_display, galacticus_error, input_parameters, linear_growth, root_finder, tables

subroutine: perturbation_dynamics_solver

Description: Integrate the dynamics of a spherical top-hat perturbation in a dark energy universe given an initial perturbation amplitude epsilonPerturbation.

Code lines: 44

Contained by: module spherical_collapse_matter_dark_energy

Modules used: fodeiv2, odeiv2_solver

function: perturbationodes

Code lines: 17

Contained by: module spherical_collapse_matter_dark_energy

function: radiusperturbation

Description: Return the radius of a spherical top-hat perturbation in a dark energy universe given an initial perturbation amplitude epsilonPerturbation.

Code lines: 8

Contained by: module spherical_collapse_matter_dark_energy

subroutine: spherical_collapse_dark_energy_critical_overdensity_tabulate
Description: Tabulate the critical overdensity for collapse for the spherical collapse model.
Code lines: 12
Contained by: module spherical_collapse_matter_dark_energy
Modules used: linear_growth tables

subroutine: spherical_collapse_dark_energy_turnaround_radius_tabulate
Description: Tabulate the ratio of turnaround to virial radiii for the spherical collapse model.
Code lines: 11
Contained by: module spherical_collapse_matter_dark_energy
Modules used: tables

subroutine: spherical_collapse_dark_energy_virial_density_contrast_tabulate
Description: Tabulate the virial density contrast for the spherical collapse model.
Code lines: 11
Contained by: module spherical_collapse_matter_dark_energy
Modules used: tables

file: structure_formation.spherical_collapse.matter_lambda.F90
Description: Contains a module which implements calculations of spherical top hat collapse in cosmologies containing matter and a cosmological constant.
Code lines: 560

module: spherical_collapse_matter_lambda
Code lines: 537
Contained by: file structure_formation.spherical_collapse.matter_lambda.F90
Modules used: fgsl iso_c_binding
Used by: subroutine function normaloverdensitynonlinear sphericalcollapsematterlambdaretabulate
subroutine program tests_spherical_collapse_-sphericalcollapsematterlambdaretabulate nonlinear

function: amaximumroot
Description: Root function for maximum expansion radius.
Code lines: 6
Contained by: module spherical_collapse_matter_lambda

function: collapseroot
Code lines: 7
Contained by: module spherical_collapse_matter_lambda

subroutine: make_table
Description: Tabulate $\delta_{\rm crit}$ or $\Delta_{\rm vir}$ vs. time.

file: structure_formation.transfer_function.BBKS.F90
Description: Contains a module which implements the transfer function fitting function of Bardeen et al. [1986].
Code lines: 163
Modules used: cosmology_parameters dark_matter_particles

function: bbksconstructorinternal
Description: Internal constructor for the "BBKS" transfer function class.
Code lines: 22
Contained by: file structure_formation.transfer_function.BBKS.F90
Modules used: galacticus_error

function: bbksconstructorparameters
Description: Constructor for the "BBKS" transfer function class which takes a parameter set as input.
Code lines: 20
Contained by: file structure_formation.transfer_function.BBKS.F90
Modules used: cosmology_functions input_parameters

subroutine: bbksdestructor
Description: Destructor for the "BBKS" transfer function class.
Code lines: 8
Contained by: file structure_formation.transfer_function.BBKS.F90

function: bbksepochtime
Description: Return the cosmic time at the epoch at which this transfer function is defined.
Code lines: 7
Contained by: file structure_formation.transfer_function.BBKS.F90

function: bbkshalfmodemass
Description: Compute the mass corresponding to the wavenumber at which the transfer function is suppressed by a factor of two relative to a CDM transfer function. Not supported in this implementation.
Code lines: 16
Contained by: file structure_formation.transfer_function.BBKS.F90
Modules used: galacticus_error

function: `bbkslogarithmicderivative`
Description: Return the logarithmic derivative of the transfer function at the given wavenumber.
Code lines: 12
Contained by: file `structure_formation.transfer_function.BBKS.F90`

function: `bbksvalue`
Description: Return the transfer function at the given wavenumber.
Code lines: 12
Contained by: file `structure_formation.transfer_function.BBKS.F90`

interface: `transferfunctionbbks`
Description: Constructors for the "BBKS" transfer function class.
Code lines: 4
Contained by: file `structure_formation.transfer_function.BBKS.F90`

file: `structure_formation.transfer_function.BBKS.WDM.F90`
Description: Contains a module which implements a transfer function class based on the WDM modifier of Bardeen et al. [1986].
Code lines: 162
Modules used: `cosmology_parameters` `dark_matter_particles`

function: `bbkswdmconstructorinternal`
Description: Internal constructor for the "`bbksWDM`" transfer function class.
Code lines: 25
Contained by: file `structure_formation.transfer_function.BBKS.WDM.F90`
Modules used: `galacticus_error`

function: `bbkswdmconstructorparameters`
Description: Constructor for the "`bbksWDM`" transfer function class which takes a parameter set as input.
Code lines: 22
Contained by: file `structure_formation.transfer_function.BBKS.WDM.F90`
Modules used: `input_parameters`

subroutine: `bbkswdmdestructor`
Description: Destructor for the `bbksWDM` transfer function class.
Code lines: 9
Contained by: file `structure_formation.transfer_function.BBKS.WDM.F90`

function: `bbkswdmepochtime`
Description: Return the cosmic time at the epoch at which this transfer function is defined.
Code lines: 7
Contained by: file `structure_formation.transfer_function.BBKS.WDM.F90`

function: `bbkswdmhalfmodemass`
Description: Compute the mass corresponding to the wavenumber at which the transfer function is suppressed by a factor of two relative to a CDM transfer function.
Code lines: 16
Contained by: file `structure_formation.transfer_function.BBKS.WDM.F90`
Modules used: `galacticus_error` `numerical_constants_math`

function: `bbkswdmlogarithmicderivative`
Description: Return the logarithmic derivative of the transfer function at the given wavenumber.
Code lines: 10
Contained by: file `structure_formation.transfer_function.BBKS.WDM.F90`

function: `bbkswdmvalue`
Description: Return the transfer function at the given wavenumber.
Code lines: 10
Contained by: file `structure_formation.transfer_function.BBKS.WDM.F90`

interface: `transferfunctionbbkswdm`
Description: Constructors for the "`bbksWDM`" transfer function class.

Contained by: file structure_formation.transfer_function.Bode2001.F90

interface: transferfunctionbode2001
Description: Constructors for the "bode2001" transfer function class.
Code lines: 4
Contained by: file structure_formation.transfer_function.Bode2001.F90

file: structure_formation.transfer_function.CAMB.F90
Description: Contains a module which implements a transfer function class using the CAMB code.
Code lines: 221
Modules used: cosmology_parameters dark_matter_particles file_utilities tables

subroutine: cambcheckrange
Description: Check that the provided wavenumber is within the tabulated range and, if not, recompute the CAMB transfer function.
Code lines: 52
Contained by: file structure_formation.transfer_function.CAMB.F90
Modules used: interfaces_camb

function: cambconstructorinternal
Description: Internal constructor for the CAMB transfer function class.
Code lines: 30
Contained by: file structure_formation.transfer_function.CAMB.F90
Modules used: dark_matter_particles galacticus_error input_parameters numerical_constants_astronomical

function: cambconstructorparameters
Description: Constructor for the CAMB transfer function class which takes a parameter set as input.
Code lines: 34
Contained by: file structure_formation.transfer_function.CAMB.F90
Modules used: input_parameters

subroutine: cambdestructor
Description: Destructor for the CAMB transfer function class.
Code lines: 8
Contained by: file structure_formation.transfer_function.CAMB.F90

function: camblogarithmicderivative
Description: Return the logarithmic derivative of the transfer function at the given wavenumber.

Code lines: 9
Contained by: file structure_formation.transfer_function.CAMB.F90

function: cambvalue
Description: Return the transfer function at the given wavenumber.
Code lines: 9
Contained by: file structure_formation.transfer_function.CAMB.F90

interface: transferfunctioncamb
Description: Constructors for the file transfer function class.
Code lines: 4
Contained by: file structure_formation.transfer_function.CAMB.F90

file: structure_formation.transfer_function.Eisenstein_Hu.F90
Description: Contains a module which implements a transfer function class using the fitting function of Eisenstein and Hu [1999].
Code lines: 271
Modules used: cosmology_parameters dark_matter_particles

subroutine: eisensteinhu1999computefactors
Description: Compute common factors required by "eisensteinHu1999" transfer function class.
Code lines: 26
Contained by: file structure_formation.transfer_function.Eisenstein_Hu.F90

function: eisensteinhu1999constructorinternal
Description: Internal constructor for the "eisensteinHu1999" transfer function class.
Code lines: 53
Contained by: file structure_formation.transfer_function.Eisenstein_Hu.F90
Modules used: dark_matter_particles galacticus_error

function: eisensteinhu1999constructorparameters
Description: Constructor for the "eisensteinHu1999" transfer function class which takes a parameter set as input.
Code lines: 41
Contained by: file structure_formation.transfer_function.Eisenstein_Hu.F90
Modules used: cosmology_functions input_parameters

subroutine: eisensteinhu1999destructor
Description: Destructor for the eisensteinHu1999 transfer function class.
Code lines: 8
Contained by: file structure_formation.transfer_function.Eisenstein_Hu.F90

function: eisensteinhu1999epochtime
Description: Return the cosmic time at the epoch at which this transfer function is defined.
Code lines: 7
Contained by: file structure_formation.transfer_function.Eisenstein_Hu.F90

function: eisensteinhu1999halfmodemass
Description: Compute the mass corresponding to the wavenumber at which the transfer function is suppressed by a factor of two relative to a CDM transfer function. Not supported in this implementation.
Code lines: 16

Contained by: file structure_formation.transfer_function.Eisenstein_Hu.F90
Modules used: galacticus_error

function: eisensteinhu1999logarithmicderivative
Description: Return the logarithmic derivative of the transfer function at the given wavenumber.
Code lines: 25
Contained by: file structure_formation.transfer_function.Eisenstein_Hu.F90

function: eisensteinhu1999value
Description: Return the transfer function at the given wavenumber.
Code lines: 17
Contained by: file structure_formation.transfer_function.Eisenstein_Hu.F90

interface: transferfunctioneisensteinhu1999
Description: Constructors for the "eisensteinHu1999" transfer function class.
Code lines: 4
Contained by: file structure_formation.transfer_function.Eisenstein_Hu.F90

file: structure_formation.transfer_function.F90
Description: Contains a module which provides a class that implements transfer functions.
Code lines: 56

module: transfer_functions
Description: Provides an object that implements transfer functions.
Code lines: 34
Contained by: file structure_formation.transfer_function.F90
Used by: file dark_matter_profiles.structure.concentration.WDM.F90; subroutine galacticus_function_classes_destroy; subroutine galacticus_state_retrieve; subroutine galacticus_state_store; file structure_formation.power_spectrum.primordial.transferred.simple.F90; file tasks.halo_mass_function.F90; file tasks.merger_tree_file_builder.F90; program tests_power_spectrum; program tests_sigma; program tests_transfer_functions

file: structure_formation.transfer_function.accelerator.F90
Description: Implements a transfer function accelerator class which tabulates a transfer function for rapid interpolation.
Code lines: 167
Modules used: tables

function: acceleratorconstructorinternal
Description: Internal constructor for the accelerator transfer function class.
Code lines: 12
Contained by: file structure_formation.transfer_function.accelerator.F90

function: acceleratorconstructorparameters
Description: Constructor for the accelerator transfer function class which takes a parameter set as input.
Code lines: 21
Contained by: file structure_formation.transfer_function.accelerator.F90

subroutine: `acceleratordestructor`
Description: Destructor for the accelerator transfer function class.
Code lines: 8
Contained by: file `structure_formation.transfer_function.accelerator.F90`

function: `acceleratorepochtime`
Description: Return the cosmic time at the epoch at which this transfer function is defined.
Code lines: 7
Contained by: file `structure_formation.transfer_function.accelerator.F90`

function: `acceleratorhalfmodemass`
Description: Compute the mass corresponding to the wavenumber at which the transfer function is suppressed by a factor of two relative to a CDM transfer function
Code lines: 9
Contained by: file `structure_formation.transfer_function.accelerator.F90`

function: `acceleratorlogarithmicderivative`
Description: Return the logarithmic derivative of the transfer function at the given wavenumber.
Code lines: 11
Contained by: file `structure_formation.transfer_function.accelerator.F90`

subroutine: `acceleratortabulate`
Description: Tabulate the transfer function for rapid interpolation.
Code lines: 21
Contained by: file `structure_formation.transfer_function.accelerator.F90`

function: `acceleratorvalue`
Description: Return the transfer function at the given wavenumber.
Code lines: 11
Contained by: file `structure_formation.transfer_function.accelerator.F90`

interface: `transferfunctionaccelerator`
Description: Constructors for the accelerator transfer function class.
Code lines: 4
Contained by: file `structure_formation.transfer_function.accelerator.F90`

file: `structure_formation.transfer_function.file.F90`
Description: Implements a file-based transfer function class.
Code lines: 343
Modules used: `cosmology_functions` `cosmology_parameters` `tables`

function: `fileconstructorinternal`
Description: Internal constructor for the file transfer function class.
Code lines: 13
Contained by: file `structure_formation.transfer_function.file.F90`

function: `fileconstructorparameters`
Description: Constructor for the file transfer function class which takes a parameter set as input.

Code lines: 33
Contained by: file structure_formation.transfer_function.file.F90
Modules used: input_parameters

subroutine: filedestructor
Description: Destructor for the file transfer function class.
Code lines: 9
Contained by: file structure_formation.transfer_function.file.F90

function: fileepochtime
Description: Return the cosmic time at the epoch at which this transfer function is defined.
Code lines: 7
Contained by: file structure_formation.transfer_function.file.F90

function: filehalfmodemass
Description: Compute the mass corresponding to the wavenumber at which the transfer function is suppressed by a factor of two relative to a CDM transfer function. Not supported in this implementation.
Code lines: 17
Contained by: file structure_formation.transfer_function.file.F90
Modules used: galacticus_error

function: filelogarithmicderivative
Description: Return the logarithmic derivative of the transfer function at the given wavenumber.
Code lines: 8
Contained by: file structure_formation.transfer_function.file.F90

subroutine: filereadfile
Description: Internal constructor for the file transfer function class.
Code lines: 74
Contained by: file structure_formation.transfer_function.file.F90
Modules used: array_utilities, fgsl, file_utilities, galacticus_display, galacticus_error, input_parameters, io_hdf5, numerical_comparison, table_labels

function: filevalue
Description: Return the transfer function at the given wavenumber.
Code lines: 8
Contained by: file structure_formation.transfer_function.file.F90

interface: transferfunctionfile
Description: Constructors for the file transfer function class.
Code lines: 4
Contained by: file structure_formation.transfer_function.file.F90

file: structure_formation.transfer_function.identity.F90
Description: Contains a module which implements an identity transfer function class.
Code lines: 138

function: `identityconstructorinternal`
Description: Internal constructor for the identity transfer function class.
Code lines: 9
Contained by: file `structure_formation.transfer_function.identity.F90`
Modules used: `input_parameters`

function: `identityconstructorparameters`
Description: Constructor for the identity transfer function class which takes a parameter set as input.
Code lines: 23
Contained by: file `structure_formation.transfer_function.identity.F90`
Modules used: `cosmology_functions` `input_parameters`

subroutine: `identitydestructor`
Description: Destructor for the identity transfer function class.
Code lines: 8
Contained by: file `structure_formation.transfer_function.identity.F90`

function: `identityepochtime`
Description: Return the cosmic time at the epoch at which this transfer function is defined.
Code lines: 7
Contained by: file `structure_formation.transfer_function.identity.F90`

function: `identityhalfmodemass`
Description: Compute the mass corresponding to the wavenumber at which the transfer function is suppressed by a factor of two relative to a CDM transfer function. Not supported in this implementation.
Code lines: 16
Contained by: file `structure_formation.transfer_function.identity.F90`
Modules used: `galacticus_error`

function: `identitylogarithmicderivative`
Description: Return the logarithmic derivative of the transfer function at the given wavenumber.
Code lines: 9
Contained by: file `structure_formation.transfer_function.identity.F90`

function: `identityvalue`
Description: Return the transfer function at the given wavenumber.
Code lines: 9
Contained by: file `structure_formation.transfer_function.identity.F90`

interface: `transferfunctionidentity`
Description: Constructors for the identity transfer function class.
Code lines: 4
Contained by: file `structure_formation.transfer_function.identity.F90`

file: `structure_formation.unevolved_subhalo_mass_function.F90`
Description: Contains a module which provides a class that implements subhalo mass functions.
Code lines: 45

module: `unevolved_subhalo_mass_functions`
Code lines: 23
Contained by: file `structure_formation.unevolved_subhalo_mass_function.F90`
Used by: subroutine `galacticus_function_-classes_destroy` subroutine `galacticus_state_retrieve` subroutine `galacticus_state_store` file `tasks.halo_mass_function.F90`

file: `structure_formation.unevolved_subhalo_mass_function.Giocoli2008.F90`
Description: Contains a module which implements a Giocoli et al. [2008] unevolved dark matter subhalo mass function class.
Code lines: 135

function: `giocoli2008constructorinternal`
Description: Internal constructor for the `giocoli2008` halo mass function class.
Code lines: 9
Contained by: file `structure_formation.unevolved_subhalo_mass_function.Giocoli2008.F90`

function: `giocoli2008constructorparameters`
Description: Constructor for the `giocoli2008` halo mass function class which takes a parameter set as input.
Code lines: 30
Contained by: file `structure_formation.unevolved_subhalo_mass_function.Giocoli2008.F90`
Modules used: `input_parameters`

function: `giocoli2008differential`
Description: Return the differential unevolved subhalo mass function at the given time and mass.
Code lines: 11
Contained by: file `structure_formation.unevolved_subhalo_mass_function.Giocoli2008.F90`

function: `giocoli2008integrated`
Description: Return the integrated unevolved subhalo mass function at the given time and mass.
Code lines: 33
Contained by: file `structure_formation.unevolved_subhalo_mass_function.Giocoli2008.F90`
Modules used: `gamma_functions`

function: `gammaincomplete`
Description: Evaluate the incomplete gamma function, possibly for a negative exponent.
Code lines: 15
Contained by: function `giocoli2008integrated`
Modules used: `galacticus_error`

interface: `unevolvedsubhalomassfunctiongiocoli2008`
Description: Constructors for the `giocoli2008` halo mass function class.
Code lines: 4
Contained by: file `structure_formation.unevolved_subhalo_mass_function.Giocoli2008.F90`

file: `structure_formation.virial_density_contrast.Bryan_Norman.F90`
Description: An implementation of Bryan and Norman [1998] dark matter halo virial density contrasts.

