void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

double precision completeness(\textcolor{red}{\textless double precision\textgreater} mass\argin) Return the completeness of the observational sample at the given mass.

void deepCopy(\textcolor{red}{\textless class((massFunctionIncompletenessClass))\textgreater} destination\arginout) Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges
Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

massFunctionIncompletenessComplete

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

double precision completeness(\textcolor{red}{\textless double precision\textgreater} mass\argin) Return the completeness of the observational sample at the given mass.

void deepCopy(\textcolor{red}{\textless class((massFunctionIncompletenessClass))\textgreater} destination\arginout) Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

massFunctionIncompletenessSurfaceBrightness

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void autoHook()` Insert any event hooks required by this object.

`double precision completeness(\textcolor{red}{\textless double precision\textgreater} mass\argin)` Return the completeness of the observational sample at the given mass.

`void deepCopy(\textcolor{red}{\textless class((massFunctionIncompletenessClass))\textgreater} destination\arginout)` Perform a deep copy of the object.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

`type(varying_string) objectType()` Return the type of the object.

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

`<void> referenceCountIncrement()` Increment the reference count to this object.

`<void> referenceCountReset()` Reset the reference count to this object to 0.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

matrix

`<void> choleskyDecompose()` Compute the Cholesky decomposition of the matrix in place.

`<void> covarianceProduct(<type(vector)> y→)` Compute $yC^{-1}y^{\mathrm{T}}$ as appears in likelihood functions utilizing covariance matrices.

`<double> determinant()` Compute and return the determinant of the matrix.

`<void> eigenSystem(<type(matrix)> eigenVectors←, <type(vector)> eigenValues←)` Compute eigenvectors and eigenvalues of the matrix.

`<type(matrix) > invert()` Compute and return the matrix inverse.

`<type(vector)> linearSystemSolve(<type(vector) y→>)` Solve the linear system $y = A \cdot x$ where A is ourself and y is the specified vector.

<double> logarithmicDeterminant() Compute and return the logarithm of the determinant of the matrix.

<type(matrix)> makeSemiPositiveDefinite() Make a matrix semi-positive definite by setting any negative eigenvalues to zero.

<void> symmetrize() Make the matrix symmetric using $A_{ij} \rightarrow (A_{ij} + A_{ji})/2$.

<type(matrix)> transpose() Return the transpose of a matrix.

mergerMassMovementsBaugh2005

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((mergerMassMovementsClass))\textgreater} destination\arginout) Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

void get(\textcolor{red}{\textless type((treeNode))\textgreater} node \arginout,\textcolor{red}{\textle integer\textgreater} destinationGasSatellite\argout,\textcolor{red}{\textless integer\textgreater} destinationStarsSatellite\argout,\textcolor{red}{\textless integer\textgreater} destinationGasHost\ integer\textgreater} destinationStarsHost\argout,\textcolor{red}{\textless logical\textgreater} mergerIsMajor \argout) Determine movements of mass during mergers.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

mergerMassMovementsClass

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((mergerMassMovementsClass))\textgreater} destination\arginout) Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

void get(\textcolor{red}{\textless type((treeNode))\textgreater} node \arginout,\textcolor{red}{\textle integer\textgreater} destinationGasSatellite\argout,\textcolor{red}{\textless integer\textgreater} destinationStarsSatellite\argout,\textcolor{red}{\textless integer\textgreater} destinationGasHost\ integer\textgreater} destinationStarsHost\argout,\textcolor{red}{\textless logical\textgreater} mergerIsMajor \argout) Determine movements of mass during mergers.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

mergerMassMovementsSimple

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((mergerMassMovementsClass))\textgreater} destination\arginout) Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex
logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

void get(\textcolor{red}{\textless type((treeNode))\textgreater} node \arginout,\textcolor{red}{\textle
integer\textgreater} destinationGasSatellite\argout,\textcolor{red}{\textless integer\textgreater}
destinationStarsSatellite\argout,\textcolor{red}{\textless integer\textgreater} destinationGasHost\
integer\textgreater} destinationStarsHost\argout,\textcolor{red}{\textless logical\textgreater}
mergerIsMajor \argout) Determine movements of mass during mergers.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges
Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl
type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-
size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles
type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-
size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

mergerMassMovementsVerySimple

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\
character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((mergerMassMovementsClass))\textgreater}
destination\arginout) Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex
logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

void get(\textcolor{red}{\textless type((treeNode))\textgreater} node \arginout,\textcolor{red}{\textle
integer\textgreater} destinationGasSatellite\argout,\textcolor{red}{\textless integer\textgreater}
destinationStarsSatellite\argout,\textcolor{red}{\textless integer\textgreater} destinationGasHost\
integer\textgreater} destinationStarsHost\argout,\textcolor{red}{\textless logical\textgreater}
mergerIsMajor \argout) Determine movements of mass during mergers.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges
Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

mergerProgenitorPropertiesClass

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((mergerProgenitorPropertiesClass))\textgreater} destination\arginout) Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

void get(\textcolor{red}{\textless type((treeNode))\textgreater} nodeSatellite\arginout,\textcolor{red} type((treeNode))\textgreater} nodeHost \arginout,\textcolor{red}{\textless double precision\textgre massSatellite\argout,\textcolor{red}{\textless double precision\textgreater} massHost \argout,\textcolor{red}{\textless double precision\textgreater} massSpheroidSatellite\argout,\textc double precision\textgreater} massSpheroidHost \argout,\textcolor{red}{\textless double precision\textgreater} massSpheroidHostPreMerger\argout,\textcolor{red}{\textless double precision\textgreater} radiusSatellite \argout,\textcolor{red}{\textless double precision\textgreat radiusHost\argout,\textcolor{red}{\textless double precision\textgreater} factorAngularMomentum \argout,\textcolor{red}{\textless double precision\textgreater} massSpheroidRemnant\argout,\textcol double precision\textgreater} massGasSpheroidRemnant\argout) alculates progenitor properties for merger calculations.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

mergerProgenitorPropertiesCole2000

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((mergerProgenitorPropertiesClass))\textgreater} destination\arginout) Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

void get(\textcolor{red}{\textless type((treeNode))\textgreater} nodeSatellite\arginout,\textcolor{red} type((treeNode))\textgreater} nodeHost \arginout,\textcolor{red}{\textless double precision\textgre massSatellite\argout,\textcolor{red}{\textless double precision\textgreater} massHost \argout,\textcolor{red}{\textless double precision\textgreater} massSpheroidSatellite\argout,\textc double precision\textgreater} massSpheroidHost \argout,\textcolor{red}{\textless double precision\textgreater} massSpheroidHostPreMerger\argout,\textcolor{red}{\textless double precision\textgreater} radiusSatellite \argout,\textcolor{red}{\textless double precision\textgreat radiusHost\argout,\textcolor{red}{\textless double precision\textgreater} factorAngularMomentum \argout,\textcolor{red}{\textless double precision\textgreater} massSpheroidRemnant\argout,\textcol double precision\textgreater} massGasSpheroidRemnant\argout) alculates progenitor properties for merger calculations.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

mergerProgenitorPropertiesStandard

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void autoHook()` Insert any event hooks required by this object.

`void deepCopy(\textcolor{red}{\textless class((mergerProgenitorPropertiesClass))\textgreater} destination\arginout)` Perform a deep copy of the object.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`void get(\textcolor{red}{\textless type((treeNode))\textgreater} nodeSatellite\arginout,\textcolor{red} type((treeNode))\textgreater} nodeHost \arginout,\textcolor{red}{\textless double precision\textgre massSatellite\argout,\textcolor{red}{\textless double precision\textgreater} massHost \argout,\textcolor{red}{\textless double precision\textgreater} massSpheroidSatellite\argout,\textc double precision\textgreater} massSpheroidHost \argout,\textcolor{red}{\textless double precision\textgreater} massSpheroidHostPreMerger\argout,\textcolor{red}{\textless double precision\textgreater} radiusSatellite \argout,\textcolor{red}{\textless double precision\textgreat radiusHost\argout,\textcolor{red}{\textless double precision\textgreater} factorAngularMomentum \argout,\textcolor{red}{\textless double precision\textgreater} massSpheroidRemnant\argout,\textcol double precision\textgreater} massGasSpheroidRemnant\argout)` alculates progenitor properties for merger calculations.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

`type(varying_string) objectType()` Return the type of the object.

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

`<void> referenceCountIncrement()` Increment the reference count to this object.

`<void> referenceCountReset()` Reset the reference count to this object to 0.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

mergerRemnantSizeClass

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void autoHook()` Insert any event hooks required by this object.

`void deepCopy(\textcolor{red}{\textless class((mergerRemnantSizeClass))\textgreater} destination\arginc` Perform a deep copy of the object.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`void get(\textcolor{red}{\textless type((treeNode))\textgreater} node \arginout,\textcolor{red}{\textle double precision\textgreater} radius\argout,\textcolor{red}{\textless double precision\textgreater} velocityCircular\argout,\textcolor{red}{\textless double precision\textgreater} angularMomentumSpec` Determine merger remnant size and related properties.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

`type(varying_string) objectType()` Return the type of the object.

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

`<void> referenceCountIncrement()` Increment the reference count to this object.

`<void> referenceCountReset()` Reset the reference count to this object to 0.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

mergerRemnantSizeCole2000

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void autoHook()` Insert any event hooks required by this object.

`void deepCopy(\textcolor{red}{\textless class((mergerRemnantSizeClass))\textgreater} destination\arginc` Perform a deep copy of the object.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`void get(\textcolor{red}{\textless type((treeNode))\textgreater} node \arginout,\textcolor{red}{\textle double precision\textgreater} radius\argout,\textcolor{red}{\textless double precision\textgreater} velocityCircular\argout,\textcolor{red}{\textless double precision\textgreater} angularMomentumSpec` Determine merger remnant size and related properties.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges
Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl
type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-
size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles
type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-
size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

mergerRemnantSizeCovington2008

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\
character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((mergerRemnantSizeClass))\textgreater} destination\argino
Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex
logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

void get(\textcolor{red}{\textless type((treeNode))\textgreater} node \arginout,\textcolor{red}{\textle
double precision\textgreater} radius\argout,\textcolor{red}{\textless double precision\textgreater}
velocityCircular\argout,\textcolor{red}{\textless double precision\textgreater} angularMomentumSpec
Determine merger remnant size and related properties.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges
Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

mergerRemnantSizeNull

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((mergerRemnantSizeClass))\textgreater} destination\argino Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

void get(\textcolor{red}{\textless type((treeNode))\textgreater} node \arginout,\textcolor{red}{\textle double precision\textgreater} radius\argout,\textcolor{red}{\textless double precision\textgreater} velocityCircular\argout,\textcolor{red}{\textless double precision\textgreater} angularMomentumSpec Determine merger remnant size and related properties.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

mergerTree

<*type(treeEvent)> createEvent() Create a treeEvent object in this tree.

<void> destroy() Destroys the merger tree, including all nodes and their components.

<double> earliestTime() Return the earliest time in a merger tree.

<double> earliestTimeEvolving() Return the earliest time in an evolving merger tree.

<*type(treeNode)> getNode(<integer(kind_int8)> nodeIndex→) Returns a pointer to the node with given index in the merger tree, or a null pointer if no such node exists.

<double> latestTime() Return the latest time in a merger tree.

<void> removeEvent(<type(treeEvent)> event→) Remove a treeEvent from this tree.

<integer(c_size_t)> sizeOf() Return the size (in bytes) of a merger tree.

mergerTreeBranchingProbabilityClass

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\
character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((mergerTreeBranchingProbabilityClass))\textgreater}
destination\arginout) Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex
logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

double precision fractionSubresolution(\textcolor{red}{\textless double precision\textgreater}
haloMass\argin,\textcolor{red}{\textless double precision\textgreater} deltaCritical\argin,\textcol
double precision\textgreater} massResolution\argin,\textcolor{red}{\textless type((treeNode))\textg
node\arginout) Computes the fraction of subresolution mass accreted per unit “time”

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges
Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

double precision massBranch(\textcolor{red}{\textless double precision\textgreater} haloMass\argin,\tex
double precision\textgreater} deltaCritical\argin,\textcolor{red}{\textless double
precision\textgreater} massResolution\argin,\textcolor{red}{\textless double precision\textgreater}
probabilityFraction\argin,\textcolor{red}{\textless type((pseudoRandom))\textgreater}
randomNumberGenerator\arginout,\textcolor{red}{\textless type((treeNode))\textgreater}
node\arginout) Returns the mass of a new halo created by a branching event.

type(varying_string) objectType() Return the type of the object.

double precision probability(\textcolor{red}{\textless double precision\textgreater} haloMass\argin,\te
double precision\textgreater} deltaCritical\argin,\textcolor{red}{\textless double
precision\textgreater} massResolution\argin,\textcolor{red}{\textless type((treeNode))\textgreater}
node\arginout) Computes the probability per unit “time” that a branching event occurs.

double precision probabilityBound(\textcolor{red}{\textless double precision\textgreater} haloMass\argin,\textcolor{red}{\textless double precision\textgreater} deltaCritical\argin,\textcol double precision\textgreater} massResolution\argin,\textcolor{red}{\textless integer\textgreater} bound\argin,\textcolor{red}{\textless type((treeNode))\textgreater} node\arginout) Computes a bound (upper or lower) to the probability per unit "time" that a branching event occurs.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

double precision stepMaximum(\textcolor{red}{\textless double precision\textgreater} haloMass\argin,\te double precision\textgreater} deltaCritical\argin,\textcolor{red}{\textless double precision\textgreater} massResolution\argin) Returns the maximum step in "time" allowed by this algorithm.

mergerTreeBranchingProbabilityGnrlzdPrssSchchtr

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

<void> computeCommonFactors(<double> deltaParent→, <double> massHaloParent→) Compute common factors needed for the calculations.

void deepCopy(\textcolor{red}{\textless class((mergerTreeBranchingProbabilityClass))\textgreater} destination\arginout) Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

<void> excursionSetTest(<type(treeNode)> *node↔) Compute common factors needed for the calculations.

double precision fractionSubresolution(\textcolor{red}{\textless double precision\textgreater} haloMass\argin,\textcolor{red}{\textless double precision\textgreater} deltaCritical\argin,\textcol double precision\textgreater} massResolution\argin,\textcolor{red}{\textless type((treeNode))\textg node\arginout) Computes the fraction of subresolution mass accreted per unit "time"

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

double precision massBranch(\textcolor{red}{\textless double precision\textgreater} haloMass\argin,\tex
double precision\textgreater} deltaCritical\argin,\textcolor{red}{\textless double
precision\textgreater} massResolution\argin,\textcolor{red}{\textless double precision\textgreater}
probabilityFraction\argin,\textcolor{red}{\textless type((pseudoRandom))\textgreater}
randomNumberGenerator\arginout,\textcolor{red}{\textless type((treeNode))\textgreater}
node\arginout) Returns the mass of a new halo created by a branching event.

type(varying_string) objectType() Return the type of the object.

double precision probability(\textcolor{red}{\textless double precision\textgreater} haloMass\argin,\te
double precision\textgreater} deltaCritical\argin,\textcolor{red}{\textless double
precision\textgreater} massResolution\argin,\textcolor{red}{\textless type((treeNode))\textgreater}
node\arginout) Computes the probability per unit "time" that a branching event occurs.

double precision probabilityBound(\textcolor{red}{\textless double precision\textgreater}
haloMass\argin,\textcolor{red}{\textless double precision\textgreater} deltaCritical\argin,\textcol
double precision\textgreater} massResolution\argin,\textcolor{red}{\textless integer\textgreater}
bound\argin,\textcolor{red}{\textless type((treeNode))\textgreater} node\arginout)
Computes a bound (upper or lower) to the probability per unit "time" that a branching event occurs.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the
new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl
type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-
size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles
type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-
size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

double precision stepMaximum(\textcolor{red}{\textless double precision\textgreater} haloMass\argin,\te
double precision\textgreater} deltaCritical\argin,\textcolor{red}{\textless double
precision\textgreater} massResolution\argin) Returns the maximum step in "time" allowed
by this algorithm.

mergerTreeBranchingProbabilityModifierClass

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\
character((len=*))\textgreater} sourceName\argin) Return a list of parameter names al-
lowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((mergerTreeBranchingProbabilityModifierClass))\textgreate
destination\arginout) Perform a deep copy of the object.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

`type(varying_string) objectType()` Return the type of the object.

`double precision rateModifier(\textcolor{red}{\textless double precision\textgreater} deltaParent\argin double precision\textgreater} sigmaChild\argin,\textcolor{red}{\textless double precision\textgreat sigmaParent\argin)` Return the multiplicative modifier to the tree branch probability rate.

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

`<void> referenceCountIncrement()` Increment the reference count to this object.

`<void> referenceCountReset()` Reset the reference count to this object to 0.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

mergerTreeBranchingProbabilityModifierIdentity

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void autoHook()` Insert any event hooks required by this object.

`void deepCopy(\textcolor{red}{\textless class((mergerTreeBranchingProbabilityModifierClass))\textgreate destination\arginout)` Perform a deep copy of the object.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

`type(varying_string) objectType()` Return the type of the object.

`double precision rateModifier(\textcolor{red}{\textless double precision\textgreater} deltaParent\argin double precision\textgreater} sigmaChild\argin,\textcolor{red}{\textless double precision\textgreat sigmaParent\argin)` Return the multiplicative modifier to the tree branch probability rate.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

mergerTreeBranchingProbabilityModifierParkinson2008

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((mergerTreeBranchingProbabilityModifierClass))\textgreate destination\arginout) Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

double precision rateModifier(\textcolor{red}{\textless double precision\textgreater} deltaParent\argin double precision\textgreater} sigmaChild\argin,\textcolor{red}{\textless double precision\textgreat sigmaParent\argin) Return the multiplicative modifier to the tree branch probability rate.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

mergerTreeBranchingProbabilityParkinsonColeHelly

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

<void> computeCommonFactors(<double> deltaParent→, <double> massHaloParent→) Compute common factors needed for the calculations.

void deepCopy(\textcolor{red}{\textless class((mergerTreeBranchingProbabilityClass))\textgreater} destination\arginout) Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

double precision fractionSubresolution(\textcolor{red}{\textless double precision\textgreater} haloMass\argin,\textcolor{red}{\textless double precision\textgreater} deltaCritical\argin,\textcol double precision\textgreater} massResolution\argin,\textcolor{red}{\textless type((treeNode))\textg node\arginout) Computes the fraction of subresolution mass accreted per unit "time"

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

double precision massBranch(\textcolor{red}{\textless double precision\textgreater} haloMass\argin,\tex double precision\textgreater} deltaCritical\argin,\textcolor{red}{\textless double precision\textgreater} massResolution\argin,\textcolor{red}{\textless double precision\textgreater} probabilityFraction\argin,\textcolor{red}{\textless type((pseudoRandom))\textgreater} randomNumberGenerator\arginout,\textcolor{red}{\textless type((treeNode))\textgreater} node\arginout) Returns the mass of a new halo created by a branching event.

type(varying_string) objectType() Return the type of the object.

double precision probability(\textcolor{red}{\textless double precision\textgreater} haloMass\argin,\te double precision\textgreater} deltaCritical\argin,\textcolor{red}{\textless double precision\textgreater} massResolution\argin,\textcolor{red}{\textless type((treeNode))\textgreater} node\arginout) Computes the probability per unit "time" that a branching event occurs.

double precision probabilityBound(\textcolor{red}{\textless double precision\textgreater} haloMass\argin,\textcolor{red}{\textless double precision\textgreater} deltaCritical\argin,\textcol double precision\textgreater} massResolution\argin,\textcolor{red}{\textless integer\textgreater} bound\argin,\textcolor{red}{\textless type((treeNode))\textgreater} node\arginout) Computes a bound (upper or lower) to the probability per unit "time" that a branching event occurs.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

`double precision stepMaximum(\textcolor{red}{\textless double precision\textgreater} haloMass\argin,\te double precision\textgreater} deltaCritical\argin,\textcolor{red}{\textless double precision\textgreater} massResolution\argin)` Returns the maximum step in "time" allowed by this algorithm.

mergerTreeBuilderClass

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void autoHook()` Insert any event hooks required by this object.

`void build(\textcolor{red}{\textless type((mergerTree))\textgreater} tree\arginout)` Builds and returns a merger tree given the root `node`.

`void deepCopy(\textcolor{red}{\textless class((mergerTreeBuilderClass))\textgreater} destination\argino` Perform a deep copy of the object.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

`type(varying_string) objectType()` Return the type of the object.

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

`<void> referenceCountIncrement()` Increment the reference count to this object.

`<void> referenceCountReset()` Reset the reference count to this object to 0.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

`void timeEarliestSet(\textcolor{red}{\textless double precision\textgreater} timeEarliest\argin)` Set the earliest time for the builder to the given value.

mergerTreeBuilderCole2000

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void build(\textcolor{red}{\textless type((mergerTree))\textgreater} tree\arginout) Builds and returns a merger tree given the root node.

<void> criticalOverdensitySet(<class(criticalOverdensityClass)>criticalOverdensity_) Set the critical overdensity object.

<double> criticalOverdensityUpdate(<double> deltaCritical→, <double> massCurrent→, <double> massNew→, <type(treeNode)> nodeNew↔) Set the critical overdensity object.

void deepCopy(\textcolor{red}{\textless class((mergerTreeBuilderClass))\textgreater} destination\argino Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

<logical> shouldAbort(<type(mergerTree)> tree→) Return true if construction of the merger tree should be aborted.

<logical> shouldFollowBranch(<type(mergerTree)> tree→, <type(treeNode)> node→) Return true if the branch should be followed.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

void timeEarliestSet(\textcolor{red}{\textless double precision\textgreater} timeEarliest\argin) Set the earliest time for the builder to the given value.

mergerTreeBuildMassDistributionClass

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void autoHook()` Insert any event hooks required by this object.

`void deepCopy(\textcolor{red}{\textless class((mergerTreeBuildMassDistributionClass))\textgreater} destination\arginout)` Perform a deep copy of the object.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

`type(varying_string) objectType()` Return the type of the object.

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

`<void> referenceCountIncrement()` Increment the reference count to this object.

`<void> referenceCountReset()` Reset the reference count to this object to 0.

`double precision sample(\textcolor{red}{\textless double precision\textgreater} mass\argin,\textcolor{r double precision\textgreater} time\argin,\textcolor{red}{\textless double precision\textgreater} massMinimum\argin,\textcolor{red}{\textless double precision\textgreater} massMaximum\argin)` Returns the sampling rate for merger trees of the given `mass`, per decade of halo mass.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

mergerTreeBuildMassDistributionGaussian

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void autoHook()` Insert any event hooks required by this object.

`void deepCopy(\textcolor{red}{\textless class((mergerTreeBuildMassDistributionClass))\textgreater} destination\arginout)` Perform a deep copy of the object.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges
Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

double precision sample(\textcolor{red}{\textless double precision\textgreater} mass\argin,\textcolor{r
double precision\textgreater} time\argin,\textcolor{red}{\textless double precision\textgreater} massMinimum\argin,\textcolor{red}{\textless double precision\textgreater} massMaximum\argin) Returns the sampling rate for merger trees of the given mass, per decade of halo mass.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl
type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles
type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

mergerTreeBuildMassDistributionHaloMassFunction

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\
character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((mergerTreeBuildMassDistributionClass))\textgreater} destination\arginout) Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex
logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges
Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

double precision sample(\textcolor{red}{\textless double precision\textgreater} mass\argin,\textcolor{r
double precision\textgreater} time\argin,\textcolor{red}{\textless double precision\textgreater}
massMinimum\argin,\textcolor{red}{\textless double precision\textgreater} massMaximum\argin)
Returns the sampling rate for merger trees of the given mass, per decade of halo mass.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl
type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-
size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles
type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-
size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

mergerTreeBuildMassDistributionPowerLaw

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\
character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((mergerTreeBuildMassDistributionClass))\textgreater}
destination\arginout) Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex
logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges
Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

double precision sample(\textcolor{red}{\textless double precision\textgreater} mass\argin,\textcolor{r
double precision\textgreater} time\argin,\textcolor{red}{\textless double precision\textgreater}
massMinimum\argin,\textcolor{red}{\textless double precision\textgreater} massMaximum\argin)
Returns the sampling rate for merger trees of the given mass, per decade of halo mass.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl
type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-
size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles
type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-
size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

mergerTreeBuildMassDistributionStllrMssFnctn

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((mergerTreeBuildMassDistributionClass))\textgreater} destination\arginout) Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

double precision sample(\textcolor{red}{\textless double precision\textgreater} mass\argin,\textcolor{r double precision\textgreater} time\argin,\textcolor{red}{\textless double precision\textgreater} massMinimum\argin,\textcolor{red}{\textless double precision\textgreater} massMaximum\argin) Returns the sampling rate for merger trees of the given mass, per decade of halo mass.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

mergerTreeBuildMassesClass

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void construct(\textcolor{red}{\textless double precision\textgreater} time \argin,\textcolor{red}{\tex double precision\textgreater} mass\argout,\textcolor{red}{\textless double precision\textgreater} massMinimum\argout,\textcolor{red}{\textless double precision\textgreater} massMaximum\argout,\text double precision\textgreater} weight\argout) Returns a set of merger tree masses (and either their weights, or corresponding mass interval) to be built.

`void deepCopy(\textcolor{red}{\textless class((mergerTreeBuildMassesClass))\textgreater} destination\arginout)` Perform a deep copy of the object.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

`type(varying_string) objectType()` Return the type of the object.

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

`<void> referenceCountIncrement()` Increment the reference count to this object.

`<void> referenceCountReset()` Reset the reference count to this object to 0.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

mergerTreeBuildMassesFixedMass

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void autoHook()` Insert any event hooks required by this object.

`void construct(\textcolor{red}{\textless double precision\textgreater} time \argin,\textcolor{red}{\tex double precision\textgreater} mass\argout,\textcolor{red}{\textless double precision\textgreater} massMinimum\argout,\textcolor{red}{\textless double precision\textgreater} massMaximum\argout,\text double precision\textgreater} weight\argout)` Returns a set of merger tree masses (and either their weights, or corresponding mass interval) to be built.

`void deepCopy(\textcolor{red}{\textless class((mergerTreeBuildMassesClass))\textgreater} destination\arginout)` Perform a deep copy of the object.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

`type(varying_string) objectType()` Return the type of the object.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

mergerTreeBuildMassesRead

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void construct(\textcolor{red}{\textless double precision\textgreater} time \argin,\textcolor{red}{\tex double precision\textgreater} mass\argout,\textcolor{red}{\textless double precision\textgreater} massMinimum\argout,\textcolor{red}{\textless double precision\textgreater} massMaximum\argout,\text double precision\textgreater} weight\argout) Returns a set of merger tree masses (and either their weights, or corresponding mass interval) to be built.

void deepCopy(\textcolor{red}{\textless class((mergerTreeBuildMassesClass))\textgreater} destination\arginout) Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

<void> read(<double(:)> mass←, <double(:)> weight←) Read the halo masses, and, optionally, weights, from file..

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

mergerTreeBuildMassesReadHDF5

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void autoHook()` Insert any event hooks required by this object.

`void construct(\textcolor{red}{\textless double precision\textgreater} time \argin,\textcolor{red}{\tex double precision\textgreater} mass\argout,\textcolor{red}{\textless double precision\textgreater} massMinimum\argout,\textcolor{red}{\textless double precision\textgreater} massMaximum\argout,\text double precision\textgreater} weight\argout)` Returns a set of merger tree masses (and either their weights, or corresponding mass interval) to be built.

`void deepCopy(\textcolor{red}{\textless class((mergerTreeBuildMassesClass))\textgreater} destination\arginout)` Perform a deep copy of the object.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

`type(varying_string) objectType()` Return the type of the object.

`<void> read(<double(:)> mass←, <double(:)> weight←)` Read the halo masses, and, optionally, weights, from file..

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

`<void> referenceCountIncrement()` Increment the reference count to this object.

`<void> referenceCountReset()` Reset the reference count to this object to 0.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

mergerTreeBuildMassesReadXML

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\
character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void construct(\textcolor{red}{\textless double precision\textgreater} time \argin,\textcolor{red}{\tex
double precision\textgreater} mass\argout,\textcolor{red}{\textless double precision\textgreater}
massMinimum\argout,\textcolor{red}{\textless double precision\textgreater} massMaximum\argout,\text
double precision\textgreater} weight\argout) Returns a set of merger tree masses (and either their weights, or corresponding mass interval) to be built.

void deepCopy(\textcolor{red}{\textless class((mergerTreeBuildMassesClass))\textgreater}
destination\arginout) Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex
logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges
Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

<void> read(<double(:)> mass←, <double(:)> weight←) Read the halo masses, and, optionally, weights, from file..

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl
type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-
size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles
type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-
size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

mergerTreeBuildMassesSampledDistribution

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\
character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void construct(\textcolor{red}{\textless double precision\textgreater} time \argin,\textcolor{red}{\tex double precision\textgreater} mass\argout,\textcolor{red}{\textless double precision\textgreater} massMinimum\argout,\textcolor{red}{\textless double precision\textgreater} massMaximum\argout,\text double precision\textgreater} weight\argout) Returns a set of merger tree masses (and either their weights, or corresponding mass interval) to be built.

<void> constructor(<type(inputParameters)> parameters↔) Handles construction of the abstract parent class.

void deepCopy(\textcolor{red}{\textless class((mergerTreeBuildMassesClass))\textgreater} destination\arginout) Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

<void> sampleCMF(<double(:)> x←) Return a set of values sampleCount in the interval 0–1, corresponding to values of the cumulative mass distribution.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

mergerTreeBuildMassesSampledDistributionPseudoRandom

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void construct(\textcolor{red}{\textless double precision\textgreater} time \argin,\textcolor{red}{\tex double precision\textgreater} mass\argout,\textcolor{red}{\textless double precision\textgreater} massMinimum\argout,\textcolor{red}{\textless double precision\textgreater} massMaximum\argout,\text double precision\textgreater} weight\argout) Returns a set of merger tree masses (and either their weights, or corresponding mass interval) to be built.

<void> constructor(<type(inputParameters)> parameters↔) Handles construction of the abstract parent class.

void deepCopy(\textcolor{red}{\textless class((mergerTreeBuildMassesClass))\textgreater} destination\arginout) Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

<void> sampleCMF(<double(:)> x←) Return a set of values sampleCount in the interval 0–1, corresponding to values of the cumulative mass distribution.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

mergerTreeBuildMassesSampledDistributionQuasiRandom

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void construct(\textcolor{red}{\textless double precision\textgreater} time \argin,\textcolor{red}{\tex double precision\textgreater} mass\argout,\textcolor{red}{\textless double precision\textgreater} massMinimum\argout,\textcolor{red}{\textless double precision\textgreater} massMaximum\argout,\text double precision\textgreater} weight\argout) Returns a set of merger tree masses (and either their weights, or corresponding mass interval) to be built.

<void> constructor(<type(inputParameters)> parameters↔) Handles construction of the abstract parent class.

void deepCopy(\textcolor{red}{\textless class((mergerTreeBuildMassesClass))\textgreater} destination\arginout) Perform a deep copy of the object.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

`type(varying_string) objectType()` Return the type of the object.

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

`<void> referenceCountIncrement()` Increment the reference count to this object.

`<void> referenceCountReset()` Reset the reference count to this object to 0.

`<void> sampleCMF(<double(:)> x←)` Return a set of values `sampleCount` in the interval 0–1, corresponding to values of the cumulative mass distribution.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

mergerTreeBuildMassesSampledDistributionUniform

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void autoHook()` Insert any event hooks required by this object.

`void construct(\textcolor{red}{\textless double precision\textgreater} time \argin,\textcolor{red}{\tex double precision\textgreater} mass\argout,\textcolor{red}{\textless double precision\textgreater} massMinimum\argout,\textcolor{red}{\textless double precision\textgreater} massMaximum\argout,\text double precision\textgreater} weight\argout)` Returns a set of merger tree masses (and either their weights, or corresponding mass interval) to be built.

`<void> constructor(<type(inputParameters)> parameters↔)` Handles construction of the abstract parent class.

`void deepCopy(\textcolor{red}{\textless class((mergerTreeBuildMassesClass))\textgreater} destination\arginout)` Perform a deep copy of the object.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

<void> sampleCMF(<double(:)> x←) Return a set of values sampleCount in the interval 0–1, corresponding to values of the cumulative mass distribution.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

mergerTreeBuildMassesUnion

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void construct(\textcolor{red}{\textless double precision\textgreater} time \argin,\textcolor{red}{\tex double precision\textgreater} mass\argout,\textcolor{red}{\textless double precision\textgreater} massMinimum\argout,\textcolor{red}{\textless double precision\textgreater} massMaximum\argout,\text double precision\textgreater} weight\argout) Returns a set of merger tree masses (and either their weights, or corresponding mass interval) to be built.

void deepCopy(\textcolor{red}{\textless class((mergerTreeBuildMassesClass))\textgreater} destination\arginout) Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

mergerTreeConstructorBuild

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void autoHook()` Insert any event hooks required by this object.

`type(mergerTree), pointer construct(\textcolor{red}{\textless integer((c_size_t))\textgreater} treeNumber\argin)` Construct the merger tree corresponding to the given `treeNumber`.

`<void> constructMasses()` Construct the set of tree masses to be built.

`void deepCopy(\textcolor{red}{\textless class((mergerTreeConstructorClass))\textgreater} destination\arginout)` Perform a deep copy of the object.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

`type(varying_string) objectType()` Return the type of the object.

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

`<void> referenceCountIncrement()` Increment the reference count to this object.

`<void> referenceCountReset()` Reset the reference count to this object to 0.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

mergerTreeConstructorClass

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

type(mergerTree), pointer construct(\textcolor{red}{\textless integer((c_size_t))\textgreater} treeNumber\argin) Construct the merger tree corresponding to the given treeNumber.

void deepCopy(\textcolor{red}{\textless class((mergerTreeConstructorClass))\textgreater} destination\arginout) Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

mergerTreeConstructorFullySpecified

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

type(mergerTree), pointer construct(\textcolor{red}{\textless integer((c_size_t))\textgreater} treeNumber\argin) Construct the merger tree corresponding to the given treeNumber.

void deepCopy(\textcolor{red}{\textless class((mergerTreeConstructorClass))\textgreater} destination\arginout) Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges
Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl
type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-
size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles
type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-
size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

mergerTreeConstructorRead

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\
character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

<void> assignMergers(<class(nodeData)(:)> nodes↔, <class(treeNodeList)(:)> nodeList↔)
Assign pointers to merge targets.

<void> assignNamedProperties(<class(nodeData)(:)> nodes↔, <class(treeNodeList)(:)> nodeList↔)
Assign named properties to nodes.

<void> assignScaleRadii(<class(nodeData)(:)> nodes↔, <class(treeNodeList)(:)> nodeList↔)
Assign scale radii to nodes.

<void> assignSpinParameters(<class(nodeData)(:)> nodes↔, <class(treeNodeList)(:)> nodeList↔)
Assign spin parameters to nodes.

<void> assignSplitForestEvents(<class(nodeData)> node→, <class(treeNodeList)(:)> nodeList↔)
Assign events to nodes if they jump between trees in a forest.

void autoHook() Insert any event hooks required by this object.

<void> buildDescendentPointers(<class(nodeData)(:)> nodes↔) Builds pointers from each node to its descendent node.

<void> buildIsolatedParentPointers(<class(nodeData)(:)> nodes↔, <class(treeNodeList)(:)>
nodeList↔) Create parent pointer links between isolated nodes and assign times and masses to those nodes.

<void> buildSubhaloMassHistories(<class(nodeData)(:)> nodes↔, <class(treeNodeList)(:)>
nodeList↔, <integer(kind_int8)(:)> historyIndex→, <integer(c_size_t)> historyCountMaximum→,
<double(:)> historyMass↔, <double(:)> hitoryTime↔, <double(:,:)> position↔, <double(:,:)>
velocity↔) Build and attached bound mass histories to subhalos.

type(mergerTree), pointer construct(\textcolor{red}{\textless integer((c_size_t))\textgreater} treeNumber\argin) Construct the merger tree corresponding to the given treeNumber.

<void> createNodeArray(<type(mergerTree)> tree↔, <class(nodeData)(:)> nodes→, <class(nodeData)> node→, <integer> isolatedNodeCount←, <logical(:)> childIsSubhalo↔) Create an array of standard nodes and associated structures.

<void> createNodeIndices(<class(nodeData)(:)> nodes↔) Create a sorted list of node indices with an index into the original array.

void deepCopy(\textcolor{red}{\textless class((mergerTreeConstructorClass))\textgreater} destination\arginout) Perform a deep copy of the object.

<integer(c_size_)> descendentNodeSortIndex(<integer(kind_int8)(:)> descendentIndex→) Return the sort index of the given descendentIndex.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

<void> destroyNodeIndices() Destroy the sorted list of node indices.

<void> enforceSubhaloStatus(<class(nodeData)(:)> nodes↔) Ensure that any node which was once a subhalo remains a subhalo.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

<logical> isOnPullList(<class(nodeData)> node→) Return true if the given node is on the current "pull-from" list of nodes for split forests.

<logical> isOnPushList(<class(nodeData)> node→) Return true if the given node is on the current "push-to" list of nodes for split forests.

<logical> isSubhaloSubhaloMerger(<class(nodeData)(:)> nodes→, <class(nodeData)> node→) Returns true if node undergoes a subhalo-subhalo merger.

<integer(c_size_)> nodeLocation(<integer(kind_int8)(:)> nodeIndex→) Return the location in the original array of the given nodeIndex.

type(varying_string) objectType() Return the type of the object.

<void> phaseSpacePositionRealize(<double> time→, <double(:)> position→, <double(:)> velocity→) Modify relative positions and velocities to account for both any periodicity of the simulated volume, and for Hubble flow.

<integer(c_size_t)> pullListCount(<class(nodeData)> node→) Return the number of the given node in the "pull-from" list of nodes for split forests.

<integer(c_size_t)> pullListIndex(<class(nodeData)> node→, <integer(c_size_t)> iPull→) Return the index of the given node in the "pull-from" list of nodes for split forests.

<integer(c_size_t)> pushListIndex(<class(nodeData)> node→) Return the index of the given node in the "push-to" list of nodes for split forests.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

<void> rootNodeAffinitiesInitial(<class(nodeData)(:)> nodes↔) Find initial root node affinities for all nodes.

<void> scanForBranchJumps(<class(nodeData)(:)> nodes↔, <class(treeNodeList)(:)> nodeList↔) Search for subhalos which move between branches/trees.

<void> scanForMergers(<class(nodeData)(:)> nodes↔, <class(treeNodeList)(:)> nodeList↔, <integer(c_size_t)> historyCountMaximum←) Scan for and record mergers between nodes.

<void> scanForSubhaloPromotions(<class(nodeData)(:)> nodes↔, <class(treeNodeList)(:)> nodeList↔) Scan for cases where a subhalo stops being a subhalo and so must be promoted.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

<void> timeUntilMergingSubresolution(<class(nodeData)> lastSeenNode→, <class(nodeData)(:)> nodes↔, <class(treeNodeList)(:)> nodeList↔, <integer> iNode→, <double> timeSubhaloMerges↔) Compute the additional time until merging after a subhalo is lost from the tree (presumably due to limited resolution).

<void> timingRecord(<character(len=*)> label→) Record timing data.

<void> timingReport() Report on time taken in various steps of processing merger trees read from file.

mergerTreeConstructorSmoothAccretion

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

type(mergerTree), pointer construct(\textcolor{red}{\textless integer((c_size_t))\textgreater} treeNumber\argin) Construct the merger tree corresponding to the given treeNumber.

void deepCopy(\textcolor{red}{\textless class((mergerTreeConstructorClass))\textgreater} destination\arginout) Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges
Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl
type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-
size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles
type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-
size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

mergerTreeConstructorStateRestored

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\
character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

type(mergerTree), pointer construct(\textcolor{red}{\textless integer((c_size_t))\textgreater}
treeNumber\argin) Construct the merger tree corresponding to the given treeNumber.

void deepCopy(\textcolor{red}{\textless class((mergerTreeConstructorClass))\textgreater}
destination\arginout) Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex
logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges
Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl
type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-
size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles
type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-
size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

mergerTreeData

<void> addMetadata(<metaDataType> metadataType→, <character(len=*)> label→, <(<double>,<integer>,char
value→) Add a metadatum to the tree data structure.

<void> export(<character(len=*)> outputFileName→, <mergerTreeFormat> outputFormat→, <integer>
hdfChunkSize→, <integer> hdfCompressionLevel→, <logical> [append]→) Export the tree
data to an output file.

<void> forestCountSet(<integer> forestCount→) Set the total number of forests in the data struc-
ture.

<void> makeReferences(<logical> makeReferences→) Specify whether or not merger tree dataset
references should be made.

<void> nodeCountSet(<integer> nodeCount→) Set the total number of nodes in the data structure.

<void> particleCountSet(<integer> particleCount→) Set the total number of particles in the data
structure.

<void> readASCII(inputFile→, [commentCharacter]→, [separator]→) Read node data from an
ASCII file into the data structure.

<void> readParticlesASCII(<character(len=*)> inputFile→, <character(len=1)> [commentCharacter]→,
<character(len=*)> [separator]→) Read particle data from an ASCII file into the data struc-
ture

<void> reset() Reset the data structure.

<void> setConversionFactor(<propertyType> propertyType→, <double> conversionFactor→)
Set property type and conversion factor to adjust inconsistent units.

<void> setDummyHostId(<integer> dummyHostId→) Set host ID for self-hosting halos if host ID is
not node ID.

<void> setIncludesHubbleFlow(<logical> includesHubbleFlow→) Specify if velocities include the
Hubble flow.

<void> setIncludesSubhaloMasses(<logical> includesSubhaloMasses→) Set whether halo masses
include the masses of the subhalos.

<void> setParticleMass(<double> particleMass→) Set the mass of an N-body particle in the sim-
ulation from which the trees were derived.

<void> setParticlePropertyColumn(<propertyType> propertyType→, <integer> columnNumber→)
Set the column in an ASCII data file corresponding to a given particle property.

<void> setPositionsArePeriodic(<logical> isPeriodic→) Set if positions are periodic.

<void> setProperty(<propertyType> propertyType→, <integer(kind=kind_int8)(:)|<double(:)>>
property→) Set a node property in the data structure.

<void> setPropertyColumn(<propertyType> propertyType→, columnNumber→) Set the column in an ASCII data file corresponding to a given node property.

<void> setSelfContained(<logical> areSelfContained→) Specify if trees are self-contained (i.e. contain no cross-links to other trees).

<void> setUnits(<metaDataType> unitType→, <double> unitsInSI→, <integer> [hubbleExponent]→, <integer> [scaleFactorExponent]→, <character(len=*)> [name]→) Set the units used.

mergerTreeEvolverClass

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((mergerTreeEvolverClass))\textgreater} destination\argino Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

void evolve(\textcolor{red}{\textless type((mergerTree))\textgreater} tree \arginout,\textcolor{red}{\ double precision\textgreater} timeEnd \argin,\textcolor{red}{\textless logical\textgreater} treeDidEvolve\argout,\textcolor{red}{\textless logical\textgreater} suspendTree\argout,\textcolor{r logical\textgreater} deadlockReporting \argin,\textcolor{red}{\textless integer((kind_- int8))\textgreater} systemClockMaximum \argin,\textcolor{red}{\textless integer((omp_- lock_kind))\textgreater} initializationLock \arginout,\textcolor{red}{\textless integer\textgreater status \argout) Evolve a merger tree.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

mergerTreeEvolverNonEvolving

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\
character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((mergerTreeEvolverClass))\textgreater} destination\argino
Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex
logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

void evolve(\textcolor{red}{\textless type((mergerTree))\textgreater} tree \arginout,\textcolor{red}{\
double precision\textgreater} timeEnd \argin,\textcolor{red}{\textless logical\textgreater} treeDidEvolve\argout,\textcolor{red}{\textless logical\textgreater} suspendTree\argout,\textcolor{r
logical\textgreater} deadlockReporting \argin,\textcolor{red}{\textless integer((kind_-
int8))\textgreater} systemClockMaximum \argin,\textcolor{red}{\textless integer((omp_-
lock_kind))\textgreater} initializationLock \arginout,\textcolor{red}{\textless integer\textgreater
status \argout) Evolve a merger tree.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges
Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl
type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-
size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles
type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-
size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

mergerTreeEvolverStandard

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\
character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

<void> deadlockAddNode(<type(treeNode)> *nodeLock→, <integer(kind_int8)> treeIndex→, <type(treeNode)> *node→, <type(varying_string)> lockType→) Add a node to the deadlock list.