Code lines: 171
Modules used: cosmology_functions cosmology_parameters

function: bryannorman1998constructorinternal
Description: Internal constructor for the bryanNorman1998 dark matter halo virial density contrast class.
Code lines: 19
Contained by: file structure_formation.virial_density_contrast.Bryan_Norman.F90
Modules used: galacticus_error numerical_comparison

function: bryannorman1998constructorparameters
Description: Constructor for the bryanNorman1998 dark matter halo virial density contrast class which takes a parameter set as input.
Code lines: 16
Contained by: file structure_formation.virial_density_contrast.Bryan_Norman.F90
Modules used: input_parameters

function: bryannorman1998densitycontrast
Description: Return the virial density contrast at the given epoch, assuming the fitting function of Bryan and Norman [1998].
Code lines: 24
Contained by: file structure_formation.virial_density_contrast.Bryan_Norman.F90
Modules used: cosmology_functions galacticus_error numerical_constants_math

function: bryannorman1998densitycontrastrateofchange
Description: Return the virial density contrast at the given epoch, assuming the fitting function of Bryan and Norman [1998].
Code lines: 24
Contained by: file structure_formation.virial_density_contrast.Bryan_Norman.F90
Modules used: cosmology_functions galacticus_error numerical_constants_math

subroutine: bryannorman1998destructor
Description: Destructor for the bryanNorman1998 virial density contrast class.
Code lines: 8
Contained by: file structure_formation.virial_density_contrast.Bryan_Norman.F90

function: bryannorman1998turnaroundovervirialradii
Description: Return the ratio of turnaround and virial radii at the given epoch, based spherical collapse in a matter plus cosmological constant universe.
Code lines: 13
Contained by: file structure_formation.virial_density_contrast.Bryan_Norman.F90

interface: virialdensitycontrastbryannorman1998
Description: Constructors for the bryanNorman1998 dark matter halo virial density contrast class.
Code lines: 4
Contained by: file structure_formation.virial_density_contrast.Bryan_Norman.F90

file: structure_formation.virial_density_contrast.F90

Description: Contains a module which provides a class implementing the virial density contrast for halos.
Code lines: 72

module: `virial_density_contrast`
Description: Provides a class implementing the virial density contrast for halos.
Code lines: 50
Contained by: file structure_formation.virial_density_contrast.F90

file: `structure_formation.virial_density_contrast.Kitayama_Suto1996.F90`
Description: An implementation of Kitayama and Suto [1996] dark matter halo virial density contrasts.
Code lines: 111
Modules used: cosmology_functions

function: `kitayamasuto1996constructorinternal`

Description: Internal constructor for the `kitayamaSuto1996` dark matter halo virial density contrast class.
Code lines: 10
Contained by: file `structure_formation.virial_density_contrast.Kitayama_Suto1996.F90`
Modules used: `galacticus_error` `numerical_comparison`

function: `kitayamasuto1996constructorparameters`
Description: Constructor for the `kitayamaSuto1996` dark matter halo virial density contrast class which takes a parameter set as input.
Code lines: 13
Contained by: file `structure_formation.virial_density_contrast.Kitayama_Suto1996.F90`
Modules used: `input_parameters`

function: `kitayamasuto1996densitycontrast`
Description: Return the virial density contrast at the given epoch, assuming the fitting function of Kitayama and Suto [1996].
Code lines: 14
Contained by: file `structure_formation.virial_density_contrast.Kitayama_Suto1996.F90`
Modules used: `numerical_constants_math`

function: `kitayamasuto1996densitycontrastrateofchange`
Description: Return the virial density contrast at the given epoch, assuming the fitting function of Kitayama and Suto [1996].
Code lines: 14
Contained by: file `structure_formation.virial_density_contrast.Kitayama_Suto1996.F90`
Modules used: `numerical_constants_math`

subroutine: `kitayamasuto1996destructor`
Description: Destructor for the `bryanNorman1998` virial density contrast class.
Code lines: 7
Contained by: file `structure_formation.virial_density_contrast.Kitayama_Suto1996.F90`

interface: `virialdensitycontrastkitayamasuto1996`
Description: Constructors for the `kitayamaSuto1996` dark matter halo virial density contrast class.
Code lines: 4
Contained by: file `structure_formation.virial_density_contrast.Kitayama_Suto1996.F90`

file: `structure_formation.virial_density_contrast.fixed.F90`
Description: An implementation of fixed dark matter halo virial density contrasts.
Code lines: 166
Modules used: `cosmology_functions` `cosmology_parameters`

function: `fixedconstructorinternal`
Description: Constructor for the `fixed` dark matter halo virial density contrast class.
Code lines: 13
Contained by: file `structure_formation.virial_density_contrast.fixed.F90`
Modules used: `galacticus_error`

function: `fixedconstructorparameters`

Description: Constructor for the `fixed` dark matter halo virial density contrast class that takes a parameter set as input.
Code lines: 35
Contained by: file `structure_formation.virial_density_contrast.fixed.F90`
Modules used: `input_parameters` `iso_varying_string`

function: `fixeddensitycontrast`
Description: Return the virial density contrast at the given epoch, assuming a fixed contrast.
Code lines: 23
Contained by: file `structure_formation.virial_density_contrast.fixed.F90`

function: `fixeddensitycontrastrateofchange`
Description: Return the virial density contrast at the given epoch, assuming a fixed contrast.
Code lines: 19
Contained by: file `structure_formation.virial_density_contrast.fixed.F90`

subroutine: `fixeddestructor`
Description: Destructor for the `fixed` virial density contrast class.
Code lines: 8
Contained by: file `structure_formation.virial_density_contrast.fixed.F90`

interface: `virialdensitycontrastfixed`
Description: Constructors for the `fixed` dark matter halo virial density contrast class.
Code lines: 4
Contained by: file `structure_formation.virial_density_contrast.fixed.F90`

file: `structure_formation.virial_density_contrast.friends-of-friends.F90`
Description: An implementation of dark matter halo virial density contrasts based on a friends-of-friends linking length.
Code lines: 110

function: `friendsoffriendsconstructorinternal`
Description: Generic constructor for the `friendsOfFriends` dark matter halo virial density contrast class.
Code lines: 9
Contained by: file `structure_formation.virial_density_contrast.friends-of-friends.F90`
Modules used: `input_parameters`

function: `friendsoffriendsconstructorparameters`
Description: Default constructor for the `friendsOfFriends` dark matter halo virial density contrast class.
Code lines: 27
Contained by: file `structure_formation.virial_density_contrast.friends-of-friends.F90`
Modules used: `input_parameters`

function: `friendsoffriendsdensitycontrast`
Description: Return the virial density contrast at the given epoch, based on the friends-of-friends algorithm linking length.
Code lines: 14
Contained by: file `structure_formation.virial_density_contrast.friends-of-friends.F90`
Modules used: `numerical_constants_math`

function: `friendsoffriendsdensitycontrastrateofchange`
Description: Return the virial density contrast at the given epoch, based on the friends-of-friends algorithm linking length.
Code lines: 12
Contained by: file `structure_formation.virial_density_contrast.friends-of-friends.F90`
Modules used: `numerical_constants_math`

interface: `virialdensitycontrastfriendsoffriends`
Description: Constructors for the `friendsOfFriends` dark matter halo virial density contrast class.
Code lines: 4
Contained by: file `structure_formation.virial_density_contrast.friends-of-friends.F90`

file: `structure_formation.virial_density_contrast.percolation.F90`
Description: An implementation of dark matter halo virial density contrasts based on the percolation analysis of More et al. [2011].
Code lines: 496
Modules used: `cosmology_functions` `kind_numbers` `tables`

function: `percolationconstructorinternal`
Description: Internal constructor for the `percolation` dark matter halo virial density contrast class.
Code lines: 57
Contained by: file `structure_formation.virial_density_contrast.percolation.F90`
Modules used: `galacticus_error` `input_parameters`

function: `percolationconstructorparameters`
Description: Constructor for the `percolation` dark matter halo virial density contrast class that takes a parameter set as input.
Code lines: 38
Contained by: file `structure_formation.virial_density_contrast.percolation.F90`
Modules used: `cosmology_functions` `functions_global` `input_parameters`

subroutine: `percolationcopytable`
Description: Copy the table from a recursive child's parent.
Code lines: 23
Contained by: file `structure_formation.virial_density_contrast.percolation.F90`
Modules used: `galacticus_error`

subroutine: `percolationdeepcopy`
Description: Perform a deep copy of the object.
Code lines: 53
Contained by: file `structure_formation.virial_density_contrast.percolation.F90`
Modules used: `functions_global` `galacticus_error`

subroutine: `percolationdeepcopyassign`
Description: Perform pointer assignment during a deep copy of the object.
Code lines: 11

Contained by: file structure_formation.virial_density_contrast.percolation.F90

function: percolationdensitycontrast
Description: Return the virial density contrast at the given epoch, based on the percolation algorithm of More et al. [2011].
Code lines: 56
Contained by: file structure_formation.virial_density_contrast.percolation.F90
Modules used: galacticus_error solvercurrent table

function: percolationdensitycontrastrateofchange
Description: Return the rate of change of the virial density contrast at the given epoch, based on the percolation algorithm of More et al. [2011].
Code lines: 34
Contained by: file structure_formation.virial_density_contrast.percolation.F90
Modules used: galacticus_error

subroutine: percolationdestructor
Description: Destructor for the percolation virial density contrast class.
Code lines: 11
Contained by: file structure_formation.virial_density_contrast.percolation.F90
Modules used: galacticus_error

subroutine: percolationfindparent
Description: Find the deep-copied parent of a recursive child.
Code lines: 15
Contained by: file structure_formation.virial_density_contrast.percolation.F90
Modules used: galacticus_error

function: percolationismassdepdendent
Description: Specify that the percolation virial density contrast class is mass-dependent.
Code lines: 8
Contained by: file structure_formation.virial_density_contrast.percolation.F90

subroutine: percolationtabulate
Description: Tabulate virial density contrast as a function of mass and time for the percolation density contrast class.
Code lines: 72
Contained by: file structure_formation.virial_density_contrast.percolation.F90
Modules used: functions_global galacticus_display galacticus_error

interface: virialdensitycontrastpercolation
Description: Constructors for the percolation dark matter halo virial density contrast class.
Code lines: 4
Contained by: file structure_formation.virial_density_contrast.percolation.F90

file: structure_formation.virial_density_contrast.percolation.utilities.F90
Description: Contains a module of utilities needed by the percolation virial density contrast class.

Code lines: 291

module: `virial_density_contrast_percolation_utilities`
Description: Provides utilities needed by the `percolation` virial density contrast class.
Code lines: 269
Contained by: file `structure_formation.virial_density_contrast.percolation.utilities.F90`
Modules used: `cosmology_functions`, `cosmology_parameters`, `dark_matter_halo_scales`, `dark_matter_profile_scales`, `dark_matter_profiles_concentration`, `dark_matter_profiles_dmo`, `dark_matter_profiles_shape`, `galacticus_nodes`
Used by: subroutine `functions_global_set`

function: `haloradiusrootfunction`
Description: Root function used to find the radius of a halo giving the correct bounding density.
Code lines: 22
Contained by: module `virial_density_contrast_percolation_utilities`
Modules used: `galacticus_calculations_resets`, `numerical_constants_math`

type: `percolationobjects`
Description: Type used to store pointers to objects
Code lines: 10
Contained by: module `virial_density_contrast_percolation_utilities`

subroutine: `percolationobjectsdeepcopy`
Description: Perform a deep copy of percolation virial density contrast objects.
Code lines: 35
Contained by: module `virial_density_contrast_percolation_utilities`
Modules used: `galacticus_error`

subroutine: `percolationobjectsdestructor`
Description: Destruct an instance of the container type for percolation virial density contrast objects.
Code lines: 12
Contained by: module `virial_density_contrast_percolation_utilities`

type: `solverstate`
Code lines: 8
Contained by: module `virial_density_contrast_percolation_utilities`

function: `virial_density_contrast_percolation_objects_constructor`
Description: Construct an instance of the container type for percolation virial density contrast objects from a parameter structure.
Code lines: 18
Contained by: module `virial_density_contrast_percolation_utilities`
Modules used: `input_parameters`

function: `virial_density_contrast_percolation_solver`
Description: Return the virial density contrast at the given epoch, based on the percolation algorithm of More et al. [2011].
Code lines: 110
Contained by: module `virial_density_contrast_percolation_utilities`

Modules used: dark_matter_profile_scales, fgsl, galacticus_calculations_resets, galacticus_display, galacticus_error, galacticus_hdf5, galacticus_nodes, io_hdf5, iso_c_binding, memory_management, numerical_constants_astronomical, numerical_integration, numerical_ranges, string_handling

function: subhaloMassFunctionIntegrand
Description: Integrand function used to find the cumulative subhalo mass function.
Code lines: 11
Contained by: subroutine haloMassFunctionPerform

interface: taskHaloMassFunction
Description: Constructors for the haloMassFunction task.
Code lines: 4

Contained by: file tasks.halo_mass_function.F90

file: tasks.halo_model.projected_correlation_function.F90
Code lines: 284
Modules used: conditional_mass_functions, cosmology_functions, dark_matter_halo_biases, dark_matter_halo_scales, dark_matter_profile_scales, dark_matter_profiles_dmo, geometry_surveys, halo_mass_functions, linear_growth, power_spectra

function: halomodelprojectedcorrelationfunctionconstructorinternal
Description: Constructor for the haloModelProjectedCorrelationFunction task class which takes a parameter set as input.
Code lines: 26
Contained by: file tasks.halo_model.projected_correlation_function.F90
Modules used: memory_management, numerical_ranges

function: halomodelprojectedcorrelationfunctionconstructorparameters
Description: Constructor for the haloModelProjectedCorrelationFunction task class which takes a parameter set as input.
Code lines: 138
Contained by: file tasks.halo_model.projected_correlation_function.F90
Modules used: galacticus_nodes, input_parameters, node_components

subroutine: halomodelprojectedcorrelationfunctiondestructor
Description: Destructor for the haloModelProjectedCorrelationFunction task class.
Code lines: 19
Contained by: file tasks.halo_model.projected_correlation_function.F90
Modules used: node_components

subroutine: halomodelprojectedcorrelationfunctionperform
Description: Generate a mock galaxy catalog using a simple halo model approach.
Code lines: 20
Contained by: file tasks.halo_model.projected_correlation_function.F90
Modules used: galacticus_display, galacticus_error, galacticus_hdf5, halo_model_projected_correlations, io_hdf5

function: halomodelprojectedcorrelationfunctionrequiresoutputfile
Description: Specifies that this task does not requires the main output file.
Code lines: 8
Contained by: file tasks.halo_model.projected_correlation_function.F90

interface: taskhalomodelprojectedcorrelationfunction
Description: Constructors for the haloModelProjectedCorrelationFunction task.
Code lines: 4
Contained by: file tasks.halo_model.projected_correlation_function.F90

file: tasks.halo_model_generate.F90
Code lines: 361
Modules used: conditional_mass_functions, cosmology_functions, cosmology_parameters, dark_matter_profile_scales, dark_matter_profiles_dmo

function: halomodelgenerateconstructorinternal
Description: Constructor for the haloModelGenerate task class which takes a parameter set as input.
Code lines: 14
Contained by: file tasks.halo_model_generate.F90

function: halomodelgenerateconstructorparameters
Description: Constructor for the haloModelGenerate task class which takes a parameter set as input.
Code lines: 74
Contained by: file tasks.halo_model_generate.F90
Modules used: galacticus_nodes, input_parameters, node_components

subroutine: halomodelgeneratedestructor
Description: Destructor for the haloModelGenerate task class.
Code lines: 14
Contained by: file tasks.halo_model_generate.F90
Modules used: node_components

subroutine: halomodelgenerateperform
Description: Generate a mock galaxy catalog using a simple halo model approach.
Code lines: 190
Contained by: file tasks.halo_model_generate.F90
Modules used: conditional_mass_functions, galactic_structure_enclosed_masses, galactic_structure_options, galacticus_calculations_resets, galacticus_display, galacticus_error, galacticus_nodes, geometry_surveys, io_hdf5, io_irate, iso_varying_string, memory_management, numerical_constants_astronomical, numerical_constants_prefixes, pseudo_random, root_finder, string_handling

function: centralmassroot
Description: Root function used to find the mass of central galaxies
Code lines: 9
Contained by: subroutine halomodelgenerateperform

subroutine: galaxyadd
Description: Add a galaxy to the output buffers.
Code lines: 38
Contained by: subroutine halomodelgenerateperform

function: `satellitemassroot`
Description: Root function used to find the mass of satellite galaxies
Code lines: 9
Contained by: subroutine halomodelgenerateperform

function: `halomodelgenerateperform`
Description: Specifies that this task does not requires the main output file.
Code lines: 8
Contained by: file tasks.halo_model_generate.F90

interface: `taskhalomodelgenerate`
Description: Constructors for the `haloModelGenerate` task.
Code lines: 4
Contained by: file tasks.halo_model_generate.F90

file: `tasks.halo_spin_distribution.F90`
Code lines: 243
Modules used: cosmology_functions, halo_spin_distributions, output_times

function: `halospindistributionconstructorinternal`
Description: Constructor for the `haloSpinDistribution` task class which takes a parameter set as input.
Code lines: 12
Contained by: file tasks.halo_spin_distribution.F90

function: `halospindistributionconstructorparameters`
Description: Constructor for the `haloSpinDistribution` task class which takes a parameter set as input.
Code lines: 83
Contained by: file tasks.halo_spin_distribution.F90
Modules used: galacticus_nodes, input_parameters, node_components

subroutine: `halospindistributiondestructor`
Description: Destructor for the `haloSpinDistribution` task class.
Code lines: 12
Contained by: file tasks.halo_spin_distribution.F90
Modules used: node_components

subroutine: `halospindistributionperform`
Description: Compute and output the halo spin distribution.
Code lines: 82
Contained by: file tasks.halo_spin_distribution.F90
Modules used: galacticus_display, galacticus_error, galacticus_hdf5, galacticus_nodes, halo_spin_distributions, io_hdf5, iso_c_binding, string_handling

interface: `taskhalospindistribution`
Description: Constructors for the `haloSpinDistribution` task.
Code lines: 4
Contained by: file tasks.halo_spin_distribution.F90

file: `tasks.intergalactic_medium_state.F90`
Code lines: 170
Modules used: cosmology_functions, intergalactic_medium_filtering_masses, intergalactic_medium_state, output_times

function: `intergalacticmediumstateconstructorinternal`
Description: Constructor for the `intergalacticMediumState` task class which takes a parameter set as input.
Code lines: 12
Contained by: file tasks.intergalactic_medium_state.F90

function: `intergalacticmediumstateconstructorparameters`
Description: Constructor for the `intergalacticMediumState` task class which takes a parameter set as input.
Code lines: 31
Contained by: file tasks.intergalactic_medium_state.F90
Modules used: input_parameters

subroutine: `intergalacticmediumstatedestructor`
Description: Destructor for the `intergalacticMediumState` task class.
Code lines: 10
Contained by: file tasks.intergalactic_medium_state.F90

subroutine: `intergalacticmediumstateperform`
Description: Output IGM state to the Galacticus output file.
Code lines: 62
Contained by: file tasks.intergalactic_medium_state.F90
Modules used: galacticus_display, galacticus_error, galacticus_hdf5, io_hdf5, iso_c_binding, string_handling

interface: `taskintergalacticmediumstate`
Description: Constructors for the `intergalacticMediumState` task.
Code lines: 4
Contained by: file tasks.intergalactic_medium_state.F90

file: `tasks.mass_function_covariance.F90`
Code lines: 924
Modules used: conditional_mass_functions, cosmology_functions, dark_matter_halo_biases, geometry_surveys, halo_mass_functions, power_spectra_nonlinear

function: massfunctioncovarianceangularpowerintegrand
Description: Integrand for large scale structure variance computed using survey mask angular power spectrum.
Code lines: 41
Contained by: file tasks.mass_function_covariance.F90

function: massfunctioncovarianceangularpowerradialterm
Description: Computes the radial term in the expression for large scale structure variance.
Code lines: 49
Contained by: file tasks.mass_function_covariance.F90
Modules used: gamma_functions hypergeometric_functions numerical_constants_math

function: massfunctioncovariancebiasintegrandi
Description: Integral for bias.
Code lines: 9
Contained by: file tasks.mass_function_covariance.F90

subroutine: massfunctioncovariancecomputevolumenormalizations
Description: Compute volume normalization factors for LSS covariance calculations.
Code lines: 22
Contained by: file tasks.mass_function_covariance.F90
Modules used: fgsl numerical_integration

function: massfunctioncovarianceconstructorinternal
Description: Internal constructor for the massFunctionCovariance task class.
Code lines: 17
Contained by: file tasks.mass_function_covariance.F90

function: massfunctioncovarianceconstructorparameters
Description: Constructor for the powerSpectrum task class which takes a parameter set as input.
Code lines: 129
Contained by: file tasks.mass_function_covariance.F90
Modules used: input_parameters

subroutine: massfunctioncovariancedestructor
Description: Destructor for the massFunctionCovariance task class.
Code lines: 12
Contained by: file tasks.mass_function_covariance.F90

function: massfunctioncovariancegalaxyrootpowerspectrum
Description: Computes the quantity $\int_{t_{\rm min}}^{t_{\rm max}} {\rm d}t b(t) \sqrt{P(k,t)} {\rm d}V/{\rm d}t$, where $b(t)$ is galaxy bias, and $P(k,t)$ is the non-linear galaxy power spectrum.
Code lines: 17
Contained by: file tasks.mass_function_covariance.F90
Modules used: fgsl numerical_integration

function: massfunctioncovariancehalooccupancyintegrand

Description: Integral for mass function.
Code lines: 9
Contained by: file tasks.mass_function_covariance.F90

function: massfunctioncovariancehalooccupancytimeinterand
Description: Integral for comoving volume.
Code lines: 17
Contained by: file tasks.mass_function_covariance.F90
Modules used: fgsl numerical_integration

function: massfunctioncovariancelargescalestructureintegrand
Description: Integral for LSS contribution to the covariance matrix.
Code lines: 22
Contained by: file tasks.mass_function_covariance.F90
Modules used: fgsl numerical_interpolation

subroutine: massfunctioncovariancelssangularspectrum
Description: Compute variance due to large scale structure by integration over the angular power spectrum.
Code lines: 61
Contained by: file tasks.mass_function_covariance.F90
Modules used: fgsl galacticus_display
memory_management numerical_constants_math
numerical_integration

subroutine: massfunctioncovariancelsswindowfunction
Description: Compute variance due to large scale structure by directly summing over the Fourier transform of the survey selection function.
Code lines: 107
Contained by: file tasks.mass_function_covariance.F90
Modules used: fftw3 galacticus_display
iso_c_binding memory_management
numerical_constants_math

function: massfunctioncovariancemassfunctionintegrandi
Description: Integral for mass function.
Code lines: 9
Contained by: file tasks.mass_function_covariance.F90

function: massfunctioncovariancemassfunctiontimeintegrandi
Description: Integral for comoving volume.
Code lines: 17
Contained by: file tasks.mass_function_covariance.F90
Modules used: fgsl numerical_integration

subroutine: massfunctioncovarianceperform
Description: Compute and output the halo mass function.
Code lines: 263
Contained by: file tasks.mass_function_covariance.F90

Modules used: completeness, fgsl, galacticus_display, galacticus_error, io_hdf5, memory_management, number, numerical_constants_astronomical, numerical_constants_math, numerical_integration, numerical_ranges

function: massfunctioncovariancerequiresoutputfile
Description: Specifies that this task does not requires the main output file.
Code lines: 8
Contained by: file tasks.mass_function_covariance.F90

function: massfunctioncovariancevolumeintegrand
Description: Integral for comoving volume.
Code lines: 7
Contained by: file tasks.mass_function_covariance.F90

interface: taskmassfunctioncovariance
Description: Constructors for the powerSpectrum task.
Code lines: 4
Contained by: file tasks.mass_function_covariance.F90

file: tasks.merger_tree_file_builder.F90
Code lines: 567
Modules used: cosmological_density_field, cosmology_parameters, power_spectra_primordial, stateful_types, transfer_functions

function: mergertreefilebuilderconstructorinternal
Description: Constructor for the mergerTreeFileBuilder task class which takes a parameter set as input.
Code lines: 24
Contained by: file tasks.merger_tree_file_builder.F90

function: mergertreefilebuilderconstructorparameters
Description: Constructor for the mergerTreeFileBuilder task class which takes a parameter set as input.
Code lines: 353
Contained by: file tasks.merger_tree_file_builder.F90
Modules used: input_parameters, merger_tree_data_structure, numerical_constants_astronomical, numerical_constants_prefixes

subroutine: mergertreefilebuilderdestructor
Description: Destructor for the mergerTreeFileBuilder task class.
Code lines: 10
Contained by: file tasks.merger_tree_file_builder.F90

subroutine: mergertreefilebuilderperform
Description: Compute and output the halo mass function.

Code lines: 90
Contained by: file tasks.merger_tree_file_builder.F90
Modules used: dates_and_times, galacticus_display, galacticus_error, hdf5, input_parameters, merger_tree_data_structure

function: mergertreefilebuilderrequiresoutputfile
Description: Specifies that this task does not require the main output file.
Code lines: 8
Contained by: file tasks.merger_tree_file_builder.F90

type: mergertreemetadata
Description: Type used for metadata in merger tree files.
Code lines: 4
Contained by: file tasks.merger_tree_file_builder.F90

type: propertycolumn
Description: Type used to specify which property to read from which column,
Code lines: 4
Contained by: file tasks.merger_tree_file_builder.F90

interface: taskmergertreefilebuilder
Description: Constructors for the mergerTreeFileBuilder task.
Code lines: 4
Contained by: file tasks.merger_tree_file_builder.F90

file: tasks.multi.F90
Code lines: 172

function: multiconstructorinternal
Description: Internal constructor for the multi task class.
Code lines: 14
Contained by: file tasks.multi.F90

function: multiconstructorparameters
Description: Constructor for the multi task class which takes a parameter set as input.
Code lines: 22
Contained by: file tasks.multi.F90
Modules used: input_parameters

subroutine: multideepcopy
Description: Perform a deep copy for the multi task class.
Code lines: 31
Contained by: file tasks.multi.F90
Modules used: galacticus_error

subroutine: multidestructor
Description: Destructor for the multi task class.
Code lines: 16

Contained by: file tasks.multi.F90

subroutine: multiperform
Description: Perform all tasks.
Code lines: 19
Contained by: file tasks.multi.F90
Modules used: galacticus_display galacticus_error

function: multirequiresoutputfile
Description: Returns true if any sub-task requires that the output file be open.
Code lines: 13
Contained by: file tasks.multi.F90

type: multitasklist
Code lines: 3
Contained by: file tasks.multi.F90

interface: taskmulti
Description: Constructors for the multi task.
Code lines: 4
Contained by: file tasks.multi.F90

file: tasks.nBody_analyze.F90
Code lines: 143
Modules used: nbody_importers nbody_operators

function: nbodyanalyzeconstructorinternal
Description: Constructor for the nbodyAnalyze task class which takes a parameter set as input.
Code lines: 12
Contained by: file tasks.nBody_analyze.F90

function: nbodyanalyzeconstructorparameters
Description: Constructor for the nbodyAnalyze task class which takes a parameter set as input.
Code lines: 36
Contained by: file tasks.nBody_analyze.F90
Modules used: input_parameters

subroutine: nbodyanalyzedestructor
Description: Destructor for the nbodyAnalyze task class.
Code lines: 8
Contained by: file tasks.nBody_analyze.F90

subroutine: nbodyanalyzeperform
Description: Compute and output the halo mass function.
Code lines: 24
Contained by: file tasks.nBody_analyze.F90
Modules used: galacticus_display galacticus_error nbody_simulation_data

function: `nbodyanalyzerequiresoutputfile`
Description: Specifies that this task does not requires the main output file.
Code lines: 8
Contained by: file tasks.nBody_analyze.F90

interface: `tasknbodyanalyze`
Description: Constructors for the `nbodyAnalyze` task.
Code lines: 4
Contained by: file tasks.nBody_analyze.F90

file: `tasks.posterior_sample.F90`
Code lines: 117
Modules used: posterior_sampling_simulation

function: `posteriorsampleconstructorinternal`
Description: Internal constructor for the `posteriorSample` task class.
Code lines: 8
Contained by: file tasks.posterior_sample.F90

function: `posteriorsampleconstructorparameters`
Description: Constructor for the `posteriorSample` task class which takes a parameter set as input.
Code lines: 38
Contained by: file tasks.posterior_sample.F90
Modules used: galacticus_nodes input_parameters node_components

subroutine: `posteriorsampledestructor`
Description: Destructor for the `posteriorSample` task class.
Code lines: 9
Contained by: file tasks.posterior_sample.F90
Modules used: node_components

subroutine: `posteriorsampleperform`
Description: Perform the posterior sampling.
Code lines: 13
Contained by: file tasks.posterior_sample.F90
Modules used: galacticus_display galacticus_error

interface: `taskposteriorsample`
Description: Constructors for the `posteriorSample` task.
Code lines: 4
Contained by: file tasks.posterior_sample.F90

file: `tasks.power_spectrum.F90`
Code lines: 313
Modules used: cosmological_density_field cosmology_functions cosmology_parameters linear_growth

output_times power_spectra
power_spectra_nonlinear power_spectrum_window_functions

function: powerspectraconstructorinternal
Description: Internal constructor for the powerSpectrum task class.
Code lines: 19
Contained by: file tasks.power_spectrum.F90

function: powerspectraconstructorparameters
Description: Constructor for the powerSpectrum task class which takes a parameter set as input.
Code lines: 78
Contained by: file tasks.power_spectrum.F90
Modules used: input_parameters

subroutine: powerspectradestructor
Description: Destructor for the powerSpectrum task class.
Code lines: 14
Contained by: file tasks.power_spectrum.F90

subroutine: powerspectraperform
Description: Compute and output the halo mass function.
Code lines: 136
Contained by: file tasks.power_spectrum.F90
Modules used: fgsl galacticus_display
galacticus_error galacticus_hdf5
io_hdf5 iso_c_binding
memory_management numerical_constants_astronomical
numerical_integration numerical_ranges
string_handling

function: varianceintegrand
Description: Integrand function used in compute the variance in (real space) top-hat spheres from the power spectrum.
Code lines: 9
Contained by: subroutine powerspectraperform

interface: taskpowerspectra
Description: Constructors for the powerSpectrum task.
Code lines: 4
Contained by: file tasks.power_spectrum.F90

file: tasks.report.F90
Code lines: 77

function: reportparameters
Description: Constructor for the report task class which takes a parameter set as input.
Code lines: 10
Contained by: file tasks.report.F90
Modules used: input_parameters

subroutine: `reportperform`
Description: Builds the tabulation.
Code lines: 17
Contained by: file `tasks.report.F90`
Modules used: `galacticus_build`, `galacticus_display`, `galacticus_error`, `galacticus_versioning`

function: `reportrequiresoutputfile`
Description: Specifies that this task does not requires the main output file.
Code lines: 8
Contained by: file `tasks.report.F90`

interface: `taskreport`
Description: Constructors for the `report` task.
Code lines: 3
Contained by: file `tasks.report.F90`

file: `tests.DiemerKravtsov2014_concentration.F90`
Description: Contains a program which tests the Diemer and Kravtsov [2014] halo concentration algorithm.
Code lines: 115

program: `test_diemerkravtsov2014_concentration`
Description: Tests the Diemer and Kravtsov [2014] halo concentration algorithm. Values of concentration are taken from their website.
Code lines: 93
Contained by: file `tests.DiemerKravtsov2014_concentration.F90`
Modules used: `cosmological_density_field`, `cosmology_functions`, `cosmology_parameters`, `dark_matter_profiles_concentration`, `events_hooks`, `file_utilities`, `galacticus_display`, `galacticus_error`, `galacticus_function_classes_destroys`, `galacticus_nodes`, `galacticus_paths`, `input_parameters`, `iso_varying_string`, `node_components`, `power_spectra`, `system_command`, `unit_tests`

file: `tests.IO.HDF5.F90`
Code lines: 716

program: `tests_io_hdf5`
Description: Tests the HDF5 I/O module.
Code lines: 696
Contained by: file `tests.IO.HDF5.F90`
Modules used: `galacticus_display`, `hdf5`, `io_hdf5`, `iso_varying_string`, `kind_numbers`, `unit_tests`

file: `tests.IO.XML.F90`
Description: Contains a program which tests functionality of the XML I/O module.
Code lines: 96

program: `tests_io_xml`
Description: Tests the XML I/O module.
Code lines: 74
Contained by: file `tests.IO.XML.F90`
Modules used: `fox_dom`, `galacticus_display`, `galacticus_error`, `io_xml`, `system_command`, `unit_tests`

file: `tests.MPI.F90`
Description: Contains a program to test MPI functions.
Code lines: 56

program: `test_mpi`
Description: Tests of MPI functions.
Code lines: 34
Contained by: file `tests.MPI.F90`
Modules used: `galacticus_display`, `iso_c_binding`, `mpi`, `mpi_utilities`, `unit_tests`

file: `tests.NFW96_concentration.dark_energy.F90`
Description: Contains a program which tests the Navarro et al. [1996] halo concentration algorithm in a dark energy Universe. Comparisons are made to the "`charden`" code written by Julio Navarro.
Code lines: 106

program: `test_nfw96_concentration_dark_energy`
Description: Tests the Navarro et al. [1996] halo concentration algorithm in a dark energy Universe. Comparisons are made to the "`charden`" code written by Julio Navarro.
Code lines: 82
Contained by: file `tests.NFW96_concentration.dark_energy.F90`
Modules used: `cosmology_functions`, `cosmology_parameters`, `dark_matter_profiles_concentration`, `events_hooks`, `galacticus_display`, `galacticus_function_classes_destroys`, `galacticus_nodes`, `input_parameters`, `iso_varying_string`, `node_components`, `string_handling`, `unit_tests`

file: `tests.ODEIV2_solver.F90`
Description: Contains a program to test ODE-IV2 solver routines.
Code lines: 91

program: `test_ode_solver`
Description: Tests that ODE solver routines work.
Code lines: 69

Contained by: file tests.ODEIV2_solver.F90
Modules used: fodeiv2, galacticus_display, iso_c_binding, numerical_integration2, odeiv2_solver, test_ode_solver_functions, unit_tests

file: tests.ODE_solver.F90
Description: Contains a program to test ODE solver routines.
Code lines: 79

program: test_ode_solver
Description: Tests that ODE solver routines work.
Code lines: 57
Contained by: file tests.ODE_solver.F90
Modules used: fgsl, galacticus_display, ode_solver, test_ode_solver_functions, unit_tests

file: tests.ODE_solver.functions.F90
Description: Contains a module of ODEs for unit tests.
Code lines: 100

module: test_ode_solver_functions
Description: Contains ODEs for unit tests.
Code lines: 78
Contained by: file tests.ODE_solver.functions.F90
Modules used: fgsl
Used by: program test_ode_solver, program test_ode_solver

subroutine: integrands_set_2
Description: A set of integrands for unit tests.
Code lines: 13
Contained by: module test_ode_solver_functions

function: jacobian_set_1
Description: Jacobian for a set of ODEs for unit tests.
Code lines: 11
Contained by: module test_ode_solver_functions

function: jacobian_set_2
Description: Jacobian for a set of ODEs for unit tests.
Code lines: 14
Contained by: module test_ode_solver_functions

function: ode_set_1
Description: A set of ODEs for unit tests.
Code lines: 10
Contained by: module test_ode_solver_functions

function: `ode_set_2`
Description: A set of ODEs for unit tests.
Code lines: 11
Contained by: module `test_ode_solver_functions`

file: `tests.Prada2011_concentration.F90`
Description: Contains a program which tests the Prada et al. [2011] halo concentration algorithm.
Code lines: 100

program: `test_prada2011_concentration`
Description: Tests the Prada et al. [2011] halo concentration algorithm. Values of concentration were read from their Figure 12.
Code lines: 78
Contained by: file `tests.Prada2011_concentration.F90`
Modules used:
`cosmology_functions`

file: `tests.comoving_distance.F90`
Code lines: 98

program: `tests_comoving_distance`

Description: Tests comoving distance calculations for various universes. Distances calculated using Python implementation of Ned Wright's cosmology calculator.
Code lines: 78
Contained by: file `tests.comoving_distance.F90`
Modules used: `cosmology_functions`, `cosmology_functions_options`, `cosmology_parameters`, `galacticus_display`, `input_parameters`, `iso_varying_string`, `unit_tests`

file: `tests.comparisons.F90`

Description: Contains a program to test numerical comparison functions.
Code lines: 45

program: `test_comparison`

Description: Tests that numerical comparison functions work.
Code lines: 23
Contained by: file `tests.comparisons.F90`
Modules used: `galacticus_display`, `numerical_comparison`, `unit_tests`

file: `tests.concentration.Correa2015.F90`

Description: Contains a program which tests the Correa et al. [2015] concentration-mass relation.
Code lines: 86

program: `test_correa2015_concentration`

Description: Tests the Correa et al. [2015] concentration-mass relation.
Code lines: 64
Contained by: file `tests.concentration.Correa2015.F90`
Modules used: `cosmology_functions`, `dark_matter_profiles_concentration`, `events_hooks`, `galacticus_display`, `galacticus_function_classes_destroys`, `galacticus_nodes`, `galacticus_paths`, `input_parameters`, `iso_varying_string`, `node_components`, `unit_tests`

file: `tests.cooling_functions.F90`

Description: Contains a program which tests cooling function functionality.
Code lines: 99

program: `test_cooling_functions`

Description: Tests cooling function functionality.
Code lines: 77
Contained by: file `tests.cooling_functions.F90`
Modules used: `abundances_structure`, `chemical_abundances_structure`, `chemical_states`, `cooling_functions`, `cosmology_functions`, `galacticus_display`, `galacticus_paths`, `input_parameters`

file: tests.cosmic_age.F90
Code lines: 111

program: tests_cosmic_age
Description: Tests cosmic age calculations for various Universers. Ages calculated using Python implementation of Ned Wright's cosmology calculator.
Code lines: 91
Contained by: file tests.cosmic_age.F90
Modules used: cosmology_functions, cosmology_parameters, galacticus_display, input_parameters, iso_varying_string, numerical_constants_math, unit_tests

file: tests.crash.F90
Description: Contains a program to test that crashes are detected.
Code lines: 26

program: test_crash
Description: Tests that crashes are detected.
Code lines: 4
Contained by: file tests.crash.F90

file: tests.dark_matter_halo_radius_enclosing_mass.F90
Description: Contains a program which tests the calculation of dark matter halo radius enclosing a given mass.
Code lines: 135

program: test_dark_matter_halo_radius_enclosing_mass
Description: Tests the calculation of dark matter halo radius enclosing a given mass.
Code lines: 111
Contained by: file tests.dark_matter_halo_radius_enclosing_mass.F90
Modules used: dark_matter_halo_scales, dark_matter_profiles_dmo, dark_matter_profiles_generic, events_hooks, galacticus_display, galacticus_nodes, input_parameters, iso_varying_string, node_components, unit_tests

file: tests.dark_matter_profiles.F90
Description: Contains a program which tests dark matter profiles.
Code lines: 96

program: test_dark_matter_profiles
Description: Tests dark matter profiles.
Code lines: 74
Contained by: file tests.dark_matter_profiles.F90

Modules used: cosmology_functions, dark_matter_halo_scales, dark_matter_profiles_dmo, events_hooks, galacticus_display, galacticus_nodes, input_parameters, iso_varying_string, node_components, unit_tests

file: `tests.dark_matter_profiles.generic.F90`
Description: Contains a program to test calculations for generic dark matter profiles.
Code lines: 343

program: `test_dark_matter_profiles_generic`
Description: Tests that numerical differentiation functions work.
Code lines: 321
Contained by: file tests.dark_matter_profiles.generic.F90
Modules used: cosmology_functions, cosmology_parameters, dark_matter_halo_scales, dark_matter_profiles, dark_matter_profiles_dmo, dark_matter_profiles_generic, events_hooks, functions_global_utilities, galacticus_display, galacticus_nodes, input_parameters, node_components, unit_tests

file: `tests.dark_matter_profiles.heated.F90`
Description: Contains a program which tests the nodes implementation.
Code lines: 101

program: `test_dark_matter_profiles_heated`
Description: Tests the heated dark matter profile implementation. An isothermal dark matter halo is used, since analytic solutions are available for this case. Specifically, the initial radius in the unheated profile is given by $r_\mathrm{i}(r) = (r_\mathrm{h}^4/4r^2+r_\mathrm{h}^2)^{1/2}-r_\mathrm{h}^2/2r$ where r is the radius in the heated profile, and $r_\mathrm{h} = (\mathrm{G}M_\mathrm{v}/2Qr_\mathrm{v})^{1/2}$ is a characteristic heating radius. Here, M_v, and r_v are the virial mass and radius of the halo respectively, and Qr_i^2 is the specific heat input to the density profile, with Q assumed to be a constant (as expected for tidal heating). Assuming no shell crossing, the enclosed mass in the final profile is simply $M(r) = M_\mathrm{v}r_\mathrm{i}(r)/r_\mathrm{v}$, from which the density of the final profile is found as $\rho(r) = (4\pi r^2)^{-1}\mathrm{d}M(r)/\mathrm{d}r$.
Code lines: 79
Contained by: file tests.dark_matter_profiles.heated.F90
Modules used: dark_matter_halo_scales, dark_matter_profiles_dmo, dark_matter_profiles_generic, events_hooks, galacticus_display, galacticus_nodes, input_parameters, iso_varying_string, numerical_constants_astronomical, numerical_constants_math, unit_tests

file: `tests.differentiation.F90`
Description: Contains a program to test differentiation functions.
Code lines: 48

program: `test_differentiation`

Description: Tests that numerical differentiation functions work.
Code lines: 26
Contained by: file tests.differentiation.F90
Modules used: galacticus_display, numerical_differentiation, test_differentiation_functions, unit_tests

file: tests.differentiation.functions.F90
Description: Contains a module of functions for differentation unit tests.
Code lines: 39

module: test_differentiation_functions
Description: Contains functions for differentation unit tests.
Code lines: 17
Contained by: file tests.differentiation.functions.F90
Used by: program test_differentiation

function: function1
Description: Function for unit testing.
Code lines: 7
Contained by: module test_differentiation_functions

file: tests.fail.F90
Description: Contains a program to test that failures are detected.
Code lines: 26

program: test_fail
Description: Tests that failures are detected.
Code lines: 4
Contained by: file tests.fail.F90

file: tests.gaunt_factors.F90
Description: Contains a program which tests Gaunt factor functions.
Code lines: 57

program: test_gaunt_factors
Description: Tests Gaunt factor functions.
Code lines: 35
Contained by: file tests.gaunt_factors.F90
Modules used: atomic_ionization_potentials, atomic_radiation_gaunt_factors, galacticus_display, input_parameters, iso_varying_string, unit_tests

file: tests.geometry.coordinate_systems.F90
Description: Contains a program to coordinate system functions.
Code lines: 55

program: test_coordinate_systems
Description: Tests of coordinate system functions.
Code lines: 33
Contained by: file tests.geometry.coordinate_systems.F90

Modules used: coordinate_systems, galacticus_display, numerical_constants_math, unit_tests

file: tests.halo_mass_function.Tinker.F90
Description: Contains a program which tests the Tinker et al. [2008] mass function by comparing to Jeremy Tinker's code.
Code lines: 100

program: tests_halo_mass_function_tinker
Description: Tests the Tinker et al. [2008] mass function by comparing to Jeremy Tinker's code.
Code lines: 77
Contained by: file tests.halo_mass_function.Tinker.F90
Modules used: cosmological_density_field, cosmology_functions, cosmology_parameters, file_utilities, galacticus_display, halo_mass_functions, input_parameters, iso_varying_string, memory_management, unit_tests

file: tests.hashes.F90
Description: Contains a program to test features of the hashes (i.e. associative arrays) module.
Code lines: 77

program: test_hashes
Description: Tests features of the hashes (i.e. associative arrays) module.
Code lines: 55
Contained by: file tests.hashes.F90
Modules used: galacticus_display, hashes, input_parameters, unit_tests

file: tests.hashes.cryptographic.F90
Description: Contains a program to test features of cryptographic hashes.
Code lines: 46

program: test_hashes_cryptographic
Description: Contains a program to test features of cryptographic hashes.
Code lines: 24
Contained by: file tests.hashes.cryptographic.F90
Modules used: galacticus_display, hashes_cryptographic, iso_varying_string, unit_tests

file: tests.hashes.perfect.F90
Description: Contains a program to test perfect hashing algorithms.
Code lines: 74

program: test_perfect_hashes
Description: Tests perfect hashing algorithms.
Code lines: 52
Contained by: file tests.hashes.perfect.F90
Modules used: galacticus_display, hashes_perfect

kind_numbers memory_management
unit_tests

file: `tests.initial_mass_functions.F90`
Description: Contains a program to test stellar inital mass functions.
Code lines: 102

program: `test_initial_mass_functions`
Description: Tests of stellar initial mass functions.
Code lines: 78
Contained by: file tests.initial_mass_functions.F90
Modules used: galacticus_display, numerical_integration2, stellar_populations_initial_mass_functions, unit_tests

function: `initialmassfunctionintegrand`
Description: Integrand used to find the total mass in the initial mass function.
Code lines: 7
Contained by: program test_initial_mass_functions

file: `tests.integration.F90`
Description: Contains a program to test integration routines.
Code lines: 64

program: `test_integration`
Description: Tests that numerical integration routines work.
Code lines: 42
Contained by: file tests.integration.F90
Modules used: fgsl, galacticus_display, numerical_constants_math, numerical_integration, test_integration_functions, unit_tests

file: `tests.integration.functions.F90`
Description: Contains a module of integrands for unit tests.
Code lines: 73

module: `test_integration_functions`
Description: Contains integrands for unit tests.
Code lines: 51
Contained by: file tests.integration.functions.F90
Modules used: fgsl, galacticus_display
Used by: program test_integration

function: `integrand1`
Description: Integral for unit testing.
Code lines: 7
Contained by: module test_integration_functions

function: `integrand2`

Description: Integral for unit testing.