<void> deadlockOutputTree(<double> timeEnd→) Output a description of a deadlocked tree.

void deepCopy(\textcolor{red}{\textless class((mergerTreeEvolverClass))\textgreater} destination\arginc Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

void evolve(\textcolor{red}{\textless type((mergerTree))\textgreater} tree \arginout,\textcolor{red}{\ double precision\textgreater} timeEnd \argin,\textcolor{red}{\textless logical\textgreater} treeDidEvolve\argout,\textcolor{red}{\textless logical\textgreater} suspendTree\argout,\textcolor{r logical\textgreater} deadlockReporting \argin,\textcolor{red}{\textless integer((kind_- int8))\textgreater} systemClockMaximum \argin,\textcolor{red}{\textless integer((omp_- lock_kind))\textgreater} initializationLock \arginout,\textcolor{red}{\textless integer\textgreater status \argout) Evolve a merger tree.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

<double> timeEvolveTo(<type(treeNode)> *node↔, <double> timeEnd→, <procedure(timestepTask)> *timestepTask_←, <class(*)> *timestepSelf ←, <logical> report→, <type(treeNode)> [*nodeLock]←, <type(varying_string)> [lockType]←) Find the time to which a node can be evolved.

mergerTreeEvolveTimestepClass

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((mergerTreeEvolveTimestepClass))\textgreater} destination\arginout) Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex
logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges
Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl
type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-
size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles
type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-
size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

double precision timeEvolveTo(\textcolor{red}{\textless type((treeNode))\textgreater}
node \arginout,\textcolor{red}{\textless procedure((timestepTask))\textgreater} task
\argout,\textcolor{red}{\textless class((*))\textgreater} taskSelf\argout,\textcolor{red}{\textles
logical\textgreater} report \argin,\textcolor{red}{\textless type((treeNode))\textgreater}
lockNode\argout,\textcolor{red}{\textless type((varying_string))\textgreater} lockType\argout)
Return the time to which the node can be evolved.

mergerTreeEvolveTimestepHistory

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\
character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((mergerTreeEvolveTimestepClass))\textgreater}
destination\arginout) Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex
logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges
Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

double precision timeEvolveTo(\textcolor{red}{\textless type((treeNode))\textgreater} node \arginout,\textcolor{red}{\textless procedure((timestepTask))\textgreater} task \argout,\textcolor{red}{\textless class((*))\textgreater} taskSelf\argout,\textcolor{red}{\textles logical\textgreater} report \argin,\textcolor{red}{\textless type((treeNode))\textgreater} lockNode\argout,\textcolor{red}{\textless type((varying_string))\textgreater} lockType\argout) Return the time to which the node can be evolved.

mergerTreeEvolveTimestepMulti

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((mergerTreeEvolveTimestepClass))\textgreater} destination\arginout) Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

`double precision timeEvolveTo(\textcolor{red}{\textless type((treeNode))\textgreater} node \arginout,\textcolor{red}{\textless procedure((timestepTask))\textgreater} task \argout,\textcolor{red}{\textless class((*))\textgreater} taskSelf\argout,\textcolor{red}{\textles logical\textgreater} report \argin,\textcolor{red}{\textless type((treeNode))\textgreater} lockNode\argout,\textcolor{red}{\textless type((varying_string))\textgreater} lockType\argout)` Return the time to which the node can be evolved.

mergerTreeEvolveTimestepRecordEvolution

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void autoHook()` Insert any event hooks required by this object.

`void deepCopy(\textcolor{red}{\textless class((mergerTreeEvolveTimestepClass))\textgreater} destination\arginout)` Perform a deep copy of the object.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

`type(varying_string) objectType()` Return the type of the object.

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

`<void> referenceCountIncrement()` Increment the reference count to this object.

`<void> referenceCountReset()` Reset the reference count to this object to 0.

`<void> reset()` Reset the record of galaxy evolution.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

`double precision timeEvolveTo(\textcolor{red}{\textless type((treeNode))\textgreater} node \arginout,\textcolor{red}{\textless procedure((timestepTask))\textgreater} task \argout,\textcolor{red}{\textless class((*))\textgreater} taskSelf\argout,\textcolor{red}{\textles logical\textgreater} report \argin,\textcolor{red}{\textless type((treeNode))\textgreater} lockNode\argout,\textcolor{red}{\textless type((varying_string))\textgreater} lockType\argout)` Return the time to which the node can be evolved.

mergerTreeEvolveTimestepSatellite

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\
character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((mergerTreeEvolveTimestepClass))\textgreater}
destination\arginout) Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex
logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges
Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl
type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-
size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles
type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-
size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

double precision timeEvolveTo(\textcolor{red}{\textless type((treeNode))\textgreater}
node \arginout,\textcolor{red}{\textless procedure((timestepTask))\textgreater} task
\argout,\textcolor{red}{\textless class((*))\textgreater} taskSelf\argout,\textcolor{red}{\textles
logical\textgreater} report \argin,\textcolor{red}{\textless type((treeNode))\textgreater}
lockNode\argout,\textcolor{red}{\textless type((varying_string))\textgreater} lockType\argout)
Return the time to which the node can be evolved.

mergerTreeEvolveTimestepSimple

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\
character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((mergerTreeEvolveTimestepClass))\textgreater}
destination\arginout) Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex
logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges
Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl
type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-
size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles
type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-
size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

double precision timeEvolveTo(\textcolor{red}{\textless type((treeNode))\textgreater}
node \arginout,\textcolor{red}{\textless procedure((timestepTask))\textgreater} task
\argout,\textcolor{red}{\textless class((*))\textgreater} taskSelf\argout,\textcolor{red}{\textles
logical\textgreater} report \argin,\textcolor{red}{\textless type((treeNode))\textgreater}
lockNode\argout,\textcolor{red}{\textless type((varying_string))\textgreater} lockType\argout)
Return the time to which the node can be evolved.

mergerTreeEvolveTimestepStandard

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\
character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((mergerTreeEvolveTimestepClass))\textgreater}
destination\arginout) Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex
logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges
Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

double precision timeEvolveTo(\textcolor{red}{\textless type((treeNode))\textgreater} node \arginout,\textcolor{red}{\textless procedure((timestepTask))\textgreater} task \argout,\textcolor{red}{\textless class((*))\textgreater} taskSelf\argout,\textcolor{red}{\textles logical\textgreater} report \argin,\textcolor{red}{\textless type((treeNode))\textgreater} lockNode\argout,\textcolor{red}{\textless type((varying_string))\textgreater} lockType\argout) Return the time to which the node can be evolved.

mergerTreeImporterClass

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

logical angularMomenta3DAvailable() Return true if angular momenta (vectors) are available.

logical angularMomentaAvailable() Return true if angular momenta (magnitudes) are available.

logical angularMomentaIncludeSubhalos() Returns a Boolean specifying whether halo angular momenta (or spins) include the contribution from their subhalos.

void autoHook() Insert any event hooks required by this object.

logical canReadSubsets() Returns true if arbitrary subsets of halos from a forest can be read.

void close() Closes the file.

double precision cubeLength(\textcolor{red}{\textless double precision\textgreater} time\argin,\textcol integer\textgreater} status\argout) Returns the length of the simulation cube.

void deepCopy(\textcolor{red}{\textless class((mergerTreeImporterClass))\textgreater} destination\argin Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`void import(\textcolor{red}{\textless integer\textgreater} i\argin,\textcolor{red}{\textless class((nodeDataMinimal))\textgreater} nodes\argout,\textcolor{red}{\textless integer((c_-size_t))\textgreater} nodeSubset\argin,\textcolor{red}{\textless logical\textgreater} requireScaleRadii\argin,\textcolor{red}{\textless logical\textgreater} requireAngularMomenta\argin,logical\textgreater} requireAngularMomenta3D\argin,\textcolor{red}{\textless logical\textgreater} requireSpin\argin,\textcolor{red}{\textless logical\textgreater} requireSpin3D\argin,\textcolor{redlogical\textgreater} requirePositions\argin,\textcolor{red}{\textless logical\textgreater} structureOnly\argin,\textcolor{red}{\textless type((varying_string))\textgreater} requireNamedReals\argin,\textcolor{red}{\textless type((varying_string))\textgreater} requireNamedIntegers\argin)` Imports the i^{th} tree.

`<logical> isDefault()` Return true if this is the default object of this class.

`logical massesIncludeSubhalos()` Returns a Boolean specifying whether halo masses include the contribution from their subhalos.

`integer(kind=c_size_t) nodeCount(\textcolor{red}{\textless integer\textgreater} i\argin)` Returns the number of nodes in the i^{th} tree.

`type(varying_string) objectType()` Return the type of the object.

`void open(\textcolor{red}{\textless type((varying_string))\textgreater} fileName\argin)` Opens the file.

`logical particleCountAvailable()` Return true if particle counts are available.

`integer positionsArePeriodic()` Returns a Boolean integer specifying whether positions are periodic.

`logical positionsAvailable(\textcolor{red}{\textless logical\textgreater} positions\argin,\textcolor{relogical\textgreater} velocities\argin)` Return true if positions and/or velocities are available.

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

`<void> referenceCountIncrement()` Increment the reference count to this object.

`<void> referenceCountReset()` Reset the reference count to this object to 0.

`logical scaleRadiiAvailable()` Return true if scale radii are available.

`logical spin3DAvailable()` Return true if spin (vectors) are available.

`logical spinAvailable()` Return true if spin (magnitudes) are available.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textltype((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textlestype((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

`void subhaloTrace(\textcolor{red}{\textless class((nodeData))\textgreater} node\argin,\textcolor{red}{\double precision\textgreater} time\argout,\textcolor{red}{\textless double precision\textgreater} position\argout,\textcolor{red}{\textless double precision\textgreater} velocity\argout)` Supplies epochs, positions, and velocities for traced subhalos.

`integer(kind=c_size_t) subhaloTraceCount(\textcolor{red}{\textless class((nodeData))\textgreater} node\argin)` Returns the length of a node's subhalo trace.

`integer(kind=c_size_t) treeCount()` Returns a count of the number of trees available.

`integer(kind=kind_int8) treeIndex(\textcolor{red}{\textless integer\textgreater} i\argin)` Returns the index of the $i^{\rm th}$ tree.

`integer treesAreSelfContained()` Returns a Boolean integer specifying whether trees are self-contained.

`integer treesHaveSubhalos()` Returns a Boolean integer specifying whether or not the trees have subhalos.

`double precision treeWeight(\textcolor{red}{\textless integer\textgreater} i\argin)` Returns the weight to assign to the $i^{\rm th}$ tree.

`integer velocitiesIncludeHubbleFlow()` Returns a Boolean integer specifying whether velocities include the Hubble flow.

`logical velocityDispersionAvailable()` Return true if halo velocity dispersions are available.

`logical velocityMaximumAvailable()` Return true if rotation curve velocity maxima are available.

mergerTreeImporterGalacticus

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`logical angularMomenta3DAvailable()` Return true if angular momenta (vectors) are available.

`logical angularMomentaAvailable()` Return true if angular momenta (magnitudes) are available.

`logical angularMomentaIncludeSubhalos()` Returns a Boolean specifying whether halo angular momenta (or spins) include the contribution from their subhalos.

`void autoHook()` Insert any event hooks required by this object.

`logical canReadSubsets()` Returns true if arbitrary subsets of halos from a forest can be read.

`void close()` Closes the file.

`double precision cubeLength(\textcolor{red}{\textless double precision\textgreater} time\argin,\textcol integer\textgreater} status\argout)` Returns the length of the simulation cube.

`void deepCopy(\textcolor{red}{\textless class((mergerTreeImporterClass))\textgreater} destination\argin` Perform a deep copy of the object.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`void import(\textcolor{red}{\textless integer\textgreater} i\argin,\textcolor{red}{\textless class((nodeDataMinimal))\textgreater} nodes\argout,\textcolor{red}{\textless integer((c_-size_t))\textgreater} nodeSubset\argin,\textcolor{red}{\textless logical\textgreater} requireScaleRadii\argin,\textcolor{red}{\textless logical\textgreater} requireAngularMomenta\argin,logical\textgreater} requireAngularMomenta3D\argin,\textcolor{red}{\textless logical\textgreater} requireSpin\argin,\textcolor{red}{\textless logical\textgreater} requireSpin3D\argin,\textcolor{redlogical\textgreater} requirePositions\argin,\textcolor{red}{\textless logical\textgreater} structureOnly\argin,\textcolor{red}{\textless type((varying_string))\textgreater} requireNamedReals\argin,\textcolor{red}{\textless type((varying_string))\textgreater} requireNamedIntegers\argin)` Imports the i^{th} tree.

`<logical> isDefault()` Return true if this is the default object of this class.

`logical massesIncludeSubhalos()` Returns a Boolean specifying whether halo masses include the contribution from their subhalos.

`integer(kind=c_size_t) nodeCount(\textcolor{red}{\textless integer\textgreater} i\argin)` Returns the number of nodes in the i^{th} tree.

`type(varying_string) objectType()` Return the type of the object.

`void open(\textcolor{red}{\textless type((varying_string))\textgreater} fileName\argin)` Opens the file.

`logical particleCountAvailable()` Return true if particle counts are available.

`integer positionsArePeriodic()` Returns a Boolean integer specifying whether positions are periodic.

`logical positionsAvailable(\textcolor{red}{\textless logical\textgreater} positions\argin,\textcolor{relogical\textgreater} velocities\argin)` Return true if positions and/or velocities are available.

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

`<void> referenceCountIncrement()` Increment the reference count to this object.

`<void> referenceCountReset()` Reset the reference count to this object to 0.

`logical scaleRadiiAvailable()` Return true if scale radii are available.

`logical spin3DAvailable()` Return true if spin (vectors) are available.

`logical spinAvailable()` Return true if spin (magnitudes) are available.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textltype((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textlestype((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

`void subhaloTrace(\textcolor{red}{\textless class((nodeData))\textgreater} node\argin,\textcolor{red}{\double precision\textgreater} time\argout,\textcolor{red}{\textless double precision\textgreater} position\argout,\textcolor{red}{\textless double precision\textgreater} velocity\argout)` Supplies epochs, positions, and velocities for traced subhalos.

integer(kind=c_size_t) subhaloTraceCount(\textcolor{red}{\textless class((nodeData))\textgreater} node\argin) Returns the length of a node's subhalo trace.

integer(kind=c_size_t) treeCount() Returns a count of the number of trees available.

integer(kind=kind_int8) treeIndex(\textcolor{red}{\textless integer\textgreater} i\argin) Returns the index of the $i^{\rm th}$ tree.

integer treesAreSelfContained() Returns a Boolean integer specifying whether trees are self-contained.

integer treesHaveSubhalos() Returns a Boolean integer specifying whether or not the trees have subhalos.

double precision treeWeight(\textcolor{red}{\textless integer\textgreater} i\argin) Returns the weight to assign to the $i^{\rm th}$ tree.

integer velocitiesIncludeHubbleFlow() Returns a Boolean integer specifying whether velocities include the Hubble flow.

logical velocityDispersionAvailable() Return true if halo velocity dispersions are available.

logical velocityMaximumAvailable() Return true if rotation curve velocity maxima are available.

mergerTreeImporterSussing

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

logical angularMomenta3DAvailable() Return true if angular momenta (vectors) are available.

logical angularMomentaAvailable() Return true if angular momenta (magnitudes) are available.

logical angularMomentaIncludeSubhalos() Returns a Boolean specifying whether halo angular momenta (or spins) include the contribution from their subhalos.

void autoHook() Insert any event hooks required by this object.

logical canReadSubsets() Returns true if arbitrary subsets of halos from a forest can be read.

void close() Closes the file.

double precision cubeLength(\textcolor{red}{\textless double precision\textgreater} time\argin,\textcol integer\textgreater} status\argout) Returns the length of the simulation cube.

void deepCopy(\textcolor{red}{\textless class((mergerTreeImporterClass))\textgreater} destination\argin Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

void import(\textcolor{red}{\textless integer\textgreater} i\argin,\textcolor{red}{\textless class((nodeDataMinimal))\textgreater} nodes\argout,\textcolor{red}{\textless integer((c_-size_t))\textgreater} nodeSubset\argin,\textcolor{red}{\textless logical\textgreater} requireScaleRadii\argin,\textcolor{red}{\textless logical\textgreater} requireAngularMomenta\argin, logical\textgreater} requireAngularMomenta3D\argin,\textcolor{red}{\textless logical\textgreater} requireSpin\argin,\textcolor{red}{\textless logical\textgreater} requireSpin3D\argin,\textcolor{red logical\textgreater} requirePositions\argin,\textcolor{red}{\textless logical\textgreater} structureOnly\argin,\textcolor{red}{\textless type((varying_string))\textgreater} requireNamedReals\argin,\textcolor{red}{\textless type((varying_string))\textgreater} requireNamedIntegers\argin) Imports the i^{th} tree.

<logical> inSubvolume(<double> x→, <double> y→, <double> z→, <logical> [buffered]→) Return true if the given x,y,z position lies within the current subvolume (plus the buffer region if buffered is true.

<logical> inSubvolume1D(<double> x→, <integer> iSubvolume→, <logical> [buffered]→) Return true if the given x position lies within the iSubvolume$^{\text{th}}$ subvolume (plus the buffer region if buffered is true.

<logical> isDefault() Return true if this is the default object of this class.

<logical> load(<integer(kind_int8,:)> nodeSelfIndices←, <integer(c_size_t,:)> nodeIndexRanks←, <integer(c_size_t,:)> nodeDescendentLocations←, <logical> nodeIncomplete←, <integer(c_-size_t)> nodeCountTrees←, <integer(kind_int8,:)> nodeTreeIndices←, <logical> treeIndicesAssigned <logical> branchJumpCheckRequired←, <type(importerUnits)> massUnits←, <type(importerUnits)> lengthUnits←, <type(importerUnits)> velocityUnits←) Load the halo data.

logical massesIncludeSubhalos() Returns a Boolean specifying whether halo masses include the contribution from their subhalos.

integer(kind=c_size_t) nodeCount(\textcolor{red}{\textless integer\textgreater} i\argin) Returns the number of nodes in the i^{th} tree.

type(varying_string) objectType() Return the type of the object.

void open(\textcolor{red}{\textless type((varying_string))\textgreater} fileName\argin) Opens the file.

logical particleCountAvailable() Return true if particle counts are available.

integer positionsArePeriodic() Returns a Boolean integer specifying whether positions are periodic.

logical positionsAvailable(\textcolor{red}{\textless logical\textgreater} positions\argin,\textcolor{re logical\textgreater} velocities\argin) Return true if positions and/or velocities are available.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

logical scaleRadiiAvailable() Return true if scale radii are available.

`logical spin3DAvailable()` Return true if spin (vectors) are available.

`logical spinAvailable()` Return true if spin (magnitudes) are available.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

`void subhaloTrace(\textcolor{red}{\textless class((nodeData))\textgreater} node\argin,\textcolor{red}{\ double precision\textgreater} time\argout,\textcolor{red}{\textless double precision\textgreater} position\argout,\textcolor{red}{\textless double precision\textgreater} velocity\argout)` Supplies epochs, positions, and velocities for traced subhalos.

`integer(kind=c_size_t) subhaloTraceCount(\textcolor{red}{\textless class((nodeData))\textgreater} node\argin)` Returns the length of a node's subhalo trace.

`integer(kind=c_size_t) treeCount()` Returns a count of the number of trees available.

`integer(kind=kind_int8) treeIndex(\textcolor{red}{\textless integer\textgreater} i\argin)` Returns the index of the $i^{\rm th}$ tree.

`integer treesAreSelfContained()` Returns a Boolean integer specifying whether trees are self-contained.

`integer treesHaveSubhalos()` Returns a Boolean integer specifying whether or not the trees have subhalos.

`double precision treeWeight(\textcolor{red}{\textless integer\textgreater} i\argin)` Returns the weight to assign to the $i^{\rm th}$ tree.

`<logical> valueIsBad(<double> x→)` Return true if the given `x` value is bad.

`integer velocitiesIncludeHubbleFlow()` Returns a Boolean integer specifying whether velocities include the Hubble flow.

`logical velocityDispersionAvailable()` Return true if halo velocity dispersions are available.

`logical velocityMaximumAvailable()` Return true if rotation curve velocity maxima are available.

mergerTreeImporterSussingASCII

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`logical angularMomenta3DAvailable()` Return true if angular momenta (vectors) are available.

`logical angularMomentaAvailable()` Return true if angular momenta (magnitudes) are available.

`logical angularMomentaIncludeSubhalos()` Returns a Boolean specifying whether halo angular momenta (or spins) include the contribution from their subhalos.

`void autoHook()` Insert any event hooks required by this object.

`logical canReadSubsets()` Returns true if arbitrary subsets of halos from a forest can be read.

`void close()` Closes the file.

`double precision cubeLength(\textcolor{red}{\textless double precision\textgreater} time\argin,\textcol integer\textgreater} status\argout)` Returns the length of the simulation cube.

`void deepCopy(\textcolor{red}{\textless class((mergerTreeImporterClass))\textgreater} destination\argin` Perform a deep copy of the object.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`void import(\textcolor{red}{\textless integer\textgreater} i\argin,\textcolor{red}{\textless class((nodeDataMinimal))\textgreater} nodes\argout,\textcolor{red}{\textless integer((c_size_t))\textgreater} nodeSubset\argin,\textcolor{red}{\textless logical\textgreater} requireScaleRadii\argin,\textcolor{red}{\textless logical\textgreater} requireAngularMomenta\argin, logical\textgreater} requireAngularMomenta3D\argin,\textcolor{red}{\textless logical\textgreater} requireSpin\argin,\textcolor{red}{\textless logical\textgreater} requireSpin3D\argin,\textcolor{red logical\textgreater} requirePositions\argin,\textcolor{red}{\textless logical\textgreater} structureOnly\argin,\textcolor{red}{\textless type((varying_string))\textgreater} requireNamedReals\argin,\textcolor{red}{\textless type((varying_string))\textgreater} requireNamedIntegers\argin)` Imports the i^{th} tree.

`<logical> inSubvolume(<double> x→, <double> y→, <double> z→, <logical> [buffered]→)` Return true if the given `x,y,z` position lies within the current subvolume (plus the buffer region if `buffered` is true.

`<logical> inSubvolume1D(<double> x→, <integer> iSubvolume→, <logical> [buffered]→)` Return true if the given `x` position lies within the `iSubvolume`$^{\text{th}}$ subvolume (plus the buffer region if `buffered` is true.

`<logical> isDefault()` Return true if this is the default object of this class.

`<logical> load(<integer(kind_int8,:)> nodeSelfIndices←, <integer(c_size_t,:)> nodeIndexRanks←, <integer(c_size_t,:)> nodeDescendentLocations←, <logical> nodeIncomplete←, <integer(c_size_t)> nodeCountTrees←, <integer(kind_int8,:)> nodeTreeIndices←, <logical> treeIndicesAssigned <logical> branchJumpCheckRequired←, <type(importerUnits)> massUnits←, <type(importerUnits)> lengthUnits←, <type(importerUnits)> velocityUnits←)` Load the halo data.

`logical massesIncludeSubhalos()` Returns a Boolean specifying whether halo masses include the contribution from their subhalos.

`integer(kind=c_size_t) nodeCount(\textcolor{red}{\textless integer\textgreater} i\argin)` Returns the number of nodes in the i^{th} tree.

`type(varying_string) objectType()` Return the type of the object.

`void open(\textcolor{red}{\textless type((varying_string))\textgreater} fileName\argin)` Opens the file.

`logical particleCountAvailable()` Return true if particle counts are available.

`integer positionsArePeriodic()` Returns a Boolean integer specifying whether positions are periodic.

`logical positionsAvailable(\textcolor{red}{\textless logical\textgreater} positions\argin,\textcolor{re logical\textgreater} velocities\argin)` Return true if positions and/or velocities are available.

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

`<void> referenceCountIncrement()` Increment the reference count to this object.

`<void> referenceCountReset()` Reset the reference count to this object to 0.

`logical scaleRadiiAvailable()` Return true if scale radii are available.

`logical spin3DAvailable()` Return true if spin (vectors) are available.

`logical spinAvailable()` Return true if spin (magnitudes) are available.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

`void subhaloTrace(\textcolor{red}{\textless class((nodeData))\textgreater} node\argin,\textcolor{red}{\ double precision\textgreater} time\argout,\textcolor{red}{\textless double precision\textgreater} position\argout,\textcolor{red}{\textless double precision\textgreater} velocity\argout)` Supplies epochs, positions, and velocities for traced subhalos.

`integer(kind=c_size_t) subhaloTraceCount(\textcolor{red}{\textless class((nodeData))\textgreater} node\argin)` Returns the length of a node's subhalo trace.

`integer(kind=c_size_t) treeCount()` Returns a count of the number of trees available.

`integer(kind=kind_int8) treeIndex(\textcolor{red}{\textless integer\textgreater} i\argin)` Returns the index of the $i^{\rm th}$ tree.

`integer treesAreSelfContained()` Returns a Boolean integer specifying whether trees are self-contained.

`integer treesHaveSubhalos()` Returns a Boolean integer specifying whether or not the trees have subhalos.

`double precision treeWeight(\textcolor{red}{\textless integer\textgreater} i\argin)` Returns the weight to assign to the $i^{\rm th}$ tree.

`<logical> valueIsBad(<double> x→)` Return true if the given `x` value is bad.

`integer velocitiesIncludeHubbleFlow()` Returns a Boolean integer specifying whether velocities include the Hubble flow.

`logical velocityDispersionAvailable()` Return true if halo velocity dispersions are available.

`logical velocityMaximumAvailable()` Return true if rotation curve velocity maxima are available.

mergerTreeImporterSussingHDF5

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`logical angularMomenta3DAvailable()` Return true if angular momenta (vectors) are available.

`logical angularMomentaAvailable()` Return true if angular momenta (magnitudes) are available.

`logical angularMomentaIncludeSubhalos()` Returns a Boolean specifying whether halo angular momenta (or spins) include the contribution from their subhalos.

`void autoHook()` Insert any event hooks required by this object.

`logical canReadSubsets()` Returns true if arbitrary subsets of halos from a forest can be read.

`void close()` Closes the file.

`double precision cubeLength(\textcolor{red}{\textless double precision\textgreater} time\argin,\textcol integer\textgreater} status\argout)` Returns the length of the simulation cube.

`void deepCopy(\textcolor{red}{\textless class((mergerTreeImporterClass))\textgreater} destination\argin` Perform a deep copy of the object.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`void import(\textcolor{red}{\textless integer\textgreater} i\argin,\textcolor{red}{\textless class((nodeDataMinimal))\textgreater} nodes\argout,\textcolor{red}{\textless integer((c_-size_t))\textgreater} nodeSubset\argin,\textcolor{red}{\textless logical\textgreater} requireScaleRadii\argin,\textcolor{red}{\textless logical\textgreater} requireAngularMomenta\argin, logical\textgreater} requireAngularMomenta3D\argin,\textcolor{red}{\textless logical\textgreater} requireSpin\argin,\textcolor{red}{\textless logical\textgreater} requireSpin3D\argin,\textcolor{red logical\textgreater} requirePositions\argin,\textcolor{red}{\textless logical\textgreater} structureOnly\argin,\textcolor{red}{\textless type((varying_string))\textgreater} requireNamedReals\argin,\textcolor{red}{\textless type((varying_string))\textgreater} requireNamedIntegers\argin)` Imports the i^{th} tree.

`<logical> inSubvolume(<double> x→, <double> y→, <double> z→, <logical> [buffered]→)` Return true if the given `x,y,z` position lies within the current subvolume (plus the buffer region if `buffered` is true.

`<logical> inSubvolume1D(<double> x→, <integer> iSubvolume→, <logical> [buffered]→)` Return true if the given `x` position lies within the `iSubvolume`$^{\text{th}}$ subvolume (plus the buffer region if `buffered` is true.

`<logical> isDefault()` Return true if this is the default object of this class.

<logical> load(<integer(kind_int8,:)> nodeSelfIndices←, <integer(c_size_t,:)> nodeIndexRanks←, <integer(c_size_t,:)> nodeDescendentLocations←, <logical> nodeIncomplete←, <integer(c_size_t)> nodeCountTrees←, <integer(kind_int8,:)> nodeTreeIndices←, <logical> treeIndicesAssigned←, <logical> branchJumpCheckRequired←, <type(importerUnits)> massUnits←, <type(importerUnits)> lengthUnits←, <type(importerUnits)> velocityUnits←) Load the halo data.

logical massesIncludeSubhalos() Returns a Boolean specifying whether halo masses include the contribution from their subhalos.

integer(kind=c_size_t) nodeCount(\textcolor{red}{\textless integer\textgreater} i\argin) Returns the number of nodes in the $i^{\rm th}$ tree.

type(varying_string) objectType() Return the type of the object.

void open(\textcolor{red}{\textless type((varying_string))\textgreater} fileName\argin) Opens the file.

logical particleCountAvailable() Return true if particle counts are available.

integer positionsArePeriodic() Returns a Boolean integer specifying whether positions are periodic.

logical positionsAvailable(\textcolor{red}{\textless logical\textgreater} positions\argin,\textcolor{red}{\textless logical\textgreater} velocities\argin) Return true if positions and/or velocities are available.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

logical scaleRadiiAvailable() Return true if scale radii are available.

logical spin3DAvailable() Return true if spin (vectors) are available.

logical spinAvailable() Return true if spin (magnitudes) are available.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

void subhaloTrace(\textcolor{red}{\textless class((nodeData))\textgreater} node\argin,\textcolor{red}{\textless double precision\textgreater} time\argout,\textcolor{red}{\textless double precision\textgreater} position\argout,\textcolor{red}{\textless double precision\textgreater} velocity\argout) Supplies epochs, positions, and velocities for traced subhalos.

integer(kind=c_size_t) subhaloTraceCount(\textcolor{red}{\textless class((nodeData))\textgreater} node\argin) Returns the length of a node's subhalo trace.

integer(kind=c_size_t) treeCount() Returns a count of the number of trees available.

integer(kind=kind_int8) treeIndex(\textcolor{red}{\textless integer\textgreater} i\argin) Returns the index of the i^{th} tree.

integer treesAreSelfContained() Returns a Boolean integer specifying whether trees are self-contained.

integer treesHaveSubhalos() Returns a Boolean integer specifying whether or not the trees have subhalos.

double precision treeWeight(\textcolor{red}{\textless integer\textgreater} i\argin) Returns the weight to assign to the i^{th} tree.

<logical> valueIsBad(<double> x→) Return true if the given x value is bad.

integer velocitiesIncludeHubbleFlow() Returns a Boolean integer specifying whether velocities include the Hubble flow.

logical velocityDispersionAvailable() Return true if halo velocity dispersions are available.

logical velocityMaximumAvailable() Return true if rotation curve velocity maxima are available.

mergerTreeMassResolutionClass

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\
character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((mergerTreeMassResolutionClass))\textgreater} destination\arginout) Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex
logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges
Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

double precision resolution(\textcolor{red}{\textless type((mergerTree))\textgreater} tree\argin) Gives the mass resolution to use for the given tree.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl
type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-
size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles
type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-
size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

mergerTreeMassResolutionFixed

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\
character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((mergerTreeMassResolutionClass))\textgreater}
destination\arginout) Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex
logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges
Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

double precision resolution(\textcolor{red}{\textless type((mergerTree))\textgreater} tree\argin)
Gives the mass resolution to use for the given tree.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl
type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-
size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles
type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-
size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

mergerTreeMassResolutionScaled

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\
character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((mergerTreeMassResolutionClass))\textgreater}
destination\arginout) Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex
logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges
Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

double precision resolution(\textcolor{red}{\textless type((mergerTree))\textgreater} tree\argin)
Gives the mass resolution to use for the given tree.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl
type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-
size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles
type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-
size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

mergerTreeNodeEvolverClass

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\
character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((mergerTreeNodeEvolverClass))\textgreater}
destination\arginout) Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex
logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

void evolve(\textcolor{red}{\textless type((mergerTree))\textgreater} tree \arginout,\textcolor{red}{\
type((treeNode))\textgreater} node \arginout,\textcolor{red}{\textless double precision\textgreate
timeEnd \argin,\textcolor{red}{\textless logical\textgreater} interrupted \argout,\textcolor{red}{\
procedure((interruptTask))\textgreater} functionInterrupt \argout,\textcolor{red}{\textless
class((galacticStructureSolverClass))\textgreater} galacticStructureSolver__\argin,\textcolor{red}{
integer((kind_int8))\textgreater} systemClockMaximum \argin,\textcolor{red}{\textless
integer\textgreater} status \argout) Evolve a node merger tree.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges
Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

logical isAccurate(\textcolor{red}{\textless double precision\textgreater} valueNode\argin,\textcolor{r
double precision\textgreater} valueExpected\argin) Return true if a tree node property is within expected accuracy of a given value.

<logical> isDefault() Return true if this is the default object of this class.

void merge(\textcolor{red}{\textless type((treeNode))\textgreater} node\arginout) Handles instances where node is about to merge with its parent node.

type(varying_string) objectType() Return the type of the object.

void promote(\textcolor{red}{\textless type((treeNode))\textgreater} node\arginout) Promote node to its parent node, then destroy it.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

mergerTreeNodeEvolverStandard

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((mergerTreeNodeEvolverClass))\textgreater} destination\arginout) Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

void evolve(\textcolor{red}{\textless type((mergerTree))\textgreater} tree \arginout,\textcolor{red}{\ type((treeNode))\textgreater} node \arginout,\textcolor{red}{\textless double precision\textgreate timeEnd \argin,\textcolor{red}{\textless logical\textgreater} interrupted \argout,\textcolor{red}{\ procedure((interruptTask))\textgreater} functionInterrupt \argout,\textcolor{red}{\textless class((galacticStructureSolverClass))\textgreater} galacticStructureSolver__\argin,\textcolor{red}{ integer((kind_int8))\textgreater} systemClockMaximum \argin,\textcolor{red}{\textless integer\textgreater} status \argout) Evolve a node merger tree.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

logical isAccurate(\textcolor{red}{\textless double precision\textgreater} valueNode\argin,\textcolor{r double precision\textgreater} valueExpected\argin) Return true if a tree node property is within expected accuracy of a given value.

<logical> isDefault() Return true if this is the default object of this class.

void merge(\textcolor{red}{\textless type((treeNode))\textgreater} node\arginout) Handles instances where node is about to merge with its parent node.

type(varying_string) objectType() Return the type of the object.

void promote(\textcolor{red}{\textless type((treeNode))\textgreater} node\arginout) Promote node to its parent node, then destroy it.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

mergerTreeNodeMergerClass

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((mergerTreeNodeMergerClass))\textgreater} destination\arginout) Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

void process(\textcolor{red}{\textless type((treeNode))\textgreater} node\arginout) Process the merger between node and its parent node, then destroy it.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

mergerTreeNodeMergerSingleLevelHierarchy

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((mergerTreeNodeMergerClass))\textgreater} destination\arginout) Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

void process(\textcolor{red}{\textless type((treeNode))\textgreater} node\arginout) Process the merger between node and its parent node, then destroy it.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

mergerTreeOperatorAssignOrbits

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

`void deepCopy(\textcolor{red}{\textless class((mergerTreeOperatorClass))\textgreater} destination\argin` Perform a deep copy of the object.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`void finalize()` Finalize a merger tree operator.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

`type(varying_string) objectType()` Return the type of the object.

`void operate(\textcolor{red}{\textless type((mergerTree))\textgreater} tree\arginout)` Perform an operation on the merger tree.

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

`<void> referenceCountIncrement()` Increment the reference count to this object.

`<void> referenceCountReset()` Reset the reference count to this object to 0.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

mergerTreeOperatorAugment

`<integer> acceptTree(<type(treeNode)> *node↔,<type(mergerTree)> tree↔,<integer>nodeChildCount↔,<logi treeBest↔,<double>treeBestWorstFit↔,<logical>treeBestOverride→,<double>massCutoffScale↔,<logica newTreeBest↔)` Determine if a newly built tree is an acceptable match.

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void autoHook()` Insert any event hooks required by this object.

`<integer> buildTreeFromNode(<type(treeNode)> *node↔,<logical>extendingEndNode→,<double>tolerance→,<d treeBest↔,<double>treeBestWorstFit↔,<logical>treeBestOverride→,<double>massCutoffScale↔,<double` Build a merger tree starting from the given node.

`void deepCopy(\textcolor{red}{\textless class((mergerTreeOperatorClass))\textgreater} destination\argin` Perform a deep copy of the object.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

<void> extendNonOverlapNodes(<type(mergerTree)> tree↔,<type(treeNode)> *nodeNonOverlapFirst↔,<double> treeBest↔,<double>massCutoffScale↔) Graft new branches onto all end-nodes of a newly built tree.

void finalize() Finalize a merger tree operator.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

<void> nonOverlapReinsert(<type(treeNode)> *listFirstElement↔) Reinsert a linked list of non-overlap nodes into their parent tree.

type(varying_string) objectType() Return the type of the object.

void operate(\textcolor{red}{\textless type((mergerTree))\textgreater} tree\arginout) Perform an operation on the merger tree.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

<void> sortChildren(<type(treeNode)> *node↔) Sort child nodes into descending mass order.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

mergerTreeOperatorClass

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((mergerTreeOperatorClass))\textgreater} destination\argin Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

void finalize() Finalize a merger tree operator.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

void operate(\textcolor{red}{\textless type((mergerTree))\textgreater} tree\arginout) Perform an operation on the merger tree.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

mergerTreeOperatorConditionalMF

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

<double(:)> binWeights(<double> mass→,<double> time→,<double> massLogarithmicMinimumBins→,<double> massLogarithmicWidthInverseBins→,<integer> countBins→) Compute weights for a halo in each bin of the mass function.

<double(:,:)> binWeights2D(<double> mass1→,<double> time1→,<double> mass2→,<double> time2→,<double> massLogarithmicMinimumBins1→,<double> massLogarithmicWidthInverseBins1→,<integer> countBins2→,<double> massLogarithmicMinimumBins2→,<double> massLogarithmicWidthInverseBins2→,<in countBins2→) Compute weights for a halo in each bin of a 2D mass function.

void deepCopy(\textcolor{red}{\textless class((mergerTreeOperatorClass))\textgreater} destination\argin Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

void finalize() Finalize a merger tree operator.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

`void operate(\textcolor{red}{\textless type((mergerTree))\textgreater} tree\arginout)` Perform an operation on the merger tree.

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

`<void> referenceCountIncrement()` Increment the reference count to this object.

`<void> referenceCountReset()` Reset the reference count to this object to 0.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

mergerTreeOperatorDeforest

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void autoHook()` Insert any event hooks required by this object.

`void deepCopy(\textcolor{red}{\textless class((mergerTreeOperatorClass))\textgreater} destination\argin` Perform a deep copy of the object.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`void finalize()` Finalize a merger tree operator.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

`type(varying_string) objectType()` Return the type of the object.

`void operate(\textcolor{red}{\textless type((mergerTree))\textgreater} tree\arginout)` Perform an operation on the merger tree.

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

`<void> referenceCountIncrement()` Increment the reference count to this object.

`<void> referenceCountReset()` Reset the reference count to this object to 0.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

mergerTreeOperatorDumpToGraphViz

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void autoHook()` Insert any event hooks required by this object.

`void deepCopy(\textcolor{red}{\textless class((mergerTreeOperatorClass))\textgreater} destination\argin` Perform a deep copy of the object.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`void finalize()` Finalize a merger tree operator.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

`type(varying_string) objectType()` Return the type of the object.

`void operate(\textcolor{red}{\textless type((mergerTree))\textgreater} tree\arginout)` Perform an operation on the merger tree.

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

`<void> referenceCountIncrement()` Increment the reference count to this object.

`<void> referenceCountReset()` Reset the reference count to this object to 0.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

mergerTreeOperatorExport

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void autoHook()` Insert any event hooks required by this object.

`void deepCopy(\textcolor{red}{\textless class((mergerTreeOperatorClass))\textgreater} destination\argin` Perform a deep copy of the object.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`void finalize()` Finalize a merger tree operator.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

`type(varying_string) objectType()` Return the type of the object.

`void operate(\textcolor{red}{\textless type((mergerTree))\textgreater} tree\arginout)` Perform an operation on the merger tree.

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

`<void> referenceCountIncrement()` Increment the reference count to this object.

`<void> referenceCountReset()` Reset the reference count to this object to 0.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

mergerTreeOperatorInformationContent

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`<logical> isDefault()` Return true if this is the default object of this class.

`type(varying_string) objectType()` Return the type of the object.

`void operate(\textcolor{red}{\textless type((mergerTree))\textgreater} tree\arginout)` Perform an operation on the merger tree.

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

`<void> referenceCountIncrement()` Increment the reference count to this object.

`<void> referenceCountReset()` Reset the reference count to this object to 0.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

mergerTreeOperatorPruneClones

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void autoHook()` Insert any event hooks required by this object.

`void deepCopy(\textcolor{red}{\textless class((mergerTreeOperatorClass))\textgreater} destination\argi` Perform a deep copy of the object.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`void finalize()` Finalize a merger tree operator.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

`type(varying_string) objectType()` Return the type of the object.

`void operate(\textcolor{red}{\textless type((mergerTree))\textgreater} tree\arginout)` Perform an operation on the merger tree.

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

mergerTreeOperatorPruneHierarchy

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((mergerTreeOperatorClass))\textgreater} destination\argin Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

void finalize() Finalize a merger tree operator.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

void operate(\textcolor{red}{\textless type((mergerTree))\textgreater} tree\arginout) Perform an operation on the merger tree.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

mergerTreeOperatorPruneLightcone

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\
character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((mergerTreeOperatorClass))\textgreater} destination\argin
Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex
logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

void finalize() Finalize a merger tree operator.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges
Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

void operate(\textcolor{red}{\textless type((mergerTree))\textgreater} tree\arginout) Perform an operation on the merger tree.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl
type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-
size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles
type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-
size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

mergerTreeOperatorPruneNonEssential

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\
character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((mergerTreeOperatorClass))\textgreater} destination\argin
Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex
logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

`void finalize()` Finalize a merger tree operator.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

`type(varying_string) objectType()` Return the type of the object.

`void operate(\textcolor{red}{\textless type((mergerTree))\textgreater} tree\arginout)` Perform an operation on the merger tree.

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

`<void> referenceCountIncrement()` Increment the reference count to this object.

`<void> referenceCountReset()` Reset the reference count to this object to 0.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

mergerTreeOperatorRegridTimes

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void autoHook()` Insert any event hooks required by this object.

`void deepCopy(\textcolor{red}{\textless class((mergerTreeOperatorClass))\textgreater} destination\argi` Perform a deep copy of the object.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`void finalize()` Finalize a merger tree operator.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

`type(varying_string) objectType()` Return the type of the object.

`void operate(\textcolor{red}{\textless type((mergerTree))\textgreater} tree\arginout)` Perform an operation on the merger tree.

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

mergerTreeOperatorSelectWithinRange

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((mergerTreeOperatorClass))\textgreater} destination\argin Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

void finalize() Finalize a merger tree operator.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

void operate(\textcolor{red}{\textless type((mergerTree))\textgreater} tree\arginout) Perform an operation on the merger tree.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

mergerTreeOperatorSequence

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((mergerTreeOperatorClass))\textgreater} destination\argin Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

void finalize() Finalize a merger tree operator.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

void operate(\textcolor{red}{\textless type((mergerTree))\textgreater} tree\arginout) Perform an operation on the merger tree.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

mergerTreeOutputterAnalyzer

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((mergerTreeOutputterClass))\textgreater} destination\arginout) Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

`void finalize()` Finalize output of merger trees.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges`
Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

`type(varying_string) objectType()` Return the type of the object.

`void output(\textcolor{red}{\textless type((mergerTree))\textgreater} tree \arginout,\textcolor{red}{\t`
`integer((c_size_t ))\textgreater} indexOutput \argin,\textcolor{red}{\textless double`
`precision\textgreater} time \argin,\textcolor{red}{\textless logical\textgreater} isLastOutput\argi`
Output a merger tree.

`void reduce(\textcolor{red}{\textless class((mergerTreeOutputterClass))\textgreater} reduced\arginout)`
Reduce the object onto another object of the class.

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

`<void> referenceCountIncrement()` Increment the reference count to this object.

`<void> referenceCountReset()` Reset the reference count to this object to 0.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl`
`type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-`
`size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles`
`type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-`
`size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

mergerTreeOutputterClass

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\`
`character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void autoHook()` Insert any event hooks required by this object.

`void deepCopy(\textcolor{red}{\textless class((mergerTreeOutputterClass))\textgreater}`
`destination\arginout)` Perform a deep copy of the object.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex`
`logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`void finalize()` Finalize output of merger trees.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges`
Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

`type(varying_string) objectType()` Return the type of the object.

`void output(\textcolor{red}{\textless type((mergerTree))\textgreater} tree \arginout,\textcolor{red}{\t integer((c_size_t ))\textgreater} indexOutput \argin,\textcolor{red}{\textless double precision\textgreater} time \argin,\textcolor{red}{\textless logical\textgreater} isLastOutput\argi` Output a merger tree.

`void reduce(\textcolor{red}{\textless class((mergerTreeOutputterClass))\textgreater} reduced\arginout)` Reduce the object onto another object of the class.

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

`<void> referenceCountIncrement()` Increment the reference count to this object.

`<void> referenceCountReset()` Reset the reference count to this object to 0.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

mergerTreeOutputterMulti

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void autoHook()` Insert any event hooks required by this object.

`void deepCopy(\textcolor{red}{\textless class((mergerTreeOutputterClass))\textgreater} destination\arginout)` Perform a deep copy of the object.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`void finalize()` Finalize output of merger trees.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

`type(varying_string) objectType()` Return the type of the object.