Contained by: module test_integration_functions
Modules used: numerical_integration

file: tests.integration2.F90
Description: Contains a program to test integration routines.
Code lines: 335

program: test_integration2
Description: Tests that numerical integration routines work.
Code lines: 313
Contained by: file tests.integration2.F90
Modules used: fgsl, galacticus_display, galacticus_error, iso_c_binding, iso_varying_string, kind_numbers, numerical_integration, numerical_integration2, test_integration2_functions, yeplibrary

file: tests.integration2.functions.F90
Description: Contains a module of integrands for unit tests.
Code lines: 238

module: test_integration2_functions
Description: Contains integrands for unit tests.
Code lines: 216
Contained by: file tests.integration2.functions.F90
Modules used: iso_varying_string, numerical_integration2
Used by: program test_integration2

subroutine: function14vector
Description: Combined functions number 1 and 4 for numerical integration tests: vector version.
Code lines: 13
Contained by: module test_integration2_functions

function: function1scalar
Description: Test function number 1 for numerical integration tests: scalar version.
Code lines: 7
Contained by: module test_integration2_functions

function: `function1vector`
Description: Test function number 1 for numerical integration tests: vector version.
Code lines: 7
Contained by: module `test_integration2_functions`

function: `function1yeppp`
Description: Test function number 1 for numerical integration tests: YEPPP! vector version.
Code lines: 17
Contained by: module `test_integration2_functions`
Modules used: `iso_c_binding` `yepcore` `yepmath`

function: `function2scalar`
Description: Test function number 1 for numerical integration tests: scalar version.
Code lines: 7
Contained by: module `test_integration2_functions`

function: `function2vector`
Description: Test function number 2 for numerical integration tests: vector version.
Code lines: 7
Contained by: module `test_integration2_functions`

function: `function2yeppp`
Description: Test function number 2 for numerical integration tests: YEPPP! vector version.
Code lines: 17
Contained by: module `test_integration2_functions`
Modules used: `iso_c_binding` `yepcore` `yepmath`

function: `function3scalar`
Description: Test function number 3 for numerical integration tests: scalar version.

Contained by: module `test_integration2_functions`
Modules used: `iso_c_binding` `yepcore` `yepmath`

function: `function4scalar`
Description: Test function number 4 for numerical integration tests: scalar version.
Code lines: 7

Contained by: module test_integration2_functions

function: `function4vector`
Description: Test function number 4 for numerical integration tests: vector version.
Code lines: 8
Contained by: module test_integration2_functions

type: `testfunction`
Description: Type used for referencing functions.
Code lines: 9
Contained by: module test_integration2_functions

type: `testfunctionmulti`
Description: Type used for referencing functions.
Code lines: 6
Contained by: module test_integration2_functions

subroutine: `testfunctionsinitialize`
Description: Initalize an array of test functions for integration tests.
Code lines: 10
Contained by: module test_integration2_functions

type: `testintegrator`
Description: Type used for testing numerical integrators.
Code lines: 6
Contained by: module test_integration2_functions

type: `testintegratormulti`
Description: Type used for testing multi-integrand numerical integrators.
Code lines: 5
Contained by: module test_integration2_functions

file: `tests.interpolation.2D.F90`
Description: Contains a program to test 2D interpolation routines.
Code lines: 61

program: `test_interpolation_2d`
Description: Tests that 2D interpolation routines work.
Code lines: 39
Contained by: file tests.interpolation.2D.F90
Modules used: galacticus_display numerical_interpolation_2d_irregular unit_tests

file: `tests.interpolation.F90`
Description: Contains a program to test the numerical interpolation code.
Code lines: 67

program: `test_interpolation`
Description: Tests that numerical interpolation code works correctly.
Code lines: 45

Contained by: file tests.interpolation.F90
Modules used: fgsl, galacticus_display, numerical_interpolation, table_labels, unit_tests

file: tests.kepler_orbits.F90
Code lines: 138

program: tests_kepler_orbits
Description: Tests for orbital parameter conversions.
Code lines: 118
Contained by: file tests.kepler_orbits.F90
Modules used: galacticus_display, input_parameters, iso_varying_string, kepler_orbits, numerical_constants_physical, unit_tests

file: tests.linear_growth.EdS.F90
Code lines: 59

program: tests_linear_growth_eds
Description: Tests linear growth calculations.
Code lines: 39
Contained by: file tests.linear_growth.EdS.F90
Modules used: cosmology_functions, galacticus_display, input_parameters, iso_varying_string, linear_growth, unit_tests

file: tests.linear_growth.cosmological_constant.F90
Code lines: 64

program: tests_linear_growth_cosmological_constant
Description: Tests linear growth calculations for a cosmological constant Universe. Growth rates are compared to calculations taken from Andrew Hamilton's "growl" code available at: http://casa.colorado.edu/ ajsh/growl/
Code lines: 44
Contained by: file tests.linear_growth.cosmological_constant.F90
Modules used: cosmology_functions, galacticus_display, input_parameters, iso_varying_string, linear_growth, memory_management, unit_tests

file: tests.linear_growth.dark_energy.F90
Code lines: 61

program: tests_linear_growth_dark_energy
Description: Tests linear growth calculations for a dark energy Universe. Growth rates are compared to Figure 1 of Linder and Jenkins (2003; MNRAS; 346; 573; http://adsabs.harvard.edu/abs/2003MNRAS.346..573L).

file: thermodynamics.ideal_gases.F90
Description: Contains a module which implements thermodynamic properties of ideal gases.
Code lines: 61

module: ideal_gases_thermodynamics
Description: Implements thermodynamic properties of ideal gases.
Code lines: 39
Contained by: file thermodynamics.ideal_gases.F90
Used by: function bondi_hoyle_lyttleton_accretion_radius, function bondi_hoyle_lyttleton_accretion_rate, subroutine node_component_black_hole_standard_mass_accretion_rate

function: ideal_gas_jeans_length
Description: Return the Jeans length (in Mpc) for gas of given temperature and density).
Code lines: 8
Contained by: module ideal_gases_thermodynamics
Modules used: numerical_constants_physical

function: ideal_gas_sound_speed
Description: Return the sound speed (in km/s) for an ideal gas of given temperature and (optionally) meanAtomicMass.
Code lines: 19
Contained by: module ideal_gases_thermodynamics
Modules used: numerical_constants_astronomical, numerical_constants_physical

file: thermodynamics.radiation.F90
Code lines: 74

module: `thermodynamics_radiation`
Description: Implements calculations of thermal radiation.
Code lines: 54
Contained by: file `thermodynamics.radiation.F90`
Used by: function `blackbodyflux`

function: `blackbody_emission`
Description: Compute the Planck blackbody spectral radiance (defined per unit wavelength, in units of J s^{-1} m^{-2} sr^{-1} $Å^{-1}$) or J s^{-1} m^{-2} sr^{-1} Hz^{-1} depending on the optional `radianceType` argument). Input `wavelength` is in Angstroms, input temperature is in Kelvin.
Code lines: 40
Contained by: module `thermodynamics_radiation`
Modules used: `numerical_constants_physical` `numerical_constants_units`

file: `tidal_stripping.mass_loss_rate.disks.F90`
Description: Contains a module which provides a class that implements tidal stripping in disks.
Code lines: 40

module: `tidal_stripping_mass_loss_rate_disks`
Description: Provides a class that implements calculations of tidal stripping in disks.
Code lines: 18
Contained by: file `tidal_stripping.mass_loss_rate.disks.F90`
Modules used: `galacticus_nodes`
Used by: subroutine `galacticus_function_-classes_destroy` subroutine `galacticus_state_retrieve`
subroutine `galacticus_state_store` module `node_component_disk_standard`

file: `tidal_stripping.mass_loss_rate.disks.null.F90`
Description: Implementation of a null tidal stripping of disks class.
Code lines: 61

function: `nullconstructorparameters`
Description: Constructor for the `null` timescale for star formation feedback in disks class which takes a parameter set as input.
Code lines: 11
Contained by: file `tidal_stripping.mass_loss_rate.disks.null.F90`
Modules used: `input_parameters`

function: `nullratemassloss`
Description: Returns a zero mass loss rate due to tidal stripping.
Code lines: 9
Contained by: file `tidal_stripping.mass_loss_rate.disks.null.F90`

interface: `tidalstrippingdisksnull`
Description: Constructors for the `null` model of tidal stripping of disks class.
Code lines: 3
Contained by: file `tidal_stripping.mass_loss_rate.disks.null.F90`

file: `tidal_stripping.mass_loss_rate.disks.simple.F90`
Description: Implementation of a simple tidal stripping of disks class.
Code lines: 148
Modules used: satellites_tidal_fields

function: `simpleconstructorinternal`
Description: Internal constructor for the `simple` model of tidal stripping of disks class.
Code lines: 9
Contained by: file tidal_stripping.mass_loss_rate.disks.simple.F90

function: `simpleconstructorparameters`
Description: Constructor for the `simple` timescale for star formation feedback in disks class which takes a parameter set as input.
Code lines: 23
Contained by: file tidal_stripping.mass_loss_rate.disks.simple.F90
Modules used: input_parameters

subroutine: `simpledestructor`
Description: Destructor for the `simple` model of tidal stripping of disks class.
Code lines: 7
Contained by: file tidal_stripping.mass_loss_rate.disks.simple.F90

function: `simpleratemassloss`
Description: Computes the mass loss rate from disks due to tidal stripping assuming a simple model. Specifically, the mass loss rate is

$$\dot{M} = -\alpha M/\tau_{\rm disk}, \tag{18.53}$$

where

$$\alpha = F_{\rm tidal}/F_{\rm gravity}, \tag{18.54}$$

$F_{\rm tidal} = \mathcal{F}_{\rm tidal} r_{1/2}$, $\mathcal{F}_{\rm tidal}$ is the tidal field from the host halo (see §12.42), and

$$F_{\rm gravity} = V_{1/2}^2(r_{1/2})/r_{1/2} \tag{18.55}$$

is the gravitational restoring force in the disk at the half-mass radius, $r_{1/2}$.
Code lines: 58
Contained by: file tidal_stripping.mass_loss_rate.disks.simple.F90
Modules used: galactic_structure_options, galactic_structure_rotation_curves, galacticus_nodes, numerical_constants_astronomical, numerical_constants_math, numerical_constants_physical

interface: `tidalstrippingdiskssimple`

type: `hdf5object`
Description: A structure that holds properties of HDF5 objects.
Code lines: 330
Contained by: module io_hdf5

subroutine: `io_hdf5_assert_attribute_type`
Description: Asserts that an attribute is of a certain type and rank.
Code lines: 75
Contained by: module io_hdf5
Modules used: galacticus_error

subroutine: `io_hdf5_assert_dataset_type`
Description: Asserts that an dataset is of a certain type and rank.
Code lines: 61
Contained by: module io_hdf5
Modules used: galacticus_error

subroutine: `io_hdf5_assert_in_critical`
Description: Assert that we are in an `HDF5_Access` OpenMP critical block.
Code lines: 7
Contained by: module io_hdf5
Modules used: galacticus_error

function: `io_hdf5_character_types`
Description: Return datatypes for character data of a given length. Types are for Fortran native and C native types.
Code lines: 30
Contained by: module io_hdf5
Modules used: galacticus_error

subroutine: `io_hdf5_close`
Description: Close an HDF5 object.
Code lines: 101
Contained by: module io_hdf5
Modules used: galacticus_display galacticus_error

string_handling

subroutine: `io_hdf5_copy`
Description: Copy the named object to the target object.
Code lines: 16
Contained by: module io_hdf5
Modules used: galacticus_error

subroutine: `io_hdf5_create_reference_scalar_to_1d`
Description: Create a scalar reference to the 1-D `toDataset` in the HDF5 group `fromGroup`.
Code lines: 111
Contained by: module io_hdf5
Modules used: galacticus_error

subroutine: `io_hdf5_create_reference_scalar_to_2d`
Description: Create a scalar reference to the 2-D `toDataset` in the HDF5 group `fromGroup`.
Code lines: 111
Contained by: module io_hdf5
Modules used: galacticus_error

subroutine: `io_hdf5_create_reference_scalar_to_3d`
Description: Create a scalar reference to the 3-D `toDataset` in the HDF5 group `fromGroup`.
Code lines: 111
Contained by: module io_hdf5
Modules used: galacticus_error

subroutine: `io_hdf5_create_reference_scalar_to_4d`
Description: Create a scalar reference to the 4-D `toDataset` in the HDF5 group `fromGroup`.
Code lines: 111
Contained by: module io_hdf5
Modules used: galacticus_error

subroutine: `io_hdf5_create_reference_scalar_to_5d`
Description: Create a scalar reference to the 5-D `toDataset` in the HDF5 group `fromGroup`.
Code lines: 111
Contained by: module io_hdf5
Modules used: galacticus_error

function: `io_hdf5_dataset_rank`
Description: Return the rank of dataset `datasetObject`.
Code lines: 39
Contained by: module io_hdf5
Modules used: galacticus_error

function: `io_hdf5_dataset_size`
Description: Return the size of the $\texttt{dim}^{\text{th}}$ dimension of dataset `datasetObject`.
Code lines: 63
Contained by: module io_hdf5
Modules used: galacticus_error

function: `io_hdf5_datasets`
Description: Return a list of all datasets present within `thisObject`.
Code lines: 67
Contained by: module io_hdf5
Modules used: galacticus_error string_handling

subroutine: `io_hdf5_deep_copy`
Description: Make a deep copy of the object, with a new HDF5 object identifier.
Code lines: 37
Contained by: module io_hdf5
Modules used: galacticus_error

subroutine: `io_hdf5_destroy`
Description: Destroy an HDF5 object by destroying its associated varying string objects.
Code lines: 8
Contained by: module io_hdf5

subroutine: `io_hdf5_end_critical`
Description: Record that we have left an `HDF5_Access` OpenMP critical block.
Code lines: 6
Contained by: module io_hdf5

subroutine: `io_hdf5_flush`
Description: Flush an HDF5 file to disk.
Code lines: 26
Contained by: module io_hdf5
Modules used: galacticus_display galacticus_error

function: `io_hdf5_has_attribute`
Description: Check if `thisObject` has an attribute with the given `attributeName`.
Code lines: 25
Contained by: module io_hdf5
Modules used: galacticus_error

function: `io_hdf5_has_dataset`
Description: Check if `thisObject` has a dataset with the given `datasetName`.
Code lines: 40
Contained by: module io_hdf5
Modules used: galacticus_error

function: `io_hdf5_has_group`
Description: Check if `thisObject` has a group with the given `groupName`.
Code lines: 32
Contained by: module io_hdf5
Modules used: galacticus_error

subroutine: `io_hdf5_initialize`
Description: Initialize the HDF5 subsystem.

Code lines: 28
Contained by: module io_hdf5
Modules used: galacticus_error

function: io_hdf5_is_hdf5
Description: Return true if the named file is an HDF5 file.
Code lines: 15
Contained by: module io_hdf5
Modules used: file_utilities galacticus_error

function: io_hdf5_is_open
Description: Returns true if thisObject is open.
Code lines: 7
Contained by: module io_hdf5

function: io_hdf5_is_reference
Description: Return true if the input dataset is a scalar reference.
Code lines: 37
Contained by: module io_hdf5
Modules used: galacticus_error

function: io_hdf5_name
Description: Returns the path to thisObject.
Code lines: 8
Contained by: module io_hdf5

function: io_hdf5_object_type
Description: Returns the object type for thisObject.
Code lines: 7
Contained by: module io_hdf5

function: io_hdf5_open_attribute
Description: Open an attribute in inObject.
Code lines: 116
Contained by: module io_hdf5
Modules used: galacticus_error

function: io_hdf5_open_dataset
Description: Open an dataset in inObject.
Code lines: 249
Contained by: module io_hdf5
Modules used: galacticus_error

subroutine: io_hdf5_open_file
Description: Open a file and return an appropriate HDF5 object. The file name can be provided as an input parameter or, if not provided, will be taken from the stored object name in fileObject.
Code lines: 154
Contained by: module io_hdf5
Modules used: file_utilities galacticus_error

function: `io_hdf5_open_group`
Description: Open an HDF5 group and return an appropriate HDF5 object. The group name can be provided as an input parameter or, if not provided, will be taken from the stored object name in `groupObject`. The location at which to open the group is taken from either `inObject` or `inPath`.
Code lines: 115
Contained by: module `io_hdf5`
Modules used: `galacticus_error`

function: `io_hdf5_parent`
Description: Return the parent object.
Code lines: 8
Contained by: module `io_hdf5`

function: `io_hdf5_path_to`
Description: Returns the path to `thisObject`.
Code lines: 8
Contained by: module `io_hdf5`

subroutine: `io_hdf5_read_attribute_character_1d_array_allocatable`
Description: Open and read an character scalar attribute in `thisObject`.
Code lines: 107
Contained by: module `io_hdf5`
Modules used: `galacticus_error` `memory_management`

subroutine: `io_hdf5_read_attribute_character_1d_array_static`
Description: Open and read an character scalar attribute in `thisObject`.
Code lines: 108
Contained by: module `io_hdf5`
Modules used: `galacticus_error`

subroutine: `io_hdf5_read_attribute_character_scalar`
Description: Open and read an character scalar attribute in `thisObject`.
Code lines: 127
Contained by: module `io_hdf5`
Modules used: `galacticus_error`

subroutine: `io_hdf5_read_attribute_double_1d_array_allocatable`
Description: Open and read an double scalar attribute in `thisObject`.
Code lines: 92
Contained by: module `io_hdf5`
Modules used: `galacticus_error` `memory_management`

subroutine: `io_hdf5_read_attribute_double_1d_array_static`

type: xincludenode
Description: Type used while resolving XInclude references during XML parsing.
Code lines: 4
Contained by: module io_xml

type: xincludenodelist
Description: Type used while resolving XInclude references during XML parsing.
Code lines: 3
Contained by: module io_xml

function: xml_array_length
Description: Return the length of an array of XML elements.
Code lines: 10
Contained by: module io_xml

interface: xml_array_read
Code lines: 4
Contained by: module io_xml

subroutine: xml_array_read_one_column
Description: Read one column of data from an array of XML elements.

Code lines: 20
Contained by: module io_xml
Modules used: memory_management

interface: `xml_array_read_static`
Code lines: 5
Contained by: module io_xml

subroutine: `xml_array_read_static_one_column`
Description: Read one column of data from an array of XML elements.
Code lines: 18
Contained by: module io_xml

subroutine: `xml_array_read_two_column`
Description: Read two columns of data from an array of XML elements.
Code lines: 22
Contained by: module io_xml
Modules used: memory_management

function: `xml_extract_text`
Description: Extract the text from an XML element and return as a variable length string.
Code lines: 8
Contained by: module io_xml

subroutine: `xml_extrapolation_element_decode`
Description: Extracts information from a standard XML `extrapolationElement`. Optionally a set of `allowedMethods` can be specified—if the extracted method does not match one of these an error is issued.
Code lines: 32
Contained by: module io_xml
Modules used: galacticus_error table_labels

function: `xml_get_first_element_by_tag_name`
Description: Return a pointer to the first node in an XML node that matches the given `tagName`.
Code lines: 47
Contained by: module io_xml
Modules used: galacticus_error

subroutine: `xml_list_array_read_one_column`
Description: Read one column of data from an array of XML elements.
Code lines: 19
Contained by: module io_xml
Modules used: memory_management

subroutine: `xml_list_character_array_read_static_one_column`
Description: Read one column of character data from an array of XML elements.
Code lines: 17
Contained by: module io_xml

subroutine: `xml_list_double_array_read_static_one_column`
Description: Read one column of integer data from an array of XML elements.
Code lines: 17
Contained by: module io_xml

subroutine: `xml_list_integer_array_read_static_one_column`
Description: Read one column of integer data from an array of XML elements.
Code lines: 17
Contained by: module io_xml

function: `xml_parse`
Description: Parse an XML document, automatically resolve XInclude references.
Code lines: 137
Contained by: module io_xml
Modules used: file_utilities galacticus_error

function: `xml_path_exists`
Description: Return true if the supplied `path` exists in the supplied `xmlElement`.
Code lines: 41
Contained by: module io_xml

file: `utility.MPI.F90`
Description: Contains a module that implements useful MPI utilities.

function: `counterconstructor`
Description: Constructor for MPI counter class.
Code lines: 30
Contained by: module mpi_utilities
Modules used: galacticus_error iso_c_binding

subroutine: `counterdestructor`
Description: Destructor for the MPI counter class.
Code lines: 12
Contained by: module mpi_utilities

function: `counterget`
Description: Return the current value of an MPI counter.
Code lines: 25
Contained by: module mpi_utilities
Modules used: galacticus_error

function: `counterincrement`
Description: Increment an MPI counter.
Code lines: 27
Contained by: module mpi_utilities
Modules used: galacticus_error

function: `mpialllogicalscalar`
Description: Return true if all of the given booleans are true over all processes.

Code lines: 26
Contained by: module mpi_utilities
Modules used: galacticus_error

function: mpianylogicalscalar
Description: Return true if any of the given booleans is true over all processes.
Code lines: 26
Contained by: module mpi_utilities
Modules used: galacticus_error

function: mpiaveragearray
Description: Average an array over all processes, returning it to all processes.
Code lines: 30
Contained by: module mpi_utilities

function: mpiaveragescalar
Description: Find the maximum values of a scalar over all processes, returning it to all processes.
Code lines: 19
Contained by: module mpi_utilities

subroutine: mpibarrier
Description: Block until all MPI processes are synchronized.
Code lines: 10
Contained by: module mpi_utilities

interface: mpicounter
Code lines: 2
Contained by: module mpi_utilities

subroutine: mpifinalize
Description: Finalize MPI.
Code lines: 13
Contained by: module mpi_utilities

function: mpigather1d
Description: Gather a 1-D array from all processes, returning it as a 2-D array.
Code lines: 15
Contained by: module mpi_utilities

function: mpigather2d
Description: Gather a 1-D array from all processes, returning it as a 2-D array.
Code lines: 15
Contained by: module mpi_utilities

function: mpigatherint1d
Description: Gather an integer 1-D array from all processes, returning it as a 2-D array.
Code lines: 15
Contained by: module mpi_utilities

function: `mpigatherintscalar`
Description: Gather an integre scalar from all processes, returning it as a 1-D array.
Code lines: 19
Contained by: module `mpi_utilities`

function: `mpigatherscalar`
Description: Gather a scalar from all processes, returning it as a 1-D array.
Code lines: 19
Contained by: module `mpi_utilities`

function: `mpigetcount`
Description: Return MPI count.
Code lines: 13
Contained by: module `mpi_utilities`

function: `mpigethostaffinity`
Description: Return host affinity of this MPI process.
Code lines: 14
Contained by: module `mpi_utilities`

function: `mpigetnodeaffinity`
Description: Return node affinity of given MPI process.
Code lines: 19
Contained by: module `mpi_utilities`

function: `mpigetnodecount`
Description: Return count of nodes used by MPI.
Code lines: 13
Contained by: module `mpi_utilities`

function: `mpigetrank`
Description: Return MPI rank.
Code lines: 13
Contained by: module `mpi_utilities`

function: `mpigetranklabel`
Description: Return MPI rank label.
Code lines: 23
Contained by: module `mpi_utilities`
Modules used: `iso_varying_string`

subroutine: `mpiinitialize`
Description: Initialize MPI.
Code lines: 64
Contained by: module `mpi_utilities`
Modules used: `galacticus_error` `hashes` `memory_management`

function: `mpiisactive`
Description: Return true if MPI is active.
Code lines: 8
Contained by: module `mpi_utilities`

function: `mpiismaster`
Description: Return true if this is the master process.
Code lines: 12
Contained by: module `mpi_utilities`

function: `mpimaxloc`
Description: Find the rank of the process having maximum values of an array over all processes, returning it to all processes.
Code lines: 28
Contained by: module `mpi_utilities`

function: `mpimaxvalarray`
Description: Find the maximum values of an array over all processes, returning it to all processes.
Code lines: 26
Contained by: module `mpi_utilities`

function: `mpimaxvalscalar`
Description: Find the maximum values of a scalar over all processes, returning it to all processes.
Code lines: 19
Contained by: module `mpi_utilities`

function: `mpimedianarray`
Description: Find the median of an array over all processes, returning it to all processes.
Code lines: 50
Contained by: module `mpi_utilities`
Modules used: `sort`

function: `mpimessagewaiting`
Description: Return true if an MPI message (matching the optional `from` and `tag` if given) is waiting for receipt.
Code lines: 23
Contained by: module `mpi_utilities`

function: `mpiminloc`
Description: Find the rank of the process having minimum values of an array over all processes, returning it to all processes.
Code lines: 28
Contained by: module `mpi_utilities`

function: `mpiminvalarray`
Description: Find the minimum values of an array over all processes, returning it to all processes.
Code lines: 26
Contained by: module `mpi_utilities`

function: `mpiminvalintarray`
Description: Find the minimum values of an array over all processes, returning it to all processes.
Code lines: 26
Contained by: module `mpi_utilities`

function: `mpiminvalintscalar`
Description: Find the minimum values of a scalar over all processes, returning it to all processes.
Code lines: 19
Contained by: module `mpi_utilities`

function: `mpiminvalscalar`
Description: Find the minimum values of a scalar over all processes, returning it to all processes.
Code lines: 19
Contained by: module `mpi_utilities`

type: `mpiobject`
Code lines: 159
Contained by: module `mpi_utilities`

function: `mpirequestdata1d`
Description: Request and receive data from other MPI processes.
Code lines: 76
Contained by: module `mpi_utilities`

function: `mpirequestdata2d`
Description: Request and receive data from other MPI processes.
Code lines: 76
Contained by: module `mpi_utilities`

function: `mpirequestdataint1d`
Description: Request and receive data from other MPI processes.
Code lines: 76
Contained by: module `mpi_utilities`

function: `mpirequestdatalogical1d`
Description: Request and receive data from other MPI processes.
Code lines: 76
Contained by: module `mpi_utilities`

function: `mpisumarraydouble`
Description: Sum an integer array over all processes, returning it to all processes.
Code lines: 28
Contained by: module `mpi_utilities`

function: `mpisumarrayint`
Description: Sum an integer array over all processes, returning it to all processes.
Code lines: 29
Contained by: module `mpi_utilities`

Modules used: galacticus_error

function: mpisumarraythreedouble
Description: Sum an rank-3 double array over all processes, returning it to all processes.
Code lines: 28
Contained by: module mpi_utilities

function: mpisumarraytwodouble
Description: Sum an rank-2 double array over all processes, returning it to all processes.
Code lines: 28
Contained by: module mpi_utilities

function: mpisumscalardouble
Description: Sum an integer scalar over all processes, returning it to all processes.
Code lines: 19
Contained by: module mpi_utilities

function: mpisumscalarint
Description: Sum an integer scalar over all processes, returning it to all processes.
Code lines: 19
Contained by: module mpi_utilities

interface: `array_cumulate`
Description: Interface to generic routines which cumulate values in an array.
Code lines: 3
Contained by: module `array_utilities`

function: `array_cumulate_double`
Description: Cumulates values in a double precision array.
Code lines: 14

Contained by: module array_utilities

interface: array_index
Description: Interface to generic routines which return a subset of an array given indices into the array.
Code lines: 6
Contained by: module array_utilities

function: array_index_double
Description: Return a subset of a double precision array given a set of indices into the array.
Code lines: 12
Contained by: module array_utilities

function: array_index_double_2d
Description: Return a subset of a 2D double precision array given a set of indices into the array.
Code lines: 28
Contained by: module array_utilities
Modules used: galacticus_error

function: array_index_integer
Description: Return a subset of an integer array given a set of indices into the array.
Code lines: 12
Contained by: module array_utilities

function: array_index_integer8
Description: Return a subset of an integer array given a set of indices into the array.
Code lines: 13
Contained by: module array_utilities
Modules used: kind_numbers

function: array_intersection_varying_string
Code lines: 22
Contained by: module array_utilities
Modules used: iso_varying_string

interface: array_is_monotonic
Description: Interface to generic routines which check if an array is monotonic.
Code lines: 4
Contained by: module array_utilities

function: array_is_monotonic_double
Description: Checks if a double precision array is monotonic.
Code lines: 82
Contained by: module array_utilities

function: array_is_monotonic_integer8
Description: Checks if an integer array is monotonic.
Code lines: 83
Contained by: module array_utilities
Modules used: kind_numbers

function: `array_is_uniform`
Description: Return true if an array is uniformly distributed (optionally in the logarithm of its values) to the given tolerance.
Code lines: 29
Contained by: module `array_utilities`
Modules used: `numerical_comparison`

interface: `array_reverse`
Description: Interface to generic routines which reverse the direction of an array.
Code lines: 5
Contained by: module `array_utilities`

function: `array_reverse_double`
Description: Reverses the direction of a double precision array.
Code lines: 11
Contained by: module `array_utilities`

function: `array_reverse_real`
Description: Reverses the direction of a real array.
Code lines: 11
Contained by: module `array_utilities`

function: `array_reverse_sizet`
Description: Reverses the direction of a real array.
Code lines: 12
Contained by: module `array_utilities`
Modules used: `iso_c_binding`

subroutine: `array_which`
Description: Return an array of indices for which `mask` is true.
Code lines: 18
Contained by: module `array_utilities`
Modules used: `galacticus_error`

interface: `operator(.intersection.)`
Code lines: 2
Contained by: module `array_utilities`

file: `utility.command_arguments.F90`
Description: Contains a module which provides an interface to read command line arguments of arbitrary type.
Code lines: 126

module: `command_arguments`
Description: Provides an interface to read command line arguments of arbitrary type.
Code lines: 103
Contained by: file `utility.command_arguments.F90`

interface: `get_argument`
Description: Generic interface to routines that read command line arguments.
Code lines: 8
Contained by: module `command_arguments`

subroutine: `get_argument_character`
Description: Reads a character command line argument.
Code lines: 8
Contained by: module `command_arguments`

subroutine: `get_argument_double`
Description: Reads a double command line argument.
Code lines: 10
Contained by: module `command_arguments`

subroutine: `get_argument_integer`
Description: Reads a integer command line argument.
Code lines: 10
Contained by: module `command_arguments`

subroutine: `get_argument_logical`
Description: Reads a logical command line argument.
Code lines: 10
Contained by: module `command_arguments`

subroutine: `get_argument_real`
Description: Reads a real command line argument.
Code lines: 10
Contained by: module `command_arguments`

subroutine: `get_argument_varying_string`
Description: Reads a varying string command line argument.
Code lines: 12
Contained by: module `command_arguments`
Modules used: `iso_varying_string`

subroutine: `get_temporary_string`
Description: Reads a command line argument into a temporary string of the correct length, and returns it as a varying string.
Code lines: 11
Contained by: module `command_arguments`
Modules used: `iso_varying_string`

file: `utility.date_and_time.F90`
Description: Contains a module which implements computation of formatted dates and times.
Code lines: 89

module: `dates_and_times`

Description: Implements computation of formatted dates and times.

interface: `count_lines_in_file`

Description: Generic interface for `Count_Lines_in_File` function.
Code lines: 4
Contained by: module file_utilities

function: `count_lines_in_file_char`

Description: Returns the number of lines in the file `in_file` (version for character argument).
Code lines: 26
Contained by: module file_utilities
Modules used: galacticus_error

function: `count_lines_in_file_varstr`
Description: Returns the number of lines in the file `in_file` (version for varying string argument).
Code lines: 12
Contained by: module `file_utilities`

interface: `directory_make`
Description: Generic interface for functions that create a directory.
Code lines: 4
Contained by: module `file_utilities`

subroutine: `directory_make_char`
Description: Make the given directory path. Will create intermediate directories in the path if necessary.
Code lines: 20
Contained by: module `file_utilities`
Modules used: `galacticus_error`

subroutine: `directory_make_varstr`
Description: Make the given directory path. Will create intermediate directories in the path if necessary.
Code lines: 7
Contained by: module `file_utilities`

function: `executable_find`
Description: Return the full path to the executable of the given name.
Code lines: 38
Contained by: module `file_utilities`
Modules used: `iso_varying_string` `string_handling`

subroutine: `get_paths`
Description: Retrieve the `PATH` environment variable.
Code lines: 11
Contained by: function `executable_find`

interface: `file_exists`
Description: Generic interface for functions that check for a files existance.
Code lines: 4
Contained by: module `file_utilities`

function: `file_exists_char`
Description: Checks for existance of file `FileName` (version for character argument).
Code lines: 7
Contained by: module `file_utilities`

function: `file_exists_varstr`
Description: Checks for existance of file `FileName` (version for varying string argument).
Code lines: 7
Contained by: module `file_utilities`

subroutine: `file_lock`

Description: Place a lock on a file.
Code lines: 16
Contained by: module file_utilities

subroutine: file_lock_initialize
Description: Initilialize the per thread lock in a file lock object.
Code lines: 7
Contained by: module file_utilities

function: file_name
Description: Returns the path to the file.
Code lines: 12
Contained by: module file_utilities

function: file_name_expand
Description: Expands placeholders for Galacticus paths in file names.
Code lines: 12
Contained by: module file_utilities
Modules used: galacticus_paths

function: file_name_temporary
Description: Returns the path to the file.
Code lines: 27
Contained by: module file_utilities
Modules used: mpi_utilities string_handling

interface: file_path
Description: Generic interface for functions that return the path to a file.
Code lines: 4
Contained by: module file_utilities

function: file_path_char
Description: Returns the path to the file.
Code lines: 12
Contained by: module file_utilities

function: file_path_varstr
Description: Returns the path to the file.
Code lines: 8
Contained by: module file_utilities

subroutine: file_remove
Description: Remove a file.
Code lines: 8
Contained by: module file_utilities
Modules used: system_command

subroutine: file_unlock
Description: Remove a lock from a file.

Code lines: 17
Contained by: module file_utilities
Modules used: galacticus_error

type: lockdescriptor
Description: Type used to store file lock descriptors.
Code lines: 6
Contained by: module file_utilities

file: utility.hashes.F90
Description: Contains a module which implements "hashes" (i.e. associative arrays).
Code lines: 432

module: hashes
Description: Implements "hashes" (i.e. associative arrays). Derived type for TypeÂęlabel hashes. Constructor for scalar hashes. Destroys thisHash.
Code lines: 410
Contained by: file utility.hashes.F90
Modules used: iso_c_binding, iso_varying_string
Used by: module galacticus_meta_evolver_-profiler, module galacticus_nodes, subroutine treenodecomponentbuilder, module stellar_populations, program test_hashes, subroutine mpiinitialize

subroutine: delete_
Description: Deletes entry key from Hash.
Code lines: 23
Contained by: module hashes
Modules used: arrays_search, galacticus_error, iso_c_binding

subroutine: destroy_
Description: Destroys thisHash.
Code lines: 14
Contained by: module hashes

function: exists_
Description: Returns true if the specified key exists in the specified thisHash, false otherwise.
Code lines: 12
Contained by: module hashes

subroutine: initialize_
Description: Routine to initialize (or re-initialize) a hash.
Code lines: 10
Contained by: module hashes

function: key_
Description: Returns the key of entry number index in thisHash.
Code lines: 9

Contained by: module hashes

subroutine: keys_
Description: Returns an array of all keys in thisHash.
Code lines: 10
Contained by: module hashes

subroutine: set_
Description: Sets the value of key in thisHash to value.
Code lines: 65
Contained by: module hashes
Modules used: arrays_search iso_c_binding

function: size_
Description: Returns the number of elements in the specified Hash.
Code lines: 7
Contained by: module hashes

function: value_
Description: Returns the value of key in thisHash.
Code lines: 19
Contained by: module hashes
Modules used: arrays_search galacticus_error iso_c_binding

subroutine: values_
Description: Returns an array of all values in thisHash.
Code lines: 19
Contained by: module hashes
Modules used: galacticus_error

file: utility.hashes.cryptographic.F90
Code lines: 66

module: hashes_cryptographic
Code lines: 43
Contained by: file utility.hashes.cryptographic.F90
Modules used: iso_c_binding
Used by: subroutine interface_camb_transfer_-function program test_hashes_cryptographic
module input_parameters function inputparametersserializetostring

function: hash_md5
Code lines: 24
Contained by: module hashes_cryptographic
Modules used: iso_varying_string string_handling

file: utility.hashes.perfect.F90

Description: Contains a module which implements a perfect hash algorithm for long integer keys.
Code lines: 309

module: `hashes_perfect`
Description: Implements a perfact hash algorithm for long integer keys based on methods described by Czech et al. [1997]. The specific implementation follows the general structure of that given in a Dr. Dobbs article.
Code lines: 287
Contained by: file `utility.hashes.perfect.F90`
Modules used: `iso_c_binding` `kind_numbers`
Used by: program `test_perfect_hashes`

subroutine: `hash_perfect_create`
Description: Create a perfect hash for a given set of keys.
Code lines: 139
Contained by: module `hashes_perfect`
Modules used: `galacticus_error` `memory_management`

subroutine: `hash_perfect_destroy`
Description: Destroy a perfect hash.
Code lines: 11
Contained by: module `hashes_perfect`
Modules used: `memory_management`

function: `hash_perfect_index`
Description: Return the index corresponding to a hash key.
Code lines: 14
Contained by: module `hashes_perfect`
Modules used: `galacticus_error`

function: `hash_perfect_is_present`
Description: Returns true if the hash contains the key.
Code lines: 12
Contained by: module `hashes_perfect`
Modules used: `galacticus_error`

function: `hash_perfect_size`
Description: Return the size of the hash table.
Code lines: 10
Contained by: module `hashes_perfect`
Modules used: `galacticus_error`

function: `hash_perfect_value`
Description: Returns the value for a specified key.
Code lines: 13
Contained by: module `hashes_perfect`
Modules used: `galacticus_error`

type: `hashperfect`

Description: A derived type which stores perfect long integer hashes.
Code lines: 54
Contained by: module hashes_perfect

type: rowstructure
Description: A row structure used in building hashes
Code lines: 4
Contained by: module hashes_perfect

file: utility.input_parameters.F90
Description: Contains a module which implements reading of parameters from an XML data file.
Code lines: 1432

module: input_parameters
Description: Implements reading of parameters from an XML file.
Code lines: 1410
Contained by: file utility.input_parameters.F90
Modules used: fox_dom, function_classes, galacticus_build, galacticus_versioning, hashes_cryptographic, io_hdf5, io_xml, iso_varying_string, kind_numbers, string_handling

function intergalacticmediumstateevolveconstructorparameters

type: `genericobjectlist`
Description: A list-type for unlimited polymorphic pointers.
Code lines: 4
Contained by: module input_parameters

type: `inputparameter`
Description: A class to handle input parameters for Galacticus.
Code lines: 69
Contained by: module input_parameters

subroutine: `inputparameterdestroy`
Description: Destructor for the `inputParameter` class.
Code lines: 17
Contained by: module input_parameters

function: `inputparameterget`
Description: Get the value of a parameter.
Code lines: 21
Contained by: module input_parameters
Modules used: galacticus_error

function: `inputparameterisparameter`
Description: Return true if this is a valid parameter.
Code lines: 13
Contained by: module input_parameters

interface: `inputparameterlist`
Description: Constructors for `inputParameterList` objects.
Code lines: 3
Contained by: module input_parameters

subroutine: `inputparameterlistadd`
Description: Add a parameter to a list of input parameters to an XML document.
Code lines: 25
Contained by: module input_parameters

function: `inputparameterlistconstructor`
Description: Construct an `inputParameterList` object.
Code lines: 7
Contained by: module input_parameters

subroutine: `inputparameterlistdestructor`
Description: Destroy an `inputParameterList` object.
Code lines: 8
Contained by: module `input_parameters`

subroutine: `inputparameterlistserializetoxml`
Description: Serialize a list of input parameters to an XML document.
Code lines: 15
Contained by: module `input_parameters`
Modules used: `fox_wxml`

function: `inputparameterobjectcreated`
Description: Return true if the specified instance of the object associated with this parameter has been created.
Code lines: 20
Contained by: module `input_parameters`

function: `inputparameterobjectget`
Description: Return a pointer to the object associated with this parameter.
Code lines: 22
Contained by: module `input_parameters`
Modules used: `galacticus_error`

subroutine: `inputparameterobjectset`
Description: Set a pointer to the object associated with this parameter.
Code lines: 23
Contained by: module `input_parameters`