`void output(\textcolor{red}{\textless type((mergerTree))\textgreater} tree \arginout,\textcolor{red}{\t integer((c_size_t ))\textgreater} indexOutput \argin,\textcolor{red}{\textless double precision\textgreater} time \argin,\textcolor{red}{\textless logical\textgreater} isLastOutput\argi` Output a merger tree.

`void reduce(\textcolor{red}{\textless class((mergerTreeOutputterClass))\textgreater} reduced\arginout)` Reduce the object onto another object of the class.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

mergerTreeOutputterNull

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((mergerTreeOutputterClass))\textgreater} destination\arginout) Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

void finalize() Finalize output of merger trees.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

void output(\textcolor{red}{\textless type((mergerTree))\textgreater} tree \arginout,\textcolor{red}{\t integer((c_size_t))\textgreater} indexOutput \argin,\textcolor{red}{\textless double precision\textgreater} time \argin,\textcolor{red}{\textless logical\textgreater} isLastOutput\argi Output a merger tree.

void reduce(\textcolor{red}{\textless class((mergerTreeOutputterClass))\textgreater} reduced\arginout) Reduce the object onto another object of the class.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

mergerTreeOutputterStandard

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void buffersAllocate(<integer(c_size_t)> indexOutput→) Allocate buffers for storage of properties.

void deepCopy(\textcolor{red}{\textless class((mergerTreeOutputterClass))\textgreater} destination\arginout) Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

void dumpDoubleBuffer(<integer(c_size_t)> indexOutput→) Dump the contents of the double properties buffer to the Galacticus output file.

void dumpIntegerBuffer(<integer(c_size_t)> indexOutput→) Dump the contents of the integer properties buffer to the Galacticus output file.

void extendDoubleBuffer() Extend the size of the double buffer.

void extendIntegerBuffer() Extend the size of the integer buffer.

void finalize() Finalize output of merger trees.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

void makeGroup(<type(mergerTree)> tree↔, <integer(c_size_t)> indexOutput→) Make an group in the Galacticus file in which to store tree.

type(varying_string) objectType() Return the type of the object.

void output(\textcolor{red}{\textless type((mergerTree))\textgreater} tree \arginout,\textcolor{red}{\t integer((c_size_t))\textgreater} indexOutput \argin,\textcolor{red}{\textless double precision\textgreater} time \argin,\textcolor{red}{\textless logical\textgreater} isLastOutput\argi Output a merger tree.

void outputGroupCreate(<integer(c_size_t)> indexOutput→, <double> time→) Create a group in which to store this output.

void propertiesCount(<double> time→, <type(treeNode)> *node↔) Count up the number of properties that will be output.

`void propertyNamesEstablish(<double> time→, <type(treeNode)> *node↔)` Set names for the properties.

`void reduce(\textcolor{red}{\textless class((mergerTreeOutputterClass))\textgreater} reduced\arginout)` Reduce the object onto another object of the class.

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

`<void> referenceCountIncrement()` Increment the reference count to this object.

`<void> referenceCountReset()` Reset the reference count to this object to 0.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

mergerTreeWalkerAllAndFormationNodes

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void autoHook()` Insert any event hooks required by this object.

`void deepCopy(\textcolor{red}{\textless class((mergerTreeWalkerClass))\textgreater} destination\arginou` Perform a deep copy of the object.

`<void> descend()` Descend through the hierarchy to the deepest node along the current branch.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

`logical next(\textcolor{red}{\textless type((treeNode))\textgreater} node\arginout)` Update the pointer to the next node to visit. Returns true if such a node exists, returns false if no such node exists (i.e. if all nodes have been visited already).

`logical nodesRemain()` Returns true if more nodes remain to be walked to in the tree.

`type(varying_string) objectType()` Return the type of the object.

`<void> previous(<type(treeNode)> *node↔)` Step back to the previously visited node (if possible).

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

<void> setNode(<type(treeNode)> node→) Set the walker to the given node.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

mergerTreeWalkerAllNodes

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((mergerTreeWalkerClass))\textgreater} destination\arginou Perform a deep copy of the object.

<void> descend() Descend through the hierarchy to the deepest node along the current branch.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

logical next(\textcolor{red}{\textless type((treeNode))\textgreater} node\arginout) Update the pointer to the next node to visit. Returns true if such a node exists, returns false if no such node exists (i.e. if all nodes have been visited already).

logical nodesRemain() Returns true if more nodes remain to be walked to in the tree.

type(varying_string) objectType() Return the type of the object.

<void> previous(<type(treeNode)> *node↔) Step back to the previously visited node (if possible).

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

<void> setNode(<type(treeNode)> node→) Set the walker to the given node.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

mergerTreeWalkerAllNodesBranch

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((mergerTreeWalkerClass))\textgreater} destination\arginou Perform a deep copy of the object.

<void> descend() Descend through the hierarchy to the deepest node along the current branch.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

logical next(\textcolor{red}{\textless type((treeNode))\textgreater} node\arginout) Update the pointer to the next node to visit. Returns true if such a node exists, returns false if no such node exists (i.e. if all nodes have been visited already).

logical nodesRemain() Returns true if more nodes remain to be walked to in the tree.

type(varying_string) objectType() Return the type of the object.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

mergerTreeWalkerClass

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((mergerTreeWalkerClass))\textgreater} destination\arginou Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

logical next(\textcolor{red}{\textless type((treeNode))\textgreater} node\arginout) Update the pointer to the next node to visit. Returns true if such a node exists, returns false if no such node exists (i.e. if all nodes have been visited already).

logical nodesRemain() Returns true if more nodes remain to be walked to in the tree.

type(varying_string) objectType() Return the type of the object.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

mergerTreeWalkerIsolatedNodes

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((mergerTreeWalkerClass))\textgreater} destination\arginou Perform a deep copy of the object.

<void> descend() Descend through the hierarchy to the deepest node along the current branch.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

`logical next(\textcolor{red}{\textless type((treeNode))\textgreater} node\arginout)` Update the pointer to the next node to visit. Returns true if such a node exists, returns false if no such node exists (i.e. if all nodes have been visited already).

`logical nodesRemain()` Returns true if more nodes remain to be walked to in the tree.

`type(varying_string) objectType()` Return the type of the object.

`<void> previous(<type(treeNode)> *node↔)` Step back to the previously visited node (if possible).

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

`<void> referenceCountIncrement()` Increment the reference count to this object.

`<void> referenceCountReset()` Reset the reference count to this object to 0.

`<void> setNode(<type(treeNode)> node→)` Set the walker to the given node.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

mergerTreeWalkerIsolatedNodesBranch

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void autoHook()` Insert any event hooks required by this object.

`void deepCopy(\textcolor{red}{\textless class((mergerTreeWalkerClass))\textgreater} destination\arginou` Perform a deep copy of the object.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

logical next(\textcolor{red}{\textless type((treeNode))\textgreater} node\arginout) Update the pointer to the next node to visit. Returns true if such a node exists, returns false if no such node exists (i.e. if all nodes have been visited already).

logical nodesRemain() Returns true if more nodes remain to be walked to in the tree.

type(varying_string) objectType() Return the type of the object.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

mergerTreeWalkerTreeConstruction

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((mergerTreeWalkerClass))\textgreater} destination\arginou Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

logical next(\textcolor{red}{\textless type((treeNode))\textgreater} node\arginout) Update the pointer to the next node to visit. Returns true if such a node exists, returns false if no such node exists (i.e. if all nodes have been visited already).

logical nodesRemain() Returns true if more nodes remain to be walked to in the tree.

type(varying_string) objectType() Return the type of the object.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

metaTreeProcessingTimeClass

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((metaTreeProcessingTimeClass))\textgreater} destination\arginout) Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

double precision time(\textcolor{red}{\textless double precision\textgreater} massTree\argin) Return an estimate of the time needed to process a tree of the given mass.

metaTreeProcessingTimeFile

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\
character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((metaTreeProcessingTimeClass))\textgreater} destination\arginout) Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex
logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges
Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl
type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-
size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles
type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-
size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

double precision time(\textcolor{red}{\textless double precision\textgreater} massTree\argin)
Return an estimate of the time needed to process a tree of the given mass.

modelParameterActive

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\
character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((modelParameterClass))\textgreater} destination\arginout)
Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex
logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges
Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

double precision logPrior(\textcolor{red}{\textless double precision\textgreater} x\argin)
Return the log-prior for this parameter.

double precision map(\textcolor{red}{\textless double precision\textgreater} x\argin) Map the parameter value.

type(varying_string) name() Return the name of this parameter.

type(varying_string) objectType() Return the type of the object.

double precision priorInvert(\textcolor{red}{\textless double precision\textgreater} f\argin)
Invert the prior, returning the parameter value given the cumulative probability.

double precision priorMaximum() Return the maximum non-zero value of the prior for this parameter.

double precision priorMinimum() Return the minimum non-zero value of the prior for this parameter.

double precision priorSample() Sample from the parameter's prior.

double precision randomPerturbation() Return a random perturbation for this parameter.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl
type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-
size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles
type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-
size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

double precision unmap(\textcolor{red}{\textless double precision\textgreater} x\argin)
Unmap the parameter value.

modelParameterClass

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\
character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((modelParameterClass))\textgreater} destination\arginout)
Perform a deep copy of the object.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

`double precision logPrior(\textcolor{red}{\textless double precision\textgreater} x\argin)` Return the log-prior for this parameter.

`double precision map(\textcolor{red}{\textless double precision\textgreater} x\argin)` Map the parameter value.

`type(varying_string) name()` Return the name of this parameter.

`type(varying_string) objectType()` Return the type of the object.

`double precision priorInvert(\textcolor{red}{\textless double precision\textgreater} f\argin)` Invert the prior, returning the parameter value given the cumulative probability.

`double precision priorMaximum()` Return the maximum non-zero value of the prior for this parameter.

`double precision priorMinimum()` Return the minimum non-zero value of the prior for this parameter.

`double precision priorSample()` Sample from the parameter's prior.

`double precision randomPerturbation()` Return a random perturbation for this parameter.

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

`<void> referenceCountIncrement()` Increment the reference count to this object.

`<void> referenceCountReset()` Reset the reference count to this object to 0.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

`double precision unmap(\textcolor{red}{\textless double precision\textgreater} x\argin)` Unmap the parameter value.

modelParameterDerived

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\
character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((modelParameterClass))\textgreater} destination\arginout)
Perform a deep copy of the object.

<type(varying_string)> definition() Return the definition for this parameter.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex
logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges
Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

double precision logPrior(\textcolor{red}{\textless double precision\textgreater} x\argin)
Return the log-prior for this parameter.

double precision map(\textcolor{red}{\textless double precision\textgreater} x\argin) Map the parameter value.

type(varying_string) name() Return the name of this parameter.

type(varying_string) objectType() Return the type of the object.

double precision priorInvert(\textcolor{red}{\textless double precision\textgreater} f\argin)
Invert the prior, returning the parameter value given the cumulative probability.

double precision priorMaximum() Return the maximum non-zero value of the prior for this parameter.

double precision priorMinimum() Return the minimum non-zero value of the prior for this parameter.

double precision priorSample() Sample from the parameter's prior.

double precision randomPerturbation() Return a random perturbation for this parameter.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl
type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-
size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

`double precision unmap(\textcolor{red}{\textless double precision\textgreater} x\argin)` Unmap the parameter value.

modelParameterInactive

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void autoHook()` Insert any event hooks required by this object.

`void deepCopy(\textcolor{red}{\textless class((modelParameterClass))\textgreater} destination\arginout)` Perform a deep copy of the object.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

`double precision logPrior(\textcolor{red}{\textless double precision\textgreater} x\argin)` Return the log-prior for this parameter.

`double precision map(\textcolor{red}{\textless double precision\textgreater} x\argin)` Map the parameter value.

`type(varying_string) name()` Return the name of this parameter.

`type(varying_string) objectType()` Return the type of the object.

`double precision priorInvert(\textcolor{red}{\textless double precision\textgreater} f\argin)` Invert the prior, returning the parameter value given the cumulative probability.

`double precision priorMaximum()` Return the maximum non-zero value of the prior for this parameter.

`double precision priorMinimum()` Return the minimum non-zero value of the prior for this parameter.

`double precision priorSample()` Sample from the parameter's prior.

`double precision randomPerturbation()` Return a random perturbation for this parameter.

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

`<void> referenceCountIncrement()` Increment the reference count to this object.

`<void> referenceCountReset()` Reset the reference count to this object to 0.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

`double precision unmap(\textcolor{red}{\textless double precision\textgreater} x\argin)` Unmap the parameter value.

mpiCounter

`<integer(c_size_t)> get()` Get the current value of the counter.

`<integer(c_size_t)> increment()` Increment the counter and return the new value.

mpiObject

`<logical> all(<logical> scalar→, <logical> [mask]→)` Return true if every `scalar` is true over all processes.

`<logical> any(<logical> scalar→, <logical> [mask]→)` Return true if any of `scalar` is true over all processes.

`<double(:)> average(<double(:)>array→)` Return the average of `array` over all processes.

`<integer> count()` Return the total number of processes.

`(<double(:)>|<double(:,:)>|<double(:,:,:)>|<integer(:,:)>) gather((<double>|<double(:)>|<double(:,:)>|< array→)` Gather arrays from all processes into an array of rank one higher.

`<type(varying_string)> hostAffinity()` Return the name of the host on which this MPI process is running.

`<logical> isActive()` Return true if MPI is active.

`<logical> isMaster()` Return true if this is the master process (i.e. rank-0 process).

`<integer(:)> maxloc(<double(:)>array→)` Return the rank of the process with the maximum value of `array` over all processes.

`<double(:)> maxval((<double>|<double(:)>) array→)` Return the maximum value of `array` over all processes.

`<integer(:)> median(<integer(:)>array→)` Return the median of `array` over all processes.

`<logical> messageWaiting(<integer> [from]→, <integer> [tag]→)` Return true if a message is waiting, optionally from the specified process and with the specified tag.

`<integer(:)> minloc(<double(:)>array→)` Return the rank of the process with the minimum value of `array` over all processes.

`<double>|<double(:)>|<integer>|<integer(:)> minval((<double>|<double(:)>|<integer>|<integer(:)>) array→)` Return the minimum value of `array` over all processes.

<integer> nodeAffinity(<integer> [rank]→) Return the index of the node on which the MPI process of the given rank (or this process if no rank is given) is running.

<integer> nodeCount() Return the number of nodes on which this MPI job is running.

<integer> rank() Return the rank of this process.

<type(varying_string)> rankLabel() Return a label containing the rank of the process.

<double(:,:)>|<integer(:,:)>|<logical(:,:)> requestData(<integer(:)>requestFrom→, <double(:)>|<integer
Request the content of array from each processes listed in requestFrom.

<integer>|<integer(:)> sum((<integer>|<integer(:)>|<double>|<double(:)>|<double(:,:)>) array→) Return the sum of array over all processes.

multiCounter

<void> append(<integer> range→) Append a new counter to the multi-counter, with the specified range.

<integer> count() Return the number of counters configured in this multi-counter.

<logical> increment() Increment the state of the multi-counter. Return .false. if incrementing was not possible (i.e. counter was in the final state), .true. otherwise.

<logical> isFinal() Return .true. if the counter is in its final state, .false. otherwise.

<void> reset() Reset the multi-counter back to its initial count state, such that the next increment will return the first count.

<integer> state(<integer> i→) Return the state of the i^{th} counter.

nbodyHaloMassErrorClass

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\
character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

double precision correlation(\textcolor{red}{\textless type((treeNode))\textgreater} node1\arginout,\te
type((treeNode))\textgreater} node2\arginout) Return the correlation in the error on the mass of a pair of N-body halos corresponding to the given node1 and node2.

void deepCopy(\textcolor{red}{\textless class((nbodyHaloMassErrorClass))\textgreater} destination\argin
Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\te
logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

double precision errorFractional(\textcolor{red}{\textless type((treeNode))\textgreater}
node\arginout) Return the fractional error on the mass of an N-body halo corresponding to the given node.

logical errorZeroAlways() Return true if the mass error is always zero for any halo.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges
Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl
type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-
size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles
type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-
size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

nbodyHaloMassErrorFriendsOfFriends

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\
character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

double precision correlation(\textcolor{red}{\textless type((treeNode))\textgreater} node1\arginout,\te
type((treeNode))\textgreater} node2\arginout) Return the correlation in the error on the mass of a pair of N-body halos corresponding to the given node1 and node2.

void deepCopy(\textcolor{red}{\textless class((nbodyHaloMassErrorClass))\textgreater} destination\argin
Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex
logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

double precision errorFractional(\textcolor{red}{\textless type((treeNode))\textgreater}
node\arginout) Return the fractional error on the mass of an N-body halo corresponding to the given node.

logical errorZeroAlways() Return true if the mass error is always zero for any halo.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges
Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

nbodyHaloMassErrorNull

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

double precision correlation(\textcolor{red}{\textless type((treeNode))\textgreater} node1\arginout,\te type((treeNode))\textgreater} node2\arginout) Return the correlation in the error on the mass of a pair of N-body halos corresponding to the given node1 and node2.

void deepCopy(\textcolor{red}{\textless class((nbodyHaloMassErrorClass))\textgreater} destination\argin Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

double precision errorFractional(\textcolor{red}{\textless type((treeNode))\textgreater} node\arginout) Return the fractional error on the mass of an N-body halo corresponding to the given node.

logical errorZeroAlways() Return true if the mass error is always zero for any halo.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

nbodyHaloMassErrorPowerLaw

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void autoHook()` Insert any event hooks required by this object.

`double precision correlation(\textcolor{red}{\textless type((treeNode))\textgreater} node1\arginout,\te type((treeNode))\textgreater} node2\arginout)` Return the correlation in the error on the mass of a pair of N-body halos corresponding to the given `node1` and `node2`.

`void deepCopy(\textcolor{red}{\textless class((nbodyHaloMassErrorClass))\textgreater} destination\argin` Perform a deep copy of the object.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`double precision errorFractional(\textcolor{red}{\textless type((treeNode))\textgreater} node\arginout)` Return the fractional error on the mass of an N-body halo corresponding to the given `node`.

`logical errorZeroAlways()` Return `true` if the mass error is always zero for any halo.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

`type(varying_string) objectType()` Return the type of the object.

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

`<void> referenceCountIncrement()` Increment the reference count to this object.

`<void> referenceCountReset()` Reset the reference count to this object to 0.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

nbodyHaloMassErrorSOHaloFinder

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void autoHook()` Insert any event hooks required by this object.

double precision correlation(\textcolor{red}{\textless type((treeNode))\textgreater} node1\arginout,\te type((treeNode))\textgreater} node2\arginout) Return the correlation in the error on the mass of a pair of N-body halos corresponding to the given node1 and node2.

void deepCopy(\textcolor{red}{\textless class((nbodyHaloMassErrorClass))\textgreater} destination\argin Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

double precision errorFractional(\textcolor{red}{\textless type((treeNode))\textgreater} node\arginout) Return the fractional error on the mass of an N-body halo corresponding to the given node.

logical errorZeroAlways() Return true if the mass error is always zero for any halo.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

nbodyHaloMassErrorTrenti2010

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

double precision correlation(\textcolor{red}{\textless type((treeNode))\textgreater} node1\arginout,\te type((treeNode))\textgreater} node2\arginout) Return the correlation in the error on the mass of a pair of N-body halos corresponding to the given node1 and node2.

void deepCopy(\textcolor{red}{\textless class((nbodyHaloMassErrorClass))\textgreater} destination\argin Perform a deep copy of the object.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`double precision errorFractional(\textcolor{red}{\textless type((treeNode))\textgreater} node\arginout)` Return the fractional error on the mass of an N-body halo corresponding to the given `node`.

`logical errorZeroAlways()` Return `true` if the mass error is always zero for any halo.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

`type(varying_string) objectType()` Return the type of the object.

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

`<void> referenceCountIncrement()` Increment the reference count to this object.

`<void> referenceCountReset()` Reset the reference count to this object to 0.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

nbodyImporterClass

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void autoHook()` Insert any event hooks required by this object.

`void deepCopy(\textcolor{red}{\textless class((nbodyImporterClass))\textgreater} destination\arginout)` Perform a deep copy of the object.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`type(nBodyData) import(\textcolor{red}{\textless character((len=*))\textgreater} fileName\argin,\textcc character((len=*))\textgreater} fileNamePrevious\argin)` Import position and velocity data from the named N-body data file.

`<logical> isDefault()` Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

nbodyImporterGadgetBinary

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((nbodyImporterClass))\textgreater} destination\arginout) Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

type(nBodyData) import(\textcolor{red}{\textless character((len=*))\textgreater} fileName\argin,\textcc character((len=*))\textgreater} fileNamePrevious\argin) Import position and velocity data from the named N-body data file.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

nbodyImporterGadgetHDF5

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void autoHook()` Insert any event hooks required by this object.

`void deepCopy(\textcolor{red}{\textless class((nbodyImporterClass))\textgreater} destination\arginout)` Perform a deep copy of the object.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`type(nBodyData) import(\textcolor{red}{\textless character((len=*))\textgreater} fileName\argin,\textco character((len=*))\textgreater} fileNamePrevious\argin)` Import position and velocity data from the named N-body data file.

`<logical> isDefault()` Return true if this is the default object of this class.

`type(varying_string) objectType()` Return the type of the object.

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

`<void> referenceCountIncrement()` Increment the reference count to this object.

`<void> referenceCountReset()` Reset the reference count to this object to 0.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

nbodyOperatorClass

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void autoHook()` Insert any event hooks required by this object.

`void deepCopy(\textcolor{red}{\textless class((nbodyOperatorClass))\textgreater} destination\arginout)` Perform a deep copy of the object.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges
Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

void operate(\textcolor{red}{\textless type((nBodyData))\textgreater} simulation\arginout)
Operate on the provided N-body simulation.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl
type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-
size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles
type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-
size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

nbodyOperatorEnvironmentalOverdensity

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\
character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((nbodyOperatorClass))\textgreater} destination\arginout)
Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex
logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges
Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

void operate(\textcolor{red}{\textless type((nBodyData))\textgreater} simulation\arginout)
Operate on the provided N-body simulation.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

nbodyOperatorMeanPosition

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void autoHook()` Insert any event hooks required by this object.

`void deepCopy(\textcolor{red}{\textless class((nbodyOperatorClass))\textgreater} destination\arginout)` Perform a deep copy of the object.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

`type(varying_string) objectType()` Return the type of the object.

`void operate(\textcolor{red}{\textless type((nBodyData))\textgreater} simulation\arginout)` Operate on the provided N-body simulation.

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

`<void> referenceCountIncrement()` Increment the reference count to this object.

`<void> referenceCountReset()` Reset the reference count to this object to 0.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

nbodyOperatorNull

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void autoHook()` Insert any event hooks required by this object.

`void deepCopy(\textcolor{red}{\textless class((nbodyOperatorClass))\textgreater} destination\arginout)` Perform a deep copy of the object.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

`type(varying_string) objectType()` Return the type of the object.

`void operate(\textcolor{red}{\textless type((nBodyData))\textgreater} simulation\arginout)` Operate on the provided N-body simulation.

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

`<void> referenceCountIncrement()` Increment the reference count to this object.

`<void> referenceCountReset()` Reset the reference count to this object to 0.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

nbodyOperatorPairCounts

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void autoHook()` Insert any event hooks required by this object.

`void deepCopy(\textcolor{red}{\textless class((nbodyOperatorClass))\textgreater} destination\arginout)` Perform a deep copy of the object.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

`type(varying_string) objectType()` Return the type of the object.

`void operate(\textcolor{red}{\textless type((nBodyData))\textgreater} simulation\arginout)` Operate on the provided N-body simulation.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

nbodyOperatorRotationCurve

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((nbodyOperatorClass))\textgreater} destination\arginout) Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

void operate(\textcolor{red}{\textless type((nBodyData))\textgreater} simulation\arginout) Operate on the provided N-body simulation.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

nbodyOperatorSelfBound

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\
character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((nbodyOperatorClass))\textgreater} destination\arginout) Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex
logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges
Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

void operate(\textcolor{red}{\textless type((nBodyData))\textgreater} simulation\arginout) Operate on the provided N-body simulation.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl
type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-
size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles
type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-
size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

nbodyOperatorSequence

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\
character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((nbodyOperatorClass))\textgreater} destination\arginout) Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex
logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges
Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

void operate(\textcolor{red}{\textless type((nBodyData))\textgreater} simulation\arginout)
Operate on the provided N-body simulation.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl
type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-
size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles
type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-
size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

nbodyOperatorVelocityDispersion

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\
character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((nbodyOperatorClass))\textgreater} destination\arginout)
Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex
logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges
Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

void operate(\textcolor{red}{\textless type((nBodyData))\textgreater} simulation\arginout)
Operate on the provided N-body simulation.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

nearestNeighbors

<void> search(<double(:)> point→, <integer> neighborCount→, <double> tolerance→, <integer(:)> neighborIndex←, <double(:)> neighborDistance←) Compute indices and distances to the approximate nearest neighbors.

<void> searchFixedRadius(<double(:)> point→, <double> radius→, <integer> neighborCount→, <double> tolerance→, <integer(:)> neighborIndex←, <double(:)> neighborDistance←) Compute indices and distances to the approximate nearest neighbors.

nodeComponent

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Read properties from raw file.

<void> deserializeValues(<double(:)> array→, <integer> propertyType→) Deserialize the evolvable quantities from an array.

<void> destroy() Destroy the object.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a nodeComponent object.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(:,:)> integerBuffer↔, <integer>doubleProperty↔, <integer> doubleBufferCount↔, <double(:,:)> doubleBuffer↔, <double> time→, <integer> instance→) Generate values of outputtable properties.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double> time→, <integer> instance→) Compute a count of outputtable properties.

<void> outputNames(<integer> integerProperty↔, <char[*](:)> integerPropertyNames↔, <char[*](:)> integerPropertyComments↔, <double(:)> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <char[*](:)> doublePropertyNames↔, <char[*](:)> doublePropertyComments↔, <double(:)> doublePropertyUnitsSI↔, <double> time→, <integer> instance→) Generate names of outputtable properties.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets() Set offsets into serialization arrays.

<void> serializeASCII() Generate an ASCII dump of all properties.

<integer> serializeCount(<integer> propertyType→) Return a count of the number of evolvable quantities to be evolved.

<void> serializeRaw(<integer> fileHandle→) Generate a binary dump of all properties.

<void> serializeValues(<double(:)> array←, <integer> propertyType→) Serialize the evolvable quantities to an array.

<void> serializeXML() Generate an XML dump of all properties.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<type(varying_string)> type() Return the type of this object.

nodeComponentAgeStatistics

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a generic ageStatistics component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Read properties from raw file.

<void> deserializeValues(<double(:)> array→, <integer> propertyType→) Deserialize the evolvable quantities from an array.

<void> destroy() Finalize a generic ageStatistics component.

<double precision> diskIntegratedSFR() Returns the default value for the diskIntegratedSFR property for the ageStatistics component class.

<type(varying_string), allocatable, dimension(:) => matches> diskIntegratedSFRAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the ageStatistics class that have the desired attributes for the diskIntegratedSFR property

<integer> diskIntegratedSFRCount() Compute the count of evolvable quantities in the diskIntegratedSFR property of the AgeStatisticsStandard component.

<logical> diskIntegratedSFRIsGettable() Returns true if the diskIntegratedSFR property is gettable for the ageStatistics component class.

<logical> diskIntegratedSFRIsSettable() Specify whether the diskIntegratedSFR property of the ageStatistics component is settable.

<void> diskIntegratedSFRRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interr [interruptProcedure]↔) Accept a rate set for the diskIntegratedSFR property of the ageStatistics component class. Trigger an interrupt to create the component.

<double precision> diskIntegratedSFRRateGet() Returns a zero rate for the diskIntegratedSFR property for the ageStatistics component class.

<void> diskIntegratedSFRScale(<double precision> value) Set the scale of the diskIntegratedSFR property of the AgeStatisticsStandard component.

<void> diskIntegratedSFRSet(<double precision> value) Set the diskIntegratedSFR property of the ageStatistics component.

<double precision> diskTimeWeightedIntegratedSFR() Returns the default value for the diskTimeWeightedIntegrate property for the ageStatistics component class.

<type(varying_string), allocatable, dimension(:) => matches> diskTimeWeightedIntegratedSFRAttributeMat [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the ageStatistics class that have the desired attributes for the diskTimeWeightedIntegratedSFR property

<integer> diskTimeWeightedIntegratedSFRCount() Compute the count of evolvable quantities in the diskTimeWeightedIntegratedSFR property of the AgeStatisticsStandard component.

<logical> diskTimeWeightedIntegratedSFRIsGettable() Returns true if the diskTimeWeightedIntegratedSFR property is gettable for the ageStatistics component class.

<logical> diskTimeWeightedIntegratedSFRIsSettable() Specify whether the diskTimeWeightedIntegratedSFR property of the ageStatistics component is settable.

<void> diskTimeWeightedIntegratedSFRRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accept a rate set for the diskTimeWeightedIntegratedSF property of the ageStatistics component class. Trigger an interrupt to create the component.

<double precision> diskTimeWeightedIntegratedSFRRateGet() Returns a zero rate for the diskTimeWeightedIntegra property for the ageStatistics component class.

<void> diskTimeWeightedIntegratedSFRScale(<double precision> value) Set the scale of the diskTimeWeightedInte property of the AgeStatisticsStandard component.

<void> diskTimeWeightedIntegratedSFRSet(<double precision> value) Set the diskTimeWeightedIntegratedSFR property of the ageStatistics component.

<void> dumpASCII() Dump the content of a ageStatistics component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a generic ageStatistics component.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a nodeComponent object.

<logical> nullIsActive() Return true if the null implementation of the ageStatistics component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a ageStatistics component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a generic ageStatistics component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Establish the names of properties to output for a generic ageStatistics component.

<void> postOutput(<double precision> time→) Perform post-output processing of a ageStatistics component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets() Set offsets into serialization arrays.

<void> serializeASCII() Serialize the content of a ageStatistics component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the number of evolvable quantities to be evolved.

<void> serializeRaw(<integer> fileHandle→) Generate a binary dump of all properties.

<void> serializeValues(<double(:)> array←, <integer> propertyType→) Serialize the evolvable quantities to an array.

<void> serializeXML() Generate an XML dump of all properties.

<integer(c_size_t)> sizeOf() Return the size in bytes of a nodeComponentAgeStatistics component.

<double precision> spheroidIntegratedSFR() Returns the default value for the spheroidIntegratedSFR property for the ageStatistics component class.

<type(varying_string), allocatable, dimension(:) => matches> spheroidIntegratedSFRAttributeMatch(<logi [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the ageStatistics class that have the desired attributes for the spheroidIntegratedSFR property

<integer> spheroidIntegratedSFRCount() Compute the count of evolvable quantities in the spheroidIntegratedSFR property of the AgeStatisticsStandard component.

<logical> spheroidIntegratedSFRIsGettable() Returns true if the spheroidIntegratedSFR property is gettable for the ageStatistics component class.

<logical> spheroidIntegratedSFRIsSettable() Specify whether the spheroidIntegratedSFR property of the ageStatistics component is settable.

<void> spheroidIntegratedSFRRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accept a rate set for the spheroidIntegratedSFR property of the ageStatistics component class. Trigger an interrupt to create the component.

<double precision> spheroidIntegratedSFRRateGet() Returns a zero rate for the spheroidIntegratedSFR property for the ageStatistics component class.

<void> spheroidIntegratedSFRScale(<double precision> value) Set the scale of the spheroidIntegratedSFR property of the AgeStatisticsStandard component.

<void> spheroidIntegratedSFRSet(<double precision> value) Set the spheroidIntegratedSFR property of the ageStatistics component.

<double precision> spheroidTimeWeightedIntegratedSFR() Returns the default value for the spheroidTimeWeightedI property for the ageStatistics component class.

<type(varying_string), allocatable, dimension(:) => matches> spheroidTimeWeightedIntegratedSFRAttribut [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the ageStatistics class that have the desired attributes for the spheroidTimeWeightedIntegratedSFR property

<integer> spheroidTimeWeightedIntegratedSFRCount() Compute the count of evolvable quantities in the spheroidTimeWeightedIntegratedSFR property of the AgeStatisticsStandard component.

<logical> spheroidTimeWeightedIntegratedSFRIsGettable() Returns true if the spheroidTimeWeightedIntegratedSF property is gettable for the ageStatistics component class.

<logical> spheroidTimeWeightedIntegratedSFRIsSettable() Specify whether the spheroidTimeWeightedIntegrated property of the ageStatistics component is settable.

<void> spheroidTimeWeightedIntegratedSFRRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accept a rate set for the spheroidTimeWeightedIntegrat property of the ageStatistics component class. Trigger an interrupt to create the component.

<double precision> spheroidTimeWeightedIntegratedSFRRateGet() Returns a zero rate for the spheroidTimeWeightedIntegratedSFR property for the ageStatistics component class.

<void> spheroidTimeWeightedIntegratedSFRScale(<double precision> value) Set the scale of the spheroidTimeWeightedIntegratedSFR property of the AgeStatisticsStandard component.

<void> spheroidTimeWeightedIntegratedSFRSet(<double precision> value) Set the spheroidTimeWeightedIntegra property of the ageStatistics component.

<logical> standardIsActive() Return true if the standard implementation of the ageStatistics component is the active choice.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<type(varying_string)> type() Returns the type name for the ageStatistics component class.

nodeComponentAgeStatisticsNull

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a null implementation of the ageStatistics component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a null implementation of the ageStatistics component from raw (binary) file.

<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→) Deserialize evolvable properties of a null implementation of the ageStatistics component from array.

<void> destroy() Finalize a null implementation of the ageStatistics component.

<double precision> diskIntegratedSFR() Returns the default value for the diskIntegratedSFR property for the ageStatistics component class.

<type(varying_string), allocatable, dimension(:) => matches> diskIntegratedSFRAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the ageStatistics class that have the desired attributes for the diskIntegratedSFR property

<integer> diskIntegratedSFRCount() Compute the count of evolvable quantities in the diskIntegratedSFR property of the AgeStatisticsStandard component.

<logical> diskIntegratedSFRIsGettable() Returns true if the diskIntegratedSFR property is gettable for the ageStatistics component class.

<logical> diskIntegratedSFRIsSettable() Specify whether the diskIntegratedSFR property of the ageStatistics component is settable.

<void> diskIntegratedSFRRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interr [interruptProcedure]↔) Accept a rate set for the diskIntegratedSFR property of the ageStatistics component class. Trigger an interrupt to create the component.

<double precision> diskIntegratedSFRRateGet() Returns a zero rate for the diskIntegratedSFR property for the ageStatistics component class.

<void> diskIntegratedSFRScale(<double precision> value) Set the scale of the diskIntegratedSFR property of the AgeStatisticsStandard component.

<void> diskIntegratedSFRSet(<double precision> value) Set the diskIntegratedSFR property of the ageStatistics component.

<double precision> diskTimeWeightedIntegratedSFR() Returns the default value for the diskTimeWeightedIntegrate property for the ageStatistics component class.

<type(varying_string), allocatable, dimension(:) => matches> diskTimeWeightedIntegratedSFRAttributeMat [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the ageStatistics class that have the desired attributes for the diskTimeWeightedIntegratedSFR property

<integer> diskTimeWeightedIntegratedSFRCount() Compute the count of evolvable quantities in the diskTimeWeightedIntegratedSFR property of the AgeStatisticsStandard component.

<logical> diskTimeWeightedIntegratedSFRIsGettable() Returns true if the diskTimeWeightedIntegratedSFR property is gettable for the ageStatistics component class.

<logical> diskTimeWeightedIntegratedSFRIsSettable() Specify whether the diskTimeWeightedIntegratedSFR property of the ageStatistics component is settable.

<void> diskTimeWeightedIntegratedSFRRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accept a rate set for the diskTimeWeightedIntegratedSF property of the ageStatistics component class. Trigger an interrupt to create the component.

<double precision> diskTimeWeightedIntegratedSFRRateGet() Returns a zero rate for the diskTimeWeightedIntegra property for the ageStatistics component class.

<void> diskTimeWeightedIntegratedSFRScale(<double precision> value) Set the scale of the diskTimeWeightedInte property of the AgeStatisticsStandard component.

<void> diskTimeWeightedIntegratedSFRSet(<double precision> value) Set the diskTimeWeightedIntegratedSFR property of the ageStatistics component.

<void> dumpASCII() Dump the content of a ageStatistics component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a null member of the ageStatistics component.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a null implementation of the ageStatistics component class.

<logical> nullIsActive() Return true if the null implementation of the ageStatistics component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a ageStatistics component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a null implementation of the ageStatistics component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Return the names of properties to output for a null implementation of the ageStatistics component.

<void> postOutput(<double precision> time→) Perform post-output processing of a ageStatistics component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→) Compute offsets into serialization arrays for a null implementation of the ageStatistics component.

<void> serializeASCII() Serialize the contents of a null implementation of the ageStatistics component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the serialization of a null implementation of the ageStatistics component.

<void> serializeRaw(<integer> fileHandle→) Serialize the contents of a null implementation of the ageStatistics component to raw (binary) file.

<void> serializeValues(<double precision[:]> array←, <integer> propertyType→) Serialize evolvable properties of a null implementation of the ageStatistics component to array.

<void> serializeXML(<integer> fileHandle→) Serialize the contents of a null implementation of the ageStatistics component to XML.

<integer(c_size_t)> sizeOf() Return the size in bytes of a null implementation of the ageStatistics component.

<double precision> spheroidIntegratedSFR() Returns the default value for the spheroidIntegratedSFR property for the ageStatistics component class.

<type(varying_string), allocatable, dimension(:) => matches> spheroidIntegratedSFRAttributeMatch(<logi [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the ageStatistics class that have the desired attributes for the spheroidIntegratedSFR property

<integer> spheroidIntegratedSFRCount() Compute the count of evolvable quantities in the spheroidIntegratedSFR property of the AgeStatisticsStandard component.

<logical> spheroidIntegratedSFRIsGettable() Returns true if the spheroidIntegratedSFR property is gettable for the ageStatistics component class.

<logical> spheroidIntegratedSFRIsSettable() Specify whether the spheroidIntegratedSFR property of the ageStatistics component is settable.

<void> spheroidIntegratedSFRRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accept a rate set for the spheroidIntegratedSFR property of the ageStatistics component class. Trigger an interrupt to create the component.

<double precision> spheroidIntegratedSFRRateGet() Returns a zero rate for the spheroidIntegratedSFR property for the ageStatistics component class.

<void> spheroidIntegratedSFRScale(<double precision> value) Set the scale of the spheroidIntegratedSFR property of the AgeStatisticsStandard component.

<void> spheroidIntegratedSFRSet(<double precision> value) Set the spheroidIntegratedSFR property of the ageStatistics component.

<double precision> spheroidTimeWeightedIntegratedSFR() Returns the default value for the spheroidTimeWeightedI property for the ageStatistics component class.

<type(varying_string), allocatable, dimension(:) => matches> spheroidTimeWeightedIntegratedSFRAttribut [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the ageStatistics class that have the desired attributes for the spheroidTimeWeightedIntegratedSFR property

<integer> spheroidTimeWeightedIntegratedSFRCount() Compute the count of evolvable quantities in the spheroidTimeWeightedIntegratedSFR property of the AgeStatisticsStandard component.

<logical> spheroidTimeWeightedIntegratedSFRIsGettable() Returns true if the spheroidTimeWeightedIntegratedSF property is gettable for the ageStatistics component class.

<logical> spheroidTimeWeightedIntegratedSFRIsSettable() Specify whether the spheroidTimeWeightedIntegrated property of the ageStatistics component is settable.

<void> spheroidTimeWeightedIntegratedSFRRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accept a rate set for the spheroidTimeWeightedIntegrat property of the ageStatistics component class. Trigger an interrupt to create the component.

<double precision> spheroidTimeWeightedIntegratedSFRRateGet() Returns a zero rate for the spheroidTimeWeightedIntegratedSFR property for the ageStatistics component class.

<void> spheroidTimeWeightedIntegratedSFRScale(<double precision> value) Set the scale of the spheroidTimeWeightedIntegratedSFR property of the AgeStatisticsStandard component.

<void> spheroidTimeWeightedIntegratedSFRSet(<double precision> value) Set the spheroidTimeWeightedIntegra property of the ageStatistics component.

<logical> standardIsActive() Return true if the standard implementation of the ageStatistics component is the active choice.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<type(varying_string)> type() Returns the type name for the null implementation of the ageStatistics component class.

nodeComponentAgeStatisticsStandard

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a standard implementation of the ageStatistics component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a standard implementation of the ageStatistics component from raw (binary) file.

<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→) Deserialize evolvable properties of a standard implementation of the ageStatistics component from array.

<void> destroy() Finalize a standard implementation of the ageStatistics component.

<double precision> diskIntegratedSFR() Get the diskIntegratedSFR property of an standard implementation of the ageStatistics component class.

<type(varying_string), allocatable, dimension(:) => matches> diskIntegratedSFRAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the ageStatistics class that have the desired attributes for the diskIntegratedSFR property

<integer> diskIntegratedSFRCount() Return a count of the number of scalar properties in the diskIntegratedSFR property of an standard implementation of the ageStatistics component class.

<void> diskIntegratedSFRInactive() Indicate that the diskIntegratedSFR property of an standard implementation of the ageStatistics component class is inactive for differential equation solving.

<logical> diskIntegratedSFRIsGettable() Returns true if the diskIntegratedSFR property is gettable for the ageStatistics component class.

<logical> diskIntegratedSFRIsSettable() Specify whether the diskIntegratedSFR property of the ageStatistics component is settable.

<void> diskIntegratedSFRRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interr [interruptProcedure]↔) Accumulate to the rate of change of the diskIntegratedSFR property of an standard implementation of the ageStatistics component class.

<double precision> diskIntegratedSFRRateGet() Get the rate of change of the diskIntegratedSFR property of an standard implementation of the ageStatistics component class.

<void> diskIntegratedSFRScale(<double precision> setValue→) Set the absolute scale of the diskIntegratedSFR property of an standard implementation of the ageStatistics component class.

<void> diskIntegratedSFRSet(<double precision> setValue→) Set the diskIntegratedSFR property of an standard implementation of the ageStatistics component class.

<double precision> diskTimeWeightedIntegratedSFR() Get the diskTimeWeightedIntegratedSFR property of an standard implementation of the ageStatistics component class.

<type(varying_string), allocatable, dimension(:) => matches> diskTimeWeightedIntegratedSFRAttributeMat [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the ageStatistics class that have the desired attributes for the diskTimeWeightedIntegratedSFR property

<integer> diskTimeWeightedIntegratedSFRCount() Return a count of the number of scalar properties in the diskTimeWeightedIntegratedSFR property of an standard implementation of the ageStatistics component class.

<void> diskTimeWeightedIntegratedSFRInactive() Indicate that the diskTimeWeightedIntegratedSFR property of an standard implementation of the ageStatistics component class is inactive for differential equation solving.

<logical> diskTimeWeightedIntegratedSFRIsGettable() Returns true if the diskTimeWeightedIntegratedSFR property is gettable for the ageStatistics component class.

<logical> diskTimeWeightedIntegratedSFRIsSettable() Specify whether the diskTimeWeightedIntegratedSFR property of the ageStatistics component is settable.

<void> diskTimeWeightedIntegratedSFRRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate to the rate of change of the diskTimeWeightedIntegratedSFR property of an standard implementation of the ageStatistics component class.

<double precision> diskTimeWeightedIntegratedSFRRateGet() Get the rate of change of the diskTimeWeightedIntegr property of an standard implementation of the ageStatistics component class.

<void> diskTimeWeightedIntegratedSFRScale(<double precision> setValue→) Set the absolute scale of the diskTimeWeightedIntegratedSFR property of an standard implementation of the ageStatistics component class.

<void> diskTimeWeightedIntegratedSFRSet(<double precision> setValue→) Set the diskTimeWeightedIntegrated property of an standard implementation of the ageStatistics component class.

<void> dumpASCII() Dump the content of a ageStatistics component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter
[interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a standard member of the ageStatistics component.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a standard implementation of the ageStatistics component class.

<logical> nullIsActive() Return true if the null implementation of the ageStatistics component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_-
int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔,
<double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)>
outputInstance→, <integer> instance→) Populate output buffers with properties to output for a ageStatistics component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double
precision> time→, <integer> instance→) Increment the count of properties to output for a standard implementation of the ageStatistics component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔,
<character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔,
<integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]>
doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision>
time→, <integer> instance→) Return the names of properties to output for a standard implementation of the ageStatistics component.

<void> postOutput(<double precision> time→) Perform post-output processing of a ageStatistics component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→)
Compute the gravitational potential.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType>
[massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType>
[massType]→) Compute the rotation curve gradient.

<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→)
Compute offsets into serialization arrays for a standard implementation of the ageStatistics component.

<void> serializeASCII() Serialize the contents of a standard implementation of the ageStatistics component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the serialization of a standard implementation of the ageStatistics component.