subroutine: `inputparameterreset`
Description: Reset objects associated with this parameter and any sub-parameters.
Code lines: 26
Contained by: module `input_parameters`

interface: `inputparameters`
Description: Constructors for the `inputParameters` class.
Code lines: 7
Contained by: module `input_parameters`

subroutine: `inputparametersaddparameter`
Description: Add a parameter to the set.
Code lines: 36
Contained by: module `input_parameters`

subroutine: `inputparametersbuildtree`
Description: Build a tree representation of the input parameter file.
Code lines: 32
Contained by: module `input_parameters`

subroutine: `inputparameterscheckparameters`
Code lines: 95
Contained by: module `input_parameters`
Modules used: `galacticus_display` `regular_expressions` `string_handling`

function: `inputparametersconstructorcopy`
Description: Constructor for the `inputParameters` class from an existing parameters object.
Code lines: 11
Contained by: module `input_parameters`

function: `inputparametersconstructorfilechar`
Description: Constructor for the `inputParameters` class from an XML file specified as a character variable.
Code lines: 30
Contained by: module `input_parameters`
Modules used: `file_utilities` `galacticus_error` `io_xml`

function: `inputparametersconstructorfilevarstr`
Description: Constructor for the `inputParameters` class from an XML file specified as a variable length string.
Code lines: 12
Contained by: module `input_parameters`

function: `inputparametersconstructornode`
Description: Constructor for the `inputParameters` class from an FoX node.
Code lines: 81
Contained by: module `input_parameters`
Modules used: `file_utilities` `galacticus_display` `galacticus_error` `galacticus_paths`

function: `inputparametersconstructornull`
Description: Constructor for the `inputParameters` class creating a null instance.
Code lines: 12
Contained by: module `input_parameters`

function: `inputparametersconstructorvarstr`
Description: Constructor for the `inputParameters` class from an XML file specified as a variable length string.
Code lines: 22
Contained by: module `input_parameters`

function: `inputparameterscopiescount`
Description: Return true if the specified parameter is present.
Code lines: 32
Contained by: module `input_parameters`
Modules used: `galacticus_error`

function: `inputparameterscount`
Description: Return a count of the number of values in a parameter.
Code lines: 22
Contained by: module `input_parameters`
Modules used: `galacticus_error`

subroutine: `inputparametersdestroy`
Description: Destructor for the `inputParameters` class.
Code lines: 17
Contained by: module `input_parameters`

subroutine: `inputparametersetdouble`
Description: Set the value of a parameter.
Code lines: 10
Contained by: module `input_parameters`

subroutine: `inputparametersetvarstr`
Description: Set the value of a parameter.
Code lines: 8
Contained by: module `input_parameters`

subroutine: `inputparametersfinalize`
Description: Finalizer for the `inputParameters` class.
Code lines: 34
Contained by: module `input_parameters`
Modules used: `file_utilities`

function: `inputparametersisglobal`
Description: Return true if an `inputParameters` object is the global input parameter set.
Code lines: 7
Contained by: module `input_parameters`

function: `inputparametersispresent`
Description: Return true if the specified parameter is present.
Code lines: 27
Contained by: module `input_parameters`

subroutine: `inputparametersmarkglobal`
Description: Mark an `inputParameters` object as the global input parameters.
Code lines: 13
Contained by: module `input_parameters`
Modules used: `galacticus_error`

function: `inputparametersnode`
Description: Return the node containing the parameter.
Code lines: 35
Contained by: module `input_parameters`

Modules used: galacticus_error

subroutine: inputparametersparametersgroupcopy
Description: Copy an output group for parameters in the given HDF5 object.
Code lines: 11
Contained by: module input_parameters

subroutine: inputparametersparametersgroupopen
Description: Open an output group for parameters in the given HDF5 object.
Code lines: 25
Contained by: module input_parameters
Modules used: file_utilities

subroutine: inputparametersreset
Description: Reset all objects in a parameter set.
Code lines: 7
Contained by: module input_parameters

subroutine: inputparametersresolvereferences
Description: Build a tree representation of the input parameter file.
Code lines: 24
Contained by: module input_parameters

function: inputparametersserializetostring
Description: Serialize input parameters to a string.
Code lines: 32
Contained by: module input_parameters
Modules used: hashes_cryptographic

subroutine: inputparametersserializetoxml
Description: Serialize input parameters to an XML file.
Code lines: 8
Contained by: module input_parameters

function: inputparameterssubparameters
Description: Return sub-parameters of the specified parameter.
Code lines: 29
Contained by: module input_parameters
Modules used: galacticus_error

subroutine: inputparametersvalidatename
Description: Validate a parameter name.
Code lines: 10
Contained by: module input_parameters
Modules used: galacticus_error

subroutine: inputparametersvaluename
Description: Return the value of the parameter specified by name.
Code lines: 31

Contained by: module input_parameters
Modules used: galacticus_error

subroutine: inputparametersvaluenode
Description: Return the value of the specified parameter.
Code lines: 65
Contained by: module input_parameters
Modules used: galacticus_error

function: inputparameterswalktree
Description: Perform a depth-first walk of a parameter tree.
Code lines: 23
Contained by: module input_parameters

file: utility.kind_numbers.F90
Description: Contains a module which defines various kind types.
Code lines: 34

module: kind_numbers
Description: Defines various kind types.
Code lines: 13

subroutine: `add_memory_component`

Description: Add a memory type to the memory reporting strings.
Code lines: 22
Contained by: module memory_management
Modules used: iso_varying_string

interface: `allocatearray`

Description: Generic interface to routines which allocate arrays.
Code lines: 36
Contained by: module memory_management

subroutine: `allocatearray_character_1d`

Description: Allocate a 1D `character` array.
Code lines: 39
Contained by: module memory_management

Modules used: dmemory galacticus_display iso_varying_string string_handling

subroutine: allocatearray_character_1d_kind_int8
Description: Allocate a 1D character array.
Code lines: 39
Contained by: module memory_management
Modules used: dmemory galacticus_display iso_varying_string string_handling

subroutine: allocatearray_complex_c_double_complex_3d
Description: Allocate a 3D complex_c_double_complex array.
Code lines: 39
Contained by: module memory_management
Modules used: dmemory galacticus_display iso_varying_string string_handling

subroutine: allocatearray_complex_c_double_complex_3d_kind_int8
Description: Allocate a 3D complex_c_double_complex array.
Code lines: 39
Contained by: module memory_management
Modules used: dmemory galacticus_display iso_varying_string string_handling

subroutine: allocatearray_double_precision_1d
Description: Allocate a 1D double precision array.
Code lines: 39
Contained by: module memory_management
Modules used: dmemory galacticus_display iso_varying_string string_handling

subroutine: allocatearray_double_precision_1d_kind_int8
Description: Allocate a 1D double precision array.
Code lines: 39
Contained by: module memory_management
Modules used: dmemory galacticus_display iso_varying_string string_handling

subroutine: allocatearray_double_precision_2d
Description: Allocate a 2D double precision array.
Code lines: 39
Contained by: module memory_management
Modules used: dmemory galacticus_display iso_varying_string string_handling

subroutine: allocatearray_double_precision_2d_kind_int8
Description: Allocate a 2D double precision array.
Code lines: 39
Contained by: module memory_management

Modules used: dmemory galacticus_display iso_varying_string string_handling

subroutine: allocatearray_double_precision_3d
Description: Allocate a 3D double precision array.
Code lines: 39
Contained by: module memory_management
Modules used: dmemory galacticus_display iso_varying_string string_handling

subroutine: allocatearray_double_precision_3d_kind_int8
Description: Allocate a 3D double precision array.
Code lines: 39
Contained by: module memory_management
Modules used: dmemory galacticus_display iso_varying_string string_handling

subroutine: allocatearray_double_precision_4d
Description: Allocate a 4D double precision array.
Code lines: 39
Contained by: module memory_management
Modules used: dmemory galacticus_display iso_varying_string string_handling

subroutine: allocatearray_double_precision_4d_kind_int8
Description: Allocate a 4D double precision array.
Code lines: 39
Contained by: module memory_management
Modules used: dmemory galacticus_display iso_varying_string string_handling

subroutine: allocatearray_double_precision_5d
Description: Allocate a 5D double precision array.
Code lines: 39
Contained by: module memory_management
Modules used: dmemory galacticus_display iso_varying_string string_handling

subroutine: allocatearray_double_precision_5d_kind_int8
Description: Allocate a 5D double precision array.
Code lines: 39
Contained by: module memory_management
Modules used: dmemory galacticus_display iso_varying_string string_handling

subroutine: allocatearray_double_precision_6d
Description: Allocate a 6D double precision array.
Code lines: 39
Contained by: module memory_management

Modules used: dmemory galacticus_display iso_varying_string string_handling

subroutine: allocatearray_double_precision_6d_kind_int8
Description: Allocate a 6D double precision array.
Code lines: 39
Contained by: module memory_management
Modules used: dmemory galacticus_display iso_varying_string string_handling

subroutine: allocatearray_integer_1d
Description: Allocate a 1D integer array.
Code lines: 39
Contained by: module memory_management
Modules used: dmemory galacticus_display iso_varying_string string_handling

subroutine: allocatearray_integer_1d_kind_int8
Description: Allocate a 1D integer array.
Code lines: 39
Contained by: module memory_management
Modules used: dmemory galacticus_display iso_varying_string string_handling

subroutine: allocatearray_integer_2d
Description: Allocate a 2D integer array.
Code lines: 39
Contained by: module memory_management
Modules used: dmemory galacticus_display iso_varying_string string_handling

subroutine: allocatearray_integer_2d_kind_int8
Description: Allocate a 2D integer array.
Code lines: 39
Contained by: module memory_management
Modules used: dmemory galacticus_display iso_varying_string string_handling

subroutine: allocatearray_integer_kind_int8_1d
Description: Allocate a 1D integer_kind_int8 array.
Code lines: 39
Contained by: module memory_management
Modules used: dmemory galacticus_display iso_varying_string string_handling

subroutine: allocatearray_integer_kind_int8_1d_kind_int8
Description: Allocate a 1D integer_kind_int8 array.
Code lines: 39
Contained by: module memory_management

Modules used: dmemory galacticus_display iso_varying_string string_handling

subroutine: allocatearray_integer_kind_int8_2d
Description: Allocate a 2D integer_kind_int8 array.
Code lines: 39
Contained by: module memory_management
Modules used: dmemory galacticus_display iso_varying_string string_handling

subroutine: allocatearray_integer_kind_int8_2d_kind_int8
Description: Allocate a 2D integer_kind_int8 array.
Code lines: 39
Contained by: module memory_management
Modules used: dmemory galacticus_display iso_varying_string string_handling

subroutine: allocatearray_logical_1d
Description: Allocate a 1D logical array.
Code lines: 39
Contained by: module memory_management
Modules used: dmemory galacticus_display iso_varying_string string_handling

subroutine: allocatearray_logical_1d_kind_int8
Description: Allocate a 1D logical array.
Code lines: 39
Contained by: module memory_management
Modules used: dmemory galacticus_display iso_varying_string string_handling

subroutine: allocatearray_logical_2d
Description: Allocate a 2D logical array.
Code lines: 39
Contained by: module memory_management
Modules used: dmemory galacticus_display iso_varying_string string_handling

subroutine: allocatearray_logical_2d_kind_int8
Description: Allocate a 2D logical array.
Code lines: 39
Contained by: module memory_management
Modules used: dmemory galacticus_display iso_varying_string string_handling

subroutine: allocatearray_real_1d
Description: Allocate a 1D real array.
Code lines: 39
Contained by: module memory_management

Modules used: dmemory galacticus_display iso_varying_string string_handling

subroutine: allocatearray_real_1d_kind_int8
Description: Allocate a 1D real array.
Code lines: 39
Contained by: module memory_management
Modules used: dmemory galacticus_display iso_varying_string string_handling

subroutine: allocatearray_real_2d
Description: Allocate a 2D real array.
Code lines: 39
Contained by: module memory_management
Modules used: dmemory galacticus_display iso_varying_string string_handling

subroutine: allocatearray_real_2d_kind_int8
Description: Allocate a 2D real array.
Code lines: 39
Contained by: module memory_management
Modules used: dmemory galacticus_display iso_varying_string string_handling

subroutine: allocatearray_real_kind_quad_1d
Description: Allocate a 1D real_kind_quad array.
Code lines: 39
Contained by: module memory_management
Modules used: dmemory galacticus_display iso_varying_string string_handling

subroutine: allocatearray_real_kind_quad_1d_kind_int8
Description: Allocate a 1D real_kind_quad array.
Code lines: 39
Contained by: module memory_management
Modules used: dmemory galacticus_display iso_varying_string string_handling

subroutine: code_memory_usage
Description: Determines the size of the “text” (i.e. code) size.
Code lines: 19
Contained by: module memory_management
Modules used: dmemory

interface: deallocatearray
Description: Generic interface to routines which deallocate arrays.
Code lines: 19
Contained by: module memory_management

subroutine: `deallocatearray_character_1d`
Description: Deallocate a 1D `character` array.
Code lines: 31
Contained by: module `memory_management`
Modules used: `dmemory` `galacticus_display` `iso_varying_string` `string_handling`

subroutine: `deallocatearray_complex_c_double_complex_3d`
Description: Deallocate a 3D `complex_c_double_complex` array.
Code lines: 31
Contained by: module `memory_management`
Modules used: `dmemory` `galacticus_display` `iso_varying_string` `string_handling`

subroutine: `deallocatearray_double_precision_1d`
Description: Deallocate a 1D `double precision` array.
Code lines: 31
Contained by: module `memory_management`
Modules used: `dmemory` `galacticus_display` `iso_varying_string` `string_handling`

subroutine: `deallocatearray_double_precision_2d`
Description: Deallocate a 2D `double precision` array.
Code lines: 31
Contained by: module `memory_management`
Modules used: `dmemory` `galacticus_display` `iso_varying_string` `string_handling`

subroutine: `deallocatearray_double_precision_3d`
Description: Deallocate a 3D `double precision` array.
Code lines: 31
Contained by: module `memory_management`
Modules used: `dmemory` `galacticus_display` `iso_varying_string` `string_handling`

subroutine: `deallocatearray_double_precision_4d`
Description: Deallocate a 4D `double precision` array.
Code lines: 31
Contained by: module `memory_management`
Modules used: `dmemory` `galacticus_display` `iso_varying_string` `string_handling`

subroutine: `deallocatearray_double_precision_5d`

function: `multicounterincrement`
Description: Increment a multi-counter. Return true if increment was possible, false otherwise.
Code lines: 29
Contained by: module `multi_counters`
Modules used: `galacticus_error`

function: `multicounterisfinal`
Description: Return true if a multi-counter is in its final state, false otherwise.
Code lines: 11
Contained by: module `multi_counters`
Modules used: `galacticus_error`

subroutine: `multicounterreset`
Description: Reset the state of the multi-counter.
Code lines: 7
Contained by: module `multi_counters`

function: `multicounterstate`
Description: Return the state of the multi-counter.
Code lines: 14
Contained by: module `multi_counters`
Modules used: `galacticus_error`

file: `utility.regular_expressions.F90`
Description: Contains a module which implements regular expressions by wrappring the GNU C Library implementations.

Code lines: 134

module: `regular_expressions`
Description: Implements regular expressions by wrappring the GNU C Library implementations.
Code lines: 109
Contained by: file utility.regular_expressions.F90
Modules used: iso_c_binding
Used by: subroutine sussingasciiopen, program tests_regular_expressions, subroutine inputparameterscheckparameters

interface: `regex`
Description: Constructor for regular expression object.
Code lines: 3
Contained by: module regular_expressions

function: `regular_expression_constructor`
Description: Constructor for `regEx` objects.
Code lines: 8
Contained by: module regular_expressions

subroutine: `regular_expression_destroy`
Description: Destroy a `regEx` object.
Code lines: 10
Contained by: module regular_expressions

subroutine: `regular_expression_destructor`
Description: Destructor for `regEx` objects.
Code lines: 8
Contained by: module regular_expressions

function: `regular_expression_match`
Description: Returns true if a `regEx` object matches the supplied `string`.
Code lines: 10
Contained by: module regular_expressions

file: `utility.semaphores.F90`
Description: Contains a module which implements semaphores.
Code lines: 200

module: `semaphores`
Description: Implements semaphores.
Code lines: 175
Contained by: file utility.semaphores.F90
Modules used: iso_c_binding
Used by: module galacticus_error, subroutine evolveforestsperform

type: `semaphore`
Code lines: 36

Contained by: module semaphores

subroutine: `semaphore_close`
Code lines: 6
Contained by: module semaphores

function: `semaphore_open`
Code lines: 26
Contained by: module semaphores

subroutine: `semaphore_post`
Code lines: 8
Contained by: module semaphores

subroutine: `semaphore_post_on_error`
Description: Attempts to post to all open semaphores before exiting the code in an error condition.
Code lines: 13
Contained by: module semaphores

subroutine: `semaphore_unlink`
Code lines: 6
Contained by: module semaphores

subroutine: `semaphore_wait`
Code lines: 8
Contained by: module semaphores

type: `semaphorelist`
Code lines: 3
Contained by: module semaphores

file: `utility.stateful_values.F90`
Description: Contains a module of stateful types.
Code lines: 42

module: `stateful_types`
Description: Contains stateful types.
Code lines: 20
Contained by: file utility.stateful_values.F90
Used by: file merger_trees.construct.read.importer.SussingMergerTreeReconstruct.F90 file merger_trees.construct.read.importer.galacticus.F90 file tasks.merger_tree_file_builder.F90

type: `statefuldouble`
Code lines: 3
Contained by: module stateful_types

type: `statefulinteger`
Code lines: 3

Contained by: module stateful_types

type: statefullogical
Code lines: 3
Contained by: module stateful_types

file: utility.string_handling.F90
Description: Contains a module which implements various useful functionality for manipulating character strings.
Code lines: 441

module: string_handling
Description: Implements various useful functionality for manipulating character strings.
Code lines: 419
Contained by: file utility.string_handling.F90
Modules used: iso_varying_string
Used by:

interface: `char`
Code lines: 2
Contained by: module string_handling

function: `char_logical`
Description: Convert a logical to a string.
Code lines: 12
Contained by: module string_handling

function: `concatenate_varstr_integer`
Description: Provides a concatenation operator to append an integer number to a `varying_string`.
Code lines: 11
Contained by: module string_handling

function: `concatenate_varstr_integer8`
Description: Provides a concatenation operator to append an integer number to a `varying_string`.
Code lines: 12
Contained by: module string_handling
Modules used: kind_numbers

function: `convert_varstring_to_char`
Description: Convert an array of varying strings into an array of characters.
Code lines: 11
Contained by: module string_handling

interface: `operator(//)`
Code lines: 3
Contained by: module string_handling

function: `string_c_to_fortran`
Description: Convert a C-style character array into a Fortran varying string variable.
Code lines: 13
Contained by: module string_handling
Modules used: `iso_c_binding`

function: `string_count_words`
Description: Return a count of the number of space separated words in `inputString`.
Code lines: 36

Contained by: module string_handling

function: string_join
Description: Joins an array of strings into one long string with the given separator.
Code lines: 14
Contained by: module string_handling

function: string_levenshtein_distance
Description: Compute the Levenshtein distance between strings a and b.
Code lines: 27
Contained by: module string_handling

function: string_lower_case
Description: Converts an input string to lower case.
Code lines: 16
Contained by: module string_handling

function: string_lower_case_first
Description: Converts the first character of an input string to lower case.
Code lines: 13
Contained by: module string_handling

interface: string_split_words
Code lines: 3
Contained by: module string_handling

subroutine: string_split_words_char
Description: Split inputString into words and return as an array.
Code lines: 47
Contained by: module string_handling

subroutine: string_split_words_varstring
Description: Split inputString into words and return as an array.
Code lines: 47
Contained by: module string_handling

function: string_strip
Description: Strips a string of leading and trailing whitespace, including tabs.
Code lines: 26
Contained by: module string_handling

function: string_subscript
Description: Converts an input string to Unicode subscripts.
Code lines: 16
Contained by: module string_handling

function: string_superscript
Description: Converts an input string to Unicode superscripts.
Code lines: 16

Contained by: module string_handling

function: string_upper_case
Description: Converts an input string to upper case.
Code lines: 16
Contained by: module string_handling

function: string_upper_case_first
Description: Converts an input string to upper case.
Code lines: 13
Contained by: module string_handling

file: utility.unit_tests.F90
Description: Contains a module which implements unit testing.
Code lines: 1208

module: unit_tests
Description: Implements unit testing.

20. Acknowledgements

In addition to the tools and libraries required to compile and run Galacticus, development of Galacticus has benefitted from extensive use of the following: GNU Octave, Maxima, Cantor, Kile, Emacs and Valgrind. We are grateful to the members of the GNU Fortran mailing list for invaluable discussions and fixes for compiler problems. We thank John Burkardt for making available the Bivar algorithm for performing interpolation on data irregularly spaced on a 2D plane, Dima Verner for making available codes to compute various atomic data for astrophysics, Warren Perger for making available his pFq code for computing generalized hypergeometric functions, and Shanjie Zhang and Jianming Jin made available code for computing the $E_1(z)$ exponential integral for complex argument. Chris Power provided instructions for installing Galacticus under Mac OS X. The community of Galacticus users[1] have provided invaluable feedback and bug reports. Gian Luigi Granato and Laura Silva kindly provided modifications to their Grasil code to allow it to read Galacticus outputs.