<void> serializeRaw(<integer> fileHandle→) Serialize the contents of a standard implementation of the ageStatistics component to raw (binary) file.

<void> serializeValues(<double precision[:]> array←, <integer> propertyType→) Serialize evolvable properties of a standard implementation of the ageStatistics component to array.

<void> serializeXML(<integer> fileHandle→) Serialize the contents of a standard implementation of the ageStatistics component to XML.

<integer(c_size_t)> sizeOf() Return the size in bytes of a standard implementation of the ageStatistics component.

<double precision> spheroidIntegratedSFR() Get the spheroidIntegratedSFR property of an standard implementation of the ageStatistics component class.

<type(varying_string), allocatable, dimension(:) => matches> spheroidIntegratedSFRAttributeMatch(<logi
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the ageStatistics class that have the desired attributes for the spheroidIntegratedSFR property

<integer> spheroidIntegratedSFRCount() Return a count of the number of scalar properties in the spheroidIntegratedSFR property of an standard implementation of the ageStatistics component class.

<void> spheroidIntegratedSFRInactive() Indicate that the spheroidIntegratedSFR property of an standard implementation of the ageStatistics component class is inactive for differential equation solving.

<logical> spheroidIntegratedSFRIsGettable() Returns true if the spheroidIntegratedSFR property is gettable for the ageStatistics component class.

<logical> spheroidIntegratedSFRIsSettable() Specify whether the spheroidIntegratedSFR property of the ageStatistics component is settable.

<void> spheroidIntegratedSFRRate(<double precision> setValue→, <logical> [interrupt]↔,
<*procedure(interruptTask)> [interruptProcedure]↔) Accumulate to the rate of change of the spheroidIntegratedSFR property of an standard implementation of the ageStatistics component class.

<double precision> spheroidIntegratedSFRRateGet() Get the rate of change of the spheroidIntegratedSFR property of an standard implementation of the ageStatistics component class.

<void> spheroidIntegratedSFRScale(<double precision> setValue→) Set the absolute scale of the spheroidIntegratedSFR property of an standard implementation of the ageStatistics component class.

<void> spheroidIntegratedSFRSet(<double precision> setValue→) Set the spheroidIntegratedSFR property of an standard implementation of the ageStatistics component class.

<double precision> spheroidTimeWeightedIntegratedSFR() Get the spheroidTimeWeightedIntegratedSFR property of an standard implementation of the ageStatistics component class.

<type(varying_string), allocatable, dimension(:) => matches> spheroidTimeWeightedIntegratedSFRAttribut
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the ageStatistics class that have the desired attributes for the spheroidTimeWeightedIntegratedSFR property

<integer> spheroidTimeWeightedIntegratedSFRCount() Return a count of the number of scalar properties in the spheroidTimeWeightedIntegratedSFR property of an standard implementation of the ageStatistics component class.

<void> spheroidTimeWeightedIntegratedSFRInactive() Indicate that the spheroidTimeWeightedIntegratedSFR property of an standard implementation of the ageStatistics component class is inactive for differential equation solving.

<logical> spheroidTimeWeightedIntegratedSFRIsGettable() Returns true if the spheroidTimeWeightedIntegratedSF property is gettable for the ageStatistics component class.

<logical> spheroidTimeWeightedIntegratedSFRIsSettable() Specify whether the spheroidTimeWeightedIntegrated property of the ageStatistics component is settable.

<void> spheroidTimeWeightedIntegratedSFRRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate to the rate of change of the spheroidTimeWeightedIntegratedSFR property of an standard implementation of the ageStatistics component class.

<double precision> spheroidTimeWeightedIntegratedSFRRateGet() Get the rate of change of the spheroidTimeWeightedIntegratedSFR property of an standard implementation of the ageStatistics component class.

<void> spheroidTimeWeightedIntegratedSFRScale(<double precision> setValue→) Set the absolute scale of the spheroidTimeWeightedIntegratedSFR property of an standard implementation of the ageStatistics component class.

<void> spheroidTimeWeightedIntegratedSFRSet(<double precision> setValue→) Set the spheroidTimeWeightedIn property of an standard implementation of the ageStatistics component class.

<logical> standardIsActive() Return true if the standard implementation of the ageStatistics component is the active choice.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<type(varying_string)> type() Returns the type name for the standard implementation of the ageStatistics component class.

nodeComponentBasic

<double precision> accretionRate() Returns the default value for the accretionRate property for the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> accretionRateAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the accretionRate property

<double precision> accretionRateBertschinger() Returns the default value for the accretionRateBertschinger property for the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> accretionRateBertschingerAttributeMatch([requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the accretionRateBertschinger property

<logical> accretionRateBertschingerIsGettable() Returns true if the accretionRateBertschinger property is gettable for the basic component class.

<logical> accretionRateBertschingerIsSettable() Specify whether the accretionRateBertschinger property of the basic component is settable.

<double precision> accretionRateBertschingerRateGet() Returns a zero rate for the accretionRateBertschinger property for the basic component class.

<void> accretionRateBertschingerSet(<double precision> value) Set the accretionRateBertschinger property of the basic component.

<logical> accretionRateIsGettable() Returns true if the accretionRate property is gettable for the basic component class.

<logical> accretionRateIsSettable() Specify whether the accretionRate property of the basic component is settable.

<double precision> accretionRateRateGet() Returns a zero rate for the accretionRate property for the basic component class.

<void> accretionRateSet(<double precision> value) Set the accretionRate property of the basic component.

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a generic basic component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Read properties from raw file.

<void> deserializeValues(<double(:)> array→, <integer> propertyType→) Deserialize the evolvable quantities from an array.

<void> destroy() Finalize a generic basic component.

<void> dumpASCII() Dump the content of a basic component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<logical> extendedTrackingIsActive() Return true if the extendedTracking implementation of the basic component is the active choice.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a generic basic component.

<double precision> mass() Returns the default value for the mass property for the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> massAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the mass property

<double precision> massBertschinger() Returns the default value for the massBertschinger property for the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> massBertschingerAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the massBertschinger property

<integer> massBertschingerCount() Compute the count of evolvable quantities in the massBertschinger property of the BasicStandardExtended component.

<logical> massBertschingerIsGettable() Returns true if the massBertschinger property is gettable for the basic component class.

<logical> massBertschingerIsSettable() Specify whether the massBertschinger property of the basic component is settable.

<void> massBertschingerRate(<double precision> value) Cumulate to the rate of the massBertschinger property of the BasicStandardExtended component.

<double precision> massBertschingerRateGet() Returns a zero rate for the massBertschinger property for the basic component class.

<void> massBertschingerScale(<double precision> value) Set the scale of the massBertschinger property of the BasicStandardExtended component.

<void> massBertschingerSet(<double precision> value) Set the massBertschinger property of the basic component.

<integer> massCount() Compute the count of evolvable quantities in the mass property of the BasicStandard component.

<logical> massIsGettable() Returns true if the mass property is gettable for the basic component class.

<logical> massIsSettable() Specify whether the mass property of the basic component is settable.

<double precision> massMaximum() Returns the default value for the massMaximum property for the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> massMaximumAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the massMaximum property

<logical> massMaximumIsGettable() Returns true if the massMaximum property is gettable for the basic component class.

<logical> massMaximumIsSettable() Specify whether the massMaximum property of the basic component is settable.

<double precision> massMaximumRateGet() Returns a zero rate for the massMaximum property for the basic component class.

<void> massMaximumSet(<double precision> value) Set the massMaximum property of the basic component.

<void> massRate(<double precision> value) Cumulate to the rate of the mass property of the BasicStandard component.

<double precision> massRateGet() Returns a zero rate for the mass property for the basic component class.

<void> massScale(<double precision> value) Set the scale of the mass property of the BasicStandard component.

<void> massSet(<double precision> value) Set the mass property of the basic component.

<double precision> massTarget() Returns the default value for the massTarget property for the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> massTargetAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the massTarget property

<logical> massTargetIsGettable() Returns true if the massTarget property is gettable for the basic component class.

<logical> massTargetIsSettable() Specify whether the massTarget property of the basic component is settable.

<double precision> massTargetRateGet() Returns a zero rate for the massTarget property for the basic component class.

<void> massTargetSet(<double precision> value) Set the massTarget property of the basic component.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a nodeComponent object.

<logical> nonEvolvingIsActive() Return true if the nonEvolving implementation of the basic component is the active choice.

<logical> nullIsActive() Return true if the null implementation of the basic component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a basic component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a generic basic component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Establish the names of properties to output for a generic basic component.

<void> postOutput(<double precision> time→) Perform post-output processing of a basic component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<double precision> radiusTurnaround() Returns the default value for the radiusTurnaround property for the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> radiusTurnaroundAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the radiusTurnaround property

<integer> radiusTurnaroundCount() Compute the count of evolvable quantities in the radiusTurnaround property of the BasicStandardExtended component.

<double precision> radiusTurnaroundGrowthRate() Returns the default value for the radiusTurnaroundGrowthRate property for the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> radiusTurnaroundGrowthRateAttributeMatch([requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the radiusTurnaroundGrowthRate property

<logical> radiusTurnaroundGrowthRateIsGettable() Returns true if the radiusTurnaroundGrowthRate property is gettable for the basic component class.

<logical> radiusTurnaroundGrowthRateIsSettable() Specify whether the radiusTurnaroundGrowthRate property of the basic component is settable.

<double precision> radiusTurnaroundGrowthRateRateGet() Returns a zero rate for the radiusTurnaroundGrowthRate property for the basic component class.

<void> radiusTurnaroundGrowthRateSet(<double precision> value) Set the radiusTurnaroundGrowthRate property of the basic component.

<logical> radiusTurnaroundIsGettable() Returns true if the radiusTurnaround property is gettable for the basic component class.

<logical> radiusTurnaroundIsSettable() Specify whether the radiusTurnaround property of the basic component is settable.

<void> radiusTurnaroundRate(<double precision> value) Cumulate to the rate of the radiusTurnaround property of the BasicStandardExtended component.

<double precision> radiusTurnaroundRateGet() Returns a zero rate for the radiusTurnaround property for the basic component class.

<void> radiusTurnaroundScale(<double precision> value) Set the scale of the radiusTurnaround property of the BasicStandardExtended component.

<void> radiusTurnaroundSet(<double precision> value) Set the radiusTurnaround property of the basic component.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets() Set offsets into serialization arrays.

<void> serializeASCII() Serialize the content of a basic component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the number of evolvable quantities to be evolved.

<void> serializeRaw(<integer> fileHandle→) Generate a binary dump of all properties.

<void> serializeValues(<double(:)> array←, <integer> propertyType→) Serialize the evolvable quantities to an array.

<void> serializeXML() Generate an XML dump of all properties.

<integer(c_size_t)> sizeOf() Return the size in bytes of a nodeComponentBasic component.

<logical> standardExtendedIsActive() Return true if the standardExtended implementation of the basic component is the active choice.

<logical> standardIsActive() Return true if the standard implementation of the basic component is the active choice.

<logical> standardTrackingIsActive() Return true if the standardTracking implementation of the basic component is the active choice.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<double precision> time() Returns the default value for the time property for the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> timeAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the time property

<integer> timeCount() Compute the count of evolvable quantities in the time property of the BasicNonEvolving component.

<logical> timeIsGettable() Returns true if the time property is gettable for the basic component class.

<logical> timeIsSettable() Specify whether the time property of the basic component is settable.

<double precision> timeLastIsolated() Returns the default value for the timeLastIsolated property for the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> timeLastIsolatedAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the timeLastIsolated property

<logical> timeLastIsolatedIsGettable() Returns true if the timeLastIsolated property is gettable for the basic component class.

<logical> timeLastIsolatedIsSettable() Specify whether the timeLastIsolated property of the basic component is settable.

<double precision> timeLastIsolatedRateGet() Returns a zero rate for the timeLastIsolated property for the basic component class.

<void> timeLastIsolatedSet(<double precision> value) Set the timeLastIsolated property of the basic component.

<void> timeRate(<double precision> value) Cumulate to the rate of the time property of the BasicNonEvolving component.

<double precision> timeRateGet() Returns a zero rate for the time property for the basic component class.

<void> timeScale(<double precision> value) Set the scale of the time property of the BasicNonEvolving component.

<void> timeSet(<double precision> value) Set the time property of the basic component.

<type(varying_string)> type() Returns the type name for the basic component class.

nodeComponentBasicExtendedTracking

<double precision> accretionRate() Get the accretionRate property of an standard implementation of the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> accretionRateAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the accretionRate property

<double precision> accretionRateBertschinger() Get the accretionRateBertschinger property of an standardExtended implementation of the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> accretionRateBertschingerAttributeMatch(< [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the accretionRateBertschinger property

<logical> accretionRateBertschingerIsGettable() Returns true if the accretionRateBertschinger property is gettable for the basic component class.

<logical> accretionRateBertschingerIsSettable() Specify whether the accretionRateBertschinger property of the basic component is settable.

<double precision> accretionRateBertschingerRateGet() Returns a zero rate for the accretionRateBertschinger property for the basic component class.

<void> accretionRateBertschingerSet(<double precision> setValue→) Set the accretionRateBertschinger property of an standardExtended implementation of the basic component class.

<logical> accretionRateIsGettable() Returns true if the accretionRate property is gettable for the basic component class.

<logical> accretionRateIsSettable() Specify whether the accretionRate property of the basic component is settable.

<double precision> accretionRateRateGet() Returns a zero rate for the accretionRate property for the basic component class.

<void> accretionRateSet(<double precision> setValue→) Set the accretionRate property of an standard implementation of the basic component class.

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a extendedTracking implementation of the basic component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a extendedTracking implementation of the basic component from raw (binary) file.

<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→) Deserialize evolvable properties of a extendedTracking implementation of the basic component from array.

<void> destroy() Finalize a extendedTracking implementation of the basic component.

<void> dumpASCII() Dump the content of a basic component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<logical> extendedTrackingIsActive() Return true if the extendedTracking implementation of the basic component is the active choice.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a extendedTracking member of the basic component.

<double precision> mass() Get the mass property of an standard implementation of the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> massAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the mass property

<double precision> massBertschinger() Get the value of the massBertschinger property of the standardExtended implementation of the basic component using a deferred function.

<type(varying_string), allocatable, dimension(:) => matches> massBertschingerAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the massBertschinger property

<integer> massBertschingerCount() Return a count of the number of scalar properties in the massBertschinger property of an standardExtended implementation of the basic component class.

<void> massBertschingerFunction() Set the function to be used for the get method of the massBertschinger property of the BasicStandardExtended component.

<void> massBertschingerInactive() Indicate that the massBertschinger property of an standardExtended implementation of the basic component class is inactive for differential equation solving.

<logical> massBertschingerIsAttached() Return true if the deferred function used to get the massBertschinger property of the BasicStandardExtended component class has been attached.

<logical> massBertschingerIsGettable() Returns true if the massBertschinger property is gettable for the basic component class.

<logical> massBertschingerIsSettable() Specify whether the massBertschinger property of the basic component is settable.

<void> massBertschingerRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interru [interruptProcedure]↔) Accumulate to the rate of change of the massBertschinger property of an standardExtended implementation of the basic component class.

<double precision> massBertschingerRateGet() Get the rate of change of the massBertschinger property of an standardExtended implementation of the basic component class.

<void> massBertschingerScale(<double precision> setValue→) Set the absolute scale of the massBertschinger property of an standardExtended implementation of the basic component class.

<void> massBertschingerSet(<double precision> setValue→) Set the massBertschinger property of an standardExtended implementation of the basic component class.

<double precision> massBertschingerValue() Get the massBertschinger property of an standardExtended implementation of the basic component class.

<integer> massCount() Return a count of the number of scalar properties in the mass property of an standard implementation of the basic component class.

<void> massInactive() Indicate that the mass property of an standard implementation of the basic component class is inactive for differential equation solving.

<logical> massIsGettable() Returns true if the mass property is gettable for the basic component class.

<logical> massIsSettable() Specify whether the mass property of the basic component is settable.

<double precision> massMaximum() Get the massMaximum property of an extendedTracking implementation of the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> massMaximumAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the massMaximum property

<logical> massMaximumIsGettable() Returns true if the massMaximum property is gettable for the basic component class.

<logical> massMaximumIsSettable() Specify whether the massMaximum property of the basic component is settable.

<double precision> massMaximumRateGet() Returns a zero rate for the massMaximum property for the basic component class.

<void> massMaximumSet(<double precision> setValue→) Set the massMaximum property of an extendedTracking implementation of the basic component class.

<void> massRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate to the rate of change of the mass property of an standard implementation of the basic component class.

<double precision> massRateGet() Get the rate of change of the mass property of an standard implementation of the basic component class.

<void> massScale(<double precision> setValue→) Set the absolute scale of the mass property of an standard implementation of the basic component class.

<void> massSet(<double precision> setValue→) Set the mass property of an standard implementation of the basic component class.

<double precision> massTarget() Get the massTarget property of an standard implementation of the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> massTargetAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the massTarget property

<logical> massTargetIsGettable() Returns true if the massTarget property is gettable for the basic component class.

<logical> massTargetIsSettable() Specify whether the massTarget property of the basic component is settable.

<double precision> massTargetRateGet() Returns a zero rate for the massTarget property for the basic component class.

<void> massTargetSet(<double precision> setValue→) Set the massTarget property of an standard implementation of the basic component class.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a extendedTracking implementation of the basic component class.

<logical> nonEvolvingIsActive() Return true if the nonEvolving implementation of the basic component is the active choice.

<logical> nullIsActive() Return true if the null implementation of the basic component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a basic component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a extendedTracking implementation of the basic component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Return the names of properties to output for a extendedTracking implementation of the basic component.

<void> postOutput(<double precision> time→) Perform post-output processing for a extendedTracking implementation of the basic component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<double precision> radiusTurnaround() Get the value of the radiusTurnaround property of the standardExtended implementation of the basic component using a deferred function.

<type(varying_string), allocatable, dimension(:) => matches> radiusTurnaroundAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the radiusTurnaround property

<integer> radiusTurnaroundCount() Return a count of the number of scalar properties in the radiusTurnaround property of an standardExtended implementation of the basic component class.

<void> radiusTurnaroundFunction() Set the function to be used for the get method of the radiusTurnaround property of the BasicStandardExtended component.

<double precision> radiusTurnaroundGrowthRate() Get the radiusTurnaroundGrowthRate property of an standardExtended implementation of the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> radiusTurnaroundGrowthRateAttributeMatch([requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the radiusTurnaroundGrowthRate property

<logical> radiusTurnaroundGrowthRateIsGettable() Returns true if the radiusTurnaroundGrowthRate property is gettable for the basic component class.

<logical> radiusTurnaroundGrowthRateIsSettable() Specify whether the radiusTurnaroundGrowthRate property of the basic component is settable.

<double precision> radiusTurnaroundGrowthRateRateGet() Returns a zero rate for the radiusTurnaroundGrowthRate property for the basic component class.

<void> radiusTurnaroundGrowthRateSet(<double precision> setValue→) Set the radiusTurnaroundGrowthRate property of an standardExtended implementation of the basic component class.

<void> radiusTurnaroundInactive() Indicate that the radiusTurnaround property of an standardExtended implementation of the basic component class is inactive for differential equation solving.

<logical> radiusTurnaroundIsAttached() Return true if the deferred function used to get the radiusTurnaround property of the BasicStandardExtended component class has been attached.

<logical> radiusTurnaroundIsGettable() Returns true if the radiusTurnaround property is gettable for the basic component class.

<logical> radiusTurnaroundIsSettable() Specify whether the radiusTurnaround property of the basic component is settable.

<void> radiusTurnaroundRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interru [interruptProcedure]↔) Accumulate to the rate of change of the radiusTurnaround property of an standardExtended implementation of the basic component class.

<double precision> radiusTurnaroundRateGet() Get the rate of change of the radiusTurnaround property of an standardExtended implementation of the basic component class.

<void> radiusTurnaroundScale(<double precision> setValue→) Set the absolute scale of the radiusTurnaround property of an standardExtended implementation of the basic component class.

<void> radiusTurnaroundSet(<double precision> setValue→) Set the radiusTurnaround property of an standardExtended implementation of the basic component class.

<double precision> radiusTurnaroundValue() Get the radiusTurnaround property of an standardExtended implementation of the basic component class.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→) Compute offsets into serialization arrays for a extendedTracking implementation of the basic component.

<void> serializeASCII() Serialize the contents of a extendedTracking implementation of the basic component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the serialization of a extendedTracking implementation of the basic component.

<void> serializeRaw(<integer> fileHandle→) Serialize the contents of a extendedTracking implementation of the basic component to raw (binary) file.

<void> serializeValues(<double precision[:]> array←, <integer> propertyType→) Serialize evolvable properties of a extendedTracking implementation of the basic component to array.

<void> serializeXML(<integer> fileHandle→) Serialize the contents of a extendedTracking implementation of the basic component to XML.

<integer(c_size_t)> sizeOf() Return the size in bytes of a extendedTracking implementation of the basic component.

<logical> standardExtendedIsActive() Return true if the standardExtended implementation of the basic component is the active choice.

<logical> standardIsActive() Return true if the standard implementation of the basic component is the active choice.

<logical> standardTrackingIsActive() Return true if the standardTracking implementation of the basic component is the active choice.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<double precision> time() Get the time property of an standard implementation of the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> timeAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the time property

<integer> timeCount() Return a count of the number of scalar properties in the time property of an standard implementation of the basic component class.

<void> timeInactive() Indicate that the time property of an standard implementation of the basic component class is inactive for differential equation solving.

<logical> timeIsGettable() Returns true if the time property is gettable for the basic component class.

<logical> timeIsSettable() Specify whether the time property of the basic component is settable.

<double precision> timeLastIsolated() Returns the default value for the timeLastIsolated property for the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> timeLastIsolatedAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the timeLastIsolated property

<logical> timeLastIsolatedIsGettable() Returns true if the timeLastIsolated property is gettable for the basic component class.

<logical> timeLastIsolatedIsSettable() Specify whether the timeLastIsolated property of the basic component is settable.

<double precision> timeLastIsolatedRateGet() Returns a zero rate for the timeLastIsolated property for the basic component class.

<void> timeLastIsolatedSet(<double precision> setValue→) Set the timeLastIsolated property of an standard implementation of the basic component class.

<void> timeRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate to the rate of change of the time property of an standard implementation of the basic component class.

<double precision> timeRateGet() Get the rate of change of the time property of an standard implementation of the basic component class.

<void> timeScale(<double precision> setValue→) Set the absolute scale of the time property of an standard implementation of the basic component class.

<void> timeSet(<double precision> setValue→) Set the time property of an standard implementation of the basic component class.

<type(varying_string)> type() Returns the type name for the extendedTracking implementation of the basic component class.

nodeComponentBasicNonEvolving

<double precision> accretionRate() Returns the default value for the accretionRate property for the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> accretionRateAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the accretionRate property

<double precision> accretionRateBertschinger() Returns the default value for the accretionRateBertschinger property for the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> accretionRateBertschingerAttributeMatch(< [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the accretionRateBertschinger property

<logical> accretionRateBertschingerIsGettable() Returns true if the accretionRateBertschinger property is gettable for the basic component class.

<logical> accretionRateBertschingerIsSettable() Specify whether the accretionRateBertschinger property of the basic component is settable.

<double precision> accretionRateBertschingerRateGet() Returns a zero rate for the accretionRateBertschinger property for the basic component class.

<void> accretionRateBertschingerSet(<double precision> value) Set the accretionRateBertschinger property of the basic component.

<logical> accretionRateIsGettable() Returns true if the accretionRate property is gettable for the basic component class.

<logical> accretionRateIsSettable() Specify whether the accretionRate property of the basic component is settable.

<double precision> accretionRateRateGet() Returns a zero rate for the accretionRate property for the basic component class.

<void> accretionRateSet(<double precision> value) Set the accretionRate property of the basic component.

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a nonEvolving implementation of the basic component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a nonEvolving implementation of the basic component from raw (binary) file.

<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→) Deserialize evolvable properties of a nonEvolving implementation of the basic component from array.

<void> destroy() Finalize a nonEvolving implementation of the basic component.

<void> dumpASCII() Dump the content of a basic component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<logical> extendedTrackingIsActive() Return true if the extendedTracking implementation of the basic component is the active choice.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a nonEvolving member of the basic component.

<double precision> mass() Get the mass property of an nonEvolving implementation of the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> massAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the mass property

<double precision> massBertschinger() Returns the default value for the massBertschinger property for the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> massBertschingerAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the massBertschinger property

<integer> massBertschingerCount() Compute the count of evolvable quantities in the massBertschinger property of the BasicStandardExtended component.

<logical> massBertschingerIsGettable() Returns true if the massBertschinger property is gettable for the basic component class.

<logical> massBertschingerIsSettable() Specify whether the massBertschinger property of the basic component is settable.

<void> massBertschingerRate(<double precision> value) Cumulate to the rate of the massBertschinger property of the BasicStandardExtended component.

<double precision> massBertschingerRateGet() Returns a zero rate for the massBertschinger property for the basic component class.

<void> massBertschingerScale(<double precision> value) Set the scale of the massBertschinger property of the BasicStandardExtended component.

<void> massBertschingerSet(<double precision> value) Set the massBertschinger property of the basic component.

<integer> massCount() Compute the count of evolvable quantities in the mass property of the BasicStandard component.

<logical> massIsGettable() Returns true if the mass property is gettable for the basic component class.

<logical> massIsSettable() Specify whether the mass property of the basic component is settable.

<double precision> massMaximum() Returns the default value for the massMaximum property for the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> massMaximumAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the massMaximum property

<logical> massMaximumIsGettable() Returns true if the massMaximum property is gettable for the basic component class.

<logical> massMaximumIsSettable() Specify whether the massMaximum property of the basic component is settable.

<double precision> massMaximumRateGet() Returns a zero rate for the massMaximum property for the basic component class.

<void> massMaximumSet(<double precision> value) Set the massMaximum property of the basic component.

<void> massRate(<double precision> value) Cumulate to the rate of the mass property of the BasicStandard component.

<double precision> massRateGet() Returns a zero rate for the mass property for the basic component class.

<void> massScale(<double precision> value) Set the scale of the mass property of the BasicStandard component.

<void> massSet(<double precision> setValue→) Set the mass property of an nonEvolving implementation of the basic component class.

<double precision> massTarget() Returns the default value for the massTarget property for the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> massTargetAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the massTarget property

<logical> massTargetIsGettable() Returns true if the massTarget property is gettable for the basic component class.

<logical> massTargetIsSettable() Specify whether the massTarget property of the basic component is settable.

<double precision> massTargetRateGet() Returns a zero rate for the massTarget property for the basic component class.

<void> massTargetSet(<double precision> value) Set the massTarget property of the basic component.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a nonEvolving implementation of the basic component class.

<logical> nonEvolvingIsActive() Return true if the nonEvolving implementation of the basic component is the active choice.

<logical> nullIsActive() Return true if the null implementation of the basic component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a basic component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a nonEvolving implementation of the basic component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Return the names of properties to output for a nonEvolving implementation of the basic component.

<void> postOutput(<double precision> time→) Perform post-output processing of a basic component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<double precision> radiusTurnaround() Returns the default value for the radiusTurnaround property for the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> radiusTurnaroundAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the radiusTurnaround property

<integer> radiusTurnaroundCount() Compute the count of evolvable quantities in the radiusTurnaround property of the BasicStandardExtended component.

<double precision> radiusTurnaroundGrowthRate() Returns the default value for the radiusTurnaroundGrowthRate property for the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> radiusTurnaroundGrowthRateAttributeMatch([requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the radiusTurnaroundGrowthRate property

<logical> radiusTurnaroundGrowthRateIsGettable() Returns true if the radiusTurnaroundGrowthRate property is gettable for the basic component class.

<logical> radiusTurnaroundGrowthRateIsSettable() Specify whether the radiusTurnaroundGrowthRate property of the basic component is settable.

<double precision> radiusTurnaroundGrowthRateRateGet() Returns a zero rate for the radiusTurnaroundGrowthRate property for the basic component class.

<void> radiusTurnaroundGrowthRateSet(<double precision> value) Set the radiusTurnaroundGrowthRate property of the basic component.

<logical> radiusTurnaroundIsGettable() Returns true if the radiusTurnaround property is gettable for the basic component class.

<logical> radiusTurnaroundIsSettable() Specify whether the radiusTurnaround property of the basic component is settable.

<void> radiusTurnaroundRate(<double precision> value) Cumulate to the rate of the radiusTurnaround property of the BasicStandardExtended component.

<double precision> radiusTurnaroundRateGet() Returns a zero rate for the radiusTurnaround property for the basic component class.

<void> radiusTurnaroundScale(<double precision> value) Set the scale of the radiusTurnaround property of the BasicStandardExtended component.

<void> radiusTurnaroundSet(<double precision> value) Set the radiusTurnaround property of the basic component.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→) Compute offsets into serialization arrays for a nonEvolving implementation of the basic component.

<void> serializeASCII() Serialize the contents of a nonEvolving implementation of the basic component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the serialization of a nonEvolving implementation of the basic component.

<void> serializeRaw(<integer> fileHandle→) Serialize the contents of a nonEvolving implementation of the basic component to raw (binary) file.

<void> serializeValues(<double precision[:]> array←, <integer> propertyType→) Serialize evolvable properties of a nonEvolving implementation of the basic component to array.

<void> serializeXML(<integer> fileHandle→) Serialize the contents of a nonEvolving implementation of the basic component to XML.

<integer(c_size_t)> sizeOf() Return the size in bytes of a nonEvolving implementation of the basic component.

<logical> standardExtendedIsActive() Return true if the standardExtended implementation of the basic component is the active choice.

<logical> standardIsActive() Return true if the standard implementation of the basic component is the active choice.

<logical> standardTrackingIsActive() Return true if the standardTracking implementation of the basic component is the active choice.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<double precision> time() Get the time property of an nonEvolving implementation of the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> timeAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the time property

<integer> timeCount() Return a count of the number of scalar properties in the time property of an nonEvolving implementation of the basic component class.

<void> timeInactive() Indicate that the time property of an nonEvolving implementation of the basic component class is inactive for differential equation solving.

<logical> timeIsGettable() Returns true if the time property is gettable for the basic component class.

<logical> timeIsSettable() Specify whether the time property of the basic component is settable.

<double precision> timeLastIsolated() Returns the default value for the timeLastIsolated property for the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> timeLastIsolatedAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the timeLastIsolated property

<logical> timeLastIsolatedIsGettable() Returns true if the timeLastIsolated property is gettable for the basic component class.

<logical> timeLastIsolatedIsSettable() Specify whether the timeLastIsolated property of the basic component is settable.

<double precision> timeLastIsolatedRateGet() Returns a zero rate for the timeLastIsolated property for the basic component class.

<void> timeLastIsolatedSet(<double precision> setValue→) Set the timeLastIsolated property of an nonEvolving implementation of the basic component class.

<void> timeRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate to the rate of change of the time property of an nonEvolving implementation of the basic component class.

<double precision> timeRateGet() Get the rate of change of the time property of an nonEvolving implementation of the basic component class.

<void> timeScale(<double precision> setValue→) Set the absolute scale of the time property of an nonEvolving implementation of the basic component class.

<void> timeSet(<double precision> setValue→) Set the time property of an nonEvolving implementation of the basic component class.

<type(varying_string)> type() Returns the type name for the nonEvolving implementation of the basic component class.

nodeComponentBasicNull

<double precision> accretionRate() Returns the default value for the accretionRate property for the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> accretionRateAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the accretionRate property

<double precision> accretionRateBertschinger() Returns the default value for the accretionRateBertschinger property for the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> accretionRateBertschingerAttributeMatch(< [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the accretionRateBertschinger property

<logical> accretionRateBertschingerIsGettable() Returns true if the accretionRateBertschinger property is gettable for the basic component class.

<logical> accretionRateBertschingerIsSettable() Specify whether the accretionRateBertschinger property of the basic component is settable.

<double precision> accretionRateBertschingerRateGet() Returns a zero rate for the accretionRateBertschinger property for the basic component class.

<void> accretionRateBertschingerSet(<double precision> value) Set the accretionRateBertschinger property of the basic component.

<logical> accretionRateIsGettable() Returns true if the accretionRate property is gettable for the basic component class.

<logical> accretionRateIsSettable() Specify whether the accretionRate property of the basic component is settable.

<double precision> accretionRateRateGet() Returns a zero rate for the accretionRate property for the basic component class.

<void> accretionRateSet(<double precision> value) Set the accretionRate property of the basic component.

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a null implementation of the basic component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a null implementation of the basic component from raw (binary) file.

<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→) Deserialize evolvable properties of a null implementation of the basic component from array.

<void> destroy() Finalize a null implementation of the basic component.

<void> dumpASCII() Dump the content of a basic component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<logical> extendedTrackingIsActive() Return true if the extendedTracking implementation of the basic component is the active choice.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a null member of the basic component.

<double precision> mass() Returns the default value for the mass property for the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> massAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the mass property

<double precision> massBertschinger() Returns the default value for the massBertschinger property for the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> massBertschingerAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the massBertschinger property

<integer> massBertschingerCount() Compute the count of evolvable quantities in the massBertschinger property of the BasicStandardExtended component.

<logical> massBertschingerIsGettable() Returns true if the massBertschinger property is gettable for the basic component class.

<logical> massBertschingerIsSettable() Specify whether the massBertschinger property of the basic component is settable.

<void> massBertschingerRate(<double precision> value) Cumulate to the rate of the massBertschinger property of the BasicStandardExtended component.

<double precision> massBertschingerRateGet() Returns a zero rate for the massBertschinger property for the basic component class.

<void> massBertschingerScale(<double precision> value) Set the scale of the massBertschinger property of the BasicStandardExtended component.

<void> massBertschingerSet(<double precision> value) Set the massBertschinger property of the basic component.

<integer> massCount() Compute the count of evolvable quantities in the mass property of the BasicStandard component.

<logical> massIsGettable() Returns true if the mass property is gettable for the basic component class.

<logical> massIsSettable() Specify whether the mass property of the basic component is settable.

<double precision> massMaximum() Returns the default value for the massMaximum property for the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> massMaximumAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the massMaximum property

<logical> massMaximumIsGettable() Returns true if the massMaximum property is gettable for the basic component class.

<logical> massMaximumIsSettable() Specify whether the massMaximum property of the basic component is settable.

<double precision> massMaximumRateGet() Returns a zero rate for the massMaximum property for the basic component class.

<void> massMaximumSet(<double precision> value) Set the massMaximum property of the basic component.

<void> massRate(<double precision> value) Cumulate to the rate of the mass property of the BasicStandard component.

<double precision> massRateGet() Returns a zero rate for the mass property for the basic component class.

<void> massScale(<double precision> value) Set the scale of the mass property of the BasicStandard component.

<void> massSet(<double precision> value) Set the mass property of the basic component.

<double precision> massTarget() Returns the default value for the massTarget property for the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> massTargetAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the massTarget property

<logical> massTargetIsGettable() Returns true if the massTarget property is gettable for the basic component class.

<logical> massTargetIsSettable() Specify whether the massTarget property of the basic component is settable.

<double precision> massTargetRateGet() Returns a zero rate for the massTarget property for the basic component class.

<void> massTargetSet(<double precision> value) Set the massTarget property of the basic component.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a null implementation of the basic component class.

<logical> nonEvolvingIsActive() Return true if the nonEvolving implementation of the basic component is the active choice.

<logical> nullIsActive() Return true if the null implementation of the basic component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a basic component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a null implementation of the basic component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Return the names of properties to output for a null implementation of the basic component.

<void> postOutput(<double precision> time→) Perform post-output processing of a basic component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<double precision> radiusTurnaround() Returns the default value for the radiusTurnaround property for the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> radiusTurnaroundAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the radiusTurnaround property

<integer> radiusTurnaroundCount() Compute the count of evolvable quantities in the radiusTurnaround property of the BasicStandardExtended component.

<double precision> radiusTurnaroundGrowthRate() Returns the default value for the radiusTurnaroundGrowthRate property for the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> radiusTurnaroundGrowthRateAttributeMatch([requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the radiusTurnaroundGrowthRate property

<logical> radiusTurnaroundGrowthRateIsGettable() Returns true if the radiusTurnaroundGrowthRate property is gettable for the basic component class.

<logical> radiusTurnaroundGrowthRateIsSettable() Specify whether the radiusTurnaroundGrowthRate property of the basic component is settable.

<double precision> radiusTurnaroundGrowthRateRateGet() Returns a zero rate for the radiusTurnaroundGrowthRate property for the basic component class.

<void> radiusTurnaroundGrowthRateSet(<double precision> value) Set the radiusTurnaroundGrowthRate property of the basic component.

<logical> radiusTurnaroundIsGettable() Returns true if the radiusTurnaround property is gettable for the basic component class.

<logical> radiusTurnaroundIsSettable() Specify whether the radiusTurnaround property of the basic component is settable.

<void> radiusTurnaroundRate(<double precision> value) Cumulate to the rate of the radiusTurnaround property of the BasicStandardExtended component.

<double precision> radiusTurnaroundRateGet() Returns a zero rate for the radiusTurnaround property for the basic component class.

<void> radiusTurnaroundScale(<double precision> value) Set the scale of the radiusTurnaround property of the BasicStandardExtended component.

<void> radiusTurnaroundSet(<double precision> value) Set the radiusTurnaround property of the basic component.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→) Compute offsets into serialization arrays for a null implementation of the basic component.

<void> serializeASCII() Serialize the contents of a null implementation of the basic component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the serialization of a null implementation of the basic component.

<void> serializeRaw(<integer> fileHandle→) Serialize the contents of a null implementation of the basic component to raw (binary) file.

<void> serializeValues(<double precision[:]> array←, <integer> propertyType→) Serialize evolvable properties of a null implementation of the basic component to array.

<void> serializeXML(<integer> fileHandle→) Serialize the contents of a null implementation of the basic component to XML.

<integer(c_size_t)> sizeOf() Return the size in bytes of a null implementation of the basic component.

<logical> standardExtendedIsActive() Return true if the standardExtended implementation of the basic component is the active choice.

<logical> standardIsActive() Return true if the standard implementation of the basic component is the active choice.

<logical> standardTrackingIsActive() Return true if the standardTracking implementation of the basic component is the active choice.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<double precision> time() Returns the default value for the time property for the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> timeAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the time property

<integer> timeCount() Compute the count of evolvable quantities in the time property of the BasicNonEvolving component.

<logical> timeIsGettable() Returns true if the time property is gettable for the basic component class.

<logical> timeIsSettable() Specify whether the time property of the basic component is settable.

<double precision> timeLastIsolated() Returns the default value for the timeLastIsolated property for the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> timeLastIsolatedAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the timeLastIsolated property

<logical> timeLastIsolatedIsGettable() Returns true if the timeLastIsolated property is gettable for the basic component class.

<logical> timeLastIsolatedIsSettable() Specify whether the timeLastIsolated property of the basic component is settable.

<double precision> timeLastIsolatedRateGet() Returns a zero rate for the timeLastIsolated property for the basic component class.

<void> timeLastIsolatedSet(<double precision> value) Set the timeLastIsolated property of the basic component.

<void> timeRate(<double precision> value) Cumulate to the rate of the time property of the BasicNonEvolving component.

<double precision> timeRateGet() Returns a zero rate for the time property for the basic component class.

<void> timeScale(<double precision> value) Set the scale of the time property of the BasicNonEvolving component.

<void> timeSet(<double precision> value) Set the time property of the basic component.

<type(varying_string)> type() Returns the type name for the null implementation of the basic component class.

nodeComponentBasicStandard

<double precision> accretionRate() Get the accretionRate property of an standard implementation of the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> accretionRateAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the accretionRate property

<double precision> accretionRateBertschinger() Returns the default value for the accretionRateBertschinger property for the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> accretionRateBertschingerAttributeMatch(< [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the accretionRateBertschinger property

<logical> accretionRateBertschingerIsGettable() Returns true if the accretionRateBertschinger property is gettable for the basic component class.

<logical> accretionRateBertschingerIsSettable() Specify whether the accretionRateBertschinger property of the basic component is settable.

<double precision> accretionRateBertschingerRateGet() Returns a zero rate for the accretionRateBertschinger property for the basic component class.

<void> accretionRateBertschingerSet(<double precision> value) Set the accretionRateBertschinger property of the basic component.

<logical> accretionRateIsGettable() Returns true if the accretionRate property is gettable for the basic component class.

<logical> accretionRateIsSettable() Specify whether the accretionRate property of the basic component is settable.

<double precision> accretionRateRateGet() Returns a zero rate for the accretionRate property for the basic component class.

<void> accretionRateSet(<double precision> setValue→) Set the accretionRate property of an standard implementation of the basic component class.

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a standard implementation of the basic component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a standard implementation of the basic component from raw (binary) file.

<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→) Deserialize evolvable properties of a standard implementation of the basic component from array.

<void> destroy() Finalize a standard implementation of the basic component.

<void> dumpASCII() Dump the content of a basic component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<logical> extendedTrackingIsActive() Return true if the extendedTracking implementation of the basic component is the active choice.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a standard member of the basic component.

<double precision> mass() Get the mass property of an standard implementation of the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> massAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the mass property

<double precision> massBertschinger() Returns the default value for the massBertschinger property for the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> massBertschingerAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the massBertschinger property

<integer> massBertschingerCount() Compute the count of evolvable quantities in the massBertschinger property of the BasicStandardExtended component.

<logical> massBertschingerIsGettable() Returns true if the massBertschinger property is gettable for the basic component class.

<logical> massBertschingerIsSettable() Specify whether the massBertschinger property of the basic component is settable.

<void> massBertschingerRate(<double precision> value) Cumulate to the rate of the massBertschinger property of the BasicStandardExtended component.

<double precision> massBertschingerRateGet() Returns a zero rate for the massBertschinger property for the basic component class.

<void> massBertschingerScale(<double precision> value) Set the scale of the massBertschinger property of the BasicStandardExtended component.

<void> massBertschingerSet(<double precision> value) Set the massBertschinger property of the basic component.

<integer> massCount() Return a count of the number of scalar properties in the mass property of an standard implementation of the basic component class.

<void> massInactive() Indicate that the mass property of an standard implementation of the basic component class is inactive for differential equation solving.

<logical> massIsGettable() Returns true if the mass property is gettable for the basic component class.

<logical> massIsSettable() Specify whether the mass property of the basic component is settable.

<double precision> massMaximum() Returns the default value for the massMaximum property for the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> massMaximumAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the massMaximum property

<logical> massMaximumIsGettable() Returns true if the massMaximum property is gettable for the basic component class.

<logical> massMaximumIsSettable() Specify whether the massMaximum property of the basic component is settable.

<double precision> massMaximumRateGet() Returns a zero rate for the massMaximum property for the basic component class.

<void> massMaximumSet(<double precision> value) Set the massMaximum property of the basic component.

<void> massRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate to the rate of change of the mass property of an standard implementation of the basic component class.

<double precision> massRateGet() Get the rate of change of the mass property of an standard implementation of the basic component class.

<void> massScale(<double precision> setValue→) Set the absolute scale of the mass property of an standard implementation of the basic component class.

<void> massSet(<double precision> setValue→) Set the mass property of an standard implementation of the basic component class.

<double precision> massTarget() Get the massTarget property of an standard implementation of the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> massTargetAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the massTarget property

<logical> massTargetIsGettable() Returns true if the massTarget property is gettable for the basic component class.

<logical> massTargetIsSettable() Specify whether the massTarget property of the basic component is settable.

<double precision> massTargetRateGet() Returns a zero rate for the massTarget property for the basic component class.

<void> massTargetSet(<double precision> setValue→) Set the massTarget property of an standard implementation of the basic component class.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a standard implementation of the basic component class.

<logical> nonEvolvingIsActive() Return true if the nonEvolving implementation of the basic component is the active choice.

<logical> nullIsActive() Return true if the null implementation of the basic component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a basic component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a standard implementation of the basic component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Return the names of properties to output for a standard implementation of the basic component.

<void> postOutput(<double precision> time→) Perform post-output processing of a basic component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<double precision> radiusTurnaround() Returns the default value for the radiusTurnaround property for the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> radiusTurnaroundAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the radiusTurnaround property

<integer> radiusTurnaroundCount() Compute the count of evolvable quantities in the radiusTurnaround property of the BasicStandardExtended component.

<double precision> radiusTurnaroundGrowthRate() Returns the default value for the radiusTurnaroundGrowthRate property for the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> radiusTurnaroundGrowthRateAttributeMatch([requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the radiusTurnaroundGrowthRate property

<logical> radiusTurnaroundGrowthRateIsGettable() Returns true if the radiusTurnaroundGrowthRate property is gettable for the basic component class.

<logical> radiusTurnaroundGrowthRateIsSettable() Specify whether the radiusTurnaroundGrowthRate property of the basic component is settable.

<double precision> radiusTurnaroundGrowthRateRateGet() Returns a zero rate for the radiusTurnaroundGrowthRate property for the basic component class.

<void> radiusTurnaroundGrowthRateSet(<double precision> value) Set the radiusTurnaroundGrowthRate property of the basic component.

<logical> radiusTurnaroundIsGettable() Returns true if the radiusTurnaround property is gettable for the basic component class.

<logical> radiusTurnaroundIsSettable() Specify whether the radiusTurnaround property of the basic component is settable.

<void> radiusTurnaroundRate(<double precision> value) Cumulate to the rate of the radiusTurnaround property of the BasicStandardExtended component.

<double precision> radiusTurnaroundRateGet() Returns a zero rate for the radiusTurnaround property for the basic component class.

<void> radiusTurnaroundScale(<double precision> value) Set the scale of the radiusTurnaround property of the BasicStandardExtended component.

<void> radiusTurnaroundSet(<double precision> value) Set the radiusTurnaround property of the basic component.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→) Compute offsets into serialization arrays for a standard implementation of the basic component.

<void> serializeASCII() Serialize the contents of a standard implementation of the basic component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the serialization of a standard implementation of the basic component.

<void> serializeRaw(<integer> fileHandle→) Serialize the contents of a standard implementation of the basic component to raw (binary) file.

<void> serializeValues(<double precision[:]> array←, <integer> propertyType→) Serialize evolvable properties of a standard implementation of the basic component to array.

<void> serializeXML(<integer> fileHandle→) Serialize the contents of a standard implementation of the basic component to XML.

<integer(c_size_t)> sizeOf() Return the size in bytes of a standard implementation of the basic component.

<logical> standardExtendedIsActive() Return true if the standardExtended implementation of the basic component is the active choice.

<logical> standardIsActive() Return true if the standard implementation of the basic component is the active choice.

<logical> standardTrackingIsActive() Return true if the standardTracking implementation of the basic component is the active choice.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<double precision> time() Get the time property of an standard implementation of the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> timeAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the time property

<integer> timeCount() Return a count of the number of scalar properties in the time property of an standard implementation of the basic component class.

<void> timeInactive() Indicate that the time property of an standard implementation of the basic component class is inactive for differential equation solving.

<logical> timeIsGettable() Returns true if the time property is gettable for the basic component class.

<logical> timeIsSettable() Specify whether the time property of the basic component is settable.

<double precision> timeLastIsolated() Returns the default value for the timeLastIsolated property for the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> timeLastIsolatedAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the timeLastIsolated property

<logical> timeLastIsolatedIsGettable() Returns true if the timeLastIsolated property is gettable for the basic component class.

<logical> timeLastIsolatedIsSettable() Specify whether the timeLastIsolated property of the basic component is settable.

<double precision> timeLastIsolatedRateGet() Returns a zero rate for the timeLastIsolated property for the basic component class.

<void> timeLastIsolatedSet(<double precision> setValue→) Set the timeLastIsolated property of an standard implementation of the basic component class.

<void> timeRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate to the rate of change of the time property of an standard implementation of the basic component class.

<double precision> timeRateGet() Get the rate of change of the time property of an standard implementation of the basic component class.

<void> timeScale(<double precision> setValue→) Set the absolute scale of the time property of an standard implementation of the basic component class.

<void> timeSet(<double precision> setValue→) Set the time property of an standard implementation of the basic component class.

<type(varying_string)> type() Returns the type name for the standard implementation of the basic component class.

nodeComponentBasicStandardExtended

<double precision> accretionRate() Get the accretionRate property of an standard implementation of the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> accretionRateAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the accretionRate property

<double precision> accretionRateBertschinger() Get the accretionRateBertschinger property of an standardExtended implementation of the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> accretionRateBertschingerAttributeMatch(< [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the accretionRateBertschinger property

<logical> accretionRateBertschingerIsGettable() Returns true if the accretionRateBertschinger property is gettable for the basic component class.

<logical> accretionRateBertschingerIsSettable() Specify whether the accretionRateBertschinger property of the basic component is settable.

<double precision> accretionRateBertschingerRateGet() Returns a zero rate for the accretionRateBertschinger property for the basic component class.

<void> accretionRateBertschingerSet(<double precision> setValue→) Set the accretionRateBertschinger property of an standardExtended implementation of the basic component class.

<logical> accretionRateIsGettable() Returns true if the accretionRate property is gettable for the basic component class.

<logical> accretionRateIsSettable() Specify whether the accretionRate property of the basic component is settable.

<double precision> accretionRateRateGet() Returns a zero rate for the accretionRate property for the basic component class.

<void> accretionRateSet(<double precision> setValue→) Set the accretionRate property of an standard implementation of the basic component class.

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a standardExtended implementation of the basic component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a standardExtended implementation of the basic component from raw (binary) file.

<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→) Deserialize evolvable properties of a standardExtended implementation of the basic component from array.

<void> destroy() Finalize a standardExtended implementation of the basic component.

<void> dumpASCII() Dump the content of a basic component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<logical> extendedTrackingIsActive() Return true if the extendedTracking implementation of the basic component is the active choice.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a standardExtended member of the basic component.

<double precision> mass() Get the mass property of an standard implementation of the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> massAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the mass property

<double precision> massBertschinger() Get the value of the massBertschinger property of the standardExtended implementation of the basic component using a deferred function.

<type(varying_string), allocatable, dimension(:) => matches> massBertschingerAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the massBertschinger property

<integer> massBertschingerCount() Return a count of the number of scalar properties in the massBertschinger property of an standardExtended implementation of the basic component class.

<void> massBertschingerFunction() Set the function to be used for the get method of the massBertschinger property of the BasicStandardExtended component.

<void> massBertschingerInactive() Indicate that the massBertschinger property of an standardExtended implementation of the basic component class is inactive for differential equation solving.

<logical> massBertschingerIsAttached() Return true if the deferred function used to get the massBertschinger property of the BasicStandardExtended component class has been attached.

<logical> massBertschingerIsGettable() Returns true if the massBertschinger property is gettable for the basic component class.

<logical> massBertschingerIsSettable() Specify whether the massBertschinger property of the basic component is settable.

<void> massBertschingerRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interru [interruptProcedure]↔) Accumulate to the rate of change of the massBertschinger property of an standardExtended implementation of the basic component class.

<double precision> massBertschingerRateGet() Get the rate of change of the massBertschinger property of an standardExtended implementation of the basic component class.

<void> massBertschingerScale(<double precision> setValue→) Set the absolute scale of the massBertschinger property of an standardExtended implementation of the basic component class.

<void> massBertschingerSet(<double precision> setValue→) Set the massBertschinger property of an standardExtended implementation of the basic component class.

<double precision> massBertschingerValue() Get the massBertschinger property of an standardExtended implementation of the basic component class.

<integer> massCount() Return a count of the number of scalar properties in the mass property of an standard implementation of the basic component class.

<void> massInactive() Indicate that the mass property of an standard implementation of the basic component class is inactive for differential equation solving.

<logical> massIsGettable() Returns true if the mass property is gettable for the basic component class.

<logical> massIsSettable() Specify whether the mass property of the basic component is settable.

<double precision> massMaximum() Returns the default value for the massMaximum property for the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> massMaximumAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the massMaximum property

<logical> massMaximumIsGettable() Returns true if the massMaximum property is gettable for the basic component class.

<logical> massMaximumIsSettable() Specify whether the massMaximum property of the basic component is settable.

<double precision> massMaximumRateGet() Returns a zero rate for the massMaximum property for the basic component class.

<void> massMaximumSet(<double precision> value) Set the massMaximum property of the basic component.

<void> massRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate to the rate of change of the mass property of an standard implementation of the basic component class.

<double precision> massRateGet() Get the rate of change of the mass property of an standard implementation of the basic component class.

<void> massScale(<double precision> setValue→) Set the absolute scale of the mass property of an standard implementation of the basic component class.

<void> massSet(<double precision> setValue→) Set the mass property of an standard implementation of the basic component class.

<double precision> massTarget() Get the massTarget property of an standard implementation of the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> massTargetAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the massTarget property

<logical> massTargetIsGettable() Returns true if the massTarget property is gettable for the basic component class.

<logical> massTargetIsSettable() Specify whether the massTarget property of the basic component is settable.

<double precision> massTargetRateGet() Returns a zero rate for the massTarget property for the basic component class.

<void> massTargetSet(<double precision> setValue→) Set the massTarget property of an standard implementation of the basic component class.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a standardExtended implementation of the basic component class.

<logical> nonEvolvingIsActive() Return true if the nonEvolving implementation of the basic component is the active choice.

<logical> nullIsActive() Return true if the null implementation of the basic component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a basic component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a standardExtended implementation of the basic component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Return the names of properties to output for a standardExtended implementation of the basic component.

<void> postOutput(<double precision> time→) Perform post-output processing for a standardExtended implementation of the basic component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<double precision> radiusTurnaround() Get the value of the radiusTurnaround property of the standardExtended implementation of the basic component using a deferred function.

<type(varying_string), allocatable, dimension(:) => matches> radiusTurnaroundAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the radiusTurnaround property

<integer> radiusTurnaroundCount() Return a count of the number of scalar properties in the radiusTurnaround property of an standardExtended implementation of the basic component class.

<void> radiusTurnaroundFunction() Set the function to be used for the get method of the radiusTurnaround property of the BasicStandardExtended component.

<double precision> radiusTurnaroundGrowthRate() Get the radiusTurnaroundGrowthRate property of an standardExtended implementation of the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> radiusTurnaroundGrowthRateAttributeMatch([requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the radiusTurnaroundGrowthRate property

<logical> radiusTurnaroundGrowthRateIsGettable() Returns true if the radiusTurnaroundGrowthRate property is gettable for the basic component class.

<logical> radiusTurnaroundGrowthRateIsSettable() Specify whether the radiusTurnaroundGrowthRate property of the basic component is settable.

<double precision> radiusTurnaroundGrowthRateRateGet() Returns a zero rate for the radiusTurnaroundGrowthRate property for the basic component class.

<void> radiusTurnaroundGrowthRateSet(<double precision> setValue→) Set the radiusTurnaroundGrowthRate property of an standardExtended implementation of the basic component class.

<void> radiusTurnaroundInactive() Indicate that the radiusTurnaround property of an standardExtended implementation of the basic component class is inactive for differential equation solving.

<logical> radiusTurnaroundIsAttached() Return true if the deferred function used to get the radiusTurnaround property of the BasicStandardExtended component class has been attached.

<logical> radiusTurnaroundIsGettable() Returns true if the radiusTurnaround property is gettable for the basic component class.

<logical> radiusTurnaroundIsSettable() Specify whether the radiusTurnaround property of the basic component is settable.

<void> radiusTurnaroundRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interru [interruptProcedure]↔) Accumulate to the rate of change of the radiusTurnaround property of an standardExtended implementation of the basic component class.

<double precision> radiusTurnaroundRateGet() Get the rate of change of the radiusTurnaround property of an standardExtended implementation of the basic component class.

<void> radiusTurnaroundScale(<double precision> setValue→) Set the absolute scale of the radiusTurnaround property of an standardExtended implementation of the basic component class.

<void> radiusTurnaroundSet(<double precision> setValue→) Set the radiusTurnaround property of an standardExtended implementation of the basic component class.

<double precision> radiusTurnaroundValue() Get the radiusTurnaround property of an standardExtended implementation of the basic component class.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→) Compute offsets into serialization arrays for a standardExtended implementation of the basic component.

<void> serializeASCII() Serialize the contents of a standardExtended implementation of the basic component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the serialization of a standardExtended implementation of the basic component.

<void> serializeRaw(<integer> fileHandle→) Serialize the contents of a standardExtended implementation of the basic component to raw (binary) file.

<void> serializeValues(<double precision[:]> array←, <integer> propertyType→) Serialize evolvable properties of a standardExtended implementation of the basic component to array.

<void> serializeXML(<integer> fileHandle→) Serialize the contents of a standardExtended implementation of the basic component to XML.

<integer(c_size_t)> sizeOf() Return the size in bytes of a standardExtended implementation of the basic component.

<logical> standardExtendedIsActive() Return true if the standardExtended implementation of the basic component is the active choice.

<logical> standardIsActive() Return true if the standard implementation of the basic component is the active choice.

<logical> standardTrackingIsActive() Return true if the standardTracking implementation of the basic component is the active choice.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<double precision> time() Get the time property of an standard implementation of the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> timeAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the time property

<integer> timeCount() Return a count of the number of scalar properties in the time property of an standard implementation of the basic component class.

<void> timeInactive() Indicate that the time property of an standard implementation of the basic component class is inactive for differential equation solving.

<logical> timeIsGettable() Returns true if the time property is gettable for the basic component class.

<logical> timeIsSettable() Specify whether the time property of the basic component is settable.

<double precision> timeLastIsolated() Returns the default value for the timeLastIsolated property for the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> timeLastIsolatedAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the timeLastIsolated property

<logical> timeLastIsolatedIsGettable() Returns true if the timeLastIsolated property is gettable for the basic component class.

<logical> timeLastIsolatedIsSettable() Specify whether the timeLastIsolated property of the basic component is settable.

<double precision> timeLastIsolatedRateGet() Returns a zero rate for the timeLastIsolated property for the basic component class.

<void> timeLastIsolatedSet(<double precision> setValue→) Set the timeLastIsolated property of an standard implementation of the basic component class.

<void> timeRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate to the rate of change of the time property of an standard implementation of the basic component class.

<double precision> timeRateGet() Get the rate of change of the time property of an standard implementation of the basic component class.

<void> timeScale(<double precision> setValue→) Set the absolute scale of the time property of an standard implementation of the basic component class.

<void> timeSet(<double precision> setValue→) Set the time property of an standard implementation of the basic component class.

<type(varying_string)> type() Returns the type name for the standardExtended implementation of the basic component class.

nodeComponentBasicStandardTracking

<double precision> accretionRate() Get the accretionRate property of an standard implementation of the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> accretionRateAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the accretionRate property

<double precision> accretionRateBertschinger() Returns the default value for the accretionRateBertschinger property for the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> accretionRateBertschingerAttributeMatch(< [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the accretionRateBertschinger property

<logical> accretionRateBertschingerIsGettable() Returns true if the accretionRateBertschinger property is gettable for the basic component class.

<logical> accretionRateBertschingerIsSettable() Specify whether the accretionRateBertschinger property of the basic component is settable.

<double precision> accretionRateBertschingerRateGet() Returns a zero rate for the accretionRateBertschinger property for the basic component class.

<void> accretionRateBertschingerSet(<double precision> value) Set the accretionRateBertschinger property of the basic component.

<logical> accretionRateIsGettable() Returns true if the accretionRate property is gettable for the basic component class.

<logical> accretionRateIsSettable() Specify whether the accretionRate property of the basic component is settable.

<double precision> accretionRateRateGet() Returns a zero rate for the accretionRate property for the basic component class.

<void> accretionRateSet(<double precision> setValue→) Set the accretionRate property of an standard implementation of the basic component class.

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a standardTracking implementation of the basic component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a standardTracking implementation of the basic component from raw (binary) file.

<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→) Deserialize evolvable properties of a standardTracking implementation of the basic component from array.

<void> destroy() Finalize a standardTracking implementation of the basic component.

<void> dumpASCII() Dump the content of a basic component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<logical> extendedTrackingIsActive() Return true if the extendedTracking implementation of the basic component is the active choice.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a standardTracking member of the basic component.

<double precision> mass() Get the mass property of an standard implementation of the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> massAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the mass property

<double precision> massBertschinger() Returns the default value for the massBertschinger property for the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> massBertschingerAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the massBertschinger property

<integer> massBertschingerCount() Compute the count of evolvable quantities in the massBertschinger property of the BasicStandardExtended component.

<logical> massBertschingerIsGettable() Returns true if the massBertschinger property is gettable for the basic component class.

<logical> massBertschingerIsSettable() Specify whether the massBertschinger property of the basic component is settable.

<void> massBertschingerRate(<double precision> value) Cumulate to the rate of the massBertschinger property of the BasicStandardExtended component.

<double precision> massBertschingerRateGet() Returns a zero rate for the massBertschinger property for the basic component class.

<void> massBertschingerScale(<double precision> value) Set the scale of the massBertschinger property of the BasicStandardExtended component.

<void> massBertschingerSet(<double precision> value) Set the massBertschinger property of the basic component.

<integer> massCount() Return a count of the number of scalar properties in the mass property of an standard implementation of the basic component class.

<void> massInactive() Indicate that the mass property of an standard implementation of the basic component class is inactive for differential equation solving.

<logical> massIsGettable() Returns true if the mass property is gettable for the basic component class.

<logical> massIsSettable() Specify whether the mass property of the basic component is settable.

<double precision> massMaximum() Get the massMaximum property of an standardTracking implementation of the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> massMaximumAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the massMaximum property

<logical> massMaximumIsGettable() Returns true if the massMaximum property is gettable for the basic component class.

<logical> massMaximumIsSettable() Specify whether the massMaximum property of the basic component is settable.

<double precision> massMaximumRateGet() Returns a zero rate for the massMaximum property for the basic component class.

<void> massMaximumSet(<double precision> setValue→) Set the massMaximum property of an standardTracking implementation of the basic component class.

<void> massRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate to the rate of change of the mass property of an standard implementation of the basic component class.

<double precision> massRateGet() Get the rate of change of the mass property of an standard implementation of the basic component class.

<void> massScale(<double precision> setValue→) Set the absolute scale of the mass property of an standard implementation of the basic component class.

<void> massSet(<double precision> setValue→) Set the mass property of an standard implementation of the basic component class.

<double precision> massTarget() Get the massTarget property of an standard implementation of the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> massTargetAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the massTarget property

<logical> massTargetIsGettable() Returns true if the massTarget property is gettable for the basic component class.

<logical> massTargetIsSettable() Specify whether the massTarget property of the basic component is settable.

<double precision> massTargetRateGet() Returns a zero rate for the massTarget property for the basic component class.

<void> massTargetSet(<double precision> setValue→) Set the massTarget property of an standard implementation of the basic component class.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a standardTracking implementation of the basic component class.

<logical> nonEvolvingIsActive() Return true if the nonEvolving implementation of the basic component is the active choice.

<logical> nullIsActive() Return true if the null implementation of the basic component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a basic component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a standardTracking implementation of the basic component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Return the names of properties to output for a standardTracking implementation of the basic component.

<void> postOutput(<double precision> time→) Perform post-output processing for a standardTracking implementation of the basic component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<double precision> radiusTurnaround() Returns the default value for the radiusTurnaround property for the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> radiusTurnaroundAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the radiusTurnaround property

<integer> radiusTurnaroundCount() Compute the count of evolvable quantities in the radiusTurnaround property of the BasicStandardExtended component.

<double precision> radiusTurnaroundGrowthRate() Returns the default value for the radiusTurnaroundGrowthRate property for the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> radiusTurnaroundGrowthRateAttributeMatch([requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the radiusTurnaroundGrowthRate property

<logical> radiusTurnaroundGrowthRateIsGettable() Returns true if the radiusTurnaroundGrowthRate property is gettable for the basic component class.

<logical> radiusTurnaroundGrowthRateIsSettable() Specify whether the radiusTurnaroundGrowthRate property of the basic component is settable.

<double precision> radiusTurnaroundGrowthRateRateGet() Returns a zero rate for the radiusTurnaroundGrowthRate property for the basic component class.

<void> radiusTurnaroundGrowthRateSet(<double precision> value) Set the radiusTurnaroundGrowthRate property of the basic component.

<logical> radiusTurnaroundIsGettable() Returns true if the radiusTurnaround property is gettable for the basic component class.

<logical> radiusTurnaroundIsSettable() Specify whether the radiusTurnaround property of the basic component is settable.

<void> radiusTurnaroundRate(<double precision> value) Cumulate to the rate of the radiusTurnaround property of the BasicStandardExtended component.

<double precision> radiusTurnaroundRateGet() Returns a zero rate for the radiusTurnaround property for the basic component class.

<void> radiusTurnaroundScale(<double precision> value) Set the scale of the radiusTurnaround property of the BasicStandardExtended component.

<void> radiusTurnaroundSet(<double precision> value) Set the radiusTurnaround property of the basic component.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→) Compute offsets into serialization arrays for a standardTracking implementation of the basic component.

<void> serializeASCII() Serialize the contents of a standardTracking implementation of the basic component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the serialization of a standardTracking implementation of the basic component.

<void> serializeRaw(<integer> fileHandle→) Serialize the contents of a standardTracking implementation of the basic component to raw (binary) file.

<void> serializeValues(<double precision[:]> array←, <integer> propertyType→) Serialize evolvable properties of a standardTracking implementation of the basic component to array.

<void> serializeXML(<integer> fileHandle→) Serialize the contents of a standardTracking implementation of the basic component to XML.

<integer(c_size_t)> sizeOf() Return the size in bytes of a standardTracking implementation of the basic component.

<logical> standardExtendedIsActive() Return true if the standardExtended implementation of the basic component is the active choice.

<logical> standardIsActive() Return true if the standard implementation of the basic component is the active choice.

<logical> standardTrackingIsActive() Return true if the standardTracking implementation of the basic component is the active choice.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<double precision> time() Get the time property of an standard implementation of the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> timeAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the time property

<integer> timeCount() Return a count of the number of scalar properties in the time property of an standard implementation of the basic component class.

<void> timeInactive() Indicate that the time property of an standard implementation of the basic component class is inactive for differential equation solving.

<logical> timeIsGettable() Returns true if the time property is gettable for the basic component class.

<logical> timeIsSettable() Specify whether the time property of the basic component is settable.

<double precision> timeLastIsolated() Returns the default value for the timeLastIsolated property for the basic component class.

<type(varying_string), allocatable, dimension(:) => matches> timeLastIsolatedAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the basic class that have the desired attributes for the timeLastIsolated property

<logical> timeLastIsolatedIsGettable() Returns true if the timeLastIsolated property is gettable for the basic component class.

<logical> timeLastIsolatedIsSettable() Specify whether the timeLastIsolated property of the basic component is settable.

<double precision> timeLastIsolatedRateGet() Returns a zero rate for the timeLastIsolated property for the basic component class.

<void> timeLastIsolatedSet(<double precision> setValue→) Set the timeLastIsolated property of an standard implementation of the basic component class.

<void> timeRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate to the rate of change of the time property of an standard implementation of the basic component class.

<double precision> timeRateGet() Get the rate of change of the time property of an standard implementation of the basic component class.

<void> timeScale(<double precision> setValue→) Set the absolute scale of the time property of an standard implementation of the basic component class.

<void> timeSet(<double precision> setValue→) Set the time property of an standard implementation of the basic component class.

<type(varying_string)> type() Returns the type name for the standardTracking implementation of the basic component class.

nodeComponentBlackHole

<double precision> accretionRate() Returns the default value for the accretionRate property for the blackHole component class.

<type(varying_string), allocatable, dimension(:) => matches> accretionRateAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the blackHole class that have the desired attributes for the accretionRate property

<logical> accretionRateIsGettable() Returns true if the accretionRate property is gettable for the blackHole component class.

<logical> accretionRateIsSettable() Specify whether the accretionRate property of the blackHole component is settable.

<double precision> accretionRateRateGet() Returns a zero rate for the accretionRate property for the blackHole component class.

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a generic blackHole component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Read properties from raw file.

<void> deserializeValues(<double(:)> array→, <integer> propertyType→) Deserialize the evolvable quantities from an array.

<void> destroy() Finalize a generic blackHole component.

<void> dumpASCII() Dump the content of a blackHole component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a generic blackHole component.

<double precision> mass() Returns the default value for the mass property for the blackHole component class.

<type(varying_string), allocatable, dimension(:) => matches> massAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the blackHole class that have the desired attributes for the mass property

<integer> massCount() Compute the count of evolvable quantities in the mass property of the BlackHoleSimple component.

<logical> massIsGettable() Returns true if the mass property is gettable for the blackHole component class.

<logical> massIsSettable() Specify whether the mass property of the blackHole component is settable.

<void> massRate(<double precision> value) Cumulate to the rate of the mass property of the BlackHoleSimple component.

<double precision> massRateGet() Returns a zero rate for the mass property for the blackHole component class.

<void> massScale(<double precision> value) Set the scale of the mass property of the BlackHoleSimple component.

<double precision> massSeed() Returns the default value for the massSeed property for the blackHole component class.

<type(varying_string), allocatable, dimension(:) => matches> massSeedAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the blackHole class that have the desired attributes for the massSeed property

<logical> massSeedIsGettable() Returns true if the massSeed property is gettable for the blackHole component class.

<logical> massSeedIsSettable() Specify whether the massSeed property of the blackHole component is settable.

<double precision> massSeedRateGet() Returns a zero rate for the massSeed property for the blackHole component class.

<void> massSet(<double precision> value) Set the mass property of the blackHole component.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a nodeComponent object.

<logical> nonCentralIsActive() Return true if the nonCentral implementation of the blackHole component is the active choice.

<logical> nullIsActive() Return true if the null implementation of the blackHole component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a blackHole component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a generic blackHole component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Establish the names of properties to output for a generic blackHole component.

<void> postOutput(<double precision> time→) Perform post-output processing of a blackHole component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<double precision> radialPosition() Returns the default value for the radialPosition property for the blackHole component class.

<type(varying_string), allocatable, dimension(:) => matches> radialPositionAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the blackHole class that have the desired attributes for the radialPosition property

<integer> radialPositionCount() Compute the count of evolvable quantities in the radialPosition property of the BlackHoleNonCentral component.

<logical> radialPositionIsGettable() Returns true if the radialPosition property is gettable for the blackHole component class.

<logical> radialPositionIsSettable() Specify whether the radialPosition property of the blackHole component is settable.

<void> radialPositionRate(<double precision> value) Cumulate to the rate of the radialPosition property of the BlackHoleNonCentral component.

<double precision> radialPositionRateGet() Returns a zero rate for the radialPosition property for the blackHole component class.

<void> radialPositionScale(<double precision> value) Set the scale of the radialPosition property of the BlackHoleNonCentral component.

<void> radialPositionSet(<double precision> value) Set the radialPosition property of the blackHole component.

<double precision> radiativeEfficiency() Returns the default value for the radiativeEfficiency property for the blackHole component class.

<type(varying_string), allocatable, dimension(:) => matches> radiativeEfficiencyAttributeMatch(<logica [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the blackHole class that have the desired attributes for the radiativeEfficiency property

<logical> radiativeEfficiencyIsGettable() Returns true if the radiativeEfficiency property is gettable for the blackHole component class.

<logical> radiativeEfficiencyIsSettable() Specify whether the radiativeEfficiency property of the blackHole component is settable.

<double precision> radiativeEfficiencyRateGet() Returns a zero rate for the radiativeEfficiency property for the blackHole component class.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets() Set offsets into serialization arrays.

<void> serializeASCII() Serialize the content of a blackHole component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the number of evolvable quantities to be evolved.

<void> serializeRaw(<integer> fileHandle→) Generate a binary dump of all properties.

<void> serializeValues(<double(:)> array←, <integer> propertyType→) Serialize the evolvable quantities to an array.

<void> serializeXML() Generate an XML dump of all properties.

<logical> simpleIsActive() Return true if the simple implementation of the blackHole component is the active choice.

<integer(c_size_t)> sizeOf() Return the size in bytes of a nodeComponentBlackHole component.

<double precision> spin() Returns the default value for the spin property for the blackHole component class.

<type(varying_string), allocatable, dimension(:) => matches> spinAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the blackHole class that have the desired attributes for the spin property

<integer> spinCount() Compute the count of evolvable quantities in the spin property of the BlackHoleStandard component.

<logical> spinIsGettable() Returns true if the spin property is gettable for the blackHole component class.

<logical> spinIsSettable() Specify whether the spin property of the blackHole component is settable.

<void> spinRate(<double precision> value) Cumulate to the rate of the spin property of the BlackHoleStandard component.

<double precision> spinRateGet() Returns a zero rate for the spin property for the blackHole component class.

<void> spinScale(<double precision> value) Set the scale of the spin property of the BlackHoleStandard component.

<double precision> spinSeed() Returns the default value for the spinSeed property for the blackHole component class.

<type(varying_string), allocatable, dimension(:) => matches> spinSeedAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the blackHole class that have the desired attributes for the spinSeed property

<logical> spinSeedIsGettable() Returns true if the spinSeed property is gettable for the blackHole component class.

<logical> spinSeedIsSettable() Specify whether the spinSeed property of the blackHole component is settable.

<double precision> spinSeedRateGet() Returns a zero rate for the spinSeed property for the blackHole component class.

<void> spinSet(<double precision> value) Set the spin property of the blackHole component.

<logical> standardIsActive() Return true if the standard implementation of the blackHole component is the active choice.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<double precision> tripleInteractionTime() Returns the default value for the tripleInteractionTime property for the blackHole component class.

<type(varying_string), allocatable, dimension(:) => matches> tripleInteractionTimeAttributeMatch(<logi
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the blackHole class that have the desired attributes for the tripleInteractionTime property

<logical> tripleInteractionTimeIsGettable() Returns true if the tripleInteractionTime property is gettable for the blackHole component class.

<logical> tripleInteractionTimeIsSettable() Specify whether the tripleInteractionTime property of the blackHole component is settable.

<double precision> tripleInteractionTimeRateGet() Returns a zero rate for the tripleInteractionTime property for the blackHole component class.

<void> tripleInteractionTimeSet(<double precision> value) Set the tripleInteractionTime property of the blackHole component.

<type(varying_string)> type() Returns the type name for the blackHole component class.

nodeComponentBlackHoleNonCentral

<double precision> accretionRate() Get the value of the accretionRate property of the standard implementation of the blackHole component using a deferred function.

<type(varying_string), allocatable, dimension(:) => matches> accretionRateAttributeMatch(<logical>
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the blackHole class that have the desired attributes for the accretionRate property

<void> accretionRateFunction() Set the function to be used for the get method of the accretionRate property of the BlackHoleStandard component.

<logical> accretionRateIsAttached() Return true if the deferred function used to get the accretionRate property of the BlackHoleStandard component class has been attached.

<logical> accretionRateIsGettable() Returns true if the accretionRate property is gettable for the blackHole component class.

<logical> accretionRateIsSettable() Specify whether the accretionRate property of the blackHole component is settable.

<double precision> accretionRateRateGet() Returns a zero rate for the accretionRate property for the blackHole component class.

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a nonCentral implementation of the blackHole component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType>
[massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a nonCentral implementation of the blackHole component from raw (binary) file.

<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→) Deserialize evolvable properties of a nonCentral implementation of the blackHole component from array.

<void> destroy() Finalize a nonCentral implementation of the blackHole component.

<void> dumpASCII() Dump the content of a blackHole component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter
[interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a nonCentral member of the blackHole component.

<double precision> mass() Get the mass property of an standard implementation of the blackHole component class.

<type(varying_string), allocatable, dimension(:) => matches> massAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the blackHole class that have the desired attributes for the mass property

<integer> massCount() Return a count of the number of scalar properties in the mass property of an standard implementation of the blackHole component class.

<void> massInactive() Indicate that the mass property of an standard implementation of the blackHole component class is inactive for differential equation solving.

<logical> massIsGettable() Returns true if the mass property is gettable for the blackHole component class.

<logical> massIsSettable() Specify whether the mass property of the blackHole component is settable.

<void> massRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate to the rate of change of the mass property of an standard implementation of the blackHole component class.

<double precision> massRateGet() Get the rate of change of the mass property of an standard implementation of the blackHole component class.

<void> massScale(<double precision> setValue→) Set the absolute scale of the mass property of an standard implementation of the blackHole component class.

<double precision> massSeed() Returns the default value for the massSeed property for the blackHole component class.

<type(varying_string), allocatable, dimension(:) => matches> massSeedAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the blackHole class that have the desired attributes for the massSeed property

<logical> massSeedIsGettable() Returns true if the massSeed property is gettable for the blackHole component class.

<logical> massSeedIsSettable() Specify whether the massSeed property of the blackHole component is settable.

<double precision> massSeedRateGet() Returns a zero rate for the massSeed property for the blackHole component class.

<void> massSet(<double precision> setValue→) Set the mass property of an standard implementation of the blackHole component class.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a nonCentral implementation of the blackHole component class.

<logical> nonCentralIsActive() Return true if the nonCentral implementation of the blackHole component is the active choice.

<logical> nullIsActive() Return true if the null implementation of the blackHole component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a blackHole component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a nonCentral implementation of the blackHole component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Return the names of properties to output for a nonCentral implementation of the blackHole component.

<void> postOutput(<double precision> time→) Perform post-output processing for a nonCentral implementation of the blackHole component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<double precision> radialPosition() Get the radialPosition property of an nonCentral implementation of the blackHole component class.

<type(varying_string), allocatable, dimension(:) => matches> radialPositionAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the blackHole class that have the desired attributes for the radialPosition property

<integer> radialPositionCount() Return a count of the number of scalar properties in the radialPosition property of an nonCentral implementation of the blackHole component class.

<void> radialPositionInactive() Indicate that the radialPosition property of an nonCentral implementation of the blackHole component class is inactive for differential equation solving.

<logical> radialPositionIsGettable() Returns true if the radialPosition property is gettable for the blackHole component class.

<logical> radialPositionIsSettable() Specify whether the radialPosition property of the blackHole component is settable.

<void> radialPositionRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interrupt [interruptProcedure]↔) Accumulate to the rate of change of the radialPosition property of an nonCentral implementation of the blackHole component class.

<double precision> radialPositionRateGet() Get the rate of change of the radialPosition property of an nonCentral implementation of the blackHole component class.

<void> radialPositionScale(<double precision> setValue→) Set the absolute scale of the radialPosition property of an nonCentral implementation of the blackHole component class.

<void> radialPositionSet(<double precision> setValue→) Set the radialPosition property of an nonCentral implementation of the blackHole component class.

<double precision> radiativeEfficiency() Get the value of the radiativeEfficiency property of the standard implementation of the blackHole component using a deferred function.

<type(varying_string), allocatable, dimension(:) => matches> radiativeEfficiencyAttributeMatch(<logica [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the blackHole class that have the desired attributes for the radiativeEfficiency property

<void> radiativeEfficiencyFunction() Set the function to be used for the get method of the radiativeEfficiency property of the BlackHoleStandard component.

<logical> radiativeEfficiencyIsAttached() Return true if the deferred function used to get the radiativeEfficiency property of the BlackHoleStandard component class has been attached.

<logical> radiativeEfficiencyIsGettable() Returns true if the radiativeEfficiency property is gettable for the blackHole component class.

<logical> radiativeEfficiencyIsSettable() Specify whether the radiativeEfficiency property of the blackHole component is settable.

<double precision> radiativeEfficiencyRateGet() Returns a zero rate for the radiativeEfficiency property for the blackHole component class.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→) Compute offsets into serialization arrays for a nonCentral implementation of the blackHole component.

<void> serializeASCII() Serialize the contents of a nonCentral implementation of the blackHole component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the serialization of a nonCentral implementation of the blackHole component.

<void> serializeRaw(<integer> fileHandle→) Serialize the contents of a nonCentral implementation of the blackHole component to raw (binary) file.

<void> serializeValues(<double precision[:]> array←, <integer> propertyType→) Serialize evolvable properties of a nonCentral implementation of the blackHole component to array.

<void> serializeXML(<integer> fileHandle→) Serialize the contents of a nonCentral implementation of the blackHole component to XML.

<logical> simpleIsActive() Return true if the simple implementation of the blackHole component is the active choice.

<integer(c_size_t)> sizeOf() Return the size in bytes of a nonCentral implementation of the blackHole component.

<double precision> spin() Returns the default value for the spin property for the blackHole component class.

<type(varying_string), allocatable, dimension(:) => matches> spinAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the blackHole class that have the desired attributes for the spin property

<integer> spinCount() Return a count of the number of scalar properties in the spin property of an standard implementation of the blackHole component class.

<void> spinInactive() Indicate that the spin property of an standard implementation of the blackHole component class is inactive for differential equation solving.

<logical> spinIsGettable() Returns true if the spin property is gettable for the blackHole component class.

<logical> spinIsSettable() Specify whether the spin property of the blackHole component is settable.

<void> spinRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate to the rate of change of the spin property of an standard implementation of the blackHole component class.

<double precision> spinRateGet() Get the rate of change of the spin property of an standard implementation of the blackHole component class.

<void> spinScale(<double precision> setValue→) Set the absolute scale of the spin property of an standard implementation of the blackHole component class.

<double precision> spinSeed() Returns the default value for the spinSeed property for the blackHole component class.

<type(varying_string), allocatable, dimension(:) => matches> spinSeedAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the blackHole class that have the desired attributes for the spinSeed property

<logical> spinSeedIsGettable() Returns true if the spinSeed property is gettable for the blackHole component class.

<logical> spinSeedIsSettable() Specify whether the spinSeed property of the blackHole component is settable.

<double precision> spinSeedRateGet() Returns a zero rate for the spinSeed property for the blackHole component class.

<void> spinSet(<double precision> setValue→) Set the spin property of an standard implementation of the blackHole component class.

<logical> standardIsActive() Return true if the standard implementation of the blackHole component is the active choice.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<double precision> tripleInteractionTime() Get the tripleInteractionTime property of an standard implementation of the blackHole component class.

<type(varying_string), allocatable, dimension(:) => matches> tripleInteractionTimeAttributeMatch(<logi [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the blackHole class that have the desired attributes for the tripleInteractionTime property

<logical> tripleInteractionTimeIsGettable() Returns true if the tripleInteractionTime property is gettable for the blackHole component class.

<logical> tripleInteractionTimeIsSettable() Specify whether the tripleInteractionTime property of the blackHole component is settable.

<double precision> tripleInteractionTimeRateGet() Returns a zero rate for the tripleInteractionTime property for the blackHole component class.

<void> tripleInteractionTimeSet(<double precision> setValue→) Set the tripleInteractionTime property of an standard implementation of the blackHole component class.

<type(varying_string)> type() Returns the type name for the nonCentral implementation of the blackHole component class.

nodeComponentBlackHoleNull

<double precision> accretionRate() Returns the default value for the accretionRate property for the blackHole component class.

<type(varying_string), allocatable, dimension(:) => matches> accretionRateAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the blackHole class that have the desired attributes for the accretionRate property

<logical> accretionRateIsGettable() Returns true if the accretionRate property is gettable for the blackHole component class.

<logical> accretionRateIsSettable() Specify whether the accretionRate property of the blackHole component is settable.

<double precision> accretionRateRateGet() Returns a zero rate for the accretionRate property for the blackHole component class.

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a null implementation of the blackHole component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a null implementation of the blackHole component from raw (binary) file.

<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→) Deserialize evolvable properties of a null implementation of the blackHole component from array.

<void> destroy() Finalize a null implementation of the blackHole component.

<void> dumpASCII() Dump the content of a blackHole component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter
[interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a null member of the blackHole component.

<double precision> mass() Returns the default value for the mass property for the blackHole component class.

<type(varying_string), allocatable, dimension(:) => matches> massAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the blackHole class that have the desired attributes for the mass property

<integer> massCount() Compute the count of evolvable quantities in the mass property of the BlackHoleSimple component.

<logical> massIsGettable() Returns true if the mass property is gettable for the blackHole component class.

<logical> massIsSettable() Specify whether the mass property of the blackHole component is settable.

<void> massRate(<double precision> value) Cumulate to the rate of the mass property of the BlackHoleSimple component.

<double precision> massRateGet() Returns a zero rate for the mass property for the blackHole component class.

<void> massScale(<double precision> value) Set the scale of the mass property of the BlackHoleSimple component.

<double precision> massSeed() Returns the default value for the massSeed property for the blackHole component class.

<type(varying_string), allocatable, dimension(:) => matches> massSeedAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the blackHole class that have the desired attributes for the massSeed property

<logical> massSeedIsGettable() Returns true if the massSeed property is gettable for the blackHole component class.

<logical> massSeedIsSettable() Specify whether the massSeed property of the blackHole component is settable.

<double precision> massSeedRateGet() Returns a zero rate for the massSeed property for the blackHole component class.

<void> massSet(<double precision> value) Set the mass property of the blackHole component.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a null implementation of the blackHole component class.

<logical> nonCentralIsActive() Return true if the nonCentral implementation of the blackHole component is the active choice.

<logical> nullIsActive() Return true if the null implementation of the blackHole component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a blackHole component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a null implementation of the blackHole component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Return the names of properties to output for a null implementation of the blackHole component.

<void> postOutput(<double precision> time→) Perform post-output processing of a blackHole component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<double precision> radialPosition() Returns the default value for the radialPosition property for the blackHole component class.

<type(varying_string), allocatable, dimension(:) => matches> radialPositionAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the blackHole class that have the desired attributes for the radialPosition property

<integer> radialPositionCount() Compute the count of evolvable quantities in the radialPosition property of the BlackHoleNonCentral component.

<logical> radialPositionIsGettable() Returns true if the radialPosition property is gettable for the blackHole component class.

<logical> radialPositionIsSettable() Specify whether the radialPosition property of the blackHole component is settable.

<void> radialPositionRate(<double precision> value) Cumulate to the rate of the radialPosition property of the BlackHoleNonCentral component.

<double precision> radialPositionRateGet() Returns a zero rate for the radialPosition property for the blackHole component class.

<void> radialPositionScale(<double precision> value) Set the scale of the radialPosition property of the BlackHoleNonCentral component.

<void> radialPositionSet(<double precision> value) Set the radialPosition property of the blackHole component.

<double precision> radiativeEfficiency() Returns the default value for the radiativeEfficiency property for the blackHole component class.

<type(varying_string), allocatable, dimension(:) => matches> radiativeEfficiencyAttributeMatch(<logica
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the blackHole class that have the desired attributes for the radiativeEfficiency property

<logical> radiativeEfficiencyIsGettable() Returns true if the radiativeEfficiency property is gettable for the blackHole component class.

<logical> radiativeEfficiencyIsSettable() Specify whether the radiativeEfficiency property of the blackHole component is settable.

<double precision> radiativeEfficiencyRateGet() Returns a zero rate for the radiativeEfficiency property for the blackHole component class.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType>
[massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType>
[massType]→) Compute the rotation curve gradient.

<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→)
Compute offsets into serialization arrays for a null implementation of the blackHole component.

<void> serializeASCII() Serialize the contents of a null implementation of the blackHole component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the serialization of a null implementation of the blackHole component.

<void> serializeRaw(<integer> fileHandle→) Serialize the contents of a null implementation of the blackHole component to raw (binary) file.

<void> serializeValues(<double precision[:]> array←, <integer> propertyType→) Serialize evolvable properties of a null implementation of the blackHole component to array.

<void> serializeXML(<integer> fileHandle→) Serialize the contents of a null implementation of the blackHole component to XML.

<logical> simpleIsActive() Return true if the simple implementation of the blackHole component is the active choice.

<integer(c_size_t)> sizeOf() Return the size in bytes of a null implementation of the blackHole component.

<double precision> spin() Returns the default value for the spin property for the blackHole component class.

<type(varying_string), allocatable, dimension(:) => matches> spinAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the blackHole class that have the desired attributes for the spin property

<integer> spinCount() Compute the count of evolvable quantities in the spin property of the BlackHoleStandard component.

<logical> spinIsGettable() Returns true if the spin property is gettable for the blackHole component class.

<logical> spinIsSettable() Specify whether the spin property of the blackHole component is settable.

<void> spinRate(<double precision> value) Cumulate to the rate of the spin property of the BlackHoleStandard component.

<double precision> spinRateGet() Returns a zero rate for the spin property for the blackHole component class.

<void> spinScale(<double precision> value) Set the scale of the spin property of the BlackHoleStandard component.

<double precision> spinSeed() Returns the default value for the spinSeed property for the blackHole component class.

<type(varying_string), allocatable, dimension(:) => matches> spinSeedAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the blackHole class that have the desired attributes for the spinSeed property

<logical> spinSeedIsGettable() Returns true if the spinSeed property is gettable for the blackHole component class.

<logical> spinSeedIsSettable() Specify whether the spinSeed property of the blackHole component is settable.

<double precision> spinSeedRateGet() Returns a zero rate for the spinSeed property for the blackHole component class.

<void> spinSet(<double precision> value) Set the spin property of the blackHole component.

<logical> standardIsActive() Return true if the standard implementation of the blackHole component is the active choice.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<double precision> tripleInteractionTime() Returns the default value for the tripleInteractionTime property for the blackHole component class.

<type(varying_string), allocatable, dimension(:) => matches> tripleInteractionTimeAttributeMatch(<logi [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the blackHole class that have the desired attributes for the tripleInteractionTime property

<logical> tripleInteractionTimeIsGettable() Returns true if the tripleInteractionTime property is gettable for the blackHole component class.

<logical> tripleInteractionTimeIsSettable() Specify whether the tripleInteractionTime property of the blackHole component is settable.

<double precision> tripleInteractionTimeRateGet() Returns a zero rate for the tripleInteractionTime property for the blackHole component class.

<void> tripleInteractionTimeSet(<double precision> value) Set the tripleInteractionTime property of the blackHole component.

<type(varying_string)> type() Returns the type name for the null implementation of the blackHole component class.

nodeComponentBlackHoleSimple

<double precision> accretionRate() Returns the default value for the accretionRate property for the blackHole component class.

<type(varying_string), allocatable, dimension(:) => matches> accretionRateAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the blackHole class that have the desired attributes for the accretionRate property

<logical> accretionRateIsGettable() Returns true if the accretionRate property is gettable for the blackHole component class.