[1] In particular, Christoph Behrens, Jianling Gan, Markus Haider, Harald Höller, Eve Kovacs, Ting-Wen Lan, Adrian Pope, Luiz Felippe Rodrigues, Sergio Sanes, Martin White and Liyan Xu.

Part VI.

Appendices

A. Merger Tree File Format

Galacticus uses a standardized HDF5 file structure for merger tree data. This allows for portability. This format is defined below.

A.1. Basic File Format

Merger trees are stored in HDF5 files for portability and convenience. Additionally, the format is intended to be sufficiently flexible to allow it to desribe merger trees obtained in a wide variety of ways, including Monte Carlo algorithms (e.g. extended Press-Schechter algorithms) and from N-body simulations.

A.1.1. Flexibility and Extensibility

All of the groups/datasets in the file except for the `forestIndex` and `forestHalos` groups are, in principle, optional. This does not mean that a file created without some of these optional groups/datasets will be useable by a given code. It is the responsibility of a given code to check that all data that it requires is present in the file. You are therefore encouraged to include as much information as possible when constructing merger tree files.

Additionally, the file format is intended to be extensible. It is permissible to add additional datasets, for example to describe some other properties of nodes in each tree. Additional datasets should follow the structure of currently defined datasets, i.e. they should be stored as a single dataset combining all trees with nodes listed in the same order as for other datasets. For additional datasets which might be of general use you are encouraged to contact us and recommend them for inclusion in the standard—this allows their name to be standardized.

A.1.2. A Note on Scalar Attributes

Many of the HDF5 attributes discussed in this document are indicated to be scalar (rank 0) attributes. It is allowable within the standard that these be pseudo-scalars (rank 1 arrays contaning a single element). This allows such attributes to be created using the `h5lt` API for example.

A.1.3. Example File Structure

An example of the structure of such a file, called "`example.hdf5`" is shown below using the format of `h5dump`. Each of the groups is described in detail in the following sections.

```
HDF5 "example.hdf5" {
GROUP "/" {
   ATTRIBUTE "formatVersion"
   GROUP "cosmology" {
   }
   GROUP "groupFinder" {
   }
   GROUP "forestHalos" {
   }
   GROUP "forests" {
   }
   GROUP "particles" {
   }
   GROUP "provenance" {
   }
   GROUP "simulation" {
   }
   GROUP "forestIndex" {
   }
```

```
   GROUP "units" {
   }
}
```

A.2. Format Version Attribute

The `formatVersion` attribute specifies which version of the merger tree file format this file follows. The current standard is version 2.

A.3. Cosmology Group

The `cosmology` group describes the cosmological model within which the merger trees contained in the file were constructed. An example of this group, showing standard attributes, is given below.

```
GROUP "cosmology" {
   ATTRIBUTE "HubbleParam" {
      DATATYPE  H5T_IEEE_F64LE
      DATASPACE  SCALAR
      DATA {
      (0): 0.73
      }
   }
   ATTRIBUTE "OmegaMatter" {
      DATATYPE  H5T_IEEE_F64LE
      DATASPACE  SCALAR
      DATA {
      (0): 0.25
      }
   }
   ATTRIBUTE "OmegaLambda" {
      DATATYPE  H5T_IEEE_F64LE
      DATASPACE  SCALAR
      DATA {
      (0): 0.75
      }
   }
   ATTRIBUTE "OmegaBaryon" {
      DATATYPE  H5T_IEEE_F64LE
      DATASPACE  SCALAR
      DATA {
      (0): 0.045
      }
   }
   ATTRIBUTE "powerSpectrumIndex" {
      DATATYPE  H5T_IEEE_F64LE
      DATASPACE  SCALAR
      DATA {
      (0): 1
      }
```

```
   }
   ATTRIBUTE "sigma_8" {
      DATATYPE  H5T_IEEE_F64LE
      DATASPACE  SCALAR
      DATA {
      (0): 0.9
      }
   }
   ATTRIBUTE "transferFunction" {
      DATATYPE  H5T_STRING {
            STRSIZE 7;
            STRPAD H5T_STR_SPACEPAD;
            CSET H5T_CSET_ASCII;
            CTYPE H5T_C_S1;
         }
      DATASPACE  SCALAR
      DATA {
      (0): "CAMB"
      }
   }
}
```

A.3.1. Standard Attributes

The following are standard attributes in the `cosmology` group (others may be added as desired).

`HubbleParam` The Hubble parameter in units of 100 km/s/Mpc at $z = 0$, h_0;

`OmegaMatter` The density of matter (both dark and baryonic matter) in units of the critical density at $z = 0$, $\Omega_{\rm M}$;

`OmegaLambda` The density of dark energy in units of the critical density at $z = 0$, Ω_Λ;

`OmegaBaryon` The density of matter (both dark and baryonic matter) in units of the critical density at $z = 0$, $\Omega_{\rm b}$;

`powerSpectrumIndex` The index of the primordial power spectrum of matter fluctuations, i.e. $n_{\rm s}$ for power spectrum $P(k) \propto k^{n_{\rm s}}$;

`sigma_8` The root-variance of mass fluctuations in real space top-hat spheres of radius $8h^{-1}$Mpc computed from the $z = 0$ linear theory power spectrum, σ_8;

`transferFunction` A descriptor of the transfer function used to compute the power spectrum.

A.4. Group Finder Group

This group, typically relevant only for merger trees derived from N-body simulations, describes the characteristics of the group finding algorithm that was used to find halos in the simulation. An example of this group, showing standard attributes, is given below.

```
GROUP "groupFinder" {
   COMMENT "Group finder parameters."
   ATTRIBUTE "code" {
      DATATYPE  H5T_STRING {
            STRSIZE 7;
            STRPAD H5T_STR_SPACEPAD;
            CSET H5T_CSET_ASCII;
            CTYPE H5T_C_S1;
         }
      DATASPACE  SCALAR
      DATA {
      (0): "SUBFIND"
      }
   }
   ATTRIBUTE "linkingLength" {
      DATATYPE  H5T_IEEE_F64LE
      DATASPACE  SCALAR
      DATA {
      (0): 0.2
      }
   }
   ATTRIBUTE "minimumParticleNumber" {
      DATATYPE  H5T_STD_I32LE
      DATASPACE  SCALAR
      DATA {
      (0): 20
      }
   }
}
```

A.4.1. Standard Attributes

The following are standard attributes in the `groupFinder` group (others may be added as desired).

`code` The name of the group finding code used in the construction of these merger trees;

`linkingLength` For friends-of-friends group finding algorithms the dimensionless (i.e. in units of the mean interparticle spacing) linking length used;

`minimumParticleNumber` The minimum number of particles that a group was required to have in order to be included in a merger tree.

A.5. Simulation Group

This group, typically relevant only for merger trees derived from N-body simulations, describes the characteristics of the simulation from which the trees were derived. An example of this group, showing standard attributes, is given below.

```
 GROUP "simulation" {
   COMMENT "Simulation parameters."
```

```
   ATTRIBUTE "ErrTolIntAccuracy" {
      DATATYPE  H5T_IEEE_F64LE
      DATASPACE  SCALAR
      DATA {
      (0): 0.02
      }
   }
   ATTRIBUTE "TypeOfTimestepCriterion" {
      DATATYPE  H5T_STD_I32LE
      DATASPACE  SCALAR
      DATA {
      (0): 0
      }
   }
   ATTRIBUTE "boxSize" {
      DATATYPE  H5T_IEEE_F64LE
      DATASPACE  SCALAR
      DATA {
      (0): 500
      }
   }
   ATTRIBUTE "code" {
      DATATYPE  H5T_STRING {
            STRSIZE 8;
            STRPAD H5T_STR_SPACEPAD;
            CSET H5T_CSET_ASCII;
            CTYPE H5T_C_S1;
         }
      DATASPACE  SCALAR
      DATA {
      (0): "GADGET-2"
      }
   }
   ATTRIBUTE "initialConditions" {
      DATATYPE  H5T_STRING {
            STRSIZE 5;
            STRPAD H5T_STR_SPACEPAD;
            CSET H5T_CSET_ASCII;
            CTYPE H5T_C_S1;
         }
      DATASPACE  SCALAR
      DATA {
      (0): "glass"
      }
   }
   ATTRIBUTE "softeningKernel" {
      DATATYPE  H5T_STRING {
            STRSIZE 6;
            STRPAD H5T_STR_SPACEPAD;
```

```
            CSET H5T_CSET_ASCII;
            CTYPE H5T_C_S1;
         }
      DATASPACE  SCALAR
      DATA {
      (0): "spline"
      }
   }
   ATTRIBUTE "softeningPlummerEquivalent" {
      DATATYPE  H5T_IEEE_F64LE
      DATASPACE  SCALAR
      DATA {
      (0): 0.005
      }
   }
   ATTRIBUTE "startRedshift" {
      DATATYPE  H5T_IEEE_F64LE
      DATASPACE  SCALAR
      DATA {
      (0): 127
      }
   }
}
```

A.5.1. Standard Attributes

The following are standard attributes in the `simulation` group (others may be added as desired).

`boxSize` Relevant for cubic volumes typical of cosmological simulations, this attributes gives the length of the box in whatever unit system the file used (see §A.6);

`code` The name of the code used to run the simulation;

`initialConditions` A description of the initial conditions;

`softeningKernel` A description of the softening kernel used;

`softeningPlummerEquivalent` The equivalent Plummer softening length;

`startRedshift` The redshift at which the simulation was begun.

GADGET-specific Standard Attributes

The following are standard attributes in the `simulation` group specifically relevant to simulations run with the GADGET code. They typically reflect the values of parameters used by that code.

`ErrTolIntAccuracy` The integration accuracy used by GADGET;

`TypeOfTimestepCriterion` The type of timestepping criterion used by GADGET;

`SofteningGas` Specifies the (comoving) softening of the first particle group in GADGET;

`SofteningHalo` Specifies the (comoving) softening of the second particle group in GADGET;

`SofteningDisk` Specifies the (comoving) softening of the third particle group in GADGET;

`SofteningBulge` Specifies the (comoving) softening of the fourth particle group in GADGET;

`SofteningStars` Specifies the (comoving) softening of the fifth particle group in GADGET;

`SofteningBndry` Specifies the (comoving) softening of the sixth particle group in GADGET;

`SofteningGasMaxPhys` Specifies the maximum physical softening of the first particle group in GADGET;

`SofteningHaloMaxPhys` Specifies the maximum physical softening of the second particle group in GADGET;

`SofteningDiskMaxPhys` Specifies the maximum physical softening of the third particle group in GADGET;

`SofteningBulgeMaxPhys` Specifies the maximum physical softening of the fourth particle group in GADGET;

`SofteningStarsMaxPhys` Specifies the maximum physical softening of the fifth particle group in GADGET;

`SofteningBndryMaxPhys` Specifies the maximum physical softening of the sixth particle group in GADGET.

A.6. Units Group

This group describes the unit system used throughout the file. Attributes should be included for length, mass and velocity units. In each case, three attributes are required to describe the units used (in the following `quantity` refers to `length`, `mass`, `time` or `velocity`):

`quantityUnitsInSI` The units of this quantity expressed in the SI system;

`quantityHubbleExponent` The exponent of the reduced Hubble constant, h, appearing in the units for this quantity;

`quantityScaleFactorExponent` The exponent, n, of the expansion factor, a, required to convert this quantity into physical units. That is, multiplying this quantity by a^n will give the quantity in physical units.

For example, if lengths in the file are expressed in units of comoving h^{-1} Mpc, then we would have

```
lengthUnitsInSI           =  3.08568e+22
lengthHubbleExponent      = -1
lengthScaleFactorExponent =  1
```

This allows a code reading the data from a merger tree file to automatically convert it into whatever unit/coordinate system it chooses.

An example of this group, showing standard attributes, is given below.

```
ATTRIBUTE "lengthHubbleExponent" {
   DATATYPE  H5T_STD_I32LE
   DATASPACE  SCALAR
   DATA {
   (0): -1
   }
```

```
}
ATTRIBUTE "lengthScaleFactorExponent" {
   DATATYPE  H5T_STD_I32LE
   DATASPACE  SCALAR
   DATA {
   (0): 1
   }
}
ATTRIBUTE "lengthUnitsInSI" {
   DATATYPE  H5T_IEEE_F64LE
   DATASPACE  SCALAR
   DATA {
   (0): 3.08568e+22
   }
}
ATTRIBUTE "massHubbleExponent" {
   DATATYPE  H5T_STD_I32LE
   DATASPACE  SCALAR
   DATA {
   (0): -1
   }
}
ATTRIBUTE "massScaleFactorExponent" {
   DATATYPE  H5T_STD_I32LE
   DATASPACE  SCALAR
   DATA {
   (0): 0
   }
}
ATTRIBUTE "massUnitsInSI" {
   DATATYPE  H5T_IEEE_F64LE
   DATASPACE  SCALAR
   DATA {
   (0): 1.98892e+40
   }
}
ATTRIBUTE "timeHubbleExponent" {
   DATATYPE  H5T_STD_I32LE
   DATASPACE  SCALAR
   DATA {
   (0): 0
   }
}
ATTRIBUTE "timeScaleFactorExponent" {
   DATATYPE  H5T_STD_I32LE
   DATASPACE  SCALAR
   DATA {
   (0): 0
   }
```

```
   }
   ATTRIBUTE "timeUnitsInSI" {
      DATATYPE  H5T_IEEE_F64LE
      DATASPACE  SCALAR
      DATA {
      (0): 3.1556926e+16
      }
   }
}   ATTRIBUTE "velocityHubbleExponent" {
      DATATYPE  H5T_STD_I32LE
      DATASPACE  SCALAR
      DATA {
      (0): 0
      }
   }
   ATTRIBUTE "velocityScaleFactorExponent" {
      DATATYPE  H5T_STD_I32LE

      }
   }
}
```

A.7. Forest Halos Group

The `forestHalos` group contains the data describing the actual merger tree forests. Nodes from each forest must be stored contiguously. An example of this group is given below. In this example, <`nodeCount`> is the total number of nodes in all merger tree forests.

```
GROUP "forestHalos" {
   ATTRIBUTE "haloMassesIncludeSubhalos" {
      DATATYPE  H5T_STD_I32LE
      DATASPACE  SCALAR
      DATA {
      (0): 0
      }
   }
   ATTRIBUTE "haloAngularMomentaIncludeSubhalos" {
      DATATYPE  H5T_STD_I32LE
      DATASPACE  SCALAR
      DATA {
```

```
   (0): 0
   }
}
ATTRIBUTE "forestsAreSelfContained" {
   DATATYPE  H5T_STD_I32LE
   DATASPACE  SCALAR
   DATA {
   (0): 1
   }
}
ATTRIBUTE "treesHaveSubhalos" {
   DATATYPE  H5T_STD_I32LE
   DATASPACE  SCALAR
   DATA {

```

A.7.1. Standard Attributes

The following are standard attributes in the `forestHalos` group (others may be added as desired).

`haloMassesIncludeSubhalos` Indicates whether or not the masses of halos include the masses of any subhalos that they may contain. A value of 0 implies that halo masses do not include masses of subhalos, while a value of 1 indicates that they do;

`haloAngularMomentaIncludeSubhalos` Indicates whether or not the angular momenta of halos include the angular momenta contributed by any subhalos that they may contain. A value of 0 implies that halo masses do not include the contribution of subhalos, while a value of 1 indicates that they do. If this attribute is not present it is assumed to be equal to the `haloMassesIncludeSubhalos` attribute;

`forestsAreSelfContained` Indicates whether or not forests are self-contained, in the sense that nodes never transfer from one forest to another. A value of 0 implies that nodes *can* move from one tree to another, while a value of 1 implies that they can not;

`treesHaveSubhalos` Indicates whether or not trees contain information on subhalos. A value of 0 implies that they do not, while a value of 1 implies that they do. This attribute is a convenience, as subhalo presence can be determined from the node data directly;

`velocitiesIncludeHubbleFlow` Indicates whether or not velocities include the Hubble flow. A value of 0 indicates that they do not, while a value of 1 indicates that they do. See §10.3 for important notes on velocity definitions in Galacticus.

`positionsArePeriodic` Indicates whether or not positions are periodic (as in a cosmological cube simulation). A value of 0 indicates that they are not, while a value of 1 indicates that they are periodic, with a period of `boxSize`.

A.7.2. Standard Datasets

The following are standard datasets in the `forestHalos` group.

`angularMomentum` The angular momentum of the halo. This can be either the magnitude of the angular momentum or a 3-D vector;

`expansionFactor` The expansion factor (normalized to unity at the present day) at which this node is identified (note that only one of the `expansionFactor`, `redshift` and `time` datasets is required, since they are simply related, but multiple *can* be present);

`descendentIndex` The `nodeIndex` of the descendent of this node in the merger tree, or -1 if there is no descendent;

`halfMassRadius` The radius containing half the mass of the node;

`hostIndex` The `nodeIndex` of the node which hosts this node. For nodes that are self-hosting (i.e. that are not subhalos inside another halo), the value of `hostIndex` should be set equal to the node's own `nodeIndex`;

`nodeIndex` An ID number for the node, unique at least within each tree. If nodes are able to move from one tree to another, the ID must be unique within all trees. No other constraints are placed on `nodeIndex` (e.g. it *does not* have to be monotonically increasing within the file for example);

`nodeMass` The mass of the node;

`position` The three dimensional position of this node;

`redshift` The redshift at which this node is identified (note that only one of the `expansionFactor`, `redshift` and `time` datasets is required, since they are simply related, but multiple *can* be present);

`scaleRadius` The characteristic scale radius in the node (typically, but not necessarily, the NFW scale radius);

`spin` The spin parameter, λ, of the halo. This can be either the spin magnitude or a 3-D vector;

`time` The time at which this node is identified (note that only one of the `expansionFactor`, `redshift` and `time` datasets is required, since they are simply related, but multiple *can* be present);

`velocity` The three dimensional velocity of the node. See §10.3 for important notes on velocity definitions in Galacticus;

`particleIndexStart` If the `particles` group is included, this dataset should give the index of the first entry in the particle datasets that corresponds to the particle associated with this node;

`particleIndexCount` If the `particles` group is included, this dataset should give the number of entries in particle datasets that correspond to the particle associated with this node;

Note that, internally, Galacticus uses a different naming convention for the links between nodes. Specifically, an isolated node's descendent is known as its parent, while a satellite node's host is also referred to as the parent. By default, Galacticus will output a `parentIndex` dataset, which therefore specifies either the descendent or host, depending on whether the node in question is isolated or not. To additionally output information which matches the use of "descendent" and "host" in these merger tree files, set both of the input parameters `[outputDescendentIndices]` and `[outputHostIndices]` to `true`. This will result in the output of two additional datasets, `descendentIndex` and `hostIndex` which correspond to the definitions used in the merger tree file.

A.8. Forest Index Group

The `forestIndex` group contains indexing information which describes which sections of the datasets in the `forestHalos` group belong to each forest. An example of this group is given below.

```
GROUP "forestIndex" {
   DATASET "firstNode" {
   COMMENT "Position of the first node in each forest in the forestHalos datasets."
      DATATYPE  H5T_STD_I32LE
      DATASPACE  SIMPLE { ( <forestCount> ) / ( <forestCount> ) }
   }
   DATASET "numberOfNodes" {
   COMMENT "Number of nodes in each forst."
      DATATYPE  H5T_STD_I32LE
      DATASPACE  SIMPLE { ( <forestCount> ) / ( <forestCount> ) }
   }
```

```
   DATASET "forestIndex" {
   COMMENT "Unique index of forst."
      DATATYPE  H5T_STD_I64LE
      DATASPACE  SIMPLE { ( <forestCount> ) / ( <forestCount> ) }
   }
   DATASET "forestWeight" {
   COMMENT "The number of such forests required per unit volume to create a representative sample."
      DATATYPE  H5T_STD_F64LE
      DATASPACE  SIMPLE { ( <forestCount> ) / ( <forestCount> ) }
   }
}
```

A.8.1. Standard Datasets

`firstNode` For each forest, gives the position[1] in the `forestHalos` datasets of the first node in the forest (note that dataset indexing begins at 0). This *does not* necessarily have to be a root node of the forest—nodes in a single forest can be stored in any order in the `forestHalos` datasets, providing that they are contiguous;

`numberOfNodes` For each forest, gives the number of nodes in the forest;

`forestIndex` A unique ID number for each forest;

`forestWeight` A weight factor specifying the number density of each forest required to construct a representative sample. If not present, it is acceptable to assume that the weight is $1/\texttt{boxSize}^3$ if that attribute is present in the `simulation` group.