<logical> accretionRateIsSettable() Specify whether the accretionRate property of the blackHole component is settable.

<double precision> accretionRateRateGet() Returns a zero rate for the accretionRate property for the blackHole component class.

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a simple implementation of the blackHole component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a simple implementation of the blackHole component from raw (binary) file.

<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→) Deserialize evolvable properties of a simple implementation of the blackHole component from array.

<void> destroy() Finalize a simple implementation of the blackHole component.

<void> dumpASCII() Dump the content of a blackHole component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a simple member of the blackHole component.

<double precision> mass() Get the mass property of an simple implementation of the blackHole component class.

<type(varying_string), allocatable, dimension(:) => matches> massAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the blackHole class that have the desired attributes for the mass property

<integer> massCount() Return a count of the number of scalar properties in the mass property of an simple implementation of the blackHole component class.

<void> massInactive() Indicate that the mass property of an simple implementation of the blackHole component class is inactive for differential equation solving.

<logical> massIsGettable() Returns true if the mass property is gettable for the blackHole component class.

<logical> massIsSettable() Specify whether the mass property of the blackHole component is settable.

<void> massRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate to the rate of change of the mass property of an simple implementation of the blackHole component class.

<double precision> massRateGet() Get the rate of change of the mass property of an simple implementation of the blackHole component class.

<void> massScale(<double precision> setValue→) Set the absolute scale of the mass property of an simple implementation of the blackHole component class.

<double precision> massSeed() Returns the default value for the massSeed property for the blackHole component class.

<type(varying_string), allocatable, dimension(:) => matches> massSeedAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the blackHole class that have the desired attributes for the massSeed property

<logical> massSeedIsGettable() Returns true if the massSeed property is gettable for the blackHole component class.

<logical> massSeedIsSettable() Specify whether the massSeed property of the blackHole component is settable.

<double precision> massSeedRateGet() Returns a zero rate for the massSeed property for the blackHole component class.

<void> massSet(<double precision> setValue→) Set the mass property of an simple implementation of the blackHole component class.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a simple implementation of the blackHole component class.

<logical> nonCentralIsActive() Return true if the nonCentral implementation of the blackHole component is the active choice.

<logical> nullIsActive() Return true if the null implementation of the blackHole component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a blackHole component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a simple implementation of the blackHole component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Return the names of properties to output for a simple implementation of the blackHole component.

<void> postOutput(<double precision> time→) Perform post-output processing of a blackHole component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<double precision> radialPosition() Returns the default value for the radialPosition property for the blackHole component class.

<type(varying_string), allocatable, dimension(:) => matches> radialPositionAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the blackHole class that have the desired attributes for the radialPosition property

`<integer> radialPositionCount()` Compute the count of evolvable quantities in the `radialPosition` property of the `BlackHoleNonCentral` component.

`<logical> radialPositionIsGettable()` Returns true if the `radialPosition` property is gettable for the `blackHole` component class.

`<logical> radialPositionIsSettable()` Specify whether the `radialPosition` property of the `blackHole` component is settable.

`<void> radialPositionRate(<double precision> value)` Cumulate to the rate of the `radialPosition` property of the `BlackHoleNonCentral` component.

`<double precision> radialPositionRateGet()` Returns a zero rate for the `radialPosition` property for the `blackHole` component class.

`<void> radialPositionScale(<double precision> value)` Set the scale of the `radialPosition` property of the `BlackHoleNonCentral` component.

`<void> radialPositionSet(<double precision> value)` Set the `radialPosition` property of the `blackHole` component.

`<double precision> radiativeEfficiency()` Returns the default value for the `radiativeEfficiency` property for the `blackHole` component class.

`<type(varying_string), allocatable, dimension(:) => matches> radiativeEfficiencyAttributeMatch(<logica [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)` Return a text list of component implementations in the `blackHole` class that have the desired attributes for the `radiativeEfficiency` property

`<logical> radiativeEfficiencyIsGettable()` Returns true if the `radiativeEfficiency` property is gettable for the `blackHole` component class.

`<logical> radiativeEfficiencyIsSettable()` Specify whether the `radiativeEfficiency` property of the `blackHole` component is settable.

`<double precision> radiativeEfficiencyRateGet()` Returns a zero rate for the `radiativeEfficiency` property for the `blackHole` component class.

`<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→)` Compute the rotation curve.

`<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→)` Compute the rotation curve gradient.

`<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→)` Compute offsets into serialization arrays for a `simple` implementation of the `blackHole` component.

`<void> serializeASCII()` Serialize the contents of a simple implementation of the blackHole component to ASCII.

`<integer> serializeCount(<integer> propertyType→)` Return a count of the serialization of a simple implementation of the blackHole component.

`<void> serializeRaw(<integer> fileHandle→)` Serialize the contents of a simple implementation of the blackHole component to raw (binary) file.

<void> serializeValues(<double precision[:]> array←, <integer> propertyType→) Serialize evolvable properties of a simple implementation of the blackHole component to array.

<void> serializeXML(<integer> fileHandle→) Serialize the contents of a simple implementation of the blackHole component to XML.

<logical> simpleIsActive() Return true if the simple implementation of the blackHole component is the active choice.

<integer(c_size_t)> sizeOf() Return the size in bytes of a simple implementation of the blackHole component.

<double precision> spin() Returns the default value for the spin property for the blackHole component class.

<type(varying_string), allocatable, dimension(:) => matches> spinAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the blackHole class that have the desired attributes for the spin property

<integer> spinCount() Compute the count of evolvable quantities in the spin property of the BlackHoleStandard component.

<logical> spinIsGettable() Returns true if the spin property is gettable for the blackHole component class.

<logical> spinIsSettable() Specify whether the spin property of the blackHole component is settable.

<void> spinRate(<double precision> value) Cumulate to the rate of the spin property of the BlackHoleStandard component.

<double precision> spinRateGet() Returns a zero rate for the spin property for the blackHole component class.

<void> spinScale(<double precision> value) Set the scale of the spin property of the BlackHoleStandard component.

<double precision> spinSeed() Returns the default value for the spinSeed property for the blackHole component class.

<type(varying_string), allocatable, dimension(:) => matches> spinSeedAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the blackHole class that have the desired attributes for the spinSeed property

<logical> spinSeedIsGettable() Returns true if the spinSeed property is gettable for the blackHole component class.

<logical> spinSeedIsSettable() Specify whether the spinSeed property of the blackHole component is settable.

<double precision> spinSeedRateGet() Returns a zero rate for the spinSeed property for the blackHole component class.

<void> spinSet(<double precision> value) Set the spin property of the blackHole component.

<logical> standardIsActive() Return true if the standard implementation of the blackHole component is the active choice.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<double precision> tripleInteractionTime() Returns the default value for the tripleInteractionTime property for the blackHole component class.

<type(varying_string), allocatable, dimension(:) => matches> tripleInteractionTimeAttributeMatch(<logi [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the blackHole class that have the desired attributes for the tripleInteractionTime property

<logical> tripleInteractionTimeIsGettable() Returns true if the tripleInteractionTime property is gettable for the blackHole component class.

<logical> tripleInteractionTimeIsSettable() Specify whether the tripleInteractionTime property of the blackHole component is settable.

<double precision> tripleInteractionTimeRateGet() Returns a zero rate for the tripleInteractionTime property for the blackHole component class.

<void> tripleInteractionTimeSet(<double precision> value) Set the tripleInteractionTime property of the blackHole component.

<type(varying_string)> type() Returns the type name for the simple implementation of the blackHole component class.

nodeComponentBlackHoleStandard

<double precision> accretionRate() Get the value of the accretionRate property of the standard implementation of the blackHole component using a deferred function.

<type(varying_string), allocatable, dimension(:) => matches> accretionRateAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the blackHole class that have the desired attributes for the accretionRate property

<void> accretionRateFunction() Set the function to be used for the get method of the accretionRate property of the BlackHoleStandard component.

<logical> accretionRateIsAttached() Return true if the deferred function used to get the accretionRate property of the BlackHoleStandard component class has been attached.

<logical> accretionRateIsGettable() Returns true if the accretionRate property is gettable for the blackHole component class.

<logical> accretionRateIsSettable() Specify whether the accretionRate property of the blackHole component is settable.

<double precision> accretionRateRateGet() Returns a zero rate for the accretionRate property for the blackHole component class.

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a standard implementation of the blackHole component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a standard implementation of the blackHole component from raw (binary) file.

<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→) Deserialize evolvable properties of a standard implementation of the blackHole component from array.

<void> destroy() Finalize a standard implementation of the blackHole component.

<void> dumpASCII() Dump the content of a blackHole component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a standard member of the blackHole component.

<double precision> mass() Get the mass property of an standard implementation of the blackHole component class.

<type(varying_string), allocatable, dimension(:) => matches> massAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the blackHole class that have the desired attributes for the mass property

<integer> massCount() Return a count of the number of scalar properties in the mass property of an standard implementation of the blackHole component class.

<void> massInactive() Indicate that the mass property of an standard implementation of the blackHole component class is inactive for differential equation solving.

<logical> massIsGettable() Returns true if the mass property is gettable for the blackHole component class.

<logical> massIsSettable() Specify whether the mass property of the blackHole component is settable.

<void> massRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate to the rate of change of the mass property of an standard implementation of the blackHole component class.

<double precision> massRateGet() Get the rate of change of the mass property of an standard implementation of the blackHole component class.

<void> massScale(<double precision> setValue→) Set the absolute scale of the mass property of an standard implementation of the blackHole component class.

<double precision> massSeed() Returns the default value for the massSeed property for the blackHole component class.

<type(varying_string), allocatable, dimension(:) => matches> massSeedAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the blackHole class that have the desired attributes for the massSeed property

<logical> massSeedIsGettable() Returns true if the massSeed property is gettable for the blackHole component class.

<logical> massSeedIsSettable() Specify whether the massSeed property of the blackHole component is settable.

<double precision> massSeedRateGet() Returns a zero rate for the massSeed property for the blackHole component class.

<void> massSet(<double precision> setValue→) Set the mass property of an standard implementation of the blackHole component class.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a standard implementation of the blackHole component class.

<logical> nonCentralIsActive() Return true if the nonCentral implementation of the blackHole component is the active choice.

<logical> nullIsActive() Return true if the null implementation of the blackHole component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a blackHole component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a standard implementation of the blackHole component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Return the names of properties to output for a standard implementation of the blackHole component.

<void> postOutput(<double precision> time→) Perform post-output processing of a blackHole component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<double precision> radialPosition() Get the radialPosition property of an standard implementation of the blackHole component class.

<type(varying_string), allocatable, dimension(:) => matches> radialPositionAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the blackHole class that have the desired attributes for the radialPosition property

<integer> radialPositionCount() Compute the count of evolvable quantities in the radialPosition property of the BlackHoleNonCentral component.

<logical> radialPositionIsGettable() Returns true if the radialPosition property is gettable for the blackHole component class.

<logical> radialPositionIsSettable() Specify whether the radialPosition property of the blackHole component is settable.

<void> radialPositionRate(<double precision> value) Cumulate to the rate of the radialPosition property of the BlackHoleNonCentral component.

<double precision> radialPositionRateGet() Returns a zero rate for the radialPosition property for the blackHole component class.

<void> radialPositionScale(<double precision> value) Set the scale of the radialPosition property of the BlackHoleNonCentral component.

<void> radialPositionSet(<double precision> setValue→) Set the radialPosition property of an standard implementation of the blackHole component class.

<double precision> radiativeEfficiency() Get the value of the radiativeEfficiency property of the standard implementation of the blackHole component using a deferred function.

<type(varying_string), allocatable, dimension(:) => matches> radiativeEfficiencyAttributeMatch(<logica [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the blackHole class that have the desired attributes for the radiativeEfficiency property

<void> radiativeEfficiencyFunction() Set the function to be used for the get method of the radiativeEfficiency property of the BlackHoleStandard component.

<logical> radiativeEfficiencyIsAttached() Return true if the deferred function used to get the radiativeEfficiency property of the BlackHoleStandard component class has been attached.

<logical> radiativeEfficiencyIsGettable() Returns true if the radiativeEfficiency property is gettable for the blackHole component class.

<logical> radiativeEfficiencyIsSettable() Specify whether the radiativeEfficiency property of the blackHole component is settable.

<double precision> radiativeEfficiencyRateGet() Returns a zero rate for the radiativeEfficiency property for the blackHole component class.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→) Compute offsets into serialization arrays for a standard implementation of the blackHole component.

<void> serializeASCII() Serialize the contents of a standard implementation of the blackHole component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the serialization of a standard implementation of the blackHole component.

<void> serializeRaw(<integer> fileHandle→) Serialize the contents of a standard implementation of the blackHole component to raw (binary) file.

<void> serializeValues(<double precision[:]> array←, <integer> propertyType→) Serialize evolvable properties of a standard implementation of the blackHole component to array.

<void> serializeXML(<integer> fileHandle→) Serialize the contents of a standard implementation of the blackHole component to XML.

<logical> simpleIsActive() Return true if the simple implementation of the blackHole component is the active choice.

<integer(c_size_t)> sizeOf() Return the size in bytes of a standard implementation of the blackHole component.

<double precision> spin() Returns the default value for the spin property for the blackHole component class.

<type(varying_string), allocatable, dimension(:) => matches> spinAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the blackHole class that have the desired attributes for the spin property

<integer> spinCount() Return a count of the number of scalar properties in the spin property of an standard implementation of the blackHole component class.

<void> spinInactive() Indicate that the spin property of an standard implementation of the blackHole component class is inactive for differential equation solving.

<logical> spinIsGettable() Returns true if the spin property is gettable for the blackHole component class.

<logical> spinIsSettable() Specify whether the spin property of the blackHole component is settable.

<void> spinRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate to the rate of change of the spin property of an standard implementation of the blackHole component class.

<double precision> spinRateGet() Get the rate of change of the spin property of an standard implementation of the blackHole component class.

<void> spinScale(<double precision> setValue→) Set the absolute scale of the spin property of an standard implementation of the blackHole component class.

<double precision> spinSeed() Returns the default value for the spinSeed property for the blackHole component class.

<type(varying_string), allocatable, dimension(:) => matches> spinSeedAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the blackHole class that have the desired attributes for the spinSeed property

<logical> spinSeedIsGettable() Returns true if the spinSeed property is gettable for the blackHole component class.

<logical> spinSeedIsSettable() Specify whether the spinSeed property of the blackHole component is settable.

<double precision> spinSeedRateGet() Returns a zero rate for the spinSeed property for the blackHole component class.

<void> spinSet(<double precision> setValue→) Set the spin property of an standard implementation of the blackHole component class.

<logical> standardIsActive() Return true if the standard implementation of the blackHole component is the active choice.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<double precision> tripleInteractionTime() Get the tripleInteractionTime property of an standard implementation of the blackHole component class.

<type(varying_string), allocatable, dimension(:) => matches> tripleInteractionTimeAttributeMatch(<logi [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the blackHole class that have the desired attributes for the tripleInteractionTime property

<logical> tripleInteractionTimeIsGettable() Returns true if the tripleInteractionTime property is gettable for the blackHole component class.

<logical> tripleInteractionTimeIsSettable() Specify whether the tripleInteractionTime property of the blackHole component is settable.

<double precision> tripleInteractionTimeRateGet() Returns a zero rate for the tripleInteractionTime property for the blackHole component class.

<void> tripleInteractionTimeSet(<double precision> setValue→) Set the tripleInteractionTime property of an standard implementation of the blackHole component class.

<type(varying_string)> type() Returns the type name for the standard implementation of the blackHole component class.

nodeComponentDarkMatterProfile

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a generic darkMatterProfile component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Read properties from raw file.

<void> deserializeValues(<double(:)> array→, <integer> propertyType→) Deserialize the evolvable quantities from an array.

<void> destroy() Finalize a generic darkMatterProfile component.

<void> dumpASCII() Dump the content of a darkMatterProfile component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a generic darkMatterProfile component.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a nodeComponent object.

<logical> nullIsActive() Return true if the null implementation of the darkMatterProfile component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a darkMatterProfile component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a generic darkMatterProfile component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Establish the names of properties to output for a generic darkMatterProfile component.

<void> postOutput(<double precision> time→) Perform post-output processing of a darkMatterProfile component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<double precision> scale() Returns the default value for the scale property for the darkMatterProfile component class.

<type(varying_string), allocatable, dimension(:) => matches> scaleAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the darkMatterProfile class that have the desired attributes for the scale property

<integer> scaleCount() Compute the count of evolvable quantities in the scale property of the DarkMatterProfileScale component.

<double precision> scaleGrowthRate() Returns the default value for the scaleGrowthRate property for the darkMatterProfile component class.

<type(varying_string), allocatable, dimension(:) => matches> scaleGrowthRateAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the darkMatterProfile class that have the desired attributes for the scaleGrowthRate property

<logical> scaleGrowthRateIsGettable() Returns true if the scaleGrowthRate property is gettable for the darkMatterProfile component class.

<logical> scaleGrowthRateIsSettable() Specify whether the scaleGrowthRate property of the darkMatterProfile component is settable.

<double precision> scaleGrowthRateRateGet() Returns a zero rate for the scaleGrowthRate property for the darkMatterProfile component class.

<void> scaleGrowthRateSet(<double precision> value) Set the scaleGrowthRate property of the darkMatterProfile component.

<logical> scaleIsActive() Return true if the scale implementation of the darkMatterProfile component is the active choice.

<logical> scaleIsGettable() Returns true if the scale property is gettable for the darkMatterProfile component class.

<logical> scaleIsLimited() Returns the default value for the scaleIsLimited property for the darkMatterProfile component class.

<type(varying_string), allocatable, dimension(:) => matches> scaleIsLimitedAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the darkMatterProfile class that have the desired attributes for the scaleIsLimited property

<logical> scaleIsLimitedIsGettable() Returns true if the scaleIsLimited property is gettable for the darkMatterProfile component class.

<logical> scaleIsLimitedIsSettable() Specify whether the scaleIsLimited property of the darkMatterProfile component is settable.

<logical> scaleIsLimitedRateGet() Returns a zero rate for the scaleIsLimited property for the darkMatterProfile component class.

<void> scaleIsLimitedSet(<logical> value) Set the scaleIsLimited property of the darkMatterProfile component.

<logical> scaleIsSettable() Specify whether the scale property of the darkMatterProfile component is settable.

<logical> scalePresetIsActive() Return true if the scalePreset implementation of the darkMatterProfile component is the active choice.

<void> scaleRate(<double precision> value) Cumulate to the rate of the scale property of the DarkMatterProfileScale component.

<double precision> scaleRateGet() Returns a zero rate for the scale property for the darkMatterProfile component class.

<void> scaleScale(<double precision> value) Set the scale of the scale property of the DarkMatterProfileScale component.

<void> scaleSet(<double precision> value) Set the scale property of the darkMatterProfile component.

<logical> scaleShapeIsActive() Return true if the scaleShape implementation of the darkMatterProfile component is the active choice.

<void> serializationOffsets() Set offsets into serialization arrays.

<void> serializeASCII() Serialize the content of a darkMatterProfile component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the number of evolvable quantities to be evolved.

<void> serializeRaw(<integer> fileHandle→) Generate a binary dump of all properties.

<void> serializeValues(<double(:)> array←, <integer> propertyType→) Serialize the evolvable quantities to an array.

<void> serializeXML() Generate an XML dump of all properties.

<double precision> shape() Returns the default value for the shape property for the darkMatterProfile component class.

<type(varying_string), allocatable, dimension(:) => matches> shapeAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the darkMatterProfile class that have the desired attributes for the shape property

<integer> shapeCount() Compute the count of evolvable quantities in the shape property of the DarkMatterProfileScaleShape component.

<double precision> shapeGrowthRate() Returns the default value for the shapeGrowthRate property for the darkMatterProfile component class.

<type(varying_string), allocatable, dimension(:) => matches> shapeGrowthRateAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the darkMatterProfile class that have the desired attributes for the shapeGrowthRate property

<logical> shapeGrowthRateIsGettable() Returns true if the shapeGrowthRate property is gettable for the darkMatterProfile component class.

<logical> shapeGrowthRateIsSettable() Specify whether the shapeGrowthRate property of the darkMatterProfile component is settable.

<double precision> shapeGrowthRateRateGet() Returns a zero rate for the shapeGrowthRate property for the darkMatterProfile component class.

<void> shapeGrowthRateSet(<double precision> value) Set the shapeGrowthRate property of the darkMatterProfile component.

<logical> shapeIsGettable() Returns true if the shape property is gettable for the darkMatterProfile component class.

<logical> shapeIsSettable() Specify whether the shape property of the darkMatterProfile component is settable.

<void> shapeRate(<double precision> value) Cumulate to the rate of the shape property of the DarkMatterProfileScaleShape component.

<double precision> shapeRateGet() Returns a zero rate for the shape property for the darkMatterProfile component class.

<void> shapeScale(<double precision> value) Set the scale of the shape property of the DarkMatterProfileScaleShap component.

<void> shapeSet(<double precision> value) Set the shape property of the darkMatterProfile component.

<integer(c_size_t)> sizeOf() Return the size in bytes of a nodeComponentDarkMatterProfile component.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<type(varying_string)> type() Returns the type name for the darkMatterProfile component class.

nodeComponentDarkMatterProfileNull

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a null implementation of the darkMatterProfile component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a null implementation of the darkMatterProfile component from raw (binary) file.

<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→) Deserialize evolvable properties of a null implementation of the darkMatterProfile component from array.

<void> destroy() Finalize a null implementation of the darkMatterProfile component.

<void> dumpASCII() Dump the content of a darkMatterProfile component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter
[interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a null member of the darkMatterProfile component.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a null implementation of the darkMatterProfile component class.

<logical> nullIsActive() Return true if the null implementation of the darkMatterProfile component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_-
int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔,
<double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)>
outputInstance→, <integer> instance→) Populate output buffers with properties to output for a darkMatterProfile component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double
precision> time→, <integer> instance→) Increment the count of properties to output for a null implementation of the darkMatterProfile component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔,
<character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔,
<integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]>
doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision>
time→, <integer> instance→) Return the names of properties to output for a null implementation of the darkMatterProfile component.

<void> postOutput(<double precision> time→) Perform post-output processing of a darkMatterProfile component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→)
Compute the gravitational potential.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType>
[massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType>
[massType]→) Compute the rotation curve gradient.

<double precision> scale() Returns the default value for the scale property for the darkMatterProfile component class.

<type(varying_string), allocatable, dimension(:) => matches> scaleAttributeMatch(<logical>
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the darkMatterProfile class that have the desired attributes for the scale property

<integer> scaleCount() Compute the count of evolvable quantities in the scale property of the DarkMatterProfileScale component.

<double precision> scaleGrowthRate() Returns the default value for the scaleGrowthRate property for the darkMatterProfile component class.

<type(varying_string), allocatable, dimension(:) => matches> scaleGrowthRateAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the darkMatterProfile class that have the desired attributes for the scaleGrowthRate property

<logical> scaleGrowthRateIsGettable() Returns true if the scaleGrowthRate property is gettable for the darkMatterProfile component class.

<logical> scaleGrowthRateIsSettable() Specify whether the scaleGrowthRate property of the darkMatterProfile component is settable.

<double precision> scaleGrowthRateRateGet() Returns a zero rate for the scaleGrowthRate property for the darkMatterProfile component class.

<void> scaleGrowthRateSet(<double precision> value) Set the scaleGrowthRate property of the darkMatterProfile component.

<logical> scaleIsActive() Return true if the scale implementation of the darkMatterProfile component is the active choice.

<logical> scaleIsGettable() Returns true if the scale property is gettable for the darkMatterProfile component class.

<logical> scaleIsLimited() Returns the default value for the scaleIsLimited property for the darkMatterProfile component class.

<type(varying_string), allocatable, dimension(:) => matches> scaleIsLimitedAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the darkMatterProfile class that have the desired attributes for the scaleIsLimited property

<logical> scaleIsLimitedIsGettable() Returns true if the scaleIsLimited property is gettable for the darkMatterProfile component class.

<logical> scaleIsLimitedIsSettable() Specify whether the scaleIsLimited property of the darkMatterProfile component is settable.

<logical> scaleIsLimitedRateGet() Returns a zero rate for the scaleIsLimited property for the darkMatterProfile component class.

<void> scaleIsLimitedSet(<logical> value) Set the scaleIsLimited property of the darkMatterProfile component.

<logical> scaleIsSettable() Specify whether the scale property of the darkMatterProfile component is settable.

<logical> scalePresetIsActive() Return true if the scalePreset implementation of the darkMatterProfile component is the active choice.

<void> scaleRate(<double precision> value) Cumulate to the rate of the scale property of the DarkMatterProfileScale component.

<double precision> scaleRateGet() Returns a zero rate for the scale property for the darkMatterProfile component class.

<void> scaleScale(<double precision> value) Set the scale of the scale property of the DarkMatterProfileScale component.

<void> scaleSet(<double precision> value) Set the scale property of the darkMatterProfile component.

<logical> scaleShapeIsActive() Return true if the scaleShape implementation of the darkMatterProfile component is the active choice.

<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→) Compute offsets into serialization arrays for a null implementation of the darkMatterProfile component.

<void> serializeASCII() Serialize the contents of a null implementation of the darkMatterProfile component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the serialization of a null implementation of the darkMatterProfile component.

<void> serializeRaw(<integer> fileHandle→) Serialize the contents of a null implementation of the darkMatterProfile component to raw (binary) file.

<void> serializeValues(<double precision[:]> array←, <integer> propertyType→) Serialize evolvable properties of a null implementation of the darkMatterProfile component to array.

<void> serializeXML(<integer> fileHandle→) Serialize the contents of a null implementation of the darkMatterProfile component to XML.

<double precision> shape() Returns the default value for the shape property for the darkMatterProfile component class.

<type(varying_string), allocatable, dimension(:) => matches> shapeAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the darkMatterProfile class that have the desired attributes for the shape property

<integer> shapeCount() Compute the count of evolvable quantities in the shape property of the DarkMatterProfileScaleShape component.

<double precision> shapeGrowthRate() Returns the default value for the shapeGrowthRate property for the darkMatterProfile component class.

<type(varying_string), allocatable, dimension(:) => matches> shapeGrowthRateAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the darkMatterProfile class that have the desired attributes for the shapeGrowthRate property

<logical> shapeGrowthRateIsGettable() Returns true if the shapeGrowthRate property is gettable for the darkMatterProfile component class.

<logical> shapeGrowthRateIsSettable() Specify whether the shapeGrowthRate property of the darkMatterProfile component is settable.

<double precision> shapeGrowthRateRateGet() Returns a zero rate for the shapeGrowthRate property for the darkMatterProfile component class.

<void> shapeGrowthRateSet(<double precision> value) Set the shapeGrowthRate property of the darkMatterProfile component.

<logical> shapeIsGettable() Returns true if the shape property is gettable for the darkMatterProfile component class.

<logical> shapeIsSettable() Specify whether the shape property of the darkMatterProfile component is settable.

<void> shapeRate(<double precision> value) Cumulate to the rate of the shape property of the DarkMatterProfileScaleShape component.

<double precision> shapeRateGet() Returns a zero rate for the shape property for the darkMatterProfile component class.

<void> shapeScale(<double precision> value) Set the scale of the shape property of the DarkMatterProfileScaleShap component.

<void> shapeSet(<double precision> value) Set the shape property of the darkMatterProfile component.

<integer(c_size_t)> sizeOf() Return the size in bytes of a null implementation of the darkMatterProfile component.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<type(varying_string)> type() Returns the type name for the null implementation of the darkMatterProfile component class.

nodeComponentDarkMatterProfileScale

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a scale implementation of the darkMatterProfile component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a scale implementation of the darkMatterProfile component from raw (binary) file.

<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→) Deserialize evolvable properties of a scale implementation of the darkMatterProfile component from array.

<void> destroy() Finalize a scale implementation of the darkMatterProfile component.

<void> dumpASCII() Dump the content of a darkMatterProfile component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a scale member of the darkMatterProfile component.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a scale implementation of the darkMatterProfile component class.

<logical> nullIsActive() Return true if the null implementation of the darkMatterProfile component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a darkMatterProfile component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a scale implementation of the darkMatterProfile component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Return the names of properties to output for a scale implementation of the darkMatterProfile component.

<void> postOutput(<double precision> time→) Perform post-output processing of a darkMatterProfile component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<double precision> scale() Get the value of the scale property of the scale implementation of the darkMatterProfile component using a deferred function.

<type(varying_string), allocatable, dimension(:) => matches> scaleAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the darkMatterProfile class that have the desired attributes for the scale property

<integer> scaleCount() Return a count of the number of scalar properties in the scale property of an scale implementation of the darkMatterProfile component class.

<void> scaleFunction() Set the function to be used for the get method of the scale property of the DarkMatterProfileScale component.

<double precision> scaleGrowthRate() Get the scaleGrowthRate property of an scale implementation of the darkMatterProfile component class.

<type(varying_string), allocatable, dimension(:) => matches> scaleGrowthRateAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the darkMatterProfile class that have the desired attributes for the scaleGrowthRate property

<logical> scaleGrowthRateIsGettable() Returns true if the scaleGrowthRate property is gettable for the darkMatterProfile component class.

<logical> scaleGrowthRateIsSettable() Specify whether the scaleGrowthRate property of the darkMatterProfile component is settable.

<double precision> scaleGrowthRateRateGet() Returns a zero rate for the scaleGrowthRate property for the darkMatterProfile component class.

<void> scaleGrowthRateSet(<double precision> setValue→) Set the scaleGrowthRate property of an scale implementation of the darkMatterProfile component class.

<void> scaleInactive() Indicate that the scale property of an scale implementation of the darkMatterProfile component class is inactive for differential equation solving.

<logical> scaleIsActive() Return true if the scale implementation of the darkMatterProfile component is the active choice.

<logical> scaleIsAttached() Return true if the deferred function used to get the scale property of the DarkMatterProfileScale component class has been attached.

<logical> scaleIsGettable() Returns true if the scale property is gettable for the darkMatterProfile component class.

<logical> scaleIsLimited() Get the scaleIsLimited property of an scale implementation of the darkMatterProfile component class.

<type(varying_string), allocatable, dimension(:) => matches> scaleIsLimitedAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the darkMatterProfile class that have the desired attributes for the scaleIsLimited property

<logical> scaleIsLimitedIsGettable() Returns true if the scaleIsLimited property is gettable for the darkMatterProfile component class.

<logical> scaleIsLimitedIsSettable() Specify whether the scaleIsLimited property of the darkMatterProfile component is settable.

<logical> scaleIsLimitedRateGet() Returns a zero rate for the scaleIsLimited property for the darkMatterProfile component class.

<void> scaleIsLimitedSet(<logical> setValue→) Set the scaleIsLimited property of an scale implementation of the darkMatterProfile component class.

<logical> scaleIsSettable() Specify whether the scale property of the darkMatterProfile component is settable.

<logical> scalePresetIsActive() Return true if the scalePreset implementation of the darkMatterProfile component is the active choice.

<void> scaleRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate to the rate of change of the scale property of an scale implementation of the darkMatterProfile component class.

<double precision> scaleRateGet() Get the rate of change of the scale property of an scale implementation of the darkMatterProfile component class.

<void> scaleScale(<double precision> setValue→) Set the absolute scale of the scale property of an scale implementation of the darkMatterProfile component class.

<void> scaleSet(<double precision> setValue→) Set the scale property of an scale implementation of the darkMatterProfile component class.

<logical> scaleShapeIsActive() Return true if the scaleShape implementation of the darkMatterProfile component is the active choice.

<double precision> scaleValue() Get the scale property of an scale implementation of the darkMatterProfile component class.

<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→) Compute offsets into serialization arrays for a scale implementation of the darkMatterProfile component.

<void> serializeASCII() Serialize the contents of a scale implementation of the darkMatterProfile component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the serialization of a scale implementation of the darkMatterProfile component.

<void> serializeRaw(<integer> fileHandle→) Serialize the contents of a scale implementation of the darkMatterProfile component to raw (binary) file.

<void> serializeValues(<double precision[:]> array←, <integer> propertyType→) Serialize evolvable properties of a scale implementation of the darkMatterProfile component to array.

<void> serializeXML(<integer> fileHandle→) Serialize the contents of a scale implementation of the darkMatterProfile component to XML.

<double precision> shape() Returns the default value for the shape property for the darkMatterProfile component class.

<type(varying_string), allocatable, dimension(:) => matches> shapeAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the darkMatterProfile class that have the desired attributes for the shape property

<integer> shapeCount() Compute the count of evolvable quantities in the shape property of the DarkMatterProfileScaleShape component.

<double precision> shapeGrowthRate() Returns the default value for the shapeGrowthRate property for the darkMatterProfile component class.

<type(varying_string), allocatable, dimension(:) => matches> shapeGrowthRateAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the darkMatterProfile class that have the desired attributes for the shapeGrowthRate property

<logical> shapeGrowthRateIsGettable() Returns true if the shapeGrowthRate property is gettable for the darkMatterProfile component class.

<logical> shapeGrowthRateIsSettable() Specify whether the shapeGrowthRate property of the darkMatterProfile component is settable.

<double precision> shapeGrowthRateRateGet() Returns a zero rate for the shapeGrowthRate property for the darkMatterProfile component class.

<void> shapeGrowthRateSet(<double precision> value) Set the shapeGrowthRate property of the darkMatterProfile component.

<logical> shapeIsGettable() Returns true if the shape property is gettable for the darkMatterProfile component class.

<logical> shapeIsSettable() Specify whether the shape property of the darkMatterProfile component is settable.

<void> shapeRate(<double precision> value) Cumulate to the rate of the shape property of the DarkMatterProfileScaleShape component.

<double precision> shapeRateGet() Returns a zero rate for the shape property for the darkMatterProfile component class.

<void> shapeScale(<double precision> value) Set the scale of the shape property of the DarkMatterProfileScaleShap component.

<void> shapeSet(<double precision> value) Set the shape property of the darkMatterProfile component.

<integer(c_size_t)> sizeOf() Return the size in bytes of a scale implementation of the darkMatterProfile component.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<type(varying_string)> type() Returns the type name for the scale implementation of the darkMatterProfile component class.

nodeComponentDarkMatterProfileScalePreset

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a scalePreset implementation of the darkMatterProfile component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a scalePreset implementation of the darkMatterProfile component from raw (binary) file.

<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→) Deserialize evolvable properties of a scalePreset implementation of the darkMatterProfile component from array.

<void> destroy() Finalize a scalePreset implementation of the darkMatterProfile component.

<void> dumpASCII() Dump the content of a darkMatterProfile component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a scalePreset member of the darkMatterProfile component.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a scalePreset implementation of the darkMatterProfile component class.

<logical> nullIsActive() Return true if the null implementation of the darkMatterProfile component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a darkMatterProfile component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a scalePreset implementation of the darkMatterProfile component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Return the names of properties to output for a scalePreset implementation of the darkMatterProfile component.

<void> postOutput(<double precision> time→) Perform post-output processing of a darkMatterProfile component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<double precision> scale() Get the scale property of an scalePreset implementation of the darkMatterProfile component class.

<type(varying_string), allocatable, dimension(:) => matches> scaleAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the darkMatterProfile class that have the desired attributes for the scale property

<integer> scaleCount() Return a count of the number of scalar properties in the scale property of an scalePreset implementation of the darkMatterProfile component class.

<double precision> scaleGrowthRate() Get the scaleGrowthRate property of an scalePreset implementation of the darkMatterProfile component class.

<type(varying_string), allocatable, dimension(:) => matches> scaleGrowthRateAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the darkMatterProfile class that have the desired attributes for the scaleGrowthRate property

<logical> scaleGrowthRateIsGettable() Returns true if the scaleGrowthRate property is gettable for the darkMatterProfile component class.

<logical> scaleGrowthRateIsSettable() Specify whether the scaleGrowthRate property of the darkMatterProfile component is settable.

<double precision> scaleGrowthRateRateGet() Returns a zero rate for the scaleGrowthRate property for the darkMatterProfile component class.

<void> scaleGrowthRateSet(<double precision> setValue→) Set the scaleGrowthRate property of an scalePreset implementation of the darkMatterProfile component class.

<void> scaleInactive() Indicate that the scale property of an scalePreset implementation of the darkMatterProfile component class is inactive for differential equation solving.

<logical> scaleIsActive() Return true if the scale implementation of the darkMatterProfile component is the active choice.

<logical> scaleIsGettable() Returns true if the scale property is gettable for the darkMatterProfile component class.

<logical> scaleIsLimited() Returns the default value for the scaleIsLimited property for the darkMatterProfile component class.

<type(varying_string), allocatable, dimension(:) => matches> scaleIsLimitedAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the darkMatterProfile class that have the desired attributes for the scaleIsLimited property

<logical> scaleIsLimitedIsGettable() Returns true if the scaleIsLimited property is gettable for the darkMatterProfile component class.

<logical> scaleIsLimitedIsSettable() Specify whether the scaleIsLimited property of the darkMatterProfile component is settable.

<logical> scaleIsLimitedRateGet() Returns a zero rate for the scaleIsLimited property for the darkMatterProfile component class.

<void> scaleIsLimitedSet(<logical> value) Set the scaleIsLimited property of the darkMatterProfile component.

<logical> scaleIsSettable() Specify whether the scale property of the darkMatterProfile component is settable.

<logical> scalePresetIsActive() Return true if the scalePreset implementation of the darkMatterProfile component is the active choice.

<void> scaleRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate to the rate of change of the scale property of an scalePreset implementation of the darkMatterProfile component class.

<double precision> scaleRateGet() Get the rate of change of the scale property of an scalePreset implementation of the darkMatterProfile component class.

<void> scaleScale(<double precision> setValue→) Set the absolute scale of the scale property of an scalePreset implementation of the darkMatterProfile component class.

<void> scaleSet(<double precision> setValue→) Set the scale property of an scalePreset implementation of the darkMatterProfile component class.

<logical> scaleShapeIsActive() Return true if the scaleShape implementation of the darkMatterProfile component is the active choice.

<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→) Compute offsets into serialization arrays for a scalePreset implementation of the darkMatterProfile component.

<void> serializeASCII() Serialize the contents of a scalePreset implementation of the darkMatterProfile component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the serialization of a scalePreset implementation of the darkMatterProfile component.

<void> serializeRaw(<integer> fileHandle→) Serialize the contents of a scalePreset implementation of the darkMatterProfile component to raw (binary) file.

<void> serializeValues(<double precision[:]> array←, <integer> propertyType→) Serialize evolvable properties of a scalePreset implementation of the darkMatterProfile component to array.

<void> serializeXML(<integer> fileHandle→) Serialize the contents of a scalePreset implementation of the darkMatterProfile component to XML.

<double precision> shape() Returns the default value for the shape property for the darkMatterProfile component class.

<type(varying_string), allocatable, dimension(:) => matches> shapeAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the darkMatterProfile class that have the desired attributes for the shape property

<integer> shapeCount() Compute the count of evolvable quantities in the shape property of the DarkMatterProfileScaleShape component.

<double precision> shapeGrowthRate() Returns the default value for the shapeGrowthRate property for the darkMatterProfile component class.

<type(varying_string), allocatable, dimension(:) => matches> shapeGrowthRateAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the darkMatterProfile class that have the desired attributes for the shapeGrowthRate property

<logical> shapeGrowthRateIsGettable() Returns true if the shapeGrowthRate property is gettable for the darkMatterProfile component class.

<logical> shapeGrowthRateIsSettable() Specify whether the shapeGrowthRate property of the darkMatterProfile component is settable.

<double precision> shapeGrowthRateRateGet() Returns a zero rate for the shapeGrowthRate property for the darkMatterProfile component class.

<void> shapeGrowthRateSet(<double precision> value) Set the shapeGrowthRate property of the darkMatterProfile component.

<logical> shapeIsGettable() Returns true if the shape property is gettable for the darkMatterProfile component class.

<logical> shapeIsSettable() Specify whether the shape property of the darkMatterProfile component is settable.

<void> shapeRate(<double precision> value) Cumulate to the rate of the shape property of the DarkMatterProfileScaleShape component.

<double precision> shapeRateGet() Returns a zero rate for the shape property for the darkMatterProfile component class.

<void> shapeScale(<double precision> value) Set the scale of the shape property of the DarkMatterProfileScaleShap component.

<void> shapeSet(<double precision> value) Set the shape property of the darkMatterProfile component.

<integer(c_size_t)> sizeOf() Return the size in bytes of a scalePreset implementation of the darkMatterProfile component.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<type(varying_string)> type() Returns the type name for the scalePreset implementation of the darkMatterProfile component class.

nodeComponentDarkMatterProfileScaleShape

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a scaleShape implementation of the darkMatterProfile component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a scaleShape implementation of the darkMatterProfile component from raw (binary) file.

<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→) Deserialize evolvable properties of a scaleShape implementation of the darkMatterProfile component from array.

<void> destroy() Finalize a scaleShape implementation of the darkMatterProfile component.

<void> dumpASCII() Dump the content of a darkMatterProfile component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a scaleShape member of the darkMatterProfile component.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a scaleShape implementation of the darkMatterProfile component class.

<logical> nullIsActive() Return true if the null implementation of the darkMatterProfile component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a darkMatterProfile component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a scaleShape implementation of the darkMatterProfile component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Return the names of properties to output for a scaleShape implementation of the darkMatterProfile component.

<void> postOutput(<double precision> time→) Perform post-output processing for a scaleShape implementation of the darkMatterProfile component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<double precision> scale() Get the value of the scale property of the scale implementation of the darkMatterProfile component using a deferred function.

<type(varying_string), allocatable, dimension(:) => matches> scaleAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the darkMatterProfile class that have the desired attributes for the scale property

<integer> scaleCount() Return a count of the number of scalar properties in the scale property of an scale implementation of the darkMatterProfile component class.

<void> scaleFunction() Set the function to be used for the get method of the scale property of the DarkMatterProfileScale component.

<double precision> scaleGrowthRate() Get the scaleGrowthRate property of an scale implementation of the darkMatterProfile component class.

<type(varying_string), allocatable, dimension(:) => matches> scaleGrowthRateAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the darkMatterProfile class that have the desired attributes for the scaleGrowthRate property

<logical> scaleGrowthRateIsGettable() Returns true if the scaleGrowthRate property is gettable for the darkMatterProfile component class.

<logical> scaleGrowthRateIsSettable() Specify whether the scaleGrowthRate property of the darkMatterProfile component is settable.

<double precision> scaleGrowthRateRateGet() Returns a zero rate for the scaleGrowthRate property for the darkMatterProfile component class.

<void> scaleGrowthRateSet(<double precision> setValue→) Set the scaleGrowthRate property of an scale implementation of the darkMatterProfile component class.

<void> scaleInactive() Indicate that the scale property of an scale implementation of the darkMatterProfile component class is inactive for differential equation solving.

<logical> scaleIsActive() Return true if the scale implementation of the darkMatterProfile component is the active choice.

<logical> scaleIsAttached() Return true if the deferred function used to get the scale property of the DarkMatterProfileScale component class has been attached.

<logical> scaleIsGettable() Returns true if the scale property is gettable for the darkMatterProfile component class.

<logical> scaleIsLimited() Get the scaleIsLimited property of an scale implementation of the darkMatterProfile component class.

<type(varying_string), allocatable, dimension(:) => matches> scaleIsLimitedAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the darkMatterProfile class that have the desired attributes for the scaleIsLimited property

<logical> scaleIsLimitedIsGettable() Returns true if the scaleIsLimited property is gettable for the darkMatterProfile component class.

<logical> scaleIsLimitedIsSettable() Specify whether the scaleIsLimited property of the darkMatterProfile component is settable.

<logical> scaleIsLimitedRateGet() Returns a zero rate for the scaleIsLimited property for the darkMatterProfile component class.

<void> scaleIsLimitedSet(<logical> setValue→) Set the scaleIsLimited property of an scale implementation of the darkMatterProfile component class.

<logical> scaleIsSettable() Specify whether the scale property of the darkMatterProfile component is settable.

<logical> scalePresetIsActive() Return true if the scalePreset implementation of the darkMatterProfile component is the active choice.

<void> scaleRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate to the rate of change of the scale property of an scale implementation of the darkMatterProfile component class.

<double precision> scaleRateGet() Get the rate of change of the scale property of an scale implementation of the darkMatterProfile component class.

<void> scaleScale(<double precision> setValue→) Set the absolute scale of the scale property of an scale implementation of the darkMatterProfile component class.

<void> scaleSet(<double precision> setValue→) Set the scale property of an scale implementation of the darkMatterProfile component class.

<logical> scaleShapeIsActive() Return true if the scaleShape implementation of the darkMatterProfile component is the active choice.

<double precision> scaleValue() Get the scale property of an scale implementation of the darkMatterProfile component class.

<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→) Compute offsets into serialization arrays for a scaleShape implementation of the darkMatterProfile component.

<void> serializeASCII() Serialize the contents of a scaleShape implementation of the darkMatterProfile component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the serialization of a scaleShape implementation of the darkMatterProfile component.

<void> serializeRaw(<integer> fileHandle→) Serialize the contents of a scaleShape implementation of the darkMatterProfile component to raw (binary) file.

<void> serializeValues(<double precision[:]> array←, <integer> propertyType→) Serialize evolvable properties of a scaleShape implementation of the darkMatterProfile component to array.

<void> serializeXML(<integer> fileHandle→) Serialize the contents of a scaleShape implementation of the darkMatterProfile component to XML.

<double precision> shape() Get the value of the shape property of the scaleShape implementation of the darkMatterProfile component using a deferred function.

<type(varying_string), allocatable, dimension(:) => matches> shapeAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the darkMatterProfile class that have the desired attributes for the shape property

<integer> shapeCount() Return a count of the number of scalar properties in the shape property of an scaleShape implementation of the darkMatterProfile component class.

<void> shapeFunction() Set the function to be used for the get method of the shape property of the DarkMatterProfileScaleShape component.

<double precision> shapeGrowthRate() Get the shapeGrowthRate property of an scaleShape implementation of the darkMatterProfile component class.

<type(varying_string), allocatable, dimension(:) => matches> shapeGrowthRateAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the darkMatterProfile class that have the desired attributes for the shapeGrowthRate property

<logical> shapeGrowthRateIsGettable() Returns true if the shapeGrowthRate property is gettable for the darkMatterProfile component class.

<logical> shapeGrowthRateIsSettable() Specify whether the shapeGrowthRate property of the darkMatterProfile component is settable.

<double precision> shapeGrowthRateRateGet() Returns a zero rate for the shapeGrowthRate property for the darkMatterProfile component class.

<void> shapeGrowthRateSet(<double precision> setValue→) Set the shapeGrowthRate property of an scaleShape implementation of the darkMatterProfile component class.

<void> shapeInactive() Indicate that the shape property of an scaleShape implementation of the darkMatterProfile component class is inactive for differential equation solving.

<logical> shapeIsAttached() Return true if the deferred function used to get the shape property of the DarkMatterProfileScaleShape component class has been attached.

<logical> shapeIsGettable() Returns true if the shape property is gettable for the darkMatterProfile component class.

<logical> shapeIsSettable() Specify whether the shape property of the darkMatterProfile component is settable.

<void> shapeRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate to the rate of change of the shape property of an scaleShape implementation of the darkMatterProfile component class.

<double precision> shapeRateGet() Get the rate of change of the shape property of an scaleShape implementation of the darkMatterProfile component class.

<void> shapeScale(<double precision> setValue→) Set the absolute scale of the shape property of an scaleShape implementation of the darkMatterProfile component class.

<void> shapeSet(<double precision> setValue→) Set the shape property of an scaleShape implementation of the darkMatterProfile component class.

<double precision> shapeValue() Get the shape property of an scaleShape implementation of the darkMatterProfile component class.

<integer(c_size_t)> sizeOf() Return the size in bytes of a scaleShape implementation of the darkMatterProfile component.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<type(varying_string)> type() Returns the type name for the scaleShape implementation of the darkMatterProfile component class.

nodeComponentDisk

<type(abundances)> abundancesGas() Returns the default value for the abundancesGas property for the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> abundancesGasAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the abundancesGas property

<integer> abundancesGasCount() Compute the count of evolvable quantities in the abundancesGas property of the DiskStandard component.

<logical> abundancesGasIsGettable() Returns true if the abundancesGas property is gettable for the disk component class.

<logical> abundancesGasIsSettable() Specify whether the abundancesGas property of the disk component is settable.

<void> abundancesGasRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptT [interruptProcedure]↔) Accept a rate set for the abundancesGas property of the disk component class. Trigger an interrupt to create the component.

<type(abundances)> abundancesGasRateGet() Returns a zero rate for the abundancesGas property for the disk component class.

<void> abundancesGasScale(<type(abundances)> value) Set the scale of the abundancesGas property of the DiskStandard component.

<void> abundancesGasSet(<type(abundances)> value) Set the abundancesGas property of the disk component.

<type(abundances)> abundancesStellar() Returns the default value for the abundancesStellar property for the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> abundancesStellarAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the abundancesStellar property

<integer> abundancesStellarCount() Compute the count of evolvable quantities in the abundancesStellar property of the DiskStandard component.

<logical> abundancesStellarIsGettable() Returns true if the abundancesStellar property is gettable for the disk component class.

<logical> abundancesStellarIsSettable() Specify whether the abundancesStellar property of the disk component is settable.

<void> abundancesStellarRate(<type(abundances)> value) Cumulate to the rate of the abundancesStellar property of the DiskStandard component.

<type(abundances)> abundancesStellarRateGet() Returns a zero rate for the abundancesStellar property for the disk component class.

<void> abundancesStellarScale(<type(abundances)> value) Set the scale of the abundancesStellar property of the DiskStandard component.

<void> abundancesStellarSet(<type(abundances)> value) Set the abundancesStellar property of the disk component.

<double precision> angularMomentum() Returns the default value for the angularMomentum property for the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> angularMomentumAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the angularMomentum property

<integer> angularMomentumCount() Compute the count of evolvable quantities in the angularMomentum property of the DiskStandard component.

<logical> angularMomentumIsGettable() Returns true if the angularMomentum property is gettable for the disk component class.

<logical> angularMomentumIsSettable() Specify whether the angularMomentum property of the disk component is settable.

<void> angularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interrup [interruptProcedure]↔) Accept a rate set for the angularMomentum property of the disk component class. Trigger an interrupt to create the component.

<double precision> angularMomentumRateGet() Returns a zero rate for the angularMomentum property for the disk component class.

<void> angularMomentumScale(<double precision> value) Set the scale of the angularMomentum property of the DiskStandard component.

<void> angularMomentumSet(<double precision> value) Set the angularMomentum property of the disk component.

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a generic disk component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Read properties from raw file.

<void> deserializeValues(<double(:)> array→, <integer> propertyType→) Deserialize the evolvable quantities from an array.

<void> destroy() Finalize a generic disk component.

<void> dumpASCII() Dump the content of a disk component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<double precision> fractionMassRetained() Returns the default value for the fractionMassRetained property for the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> fractionMassRetainedAttributeMatch(<logic [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the fractionMassRetained property

<integer> fractionMassRetainedCount() Compute the count of evolvable quantities in the fractionMassRetained property of the DiskStandard component.

<logical> fractionMassRetainedIsGettable() Returns true if the fractionMassRetained property is gettable for the disk component class.

<logical> fractionMassRetainedIsSettable() Specify whether the fractionMassRetained property of the disk component is settable.

<void> fractionMassRetainedRate(<double precision> value) Cumulate to the rate of the fractionMassRetained property of the DiskStandard component.

<double precision> fractionMassRetainedRateGet() Returns a zero rate for the fractionMassRetained property for the disk component class.

<void> fractionMassRetainedScale(<double precision> value) Set the scale of the fractionMassRetained property of the DiskStandard component.

<void> fractionMassRetainedSet(<double precision> value) Set the fractionMassRetained property of the disk component.

<double precision> halfMassRadius() Returns the default value for the halfMassRadius property for the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> halfMassRadiusAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the halfMassRadius property

<logical> halfMassRadiusIsGettable() Returns true if the halfMassRadius property is gettable for the disk component class.

<logical> halfMassRadiusIsSettable() Specify whether the halfMassRadius property of the disk component is settable.

<double precision> halfMassRadiusRateGet() Returns a zero rate for the halfMassRadius property for the disk component class.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a generic disk component.

<logical> isInitialized() Returns the default value for the isInitialized property for the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> isInitializedAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the isInitialized property

<logical> isInitializedIsGettable() Returns true if the isInitialized property is gettable for the disk component class.

<logical> isInitializedIsSettable() Specify whether the isInitialized property of the disk component is settable.

<logical> isInitializedRateGet() Returns a zero rate for the isInitialized property for the disk component class.

<void> isInitializedSet(<logical> value) Set the isInitialized property of the disk component.

<type(stellarLuminosities)> luminositiesStellar() Returns the default value for the luminositiesStellar property for the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> luminositiesStellarAttributeMatch(<logica
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the disk class that have the desired attributes for the luminositiesStellar property

<integer> luminositiesStellarCount() Compute the count of evolvable quantities in the luminositiesStellar property of the DiskStandard component.

<logical> luminositiesStellarIsGettable() Returns true if the luminositiesStellar property is gettable for the disk component class.

<logical> luminositiesStellarIsSettable() Specify whether the luminositiesStellar property of the disk component is settable.

<void> luminositiesStellarRate(<type(stellarLuminosities)> value) Cumulate to the rate of the luminositiesStellar property of the DiskStandard component.

<type(stellarLuminosities)> luminositiesStellarRateGet() Returns a zero rate for the luminositiesStellar property for the disk component class.

<void> luminositiesStellarScale(<type(stellarLuminosities)> value) Set the scale of the luminositiesStellar property of the DiskStandard component.

<void> luminositiesStellarSet(<type(stellarLuminosities)> value) Set the luminositiesStellar property of the disk component.

<double precision> massGas() Returns the default value for the massGas property for the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> massGasAttributeMatch(<logical>
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the disk class that have the desired attributes for the massGas property

<integer> massGasCount() Compute the count of evolvable quantities in the massGas property of the DiskStandard component.

<logical> massGasIsGettable() Returns true if the massGas property is gettable for the disk component class.

<logical> massGasIsSettable() Specify whether the massGas property of the disk component is settable.

<void> massGasRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)>
[interruptProcedure]↔) Accept a rate set for the massGas property of the disk component class. Trigger an interrupt to create the component.

<double precision> massGasRateGet() Returns a zero rate for the massGas property for the disk component class.

<void> massGasScale(<double precision> value) Set the scale of the massGas property of the DiskStandard component.

<void> massGasSet(<double precision> value) Set the massGas property of the disk component.

<double precision> massStellar() Returns the default value for the massStellar property for the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> massStellarAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the massStellar property

<integer> massStellarCount() Compute the count of evolvable quantities in the massStellar property of the DiskStandard component.

<double precision> massStellarFormed() Returns the default value for the massStellarFormed property for the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> massStellarFormedAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the massStellarFormed property

<integer> massStellarFormedCount() Compute the count of evolvable quantities in the massStellarFormed property of the DiskStandard component.

<logical> massStellarFormedIsGettable() Returns true if the massStellarFormed property is gettable for the disk component class.

<logical> massStellarFormedIsSettable() Specify whether the massStellarFormed property of the disk component is settable.

<void> massStellarFormedRate(<double precision> value) Cumulate to the rate of the massStellarFormed property of the DiskStandard component.

<double precision> massStellarFormedRateGet() Returns a zero rate for the massStellarFormed property for the disk component class.

<void> massStellarFormedScale(<double precision> value) Set the scale of the massStellarFormed property of the DiskStandard component.

<void> massStellarFormedSet(<double precision> value) Set the massStellarFormed property of the disk component.

<logical> massStellarIsGettable() Returns true if the massStellar property is gettable for the disk component class.

<logical> massStellarIsSettable() Specify whether the massStellar property of the disk component is settable.

<void> massStellarRate(<double precision> value) Cumulate to the rate of the massStellar property of the DiskStandard component.

<double precision> massStellarRateGet() Returns a zero rate for the massStellar property for the disk component class.

<void> massStellarScale(<double precision> value) Set the scale of the massStellar property of the DiskStandard component.

<void> massStellarSet(<double precision> value) Set the massStellar property of the disk component.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a nodeComponent object.

<logical> nullIsActive() Return true if the null implementation of the disk component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a disk component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a generic disk component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Establish the names of properties to output for a generic disk component.

<void> postOutput(<double precision> time→) Perform post-output processing of a disk component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<double precision> radius() Returns the default value for the radius property for the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> radiusAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the radius property

<logical> radiusIsGettable() Returns true if the radius property is gettable for the disk component class.

<logical> radiusIsSettable() Specify whether the radius property of the disk component is settable.

<double precision> radiusRateGet() Returns a zero rate for the radius property for the disk component class.

<void> radiusSet(<double precision> value) Set the radius property of the disk component.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets() Set offsets into serialization arrays.

<void> serializeASCII() Serialize the content of a disk component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the number of evolvable quantities to be evolved.

<void> serializeRaw(<integer> fileHandle→) Generate a binary dump of all properties.

<void> serializeValues(<double(:)> array←, <integer> propertyType→) Serialize the evolvable quantities to an array.

<void> serializeXML() Generate an XML dump of all properties.

<integer(c_size_t)> sizeOf() Return the size in bytes of a nodeComponentDisk component.

<logical> standardIsActive() Return true if the standard implementation of the disk component is the active choice.

<type(history)> starFormationHistory() Returns the default value for the starFormationHistory property for the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> starFormationHistoryAttributeMatch(<logic [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the starFormationHistory property

<integer> starFormationHistoryCount() Compute the count of evolvable quantities in the starFormationHistory property of the DiskStandard component.

<logical> starFormationHistoryIsGettable() Returns true if the starFormationHistory property is gettable for the disk component class.

<logical> starFormationHistoryIsSettable() Specify whether the starFormationHistory property of the disk component is settable.

<void> starFormationHistoryRate(<type(history)> value) Cumulate to the rate of the starFormationHistory property of the DiskStandard component.

<type(history)> starFormationHistoryRateGet() Returns a zero rate for the starFormationHistory property for the disk component class.

<void> starFormationHistoryScale(<type(history)> value) Set the scale of the starFormationHistory property of the DiskStandard component.

<void> starFormationHistorySet(<type(history)> value) Set the starFormationHistory property of the disk component.

<double precision> starFormationRate() Returns the default value for the starFormationRate property for the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> starFormationRateAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the starFormationRate property

<logical> starFormationRateIsGettable() Returns true if the starFormationRate property is gettable for the disk component class.

<logical> starFormationRateIsSettable() Specify whether the starFormationRate property of the disk component is settable.

<double precision> starFormationRateRateGet() Returns a zero rate for the starFormationRate property for the disk component class.

<type(history)> stellarPropertiesHistory() Returns the default value for the stellarPropertiesHistory property for the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> stellarPropertiesHistoryAttributeMatch(<l [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the stellarPropertiesHistory property

<integer> stellarPropertiesHistoryCount() Compute the count of evolvable quantities in the stellarPropertiesHist property of the DiskStandard component.

<logical> stellarPropertiesHistoryIsGettable() Returns true if the stellarPropertiesHistory property is gettable for the disk component class.

<logical> stellarPropertiesHistoryIsSettable() Specify whether the stellarPropertiesHistory property of the disk component is settable.

<void> stellarPropertiesHistoryRate(<type(history)> value) Cumulate to the rate of the stellarPropertiesHisto property of the DiskStandard component.

<type(history)> stellarPropertiesHistoryRateGet() Returns a zero rate for the stellarPropertiesHistory property for the disk component class.

<void> stellarPropertiesHistoryScale(<type(history)> value) Set the scale of the stellarPropertiesHistory property of the DiskStandard component.

<void> stellarPropertiesHistorySet(<type(history)> value) Set the stellarPropertiesHistory property of the disk component.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<type(varying_string)> type() Returns the type name for the disk component class.

<double precision> velocity() Returns the default value for the velocity property for the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> velocityAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the velocity property

<logical> velocityIsGettable() Returns true if the velocity property is gettable for the disk component class.

<logical> velocityIsSettable() Specify whether the velocity property of the disk component is settable.

<double precision> velocityRateGet() Returns a zero rate for the velocity property for the disk component class.

<void> velocitySet(<double precision> value) Set the velocity property of the disk component.

<logical> verySimpleIsActive() Return true if the verySimple implementation of the disk component is the active choice.

<logical> verySimpleSizeIsActive() Return true if the verySimpleSize implementation of the disk component is the active choice.

nodeComponentDiskNull

<type(abundances)> abundancesGas() Returns the default value for the abundancesGas property for the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> abundancesGasAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the abundancesGas property

<integer> abundancesGasCount() Compute the count of evolvable quantities in the abundancesGas property of the DiskStandard component.

<logical> abundancesGasIsGettable() Returns true if the abundancesGas property is gettable for the disk component class.

<logical> abundancesGasIsSettable() Specify whether the abundancesGas property of the disk component is settable.

<void> abundancesGasRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptT [interruptProcedure]↔) Accept a rate set for the abundancesGas property of the disk component class. Trigger an interrupt to create the component.

<type(abundances)> abundancesGasRateGet() Returns a zero rate for the abundancesGas property for the disk component class.

<void> abundancesGasScale(<type(abundances)> value) Set the scale of the abundancesGas property of the DiskStandard component.

<void> abundancesGasSet(<type(abundances)> value) Set the abundancesGas property of the disk component.

<type(abundances)> abundancesStellar() Returns the default value for the abundancesStellar property for the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> abundancesStellarAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the abundancesStellar property

`<integer>` `abundancesStellarCount()` Compute the count of evolvable quantities in the `abundancesStellar` property of the `DiskStandard` component.

`<logical>` `abundancesStellarIsGettable()` Returns true if the `abundancesStellar` property is gettable for the `disk` component class.

`<logical>` `abundancesStellarIsSettable()` Specify whether the `abundancesStellar` property of the `disk` component is settable.

`<void>` `abundancesStellarRate(<type(abundances)> value)` Cumulate to the rate of the `abundancesStellar` property of the `DiskStandard` component.

`<type(abundances)>` `abundancesStellarRateGet()` Returns a zero rate for the `abundancesStellar` property for the `disk` component class.

`<void>` `abundancesStellarScale(<type(abundances)> value)` Set the scale of the `abundancesStellar` property of the `DiskStandard` component.

`<void>` `abundancesStellarSet(<type(abundances)> value)` Set the `abundancesStellar` property of the `disk` component.

`<double precision>` `angularMomentum()` Returns the default value for the `angularMomentum` property for the `disk` component class.

`<type(varying_string), allocatable, dimension(:) => matches>` `angularMomentumAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)` Return a text list of component implementations in the `disk` class that have the desired attributes for the `angularMomentum` property

`<integer>` `angularMomentumCount()` Compute the count of evolvable quantities in the `angularMomentum` property of the `DiskStandard` component.

`<logical>` `angularMomentumIsGettable()` Returns true if the `angularMomentum` property is gettable for the `disk` component class.

`<logical>` `angularMomentumIsSettable()` Specify whether the `angularMomentum` property of the `disk` component is settable.

`<void>` `angularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interrup [interruptProcedure]↔)` Accept a rate set for the `angularMomentum` property of the `disk` component class. Trigger an interrupt to create the component.

`<double precision>` `angularMomentumRateGet()` Returns a zero rate for the `angularMomentum` property for the `disk` component class.

`<void>` `angularMomentumScale(<double precision> value)` Set the scale of the `angularMomentum` property of the `DiskStandard` component.

`<void>` `angularMomentumSet(<double precision> value)` Set the `angularMomentum` property of the `disk` component.

`<void>` `assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→)` Assign a node component to another node component.

`<void>` `builder(<*type(node)> componentDefinition→)` Build a `null` implementation of the `disk` component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a null implementation of the disk component from raw (binary) file.

<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→) Deserialize evolvable properties of a null implementation of the disk component from array.

<void> destroy() Finalize a null implementation of the disk component.

<void> dumpASCII() Dump the content of a disk component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<double precision> fractionMassRetained() Returns the default value for the fractionMassRetained property for the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> fractionMassRetainedAttributeMatch(<logic [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the fractionMassRetained property

<integer> fractionMassRetainedCount() Compute the count of evolvable quantities in the fractionMassRetained property of the DiskStandard component.

<logical> fractionMassRetainedIsGettable() Returns true if the fractionMassRetained property is gettable for the disk component class.

<logical> fractionMassRetainedIsSettable() Specify whether the fractionMassRetained property of the disk component is settable.

<void> fractionMassRetainedRate(<double precision> value) Cumulate to the rate of the fractionMassRetained property of the DiskStandard component.

<double precision> fractionMassRetainedRateGet() Returns a zero rate for the fractionMassRetained property for the disk component class.

<void> fractionMassRetainedScale(<double precision> value) Set the scale of the fractionMassRetained property of the DiskStandard component.

<void> fractionMassRetainedSet(<double precision> value) Set the fractionMassRetained property of the disk component.

<double precision> halfMassRadius() Returns the default value for the halfMassRadius property for the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> halfMassRadiusAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the halfMassRadius property

<logical> halfMassRadiusIsGettable() Returns true if the halfMassRadius property is gettable for the disk component class.

<logical> halfMassRadiusIsSettable() Specify whether the halfMassRadius property of the disk component is settable.

<double precision> halfMassRadiusRateGet() Returns a zero rate for the halfMassRadius property for the disk component class.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a null member of the disk component.

<logical> isInitialized() Returns the default value for the isInitialized property for the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> isInitializedAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the isInitialized property

<logical> isInitializedIsGettable() Returns true if the isInitialized property is gettable for the disk component class.

<logical> isInitializedIsSettable() Specify whether the isInitialized property of the disk component is settable.

<logical> isInitializedRateGet() Returns a zero rate for the isInitialized property for the disk component class.

<void> isInitializedSet(<logical> value) Set the isInitialized property of the disk component.

<type(stellarLuminosities)> luminositiesStellar() Returns the default value for the luminositiesStellar property for the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> luminositiesStellarAttributeMatch(<logica [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the luminositiesStellar property

<integer> luminositiesStellarCount() Compute the count of evolvable quantities in the luminositiesStellar property of the DiskStandard component.

<logical> luminositiesStellarIsGettable() Returns true if the luminositiesStellar property is gettable for the disk component class.

<logical> luminositiesStellarIsSettable() Specify whether the luminositiesStellar property of the disk component is settable.

<void> luminositiesStellarRate(<type(stellarLuminosities)> value) Cumulate to the rate of the luminositiesStellar property of the DiskStandard component.

<type(stellarLuminosities)> luminositiesStellarRateGet() Returns a zero rate for the luminositiesStellar property for the disk component class.

<void> luminositiesStellarScale(<type(stellarLuminosities)> value) Set the scale of the luminositiesStellar property of the DiskStandard component.

<void> luminositiesStellarSet(<type(stellarLuminosities)> value) Set the luminositiesStellar property of the disk component.

<double precision> massGas() Returns the default value for the massGas property for the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> massGasAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the massGas property

<integer> massGasCount() Compute the count of evolvable quantities in the massGas property of the DiskStandard component.

<logical> massGasIsGettable() Returns true if the massGas property is gettable for the disk component class.

<logical> massGasIsSettable() Specify whether the massGas property of the disk component is settable.

<void> massGasRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accept a rate set for the massGas property of the disk component class. Trigger an interrupt to create the component.

<double precision> massGasRateGet() Returns a zero rate for the massGas property for the disk component class.

<void> massGasScale(<double precision> value) Set the scale of the massGas property of the DiskStandard component.

<void> massGasSet(<double precision> value) Set the massGas property of the disk component.

<double precision> massStellar() Returns the default value for the massStellar property for the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> massStellarAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the massStellar property

`<integer> massStellarCount()` Compute the count of evolvable quantities in the `massStellar` property of the `DiskStandard` component.

`<double precision> massStellarFormed()` Returns the default value for the `massStellarFormed` property for the `disk` component class.

`<type(varying_string), allocatable, dimension(:) => matches> massStellarFormedAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)` Return a text list of component implementations in the `disk` class that have the desired attributes for the `massStellarFormed` property

`<integer> massStellarFormedCount()` Compute the count of evolvable quantities in the `massStellarFormed` property of the `DiskStandard` component.

`<logical> massStellarFormedIsGettable()` Returns true if the `massStellarFormed` property is gettable for the `disk` component class.

`<logical> massStellarFormedIsSettable()` Specify whether the `massStellarFormed` property of the `disk` component is settable.

`<void> massStellarFormedRate(<double precision> value)` Cumulate to the rate of the `massStellarFormed` property of the `DiskStandard` component.

`<double precision> massStellarFormedRateGet()` Returns a zero rate for the `massStellarFormed` property for the `disk` component class.

`<void> massStellarFormedScale(<double precision> value)` Set the scale of the `massStellarFormed` property of the `DiskStandard` component.

`<void> massStellarFormedSet(<double precision> value)` Set the `massStellarFormed` property of the `disk` component.

`<logical> massStellarIsGettable()` Returns true if the `massStellar` property is gettable for the `disk` component class.

`<logical> massStellarIsSettable()` Specify whether the `massStellar` property of the `disk` component is settable.

`<void> massStellarRate(<double precision> value)` Cumulate to the rate of the `massStellar` property of the `DiskStandard` component.

`<double precision> massStellarRateGet()` Returns a zero rate for the `massStellar` property for the `disk` component class.

`<void> massStellarScale(<double precision> value)` Set the scale of the `massStellar` property of the `DiskStandard` component.

`<void> massStellarSet(<double precision> value)` Set the `massStellar` property of the `disk` component.

`<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→)` Return the name of the property of given index for a `null` implementation of the `disk` component class.

`<logical> nullIsActive()` Return true if the null implementation of the disk component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a disk component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a null implementation of the disk component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Return the names of properties to output for a null implementation of the disk component.

<void> postOutput(<double precision> time→) Perform post-output processing of a disk component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<double precision> radius() Returns the default value for the radius property for the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> radiusAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the radius property

<logical> radiusIsGettable() Returns true if the radius property is gettable for the disk component class.

<logical> radiusIsSettable() Specify whether the radius property of the disk component is settable.

<double precision> radiusRateGet() Returns a zero rate for the radius property for the disk component class.

<void> radiusSet(<double precision> value) Set the radius property of the disk component.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→) Compute offsets into serialization arrays for a null implementation of the disk component.

<void> serializeASCII() Serialize the contents of a null implementation of the disk component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the serialization of a null implementation of the disk component.

<void> serializeRaw(<integer> fileHandle→) Serialize the contents of a null implementation of the disk component to raw (binary) file.

<void> serializeValues(<double precision[:]> array←, <integer> propertyType→) Serialize evolvable properties of a null implementation of the disk component to array.

<void> serializeXML(<integer> fileHandle→) Serialize the contents of a null implementation of the disk component to XML.

<integer(c_size_t)> sizeOf() Return the size in bytes of a null implementation of the disk component.

<logical> standardIsActive() Return true if the standard implementation of the disk component is the active choice.

<type(history)> starFormationHistory() Returns the default value for the starFormationHistory property for the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> starFormationHistoryAttributeMatch(<logic
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the disk class that have the desired attributes for the starFormationHistory property

<integer> starFormationHistoryCount() Compute the count of evolvable quantities in the starFormationHistory property of the DiskStandard component.

<logical> starFormationHistoryIsGettable() Returns true if the starFormationHistory property is gettable for the disk component class.

<logical> starFormationHistoryIsSettable() Specify whether the starFormationHistory property of the disk component is settable.

<void> starFormationHistoryRate(<type(history)> value) Cumulate to the rate of the starFormationHistory property of the DiskStandard component.

<type(history)> starFormationHistoryRateGet() Returns a zero rate for the starFormationHistory property for the disk component class.

<void> starFormationHistoryScale(<type(history)> value) Set the scale of the starFormationHistory property of the DiskStandard component.

<void> starFormationHistorySet(<type(history)> value) Set the starFormationHistory property of the disk component.

<double precision> starFormationRate() Returns the default value for the starFormationRate property for the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> starFormationRateAttributeMatch(<logical>
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the disk class that have the desired attributes for the starFormationRate property

<logical> starFormationRateIsGettable() Returns true if the starFormationRate property is gettable for the disk component class.

<logical> starFormationRateIsSettable() Specify whether the starFormationRate property of the disk component is settable.

<double precision> starFormationRateRateGet() Returns a zero rate for the starFormationRate property for the disk component class.

<type(history)> stellarPropertiesHistory() Returns the default value for the stellarPropertiesHistory property for the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> stellarPropertiesHistoryAttributeMatch(<l [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the stellarPropertiesHistory property

<integer> stellarPropertiesHistoryCount() Compute the count of evolvable quantities in the stellarPropertiesHist property of the DiskStandard component.

<logical> stellarPropertiesHistoryIsGettable() Returns true if the stellarPropertiesHistory property is gettable for the disk component class.

<logical> stellarPropertiesHistoryIsSettable() Specify whether the stellarPropertiesHistory property of the disk component is settable.

<void> stellarPropertiesHistoryRate(<type(history)> value) Cumulate to the rate of the stellarPropertiesHisto property of the DiskStandard component.

<type(history)> stellarPropertiesHistoryRateGet() Returns a zero rate for the stellarPropertiesHistory property for the disk component class.

<void> stellarPropertiesHistoryScale(<type(history)> value) Set the scale of the stellarPropertiesHistory property of the DiskStandard component.

<void> stellarPropertiesHistorySet(<type(history)> value) Set the stellarPropertiesHistory property of the disk component.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<type(varying_string)> type() Returns the type name for the null implementation of the disk component class.

<double precision> velocity() Returns the default value for the velocity property for the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> velocityAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the velocity property

<logical> velocityIsGettable() Returns true if the velocity property is gettable for the disk component class.

<logical> velocityIsSettable() Specify whether the velocity property of the disk component is settable.

<double precision> velocityRateGet() Returns a zero rate for the velocity property for the disk component class.

<void> velocitySet(<double precision> value) Set the velocity property of the disk component.

<logical> verySimpleIsActive() Return true if the verySimple implementation of the disk component is the active choice.

<logical> verySimpleSizeIsActive() Return true if the verySimpleSize implementation of the disk component is the active choice.

nodeComponentDiskStandard

<type(abundances)> abundancesGas() Get the abundancesGas property of an standard implementation of the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> abundancesGasAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the abundancesGas property

<integer> abundancesGasCount() Return a count of the number of scalar properties in the abundancesGas property of an standard implementation of the disk component class.

<void> abundancesGasInactive() Indicate that the abundancesGas property of an standard implementation of the disk component class is inactive for differential equation solving.

<logical> abundancesGasIsGettable() Returns true if the abundancesGas property is gettable for the disk component class.

<logical> abundancesGasIsSettable() Specify whether the abundancesGas property of the disk component is settable.

<void> abundancesGasRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptT [interruptProcedure]↔) Accumulate to the rate of change of the abundancesGas property of an standard implementation of the disk component class.

<type(abundances)> abundancesGasRateGet() Get the rate of change of the abundancesGas property of an standard implementation of the disk component class.

<void> abundancesGasScale(<type(abundances)> setValue→) Set the absolute scale of the abundancesGas property of an standard implementation of the disk component class.

<void> abundancesGasSet(<type(abundances)> setValue→) Set the abundancesGas property of an standard implementation of the disk component class.

<type(abundances)> abundancesStellar() Get the abundancesStellar property of an standard implementation of the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> abundancesStellarAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the abundancesStellar property

<integer> abundancesStellarCount() Return a count of the number of scalar properties in the abundancesStellar property of an standard implementation of the disk component class.

<void> abundancesStellarInactive() Indicate that the abundancesStellar property of an standard implementation of the disk component class is inactive for differential equation solving.

<logical> abundancesStellarIsGettable() Returns true if the abundancesStellar property is gettable for the disk component class.

<logical> abundancesStellarIsSettable() Specify whether the abundancesStellar property of the disk component is settable.

<void> abundancesStellarRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interr [interruptProcedure]↔) Accumulate to the rate of change of the abundancesStellar property of an standard implementation of the disk component class.

<type(abundances)> abundancesStellarRateGet() Get the rate of change of the abundancesStellar property of an standard implementation of the disk component class.

<void> abundancesStellarScale(<type(abundances)> setValue→) Set the absolute scale of the abundancesStellar property of an standard implementation of the disk component class.

<void> abundancesStellarSet(<type(abundances)> setValue→) Set the abundancesStellar property of an standard implementation of the disk component class.

<double precision> angularMomentum() Get the angularMomentum property of an standard implementation of the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> angularMomentumAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the angularMomentum property

<integer> angularMomentumCount() Return a count of the number of scalar properties in the angularMomentum property of an standard implementation of the disk component class.

<void> angularMomentumInactive() Indicate that the angularMomentum property of an standard implementation of the disk component class is inactive for differential equation solving.

<logical> angularMomentumIsGettable() Returns true if the angularMomentum property is gettable for the disk component class.

<logical> angularMomentumIsSettable() Specify whether the angularMomentum property of the disk component is settable.

<void> angularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interrup [interruptProcedure]↔) Accumulate to the rate of change of the angularMomentum property of an standard implementation of the disk component class.

<double precision> angularMomentumRateGet() Get the rate of change of the angularMomentum property of an standard implementation of the disk component class.

<void> angularMomentumScale(<double precision> setValue→) Set the absolute scale of the angularMomentum property of an standard implementation of the disk component class.

<void> angularMomentumSet(<double precision> setValue→) Set the angularMomentum property of an standard implementation of the disk component class.

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> attachPipes() Attach pipes to the standard disk component.

<void> builder(<*type(node)> componentDefinition→) Build a standard implementation of the disk component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a standard implementation of the disk component from raw (binary) file.

<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→) Deserialize evolvable properties of a standard implementation of the disk component from array.

<void> destroy() Finalize a standard implementation of the disk component.

<void> dumpASCII() Dump the content of a disk component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<double precision> fractionMassRetained() Get the fractionMassRetained property of an standard implementation of the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> fractionMassRetainedAttributeMatch(<logic [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the fractionMassRetained property

<integer> fractionMassRetainedCount() Return a count of the number of scalar properties in the fractionMassRetained property of an standard implementation of the disk component class.

<void> fractionMassRetainedInactive() Indicate that the fractionMassRetained property of an standard implementation of the disk component class is inactive for differential equation solving.

<logical> fractionMassRetainedIsGettable() Returns true if the fractionMassRetained property is gettable for the disk component class.

<logical> fractionMassRetainedIsSettable() Specify whether the fractionMassRetained property of the disk component is settable.

<void> fractionMassRetainedRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate to the rate of change of the fractionMassRetained property of an standard implementation of the disk component class.

<double precision> fractionMassRetainedRateGet() Get the rate of change of the fractionMassRetained property of an standard implementation of the disk component class.

<void> fractionMassRetainedScale(<double precision> setValue→) Set the absolute scale of the fractionMassRetained property of an standard implementation of the disk component class.

<void> fractionMassRetainedSet(<double precision> setValue→) Set the fractionMassRetained property of an standard implementation of the disk component class.

<double precision> halfMassRadius() Returns the default value for the halfMassRadius property for the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> halfMassRadiusAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the halfMassRadius property

<logical> halfMassRadiusIsGettable() Returns true if the halfMassRadius property is gettable for the disk component class.

<logical> halfMassRadiusIsSettable() Specify whether the halfMassRadius property of the disk component is settable.

<double precision> halfMassRadiusRateGet() Returns a zero rate for the halfMassRadius property for the disk component class.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a standard member of the disk component.

<logical> isInitialized() Get the isInitialized property of an standard implementation of the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> isInitializedAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the isInitialized property

<logical> isInitializedIsGettable() Returns true if the isInitialized property is gettable for the disk component class.

<logical> isInitializedIsSettable() Specify whether the isInitialized property of the disk component is settable.

<logical> isInitializedRateGet() Returns a zero rate for the isInitialized property for the disk component class.

<void> isInitializedSet(<logical> setValue→) Set the isInitialized property of an standard implementation of the disk component class.

<type(stellarLuminosities)> luminositiesStellar() Get the luminositiesStellar property of an standard implementation of the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> luminositiesStellarAttributeMatch(<logica [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the luminositiesStellar property

<integer> luminositiesStellarCount() Return a count of the number of scalar properties in the luminositiesStellar property of an standard implementation of the disk component class.

<void> luminositiesStellarInactive() Indicate that the luminositiesStellar property of an standard implementation of the disk component class is inactive for differential equation solving.

<logical> luminositiesStellarIsGettable() Returns true if the luminositiesStellar property is gettable for the disk component class.

<logical> luminositiesStellarIsSettable() Specify whether the luminositiesStellar property of the disk component is settable.

<void> luminositiesStellarRate(<type(stellarLuminosities)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate to the rate of change of the luminositiesStellar property of an standard implementation of the disk component class.

<type(stellarLuminosities)> luminositiesStellarRateGet() Get the rate of change of the luminositiesStellar property of an standard implementation of the disk component class.

<void> luminositiesStellarScale(<type(stellarLuminosities)> setValue→) Set the absolute scale of the luminositiesStellar property of an standard implementation of the disk component class.

<void> luminositiesStellarSet(<type(stellarLuminosities)> setValue→) Set the luminositiesStellar property of an standard implementation of the disk component class.

<double precision> massGas() Get the massGas property of an standard implementation of the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> massGasAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the massGas property

<integer> massGasCount() Return a count of the number of scalar properties in the massGas property of an standard implementation of the disk component class.

<void> massGasInactive() Indicate that the massGas property of an standard implementation of the disk component class is inactive for differential equation solving.

<logical> massGasIsGettable() Returns true if the massGas property is gettable for the disk component class.

<logical> massGasIsSettable() Specify whether the massGas property of the disk component is settable.

<void> massGasRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate to the rate of change of the massGas property of an standard implementation of the disk component class.

<double precision> massGasRateGet() Get the rate of change of the massGas property of an standard implementation of the disk component class.

<void> massGasScale(<double precision> setValue→) Set the absolute scale of the massGas property of an standard implementation of the disk component class.

<void> massGasSet(<double precision> setValue→) Set the massGas property of an standard implementation of the disk component class.

<double precision> massStellar() Get the massStellar property of an standard implementation of the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> massStellarAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the massStellar property

<integer> massStellarCount() Return a count of the number of scalar properties in the massStellar property of an standard implementation of the disk component class.

<double precision> massStellarFormed() Get the massStellarFormed property of an standard implementation of the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> massStellarFormedAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the massStellarFormed property

<integer> massStellarFormedCount() Return a count of the number of scalar properties in the massStellarFormed property of an standard implementation of the disk component class.

<void> massStellarFormedInactive() Indicate that the massStellarFormed property of an standard implementation of the disk component class is inactive for differential equation solving.

<logical> massStellarFormedIsGettable() Returns true if the massStellarFormed property is gettable for the disk component class.

<logical> massStellarFormedIsSettable() Specify whether the massStellarFormed property of the disk component is settable.

<void> massStellarFormedRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interr [interruptProcedure]↔) Accumulate to the rate of change of the massStellarFormed property of an standard implementation of the disk component class.

<double precision> massStellarFormedRateGet() Get the rate of change of the massStellarFormed property of an standard implementation of the disk component class.

<void> massStellarFormedScale(<double precision> setValue→) Set the absolute scale of the massStellarFormed property of an standard implementation of the disk component class.

<void> massStellarFormedSet(<double precision> setValue→) Set the massStellarFormed property of an standard implementation of the disk component class.

<void> massStellarInactive() Indicate that the massStellar property of an standard implementation of the disk component class is inactive for differential equation solving.

<logical> massStellarIsGettable() Returns true if the massStellar property is gettable for the disk component class.

<logical> massStellarIsSettable() Specify whether the massStellar property of the disk component is settable.

<void> massStellarRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTas [interruptProcedure]↔) Accumulate to the rate of change of the massStellar property of an standard implementation of the disk component class.

<double precision> massStellarRateGet() Get the rate of change of the massStellar property of an standard implementation of the disk component class.

<void> massStellarScale(<double precision> setValue→) Set the absolute scale of the massStellar property of an standard implementation of the disk component class.

<void> massStellarSet(<double precision> setValue→) Set the massStellar property of an standard implementation of the disk component class.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a standard implementation of the disk component class.

<logical> nullIsActive() Return true if the null implementation of the disk component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a disk component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a standard implementation of the disk component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Return the names of properties to output for a standard implementation of the disk component.

<void> postOutput(<double precision> time→) Perform post-output processing for a standard implementation of the disk component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<double precision> radius() Get the radius property of an standard implementation of the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> radiusAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the radius property

<logical> radiusIsGettable() Returns true if the radius property is gettable for the disk component class.

<logical> radiusIsSettable() Specify whether the radius property of the disk component is settable.

<double precision> radiusRateGet() Returns a zero rate for the radius property for the disk component class.

<void> radiusSet(<double precision> setValue→) Set the radius property of an standard implementation of the disk component class.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→) Compute offsets into serialization arrays for a standard implementation of the disk component.

<void> serializeASCII() Serialize the contents of a standard implementation of the disk component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the serialization of a standard implementation of the disk component.

<void> serializeRaw(<integer> fileHandle→) Serialize the contents of a standard implementation of the disk component to raw (binary) file.

<void> serializeValues(<double precision[:]> array←, <integer> propertyType→) Serialize evolvable properties of a standard implementation of the disk component to array.

<void> serializeXML(<integer> fileHandle→) Serialize the contents of a standard implementation of the disk component to XML.

<integer(c_size_t)> sizeOf() Return the size in bytes of a standard implementation of the disk component.

<logical> standardIsActive() Return true if the standard implementation of the disk component is the active choice.

<type(history)> starFormationHistory() Get the starFormationHistory property of an standard implementation of the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> starFormationHistoryAttributeMatch(<logic [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the starFormationHistory property

<integer> starFormationHistoryCount() Return a count of the number of scalar properties in the starFormationHistory property of an standard implementation of the disk component class.

<void> starFormationHistoryInactive() Indicate that the starFormationHistory property of an standard implementation of the disk component class is inactive for differential equation solving.

<logical> starFormationHistoryIsGettable() Returns true if the starFormationHistory property is gettable for the disk component class.

<logical> starFormationHistoryIsSettable() Specify whether the starFormationHistory property of the disk component is settable.

<void> starFormationHistoryRate(<type(history)> setValue→, <logical> [interrupt]↔, <*procedure(interr [interruptProcedure]↔) Accumulate to the rate of change of the starFormationHistory property of an standard implementation of the disk component class.

<type(history)> starFormationHistoryRateGet() Get the rate of change of the starFormationHistory property of an standard implementation of the disk component class.

<void> starFormationHistoryScale(<type(history)> setValue→) Set the absolute scale of the starFormationHistory property of an standard implementation of the disk component class.

<void> starFormationHistorySet(<type(history)> setValue→) Set the starFormationHistory property of an standard implementation of the disk component class.

<double precision> starFormationRate() Get the value of the starFormationRate property of the standard implementation of the disk component using a deferred function.

<type(varying_string), allocatable, dimension(:) => matches> starFormationRateAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the starFormationRate property

<void> starFormationRateFunction() Set the function to be used for the get method of the starFormationRate property of the DiskStandard component.

<logical> starFormationRateIsAttached() Return true if the deferred function used to get the starFormationRate property of the DiskStandard component class has been attached.

<logical> starFormationRateIsGettable() Returns true if the starFormationRate property is gettable for the disk component class.

<logical> starFormationRateIsSettable() Specify whether the starFormationRate property of the disk component is settable.

<double precision> starFormationRateRateGet() Returns a zero rate for the starFormationRate property for the disk component class.

<type(history)> stellarPropertiesHistory() Get the stellarPropertiesHistory property of an standard implementation of the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> stellarPropertiesHistoryAttributeMatch(<l
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the disk class that have the desired attributes for the stellarPropertiesHistory property

<integer> stellarPropertiesHistoryCount() Return a count of the number of scalar properties in the stellarPropertiesHistory property of an standard implementation of the disk component class.

<void> stellarPropertiesHistoryInactive() Indicate that the stellarPropertiesHistory property of an standard implementation of the disk component class is inactive for differential equation solving.

<logical> stellarPropertiesHistoryIsGettable() Returns true if the stellarPropertiesHistory property is gettable for the disk component class.

<logical> stellarPropertiesHistoryIsSettable() Specify whether the stellarPropertiesHistory property of the disk component is settable.

<void> stellarPropertiesHistoryRate(<type(history)> setValue→, <logical> [interrupt]↔,
<*procedure(interruptTask)> [interruptProcedure]↔) Accumulate to the rate of change of the stellarPropertiesHistory property of an standard implementation of the disk component class.

<type(history)> stellarPropertiesHistoryRateGet() Get the rate of change of the stellarPropertiesHistory property of an standard implementation of the disk component class.

<void> stellarPropertiesHistoryScale(<type(history)> setValue→) Set the absolute scale of the stellarPropertiesHistory property of an standard implementation of the disk component class.

<void> stellarPropertiesHistorySet(<type(history)> setValue→) Set the stellarPropertiesHistory property of an standard implementation of the disk component class.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→,
<massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<type(varying_string)> type() Returns the type name for the standard implementation of the disk component class.

<double precision> velocity() Get the velocity property of an standard implementation of the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> velocityAttributeMatch(<logical>
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the disk class that have the desired attributes for the velocity property

<logical> velocityIsGettable() Returns true if the velocity property is gettable for the disk component class.

<logical> velocityIsSettable() Specify whether the velocity property of the disk component is settable.

<double precision> velocityRateGet() Returns a zero rate for the velocity property for the disk component class.

<void> velocitySet(<double precision> setValue→) Set the velocity property of an standard implementation of the disk component class.

<logical> verySimpleIsActive() Return true if the verySimple implementation of the disk component is the active choice.