A.9. Forests Group

The `forests` group is optional and provides a convenience method for accessing the properties of individual forests. If present, it contains one group for each tree in the file, named `forest<forestID>` where `<forestID>` is the ID of the forest. Each of these groups should contain a set of scalar references to the sections of the datasets in the `forestHalos` group to which this forest corresponds. For example, the `descendentIndex` reference for the forest with ID number 89 would be as follows:

```
GROUP "forests/forest89" {
   DATASET "descendentIndex" {
      DATATYPE  H5T_REFERENCE
      DATASPACE  SCALAR
      DATA {
         DATASET /forestHalos/descendentIndex {(<indexBegin>)-(<indexEnd>)}
      }
   }
}
```

[1] That is, it gives the array index of the first node of the forest in the `forestHalos/nodeIndex` dataset for example. It does *not* give the `nodeIndex` of the first node in the forest.

A.10. Particles Group

The `particles` group is optional and contains information on particle trajectories. It is intended for use with merger trees derived from N-body simulations for which it is often useful to track the location of, for example, the most bound particle associated with a subhalo even after that subhalo can no longer be tracked in the simulation. An example of this group is given below. In this example, $< particleCount >$ is the total number of particles included in the group.

```
GROUP "particles" {
   DATASET "particleID" {
   COMMENT "The ID of each particle."
      DATATYPE  H5T_STD_I64LE
      DATASPACE  SIMPLE { ( <particleCount> ) / ( <particleCount> ) }
   }
   DATASET "redshift" {
   COMMENT "The redshift of each particle."
      DATATYPE  H5T_IEEE_F64LE
      DATASPACE  SIMPLE { ( <particleCount> ) / ( <particleCount> ) }
   }
   DATASET "time" {
   COMMENT "The time of each particle."
      DATATYPE  H5T_IEEE_F64LE
      DATASPACE  SIMPLE { ( <particleCount> ) / ( <particleCount> ) }
   }
   DATASET "expansionFactor" {
   COMMENT "The expansion factor of each particle."
      DATATYPE  H5T_IEEE_F64LE
      DATASPACE  SIMPLE { ( <particleCount> ) / ( <particleCount> ) }
   }
   DATASET "position" {
   COMMENT "The position of each node."
      DATATYPE  H5T_IEEE_F64LE
      DATASPACE  SIMPLE { ( <particleCount>, 3 ) / ( <particleCount>, 3 ) }
   }
   DATASET "velocity" {
   COMMENT "The velocity of each node."
      DATATYPE  H5T_IEEE_F64LE
      DATASPACE  SIMPLE { ( <particleCount>, 3 ) / ( <particleCount>, 3 ) }
   }
}
```

Each particle should be stored contiguously (i.e. entries with the same `particleID` should be consecutive) and it is frequently convenient (although not required) that entries for each particle be arranged in order of increasing cosmic time.

A.10.1. Standard Datasets

`particleID` An ID, unique within the entire simulation, for each particle;

`redshift` The redshift at which the particle is recorded (a single particle can appear in these datasets at multiple times);

`time` The time at which the particle is recorded (a single particle can appear in these datasets multiple times at different redshifts);

`expansionFactor` The expansion factor at which the particle is recorded (a single particle can appear in these datasets multiple times at different expansion factors);

`position` The spatial position of the particle;

`velocity` The velocity of the particle. See §10.3 for important notes on velocity definitions in GALACTICUS.

Note that only one of the `expansionFactor`, `time` and `redshift` datasets is required, as they are simply related, but multiple of them *can* be present.

A.11. Merger Tree Builder

Galacticus contains software which builds merger tree files in the format described in §A.1 from merger tree descriptions in other formats, such as ASCII output from an SQL database. The merger tree building engine can be found in `source/objects.merger_tree_data.F90`. Examples of how this engine is used can be found in `source/Millennium_Merger_Tree_File_Maker.F90` and `source/merger_trees.file_maker.Millennium.F90` which are designed to work with the `scripts/aux/Millennium_Trees_Grab.pl` script to convert data extracted from the Millennium Simulation database into a format that Galacticus can read, and in `source/Simple_Merger_Tree_File_Maker.F90` and `source/merger_trees.file_maker.simple.F90` which are designed to work with ASCII file representations of mergers trees that contain just the mass, redshift and descendent of each node.

The basic process for building a merger tree file is to inform the engine of the data file to read and where specific information is located within that file. The data can then be processed and, finally, output in the required format. Specific interfaces that can be used are described below. Many of these interfaces work on an object `mergerTrees` of `mergerTreeData` type. This object stores all information on the merger trees while they are being internally processed.

Setting property locations: Before reading data from a file it is necessary to inform the tree builder engine of which column in the file corresponds to which property. This is done with repeated calls to `setProperty`, one for each column to read, as follows:

```
call mergerTrees%setProperty(propertyType,columnIndex)
```

where `columnIndex` is the number of the column (counting from 1) which contains the property specified by `propertyType`. `propertyType` can take one of the following values:

`propertyTypeTreeIndex` A unique ID number for the tree to which this node belongs;

`propertyTypeNodeIndex` An ID (unique within the tree) for this node;

`propertyTypeDescendentIndex` The ID of the node's descendent node;

`propertyTypeHostIndex` The ID of the larger halo in which this node is hosted (equal to the node's own ID if the node is self-hosting);

`propertyTypeRedshift` The redshift of the node;

`propertyTypeNodeMass` The mass of the node;

`propertyTypeParticleCount` The number of particles in the node;

`propertyTypePositionX` The x-position of the node (if present, both y and z components must also be present);

`propertyTypePositionY` The y-position of the node (if present, both x and z components must also be present);

`propertyTypePositionZ` The z-position of the node (if present, both x and y components must also be present);

`propertyTypeVelocityX` The x-velocity of the node (if present, both y and z components must also be present);

`propertyTypeVelocityY` The y-velocity of the node (if present, both x and z components must also be present);

`propertyTypeVelocityZ` The z-velocity of the node (if present, both x and y components must also be present);

`propertyTypeSpinX` The x component of the node's spin parameter (if present, both y and z components must also be present; cannot be present if spin magnitude is given);

`propertyTypeSpinY` The y component of the node's spin parameter (if present, both x and z components must also be present; cannot be present if spin magnitude is given);

`propertyTypeSpinZ` The z component of the node's spin parameter (if present, both x and y components must also be present; cannot be present if spin magnitude is given);

`propertyTypeSpin` The magnitude of the node's spin parameter (cannot be present if spin vector components are given);

`propertyTypeAngularMomentumX` The x-component of the node's angular momentum (if present, both y and z components must also be present; cannot be present if angular momentum magnitude is given);

`propertyTypeAngularMomentumY` The y-component of the node's angular momentum (if present, both x and z components must also be present; cannot be present if angular momentum magnitude is given);

`propertyTypeAngularMomentumZ` The z-component of the node's angular momentum (if present, both x and y components must also be present; cannot be present if angular momentum magnitude is given);

`propertyTypeAngularMomentum` The magnitude of the node's angular momentum (cannot be present if angular momentum vector components are given);

`propertyTypeHalfMassRadius` The half-mass radius of the node;

`propertyTypeMostBoundParticleIndex` The index of the most bound particle in this node.

Not all properties must be specified—any required properties that are not specified will result in an error. Likewise, some properties, if present, require that other properties also be present. For example, if any of the position properties is given then all three positions are required.

Reading ASCII data: Once property columns have been specified, data from an ASCII file with one node per line can be read as follows:

```
call mergerTrees%readASCII(nodesFile,lineNumberStart,lineNumberStop,separator=",")
```

where `nodesFile` is the name of the file to read. The optional `lineNumberStart` and `lineNumberEnd` arguments give the first and last lines of the file to read, while the optional `separator` argument specifies the character used to separate columns (white space is assumed by default).

Setting particle property locations: If particle information is to be stored in the file, the locations of particle properties within the input file must be specified with repeated calls to `setParticleProperty` as follows:

```
call mergerTrees%setParticleProperty(propertyType,columnIndex)
```

where `columnIndex` is the number of the column (counting from 1) which contains the property specified by `propertyType`. `propertyType` can take one of the following values:

`propertyTypeParticleIndex` A unique ID for the particle;

`propertyTypeRedshift` The redshift of the particle;

`propertyTypeNodeMass` The mass of the particle;

`propertyTypeParticleCount` The number of particles in the particle;

`propertyTypePositionX` The x-position of the particle (if present, both y and z components must also be present);

`propertyTypePositionY` The y-position of the particle (if present, both x and z components must also be present);

`propertyTypePositionZ` The z-position of the particle (if present, both x and y components must also be present);

`propertyTypeVelocityX` The x-velocity of the particle (if present, both y and z components must also be present);

`propertyTypeVelocityY` The y-velocity of the particle (if present, both x and z components must also be present);

`propertyTypeVelocityZ` The z-velocity of the particle (if present, both x and y components must also be present).

Reading ASCII particle data: Once property columns have been specified, particle data from an ASCII file with one particle per line can be read as follows:

```
call mergerTrees%readParticlesASCII(particlesFile,lineNumberStart,lineNumberStop,separator=",")
```

where `particlesFile` is the name of the file to read. The optional `lineNumberStart` and `lineNumberEnd` arguments give the first and last lines of the file to read, while the optional `separator` argument specifies the character used to separate columns (white space is assumed by default).

Setting particle mass: The particle mass, `particleMass`, can be specified using:

```
call mergerTrees%setParticleMass(particleMass)
```

Specifying tree self-containment: Whether or not trees are self-contained can be specified using:

```
call mergerTrees%setSelfContained([.true.|.false.])
```

Specifying Hubble flow inclusion: Whether or not velocities include the Hubble flow can be speified using:

```
call mergerTrees%setIncludesHubbleFlow([.true.|.false.])
```

Specifying subhalo mass inclusion: Whether or not halo masses include the masses of any subhalos can be specified using:

```
call mergerTrees%setIncludesSubhaloMasses([.true.|.false.])
```

Specifying reference creation: Whether or not HDF5 reference to individual merger trees within the `haloTrees` datasets should be made can be specified using:

```
call mergerTrees%makeReferences([.true.|.false.])
```

Specifying units: The units used in the files can be specified with repeated calls to `setUnits` as follows:

```
call mergerTrees%setUnits(unitsType,unitsInSI,hubbleExponent,scaleFactorExponent)
```

where `unitsType` is one of:

`unitsMass` Units of mass;

`unitsLength` Units of length;

`unitsTime` Units of time;

`unitsVelocity` Units of velocity;

`unitsInSI` gives the units in the SI system, `hubbleExponent` specifies the power to which h appears in the units and `scaleFactorExponent` specifies the number of powers of the expansion factor by which the quantity should be multiplied to place it into physical units.

Adding metadata: Meta-data can be added to the file by making repeated calls to `addMetadata` as follows:

```
call mergerTrees%addMetadata(metaDataType,label,value)
```

where `metaDataType` is one of:

`metaDataGeneric` Add to the generic `metaData` group;

`metaDataCosmology` Add to the `cosmology` group;

`metaDataSimulation` Add to the `simulation` group;

`metaDataGroupFinder` Add to the `groupFinder` group;

`metaDataTreeBuilder` Add to the `treeBuilder` group;

`metaDataProvenance` Add to the `provenance` group,

`label` is a label for this metadatum and `value` is the value to store. Currently integer, double precision and character data types are supported for metadata.

Exporting the data: Once the data has been read, units and properties specified and any metadata added, the trees can be exported to an HDF5 file using:

```
call mergerTrees%export(outputFile,outputFormat,hdfChunkSize,hdfCompressionLevel)
```

where `outputFile` is the name of the file to which the trees should be exported, `outputFormat` specifies the format to use (see §A.11.1), and `hdfChunkSize` and `hdfCompressionLevel` respectively give the chunk size and compression level to use when writing the file.

A.11.1. File Formats

The merger tree file builder engine can currently export in one of two formats. These formats can be specified on the command line to both `Millennium_Merger_Tree_File_Maker.F90`, and `Simple_Merger_Tree_File_Maker.F90`:

`galacticus` merger trees are exported in Galacticus's native format described in detail in §A.1;

`irate` merger trees are exported in the `IRATE` format.

A.11.2. Exporting Trees from Galacticus

By setting `[mergerTreesWrite]`=`true`, Galacticus will export each merger tree generated to the file specified by `[mergerTreeExportFileName]` using the format specified by `[mergerTreeExportOutputFormat]`. Currently, node indices (plus host indices, which are assumed identical to the node indices), descendent indices, masses and redshifts are exported. Positions and velocities are exported if available. If `IRATE`-format output is requested then "snapshot" numbers will be assigned to nodes based on the time at which they exist. This usually only makes sense if the nodes are defined on a time grid (i.e. if merger trees were extracted from an N-body simulation, or if trees were re-gridded onto such a time grid; see §12.38.2). Export happens after any merger tree pre-evolution tasks (see §16.4.3).

Glossary

MANGLE MANGLE is a software package used for defining angular masks on the surface of a sphere. It is used primarily for defining the geometry of galaxy surveys. 249, 399, 403, 404, 1697–1699, 1705, 1706, 1709–1712, 1715, 1717, 1719, 1720, 1724, 1725, 1727, 1730, 2178, 2579–2583, 2585, 2590, 2592, 2595–2598, 2601, 2602

AB magnitude An astronomical magnitude system in which the apparent magnitude is defined as $m = -2.5 \log_{10} f - 48.60$ for a flux density, f, measured in ergs per second per square centimeter per hertz. 282

ADAF An advection-dominated accretion flow (ADAF) is a particular solution for an accretion flow around a black hole, star or compact object in which energy liberated by viscous forces is stored within the accretion flow and advected inward to the central object (see Narayan et al. 1998). 3909

AHF Amiga's Halo Finder (AHF) is a software package which identifies dark matter halos in N-body simulations. Full details are given by Gill et al. [2004] and Knollmann and Knebe [2009]. 3909

Approximate Nearest Neighbor The Approximate Nearest Neighbor library is a software package used finding the closest set of points to a given point, approximately. 267

backward descendent The primary progenitor of a node. This type of descendent is usually relevant when building merger trees and should be distinguished from a forward descendent which is relevant when considering how halos and galaxies evolve forward in time. 3906

BIE The Bayesian Inference Engine (BIE) is a software package designed to facilitate exploration of complexes parameter spaces using Bayesian techniques.. 3909

CAMB CAMB is a code to compute anisotropies in the cosmic microwave background, and the linear theory power spectra of matter and radiation. 2633

CDF Cumulative Distribution Function (CDF) is a function which describes the cumulative probability for a random variable to be equal to or less than a given value.. 3909

CDM Cold dark matter (CDM) is a hypothesized type of dark matter in which the particles move slowly compared to the speed of light. 3909

Cloudy Cloudy is a code to compute the ionization structure of HII regions. 2634

component An individual physical system within a node, such as a dark matter halo, a galactic disk or a supermassive black hole. 286, 289, 291–293, 295, 297, 299, 301, 303, 304, 308–312, 315, 317–321, 356–361, 387, 398, 3906

deadlock A deadlock describes a situation in which no node in a merger tree (or forest) can be evolved further forward in time due to the existence of circular dependencies between nodes. Deadlocks can occur due to incompatible parameter choices, or may indicate a bug in Galacticus.. 216

DSL Domain-specific languages (DSL) are a type of programming language dedicated to a particular problem. In Galacticus a DSL is used to specify the structure of components. 3909

ENZO Enzo is an adaptive mesh refinement hydrodynamics code. 363, 366

FFTLog FFTLog is a code to compute fast Fourier transforms of discrete periodic sequences of logarithmically spaced data. 2874

forest A collection of merger trees that are linked together by virtue of nodes which jump between trees. 211, 216

forward descendent The node with which the mass (or majority of the mass) of a node will become associated with at a later time. This type of descendent is usually relevant when considering how halos and galaxies evolve forward in time and should be distinguished from a backward descendent which is relevant when building merger trees. 409, 3905

GAMA The Galaxy and Mass Assembly (GAMA) survey is a spectroscopic survey of $\approx 300,000$ galaxies down to $r < 19.8$ mag over ≈ 286 deg^2.. 3909

GraphViz GraphViz is an open source graph visualization package. It is used by Galacticus in making diagrams of merger trees.. 424, 425, 428, 2032, 2760, 2761

GSL GNU Scientific Library (GSL) is a library providing a variety of numerical algorithms.. 3909

HDF5 The hierarhical data format (version 5; HDF5) is a file format designed for storing scientific data.. 3909

HOD A halo occupation distribution (HOD) is a mathematical model describing the distribution of the number of galaxies (of some given physical properties) found in a dark matter halo of given mass.. 3909

IRATE IRATE is file format designed for N-body simulation particle, halo, merger tree, and galaxy data. 790, 3765, 3766

Latin hypercube A Latin hypercube is a construct for generating a sample of plausible collections of parameter values from a multidimensional distribution. 270, 3906

maximin In Latin hypercube design, the "maximin" approach generates a large number of Latin hypercubes and selects the one which has the greatest minimum distance between all pairs of points in the hypercube. 270

MD5 hash The MD5 Message-Digest Algorithm is a widely used cryptographic hash function that produces a 128-bit (16-byte) hash value. In Galacticus it is used to encode unique labels for modules which are incorporated into file names. Galacticus uses the `glibc crypt()` function to compute MD5 hashes, but switches "`/`" for "`@`" in the hash (since "`/`" is inconvenient for use in file names). 431

mergee For a given node in a merger tree, the set of mergee nodes consists of all nodes which will undergo a galaxy merger with the node at some point in the future. 232

Millennium Simulation The Millennium Simulation is a high-resolution N-body simulation of structure formation in a cold dark matter universe.. 239

MPI Message Passing Interface (MPI) is a standard for passing messages between processes on parallel computers.. 3909

node A single point in a merger tree, consisting of a dark matter halo and associated baryons. 210, 216, 217, 231, 232, 287, 288, 291, 292, 294, 295, 304–308, 313, 314, 317, 318, 320, 342, 343, 347, 356, 357, 374, 381, 394, 438, 567–570, 908–913, 1886, 2043, 2340, 2341, 3122, 3343, 3723, 3733, 3734, 3905, 3907

OpenMP OpenMP is an API for shared memory parallel programming.. 445

PAH Polycyclic aromatic hydrocarbons (PAH) are large organic molecules consisting of fused aromatic rings. 3909

parent In a merger tree, the parent node of any given node that exists at time t_0 is that node to which it is directly connected in the tree at time $t_1 > t_0$. 231, 232

PBS Portable Batch System (PBS) is a job scheduler used on many compute cluster environments.. 3909

PDF Probability Density Function (PDF) is a function which describes the probability for a random variable to take on a given value.. 3909

primary progenitor The progenitor of a given node which is regarding as the direct descendent of that node (often, but not always, the most massive progenitor). Other progenitors are considered to merge into this primary progenitor. 231, 232, 3905

RecFast RecFast is a code to calculate the recombination history of the universe. 2637

SAM Semi-analytic models (SAMs) are a type of galaxy formation model utilizing simple parameterizations of physical processes to follow the evolution of galaxies through a merging hierarchy of galaxies.. 3910

WDM Warm dark matter (WDM) is a hypothesized type of dark matter in which the particle has non-negligible thermal velocity at decoupling. 3910

Acronyms

ADAF advection-dominated accretion flow. 326, 327, *Glossary:* ADAF

AHF Amiga's Halo Finder. 379, *Glossary:* AHF

BIE semi-analytic model. *Glossary:* BIE

CDF cumulative distribution function. 715–717, 719, 1950, *Glossary:* CDF

CDM cold dark matter. 3, 19, 41, 330, 377, 2698, 3671–3673, 3675, 3677–3679, *Glossary:* CDM

CMB cosmic microwave background. 155, 336, 1854, 2288, 2292, 2293, 2334

DSL domain-specific language. *Glossary:* DSL

GAMA Galaxy and Mass Assembly. 130, 131, *Glossary:* GAMA

GSL GNU Scientific Library. 2875, 2876, 2900, 2901, 2904, 2905, *Glossary:* GSL

HDF5 hierarchical data format. 2030, *Glossary:* HDF5

HOD halo occupation distribution. 249, 250, 257, 258, *Glossary:* HOD

IGM intergalactic medium. 29, 59, 120, 134, 226–228, 293, 323, 324, 388, 389, 469–477, 479, 480, 783–790, 1815–1818, 1980–1983, 2235, 2236, 2238, 2240, 2242, 2243, 2639–2646, 3707

IMF initial mass function. 93, 97, 100, 101, 142, 225, 366–368, 387, 388, 767–775, 1977, 2635, 3581–3586

ISCO innermost stable circular orbit. 326

ISM interstellar medium. 206, 286, 390, 2233, 2234, 3606

MCMC Markov Chain Monte Carlo. 249, 260, 264, 274

MPI message passing interface. 260, 272, *Glossary:* MPI

NFW Navarro-Frenk-White (dark matter halo profile). 51, 333, 342, 343, 346, 363

ODE ordinary differential equation. 231, 323, 1665–1667, 1805, 2153

PAH polycyclic aromatic hydrocarbon. *Glossary:* PAH

PBS portable batch system. 260, *Glossary:* PBS

PDF probability density function. 716–719, 1949, 3635, 3638, 3640, *Glossary:* PDF

SAM semi-analytic model. 252, 399, 406, *Glossary:* SAM

SDSS Sloan Digitial Sky Survey. 250, 257, 259

SNe supernovae. 171, 225

WDM warm dark matter. 1885, 2187, 2188, 2381, 3618, 3672, 3673, *Glossary:* WDM