<logical> verySimpleSizeIsActive() Return true if the verySimpleSize implementation of the disk component is the active choice.

nodeComponentDiskVerySimple

<type(abundances)> abundancesGas() Get the abundancesGas property of an verySimple implementation of the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> abundancesGasAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the abundancesGas property

<integer> abundancesGasCount() Return a count of the number of scalar properties in the abundancesGas property of an verySimple implementation of the disk component class.

<void> abundancesGasInactive() Indicate that the abundancesGas property of an verySimple implementation of the disk component class is inactive for differential equation solving.

<logical> abundancesGasIsGettable() Returns true if the abundancesGas property is gettable for the disk component class.

<logical> abundancesGasIsSettable() Specify whether the abundancesGas property of the disk component is settable.

<void> abundancesGasRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptT [interruptProcedure]↔) Accumulate to the rate of change of the abundancesGas property of an verySimple implementation of the disk component class.

<type(abundances)> abundancesGasRateGet() Get the rate of change of the abundancesGas property of an verySimple implementation of the disk component class.

<void> abundancesGasScale(<type(abundances)> setValue→) Set the absolute scale of the abundancesGas property of an verySimple implementation of the disk component class.

<void> abundancesGasSet(<type(abundances)> setValue→) Set the abundancesGas property of an verySimple implementation of the disk component class.

<type(abundances)> abundancesStellar() Get the abundancesStellar property of an verySimple implementation of the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> abundancesStellarAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the abundancesStellar property

<integer> abundancesStellarCount() Return a count of the number of scalar properties in the abundancesStellar property of an verySimple implementation of the disk component class.

<void> abundancesStellarInactive() Indicate that the abundancesStellar property of an verySimple implementation of the disk component class is inactive for differential equation solving.

<logical> abundancesStellarIsGettable() Returns true if the abundancesStellar property is gettable for the disk component class.

<logical> abundancesStellarIsSettable() Specify whether the abundancesStellar property of the disk component is settable.

<void> abundancesStellarRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interr [interruptProcedure]↔) Accumulate to the rate of change of the abundancesStellar property of an verySimple implementation of the disk component class.

<type(abundances)> abundancesStellarRateGet() Get the rate of change of the abundancesStellar property of an verySimple implementation of the disk component class.

<void> abundancesStellarScale(<type(abundances)> setValue→) Set the absolute scale of the abundancesStellar property of an verySimple implementation of the disk component class.

<void> abundancesStellarSet(<type(abundances)> setValue→) Set the abundancesStellar property of an verySimple implementation of the disk component class.

<double precision> angularMomentum() Returns the default value for the angularMomentum property for the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> angularMomentumAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the angularMomentum property

<integer> angularMomentumCount() Compute the count of evolvable quantities in the angularMomentum property of the DiskStandard component.

<logical> angularMomentumIsGettable() Returns true if the angularMomentum property is gettable for the disk component class.

<logical> angularMomentumIsSettable() Specify whether the angularMomentum property of the disk component is settable.

<void> angularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interrup [interruptProcedure]↔) Accept a rate set for the angularMomentum property of the disk component class. Trigger an interrupt to create the component.

<double precision> angularMomentumRateGet() Returns a zero rate for the angularMomentum property for the disk component class.

<void> angularMomentumScale(<double precision> value) Set the scale of the angularMomentum property of the DiskStandard component.

<void> angularMomentumSet(<double precision> value) Set the angularMomentum property of the disk component.

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> attachPipe() Attach pipes to the very simple disk component.

<void> builder(<*type(node)> componentDefinition→) Build a verySimple implementation of the disk component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a verySimple implementation of the disk component from raw (binary) file.

<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→) Deserialize evolvable properties of a verySimple implementation of the disk component from array.

<void> destroy() Finalize a verySimple implementation of the disk component.

<void> dumpASCII() Dump the content of a disk component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<double precision> fractionMassRetained() Returns the default value for the fractionMassRetained property for the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> fractionMassRetainedAttributeMatch(<logic [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the fractionMassRetained property

<integer> fractionMassRetainedCount() Compute the count of evolvable quantities in the fractionMassRetained property of the DiskStandard component.

<logical> fractionMassRetainedIsGettable() Returns true if the fractionMassRetained property is gettable for the disk component class.

<logical> fractionMassRetainedIsSettable() Specify whether the fractionMassRetained property of the disk component is settable.

<void> fractionMassRetainedRate(<double precision> value) Cumulate to the rate of the fractionMassRetained property of the DiskStandard component.

<double precision> fractionMassRetainedRateGet() Returns a zero rate for the fractionMassRetained property for the disk component class.

<void> fractionMassRetainedScale(<double precision> value) Set the scale of the fractionMassRetained property of the DiskStandard component.

<void> fractionMassRetainedSet(<double precision> value) Set the fractionMassRetained property of the disk component.

<double precision> halfMassRadius() Returns the default value for the halfMassRadius property for the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> halfMassRadiusAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the halfMassRadius property

<logical> halfMassRadiusIsGettable() Returns true if the halfMassRadius property is gettable for the disk component class.

<logical> halfMassRadiusIsSettable() Specify whether the halfMassRadius property of the disk component is settable.

<double precision> halfMassRadiusRateGet() Returns a zero rate for the halfMassRadius property for the disk component class.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a verySimple member of the disk component.

<logical> isInitialized() Get the isInitialized property of an verySimple implementation of the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> isInitializedAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the isInitialized property

<logical> isInitializedIsGettable() Returns true if the isInitialized property is gettable for the disk component class.

<logical> isInitializedIsSettable() Specify whether the isInitialized property of the disk component is settable.

<logical> isInitializedRateGet() Returns a zero rate for the isInitialized property for the disk component class.

<void> isInitializedSet(<logical> setValue→) Set the isInitialized property of an verySimple implementation of the disk component class.

<type(stellarLuminosities)> luminositiesStellar() Get the luminositiesStellar property of an verySimple implementation of the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> luminositiesStellarAttributeMatch(<logica [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the luminositiesStellar property

<integer> luminositiesStellarCount() Return a count of the number of scalar properties in the luminositiesStellar property of an verySimple implementation of the disk component class.

<void> luminositiesStellarInactive() Indicate that the luminositiesStellar property of an verySimple implementation of the disk component class is inactive for differential equation solving.

<logical> luminositiesStellarIsGettable() Returns true if the luminositiesStellar property is gettable for the disk component class.

<logical> luminositiesStellarIsSettable() Specify whether the luminositiesStellar property of the disk component is settable.

<void> luminositiesStellarRate(<type(stellarLuminosities)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate to the rate of change of the luminositiesStellar property of an verySimple implementation of the disk component class.

<type(stellarLuminosities)> luminositiesStellarRateGet() Get the rate of change of the luminositiesStellar property of an verySimple implementation of the disk component class.

<void> luminositiesStellarScale(<type(stellarLuminosities)> setValue→) Set the absolute scale of the luminositiesStellar property of an verySimple implementation of the disk component class.

<void> luminositiesStellarSet(<type(stellarLuminosities)> setValue→) Set the luminositiesStellar property of an verySimple implementation of the disk component class.

<double precision> massGas() Get the massGas property of an verySimple implementation of the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> massGasAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the massGas property

<integer> massGasCount() Return a count of the number of scalar properties in the massGas property of an verySimple implementation of the disk component class.

<void> massGasInactive() Indicate that the massGas property of an verySimple implementation of the disk component class is inactive for differential equation solving.

<logical> massGasIsGettable() Returns true if the massGas property is gettable for the disk component class.

<logical> massGasIsSettable() Specify whether the massGas property of the disk component is settable.

<void> massGasRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate to the rate of change of the massGas property of an verySimple implementation of the disk component class.

<double precision> massGasRateGet() Get the rate of change of the massGas property of an verySimple implementation of the disk component class.

<void> massGasScale(<double precision> setValue→) Set the absolute scale of the massGas property of an verySimple implementation of the disk component class.

<void> massGasSet(<double precision> setValue→) Set the massGas property of an verySimple implementation of the disk component class.

<double precision> massStellar() Get the massStellar property of an verySimple implementation of the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> massStellarAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the massStellar property

<integer> massStellarCount() Return a count of the number of scalar properties in the massStellar property of an verySimple implementation of the disk component class.

<double precision> massStellarFormed() Returns the default value for the massStellarFormed property for the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> massStellarFormedAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the massStellarFormed property

<integer> massStellarFormedCount() Compute the count of evolvable quantities in the massStellarFormed property of the DiskStandard component.

<logical> massStellarFormedIsGettable() Returns true if the massStellarFormed property is gettable for the disk component class.

<logical> massStellarFormedIsSettable() Specify whether the massStellarFormed property of the disk component is settable.

<void> massStellarFormedRate(<double precision> value) Cumulate to the rate of the massStellarFormed property of the DiskStandard component.

<double precision> massStellarFormedRateGet() Returns a zero rate for the massStellarFormed property for the disk component class.

<void> massStellarFormedScale(<double precision> value) Set the scale of the massStellarFormed property of the DiskStandard component.

<void> massStellarFormedSet(<double precision> value) Set the massStellarFormed property of the disk component.

<void> massStellarInactive() Indicate that the massStellar property of an verySimple implementation of the disk component class is inactive for differential equation solving.

<logical> massStellarIsGettable() Returns true if the massStellar property is gettable for the disk component class.

<logical> massStellarIsSettable() Specify whether the massStellar property of the disk component is settable.

<void> massStellarRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTas [interruptProcedure]↔) Accumulate to the rate of change of the massStellar property of an verySimple implementation of the disk component class.

<double precision> massStellarRateGet() Get the rate of change of the massStellar property of an verySimple implementation of the disk component class.

<void> massStellarScale(<double precision> setValue→) Set the absolute scale of the massStellar property of an verySimple implementation of the disk component class.

<void> massStellarSet(<double precision> setValue→) Set the massStellar property of an verySimple implementation of the disk component class.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a verySimple implementation of the disk component class.

<logical> nullIsActive() Return true if the null implementation of the disk component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a disk component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a verySimple implementation of the disk component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Return the names of properties to output for a verySimple implementation of the disk component.

<void> postOutput(<double precision> time→) Perform post-output processing for a verySimple implementation of the disk component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<double precision> radius() Returns the default value for the radius property for the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> radiusAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the radius property

<logical> radiusIsGettable() Returns true if the radius property is gettable for the disk component class.

<logical> radiusIsSettable() Specify whether the radius property of the disk component is settable.

<double precision> radiusRateGet() Returns a zero rate for the radius property for the disk component class.

<void> radiusSet(<double precision> value) Set the radius property of the disk component.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→) Compute offsets into serialization arrays for a verySimple implementation of the disk component.

<void> serializeASCII() Serialize the contents of a verySimple implementation of the disk component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the serialization of a verySimple implementation of the disk component.

<void> serializeRaw(<integer> fileHandle→) Serialize the contents of a verySimple implementation of the disk component to raw (binary) file.

<void> serializeValues(<double precision[:]> array←, <integer> propertyType→) Serialize evolvable properties of a verySimple implementation of the disk component to array.

<void> serializeXML(<integer> fileHandle→) Serialize the contents of a verySimple implementation of the disk component to XML.

<integer(c_size_t)> sizeOf() Return the size in bytes of a verySimple implementation of the disk component.

<logical> standardIsActive() Return true if the standard implementation of the disk component is the active choice.

<type(history)> starFormationHistory() Returns the default value for the starFormationHistory property for the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> starFormationHistoryAttributeMatch(<logic
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the starFormationHistory property

<integer> starFormationHistoryCount() Compute the count of evolvable quantities in the starFormationHistory property of the DiskStandard component.

<logical> starFormationHistoryIsGettable() Returns true if the starFormationHistory property is gettable for the disk component class.

<logical> starFormationHistoryIsSettable() Specify whether the starFormationHistory property of the disk component is settable.

<void> starFormationHistoryRate(<type(history)> value) Cumulate to the rate of the starFormationHistory property of the DiskStandard component.

<type(history)> starFormationHistoryRateGet() Returns a zero rate for the starFormationHistory property for the disk component class.

<void> starFormationHistoryScale(<type(history)> value) Set the scale of the starFormationHistory property of the DiskStandard component.

<void> starFormationHistorySet(<type(history)> value) Set the starFormationHistory property of the disk component.

<double precision> starFormationRate() Get the value of the starFormationRate property of the verySimple implementation of the disk component using a deferred function.

<type(varying_string), allocatable, dimension(:) => matches> starFormationRateAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the starFormationRate property

<void> starFormationRateFunction() Set the function to be used for the get method of the starFormationRate property of the DiskVerySimple component.

<logical> starFormationRateIsAttached() Return true if the deferred function used to get the starFormationRate property of the DiskVerySimple component class has been attached.

<logical> starFormationRateIsGettable() Returns true if the starFormationRate property is gettable for the disk component class.

<logical> starFormationRateIsSettable() Specify whether the starFormationRate property of the disk component is settable.

<double precision> starFormationRateRateGet() Returns a zero rate for the starFormationRate property for the disk component class.

<type(history)> stellarPropertiesHistory() Get the stellarPropertiesHistory property of an verySimple implementation of the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> stellarPropertiesHistoryAttributeMatch(<l [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the stellarPropertiesHistory property

<integer> stellarPropertiesHistoryCount() Return a count of the number of scalar properties in the stellarPropertiesHistory property of an verySimple implementation of the disk component class.

<void> stellarPropertiesHistoryInactive() Indicate that the stellarPropertiesHistory property of an verySimple implementation of the disk component class is inactive for differential equation solving.

<logical> stellarPropertiesHistoryIsGettable() Returns true if the stellarPropertiesHistory property is gettable for the disk component class.

<logical> stellarPropertiesHistoryIsSettable() Specify whether the stellarPropertiesHistory property of the disk component is settable.

<void> stellarPropertiesHistoryRate(<type(history)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate to the rate of change of the stellarPropertiesHistory property of an verySimple implementation of the disk component class.

<type(history)> stellarPropertiesHistoryRateGet() Get the rate of change of the stellarPropertiesHistory property of an verySimple implementation of the disk component class.

<void> stellarPropertiesHistoryScale(<type(history)> setValue→) Set the absolute scale of the stellarPropertiesHistory property of an verySimple implementation of the disk component class.

<void> stellarPropertiesHistorySet(<type(history)> setValue→) Set the stellarPropertiesHistory property of an verySimple implementation of the disk component class.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<type(varying_string)> type() Returns the type name for the verySimple implementation of the disk component class.

<double precision> velocity() Returns the default value for the velocity property for the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> velocityAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the velocity property

<logical> velocityIsGettable() Returns true if the velocity property is gettable for the disk component class.

<logical> velocityIsSettable() Specify whether the velocity property of the disk component is settable.

<double precision> velocityRateGet() Returns a zero rate for the velocity property for the disk component class.

<void> velocitySet(<double precision> value) Set the velocity property of the disk component.

<logical> verySimpleIsActive() Return true if the verySimple implementation of the disk component is the active choice.

<logical> verySimpleSizeIsActive() Return true if the verySimpleSize implementation of the disk component is the active choice.

nodeComponentDiskVerySimpleSize

<type(abundances)> abundancesGas() Get the abundancesGas property of an verySimple implementation of the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> abundancesGasAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the abundancesGas property

<integer> abundancesGasCount() Return a count of the number of scalar properties in the abundancesGas property of an verySimple implementation of the disk component class.

<void> abundancesGasInactive() Indicate that the abundancesGas property of an verySimple implementation of the disk component class is inactive for differential equation solving.

<logical> abundancesGasIsGettable() Returns true if the abundancesGas property is gettable for the disk component class.

<logical> abundancesGasIsSettable() Specify whether the abundancesGas property of the disk component is settable.

<void> abundancesGasRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptT [interruptProcedure]↔) Accumulate to the rate of change of the abundancesGas property of an verySimple implementation of the disk component class.

<type(abundances)> abundancesGasRateGet() Get the rate of change of the abundancesGas property of an verySimple implementation of the disk component class.

<void> abundancesGasScale(<type(abundances)> setValue→) Set the absolute scale of the abundancesGas property of an verySimple implementation of the disk component class.

<void> abundancesGasSet(<type(abundances)> setValue→) Set the abundancesGas property of an verySimple implementation of the disk component class.

<type(abundances)> abundancesStellar() Get the abundancesStellar property of an verySimple implementation of the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> abundancesStellarAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the abundancesStellar property

<integer> abundancesStellarCount() Return a count of the number of scalar properties in the abundancesStellar property of an verySimple implementation of the disk component class.

<void> abundancesStellarInactive() Indicate that the abundancesStellar property of an verySimple implementation of the disk component class is inactive for differential equation solving.

<logical> abundancesStellarIsGettable() Returns true if the abundancesStellar property is gettable for the disk component class.

<logical> abundancesStellarIsSettable() Specify whether the abundancesStellar property of the disk component is settable.

<void> abundancesStellarRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interr
[interruptProcedure]↔) Accumulate to the rate of change of the abundancesStellar property of an verySimple implementation of the disk component class.

<type(abundances)> abundancesStellarRateGet() Get the rate of change of the abundancesStellar property of an verySimple implementation of the disk component class.

<void> abundancesStellarScale(<type(abundances)> setValue→) Set the absolute scale of the abundancesStellar property of an verySimple implementation of the disk component class.

<void> abundancesStellarSet(<type(abundances)> setValue→) Set the abundancesStellar property of an verySimple implementation of the disk component class.

<double precision> angularMomentum() Returns the default value for the angularMomentum property for the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> angularMomentumAttributeMatch(<logical>
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the disk class that have the desired attributes for the angularMomentum property

<integer> angularMomentumCount() Compute the count of evolvable quantities in the angularMomentum property of the DiskStandard component.

<logical> angularMomentumIsGettable() Returns true if the angularMomentum property is gettable for the disk component class.

<logical> angularMomentumIsSettable() Specify whether the angularMomentum property of the disk component is settable.

<void> angularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interrup
[interruptProcedure]↔) Accept a rate set for the angularMomentum property of the disk component class. Trigger an interrupt to create the component.

<double precision> angularMomentumRateGet() Returns a zero rate for the angularMomentum property for the disk component class.

<void> angularMomentumScale(<double precision> value) Set the scale of the angularMomentum property of the DiskStandard component.

<void> angularMomentumSet(<double precision> value) Set the angularMomentum property of the disk component.

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> attachPipe() Attach pipes to the very simple disk component.

<void> builder(<*type(node)> componentDefinition→) Build a verySimpleSize implementation of the disk component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType>
[massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a verySimpleSize implementation of the disk component from raw (binary) file.

`<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→)` Deserialize evolvable properties of a verySimpleSize implementation of the disk component from array.

`<void> destroy()` Finalize a `verySimpleSize` implementation of the `disk` component.

`<void> dumpASCII()` Dump the content of a `disk` component.

`<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→)` Compute the mass enclosed within a radius.

`<double precision> fractionMassRetained()` Returns the default value for the `fractionMassRetained` property for the `disk` component class.

`<type(varying_string), allocatable, dimension(:) => matches> fractionMassRetainedAttributeMatch(<logic [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)` Return a text list of component implementations in the `disk` class that have the desired attributes for the `fractionMassRetained` property

`<integer> fractionMassRetainedCount()` Compute the count of evolvable quantities in the `fractionMassRetained` property of the `DiskStandard` component.

`<logical> fractionMassRetainedIsGettable()` Returns true if the `fractionMassRetained` property is gettable for the `disk` component class.

`<logical> fractionMassRetainedIsSettable()` Specify whether the `fractionMassRetained` property of the `disk` component is settable.

`<void> fractionMassRetainedRate(<double precision> value)` Cumulate to the rate of the `fractionMassRetained` property of the `DiskStandard` component.

`<double precision> fractionMassRetainedRateGet()` Returns a zero rate for the `fractionMassRetained` property for the `disk` component class.

`<void> fractionMassRetainedScale(<double precision> value)` Set the scale of the `fractionMassRetained` property of the `DiskStandard` component.

`<void> fractionMassRetainedSet(<double precision> value)` Set the `fractionMassRetained` property of the `disk` component.

`<double precision> halfMassRadius()` Returns the default value for the `halfMassRadius` property for the `disk` component class.

`<type(varying_string), allocatable, dimension(:) => matches> halfMassRadiusAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)` Return a text list of component implementations in the `disk` class that have the desired attributes for the `halfMassRadius` property

`<logical> halfMassRadiusIsGettable()` Returns true if the `halfMassRadius` property is gettable for the `disk` component class.

`<logical> halfMassRadiusIsSettable()` Specify whether the `halfMassRadius` property of the `disk` component is settable.

`<double precision> halfMassRadiusRateGet()` Returns a zero rate for the `halfMassRadius` property for the `disk` component class.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a verySimpleSize member of the disk component.

<logical> isInitialized() Get the isInitialized property of an verySimple implementation of the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> isInitializedAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the isInitialized property

<logical> isInitializedIsGettable() Returns true if the isInitialized property is gettable for the disk component class.

<logical> isInitializedIsSettable() Specify whether the isInitialized property of the disk component is settable.

<logical> isInitializedRateGet() Returns a zero rate for the isInitialized property for the disk component class.

<void> isInitializedSet(<logical> setValue→) Set the isInitialized property of an verySimple implementation of the disk component class.

<type(stellarLuminosities)> luminositiesStellar() Get the luminositiesStellar property of an verySimple implementation of the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> luminositiesStellarAttributeMatch(<logica [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the luminositiesStellar property

<integer> luminositiesStellarCount() Return a count of the number of scalar properties in the luminositiesStellar property of an verySimple implementation of the disk component class.

<void> luminositiesStellarInactive() Indicate that the luminositiesStellar property of an verySimple implementation of the disk component class is inactive for differential equation solving.

<logical> luminositiesStellarIsGettable() Returns true if the luminositiesStellar property is gettable for the disk component class.

<logical> luminositiesStellarIsSettable() Specify whether the luminositiesStellar property of the disk component is settable.

<void> luminositiesStellarRate(<type(stellarLuminosities)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate to the rate of change of the luminositiesStellar property of an verySimple implementation of the disk component class.

<type(stellarLuminosities)> luminositiesStellarRateGet() Get the rate of change of the luminositiesStellar property of an verySimple implementation of the disk component class.

<void> luminositiesStellarScale(<type(stellarLuminosities)> setValue→) Set the absolute scale of the luminositiesStellar property of an verySimple implementation of the disk component class.

<void> luminositiesStellarSet(<type(stellarLuminosities)> setValue→) Set the luminositiesStellar property of an verySimple implementation of the disk component class.

<double precision> massGas() Get the massGas property of an verySimple implementation of the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> massGasAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the massGas property

<integer> massGasCount() Return a count of the number of scalar properties in the massGas property of an verySimple implementation of the disk component class.

<void> massGasInactive() Indicate that the massGas property of an verySimple implementation of the disk component class is inactive for differential equation solving.

<logical> massGasIsGettable() Returns true if the massGas property is gettable for the disk component class.

<logical> massGasIsSettable() Specify whether the massGas property of the disk component is settable.

<void> massGasRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate to the rate of change of the massGas property of an verySimple implementation of the disk component class.

<double precision> massGasRateGet() Get the rate of change of the massGas property of an verySimple implementation of the disk component class.

<void> massGasScale(<double precision> setValue→) Set the absolute scale of the massGas property of an verySimple implementation of the disk component class.

<void> massGasSet(<double precision> setValue→) Set the massGas property of an verySimple implementation of the disk component class.

<double precision> massStellar() Get the massStellar property of an verySimple implementation of the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> massStellarAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the massStellar property

<integer> massStellarCount() Return a count of the number of scalar properties in the massStellar property of an verySimple implementation of the disk component class.

<double precision> massStellarFormed() Returns the default value for the massStellarFormed property for the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> massStellarFormedAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the massStellarFormed property

<integer> massStellarFormedCount() Compute the count of evolvable quantities in the massStellarFormed property of the DiskStandard component.

<logical> massStellarFormedIsGettable() Returns true if the massStellarFormed property is gettable for the disk component class.

<logical> massStellarFormedIsSettable() Specify whether the massStellarFormed property of the disk component is settable.

<void> massStellarFormedRate(<double precision> value) Cumulate to the rate of the massStellarFormed property of the DiskStandard component.

<double precision> massStellarFormedRateGet() Returns a zero rate for the massStellarFormed property for the disk component class.

<void> massStellarFormedScale(<double precision> value) Set the scale of the massStellarFormed property of the DiskStandard component.

<void> massStellarFormedSet(<double precision> value) Set the massStellarFormed property of the disk component.

<void> massStellarInactive() Indicate that the massStellar property of an verySimple implementation of the disk component class is inactive for differential equation solving.

<logical> massStellarIsGettable() Returns true if the massStellar property is gettable for the disk component class.

<logical> massStellarIsSettable() Specify whether the massStellar property of the disk component is settable.

<void> massStellarRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTas [interruptProcedure]↔) Accumulate to the rate of change of the massStellar property of an verySimple implementation of the disk component class.

<double precision> massStellarRateGet() Get the rate of change of the massStellar property of an verySimple implementation of the disk component class.

<void> massStellarScale(<double precision> setValue→) Set the absolute scale of the massStellar property of an verySimple implementation of the disk component class.

<void> massStellarSet(<double precision> setValue→) Set the massStellar property of an verySimple implementation of the disk component class.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a verySimpleSize implementation of the disk component class.

<logical> nullIsActive() Return true if the null implementation of the disk component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a disk component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a verySimpleSize implementation of the disk component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Return the names of properties to output for a verySimpleSize implementation of the disk component.

<void> postOutput(<double precision> time→) Perform post-output processing for a verySimpleSize implementation of the disk component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<double precision> radius() Get the radius property of an verySimpleSize implementation of the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> radiusAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the radius property

<logical> radiusIsGettable() Returns true if the radius property is gettable for the disk component class.

<logical> radiusIsSettable() Specify whether the radius property of the disk component is settable.

<double precision> radiusRateGet() Returns a zero rate for the radius property for the disk component class.

<void> radiusSet(<double precision> setValue→) Set the radius property of an verySimpleSize implementation of the disk component class.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→) Compute offsets into serialization arrays for a verySimpleSize implementation of the disk component.

<void> serializeASCII() Serialize the contents of a verySimpleSize implementation of the disk component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the serialization of a verySimpleSize implementation of the disk component.

<void> serializeRaw(<integer> fileHandle→) Serialize the contents of a verySimpleSize implementation of the disk component to raw (binary) file.

<void> serializeValues(<double precision[:]> array←, <integer> propertyType→) Serialize evolvable properties of a verySimpleSize implementation of the disk component to array.

<void> serializeXML(<integer> fileHandle→) Serialize the contents of a verySimpleSize implementation of the disk component to XML.

<integer(c_size_t)> sizeOf() Return the size in bytes of a verySimpleSize implementation of the disk component.

<logical> standardIsActive() Return true if the standard implementation of the disk component is the active choice.

<type(history)> starFormationHistory() Returns the default value for the starFormationHistory property for the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> starFormationHistoryAttributeMatch(<logic [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the starFormationHistory property

<integer> starFormationHistoryCount() Compute the count of evolvable quantities in the starFormationHistory property of the DiskStandard component.

<logical> starFormationHistoryIsGettable() Returns true if the starFormationHistory property is gettable for the disk component class.

<logical> starFormationHistoryIsSettable() Specify whether the starFormationHistory property of the disk component is settable.

<void> starFormationHistoryRate(<type(history)> value) Cumulate to the rate of the starFormationHistory property of the DiskStandard component.

<type(history)> starFormationHistoryRateGet() Returns a zero rate for the starFormationHistory property for the disk component class.

<void> starFormationHistoryScale(<type(history)> value) Set the scale of the starFormationHistory property of the DiskStandard component.

<void> starFormationHistorySet(<type(history)> value) Set the starFormationHistory property of the disk component.

<double precision> starFormationRate() Get the value of the starFormationRate property of the verySimple implementation of the disk component using a deferred function.

<type(varying_string), allocatable, dimension(:) => matches> starFormationRateAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the starFormationRate property

<void> starFormationRateFunction() Set the function to be used for the get method of the starFormationRate property of the DiskVerySimple component.

<logical> starFormationRateIsAttached() Return true if the deferred function used to get the starFormationRate property of the DiskVerySimple component class has been attached.

<logical> starFormationRateIsGettable() Returns true if the starFormationRate property is gettable for the disk component class.

<logical> starFormationRateIsSettable() Specify whether the starFormationRate property of the disk component is settable.

<double precision> starFormationRateRateGet() Returns a zero rate for the starFormationRate property for the disk component class.

<type(history)> stellarPropertiesHistory() Get the stellarPropertiesHistory property of an verySimple implementation of the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> stellarPropertiesHistoryAttributeMatch(<l [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the stellarPropertiesHistory property

<integer> stellarPropertiesHistoryCount() Return a count of the number of scalar properties in the stellarPropertiesHistory property of an verySimple implementation of the disk component class.

<void> stellarPropertiesHistoryInactive() Indicate that the stellarPropertiesHistory property of an verySimple implementation of the disk component class is inactive for differential equation solving.

<logical> stellarPropertiesHistoryIsGettable() Returns true if the stellarPropertiesHistory property is gettable for the disk component class.

<logical> stellarPropertiesHistoryIsSettable() Specify whether the stellarPropertiesHistory property of the disk component is settable.

<void> stellarPropertiesHistoryRate(<type(history)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate to the rate of change of the stellarPropertiesHistory property of an verySimple implementation of the disk component class.

<type(history)> stellarPropertiesHistoryRateGet() Get the rate of change of the stellarPropertiesHistory property of an verySimple implementation of the disk component class.

<void> stellarPropertiesHistoryScale(<type(history)> setValue→) Set the absolute scale of the stellarPropertiesHistory property of an verySimple implementation of the disk component class.

<void> stellarPropertiesHistorySet(<type(history)> setValue→) Set the stellarPropertiesHistory property of an verySimple implementation of the disk component class.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<type(varying_string)> type() Returns the type name for the verySimpleSize implementation of the disk component class.

<double precision> velocity() Get the velocity property of an verySimpleSize implementation of the disk component class.

<type(varying_string), allocatable, dimension(:) => matches> velocityAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the disk class that have the desired attributes for the velocity property

<logical> velocityIsGettable() Returns true if the velocity property is gettable for the disk component class.

<logical> velocityIsSettable() Specify whether the velocity property of the disk component is settable.

<double precision> velocityRateGet() Returns a zero rate for the velocity property for the disk component class.

<void> velocitySet(<double precision> setValue→) Set the velocity property of an verySimpleSize implementation of the disk component class.

<logical> verySimpleIsActive() Return true if the verySimple implementation of the disk component is the active choice.

<logical> verySimpleSizeIsActive() Return true if the verySimpleSize implementation of the disk component is the active choice.

nodeComponentDynamicsStatistics

<double precision, dimension(:), allocatable => classDefault> adiabaticRatio() Returns the default value for the adiabaticRatio property for the dynamicsStatistics component class.

<type(varying_string), allocatable, dimension(:) => matches> adiabaticRatioAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the dynamicsStatistics class that have the desired attributes for the adiabaticRatio property

<logical> adiabaticRatioIsGettable() Returns true if the adiabaticRatio property is gettable for the dynamicsStatistics component class.

<logical> adiabaticRatioIsSettable() Specify whether the adiabaticRatio property of the dynamicsStatistics component is settable.

<double precision, dimension(:), allocatable => classDefault> adiabaticRatioRateGet() Returns a zero rate for the adiabaticRatio property for the dynamicsStatistics component class.

<void> adiabaticRatioSet(<double precision[:]> value) Set the adiabaticRatio property of the dynamicsStatistics component.

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<double precision, dimension(:), allocatable => classDefault> barInstabilityTimescale() Returns the default value for the barInstabilityTimescale property for the dynamicsStatistics component class.

<type(varying_string), allocatable, dimension(:) => matches> barInstabilityTimescaleAttributeMatch(<lo [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the dynamicsStatistics class that have the desired attributes for the barInstabilityTimescale property

<logical> barInstabilityTimescaleIsGettable() Returns true if the barInstabilityTimescale property is gettable for the dynamicsStatistics component class.

<logical> barInstabilityTimescaleIsSettable() Specify whether the barInstabilityTimescale property of the dynamicsStatistics component is settable.

<double precision, dimension(:), allocatable => classDefault> barInstabilityTimescaleRateGet() Returns a zero rate for the barInstabilityTimescale property for the dynamicsStatistics component class.

<void> barInstabilityTimescaleSet(<double precision[:]> value) Set the barInstabilityTimescale property of the dynamicsStatistics component.

<logical> barsIsActive() Return true if the bars implementation of the dynamicsStatistics component is the active choice.

<void> builder(<*type(node)> componentDefinition→) Build a generic dynamicsStatistics component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Read properties from raw file.

<void> deserializeValues(<double(:)> array→, <integer> propertyType→) Deserialize the evolvable quantities from an array.

<void> destroy() Finalize a generic dynamicsStatistics component.

<void> dumpASCII() Dump the content of a dynamicsStatistics component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a generic dynamicsStatistics component.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a nodeComponent object.

<logical> nullIsActive() Return true if the null implementation of the dynamicsStatistics component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a dynamicsStatistics component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a generic dynamicsStatistics component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Establish the names of properties to output for a generic dynamicsStatistics component.

<void> postOutput(<double precision> time→) Perform post-output processing of a dynamicsStatistics component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

`<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→)` Compute the rotation curve gradient.

`<void> serializationOffsets()` Set offsets into serialization arrays.

`<void> serializeASCII()` Serialize the content of a `dynamicsStatistics` component to ASCII.

`<integer> serializeCount(<integer> propertyType→)` Return a count of the number of evolvable quantities to be evolved.

`<void> serializeRaw(<integer> fileHandle→)` Generate a binary dump of all properties.

`<void> serializeValues(<double(:)> array←, <integer> propertyType→)` Serialize the evolvable quantities to an array.

`<void> serializeXML()` Generate an XML dump of all properties.

`<integer(c_size_t)> sizeOf()` Return the size in bytes of a nodeComponentDynamicsStatistics component.

`<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→)` Compute the surface density.

`<double precision, dimension(:), allocatable => classDefault> time()` Returns the default value for the `time` property for the `dynamicsStatistics` component class.

`<type(varying_string), allocatable, dimension(:) => matches> timeAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)` Return a text list of component implementations in the `dynamicsStatistics` class that have the desired attributes for the `time` property

`<logical> timeIsGettable()` Returns true if the `time` property is gettable for the `dynamicsStatistics` component class.

`<logical> timeIsSettable()` Specify whether the `time` property of the `dynamicsStatistics` component is settable.

`<double precision, dimension(:), allocatable => classDefault> timeRateGet()` Returns a zero rate for the `time` property for the `dynamicsStatistics` component class.

`<void> timeSet(<double precision[:]> value)` Set the `time` property of the `dynamicsStatistics` component.

`<type(varying_string)> type()` Returns the type name for the dynamicsStatistics component class.

nodeComponentDynamicsStatisticsBars

`<double precision, dimension(:), allocatable => propertyValue> adiabaticRatio()` Get the `adiabaticRatio` property of an `bars` implementation of the `dynamicsStatistics` component class.

`<type(varying_string), allocatable, dimension(:) => matches> adiabaticRatioAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)` Return a text list of component implementations in the `dynamicsStatistics` class that have the desired attributes for the `adiabaticRatio` property

<logical> adiabaticRatioIsGettable() Returns true if the adiabaticRatio property is gettable for the dynamicsStatistics component class.

<logical> adiabaticRatioIsSettable() Specify whether the adiabaticRatio property of the dynamicsStatistics component is settable.

<double precision, dimension(:), allocatable => classDefault> adiabaticRatioRateGet() Returns a zero rate for the adiabaticRatio property for the dynamicsStatistics component class.

<void> adiabaticRatioSet(<double precision[:]> setValue→) Set the adiabaticRatio property of an bars implementation of the dynamicsStatistics component class.

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<double precision, dimension(:), allocatable => propertyValue> barInstabilityTimescale() Get the barInstabilityTimescale property of an bars implementation of the dynamicsStatistics component class.

<type(varying_string), allocatable, dimension(:) => matches> barInstabilityTimescaleAttributeMatch(<lo [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the dynamicsStatistics class that have the desired attributes for the barInstabilityTimescale property

<logical> barInstabilityTimescaleIsGettable() Returns true if the barInstabilityTimescale property is gettable for the dynamicsStatistics component class.

<logical> barInstabilityTimescaleIsSettable() Specify whether the barInstabilityTimescale property of the dynamicsStatistics component is settable.

<double precision, dimension(:), allocatable => classDefault> barInstabilityTimescaleRateGet() Returns a zero rate for the barInstabilityTimescale property for the dynamicsStatistics component class.

<void> barInstabilityTimescaleSet(<double precision[:]> setValue→) Set the barInstabilityTimescale property of an bars implementation of the dynamicsStatistics component class.

<logical> barsIsActive() Return true if the bars implementation of the dynamicsStatistics component is the active choice.

<void> builder(<*type(node)> componentDefinition→) Build a bars implementation of the dynamicsStatistics component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a bars implementation of the dynamicsStatistics component from raw (binary) file.

<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→) Deserialize evolvable properties of a bars implementation of the dynamicsStatistics component from array.

<void> destroy() Finalize a bars implementation of the dynamicsStatistics component.

<void> dumpASCII() Dump the content of a dynamicsStatistics component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a bars member of the dynamicsStatistics component.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a bars implementation of the dynamicsStatistics component class.

<logical> nullIsActive() Return true if the null implementation of the dynamicsStatistics component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a dynamicsStatistics component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a bars implementation of the dynamicsStatistics component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Return the names of properties to output for a bars implementation of the dynamicsStatistics component.

<void> postOutput(<double precision> time→) Perform post-output processing of a dynamicsStatistics component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<void> record(<double> time→, <double> barInstabilityTimescale→, <double>adiabaticRatio→) Record the current bar-dynamical state of the node.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→) Compute offsets into serialization arrays for a bars implementation of the dynamicsStatistics component.

<void> serializeASCII() Serialize the contents of a bars implementation of the dynamicsStatistics component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the serialization of a bars implementation of the dynamicsStatistics component.

<void> serializeRaw(<integer> fileHandle→) Serialize the contents of a bars implementation of the dynamicsStatistics component to raw (binary) file.

<void> serializeValues(<double precision[:]> array←, <integer> propertyType→) Serialize evolvable properties of a bars implementation of the dynamicsStatistics component to array.

<void> serializeXML(<integer> fileHandle→) Serialize the contents of a bars implementation of the dynamicsStatistics component to XML.

<integer(c_size_t)> sizeOf() Return the size in bytes of a bars implementation of the dynamicsStatistics component.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<double precision, dimension(:), allocatable => propertyValue> time() Get the time property of an bars implementation of the dynamicsStatistics component class.

<type(varying_string), allocatable, dimension(:) => matches> timeAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the dynamicsStatistics class that have the desired attributes for the time property

<logical> timeIsGettable() Returns true if the time property is gettable for the dynamicsStatistics component class.

<logical> timeIsSettable() Specify whether the time property of the dynamicsStatistics component is settable.

<double precision, dimension(:), allocatable => classDefault> timeRateGet() Returns a zero rate for the time property for the dynamicsStatistics component class.

<void> timeSet(<double precision[:]> setValue→) Set the time property of an bars implementation of the dynamicsStatistics component class.

<type(varying_string)> type() Returns the type name for the bars implementation of the dynamicsStatistics component class.

nodeComponentDynamicsStatisticsNull

<double precision, dimension(:), allocatable => classDefault> adiabaticRatio() Returns the default value for the adiabaticRatio property for the dynamicsStatistics component class.

<type(varying_string), allocatable, dimension(:) => matches> adiabaticRatioAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the dynamicsStatistics class that have the desired attributes for the adiabaticRatio property

<logical> adiabaticRatioIsGettable() Returns true if the adiabaticRatio property is gettable for the dynamicsStatistics component class.

<logical> adiabaticRatioIsSettable() Specify whether the adiabaticRatio property of the dynamicsStatistics component is settable.

<double precision, dimension(:), allocatable => classDefault> adiabaticRatioRateGet() Returns a zero rate for the adiabaticRatio property for the dynamicsStatistics component class.

<void> adiabaticRatioSet(<double precision[:]> value) Set the adiabaticRatio property of the dynamicsStatistics component.

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<double precision, dimension(:), allocatable => classDefault> barInstabilityTimescale() Returns the default value for the barInstabilityTimescale property for the dynamicsStatistics component class.

<type(varying_string), allocatable, dimension(:) => matches> barInstabilityTimescaleAttributeMatch(<lo [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the dynamicsStatistics class that have the desired attributes for the barInstabilityTimescale property

<logical> barInstabilityTimescaleIsGettable() Returns true if the barInstabilityTimescale property is gettable for the dynamicsStatistics component class.

<logical> barInstabilityTimescaleIsSettable() Specify whether the barInstabilityTimescale property of the dynamicsStatistics component is settable.

<double precision, dimension(:), allocatable => classDefault> barInstabilityTimescaleRateGet() Returns a zero rate for the barInstabilityTimescale property for the dynamicsStatistics component class.

<void> barInstabilityTimescaleSet(<double precision[:]> value) Set the barInstabilityTimescale property of the dynamicsStatistics component.

<logical> barsIsActive() Return true if the bars implementation of the dynamicsStatistics component is the active choice.

<void> builder(<*type(node)> componentDefinition→) Build a null implementation of the dynamicsStatistics component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a null implementation of the dynamicsStatistics component from raw (binary) file.

<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→) Deserialize evolvable properties of a null implementation of the dynamicsStatistics component from array.

<void> destroy() Finalize a null implementation of the dynamicsStatistics component.

<void> dumpASCII() Dump the content of a dynamicsStatistics component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a null member of the dynamicsStatistics component.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a null implementation of the dynamicsStatistics component class.

<logical> nullIsActive() Return true if the null implementation of the dynamicsStatistics component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a dynamicsStatistics component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a null implementation of the dynamicsStatistics component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Return the names of properties to output for a null implementation of the dynamicsStatistics component.

<void> postOutput(<double precision> time→) Perform post-output processing of a dynamicsStatistics component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→) Compute offsets into serialization arrays for a null implementation of the dynamicsStatistics component.

<void> serializeASCII() Serialize the contents of a null implementation of the dynamicsStatistics component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the serialization of a null implementation of the dynamicsStatistics component.

<void> serializeRaw(<integer> fileHandle→) Serialize the contents of a null implementation of the dynamicsStatistics component to raw (binary) file.

<void> serializeValues(<double precision[:]> array←, <integer> propertyType→) Serialize evolvable properties of a null implementation of the dynamicsStatistics component to array.

<void> serializeXML(<integer> fileHandle→) Serialize the contents of a null implementation of the dynamicsStatistics component to XML.

<integer(c_size_t)> sizeOf() Return the size in bytes of a null implementation of the dynamicsStatistics component.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<double precision, dimension(:), allocatable => classDefault> time() Returns the default value for the time property for the dynamicsStatistics component class.

<type(varying_string), allocatable, dimension(:) => matches> timeAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the dynamicsStatistics class that have the desired attributes for the time property

<logical> timeIsGettable() Returns true if the time property is gettable for the dynamicsStatistics component class.

<logical> timeIsSettable() Specify whether the time property of the dynamicsStatistics component is settable.

<double precision, dimension(:), allocatable => classDefault> timeRateGet() Returns a zero rate for the time property for the dynamicsStatistics component class.

<void> timeSet(<double precision[:]> value) Set the time property of the dynamicsStatistics component.

<type(varying_string)> type() Returns the type name for the null implementation of the dynamicsStatistics component class.

nodeComponentFormationTime

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a generic formationTime component from a supplied XML definition.

<logical> Cole2000IsActive() Return true if the Cole2000 implementation of the formationTime component is the active choice.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Read properties from raw file.

<void> deserializeValues(<double(:)> array→, <integer> propertyType→) Deserialize the evolvable quantities from an array.

<void> destroy() Finalize a generic formationTime component.

<void> dumpASCII() Dump the content of a formationTime component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<double precision> formationTime() Returns the default value for the formationTime property for the formationTime component class.

<type(varying_string), allocatable, dimension(:) => matches> formationTimeAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the formationTime class that have the desired attributes for the formationTime property

<logical> formationTimeIsGettable() Returns true if the formationTime property is gettable for the formationTime component class.

<logical> formationTimeIsSettable() Specify whether the formationTime property of the formationTime component is settable.

<double precision> formationTimeRateGet() Returns a zero rate for the formationTime property for the formationTime component class.

<void> formationTimeSet(<double precision> value) Set the formationTime property of the formationTime component.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a generic formationTime component.

<logical> massFractionIsActive() Return true if the massFraction implementation of the formationTime component is the active choice.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a nodeComponent object.

<logical> nullIsActive() Return true if the null implementation of the formationTime component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a formationTime component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a generic formationTime component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Establish the names of properties to output for a generic formationTime component.

<void> postOutput(<double precision> time→) Perform post-output processing of a formationTime component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets() Set offsets into serialization arrays.

<void> serializeASCII() Serialize the content of a formationTime component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the number of evolvable quantities to be evolved.

<void> serializeRaw(<integer> fileHandle→) Generate a binary dump of all properties.

<void> serializeValues(<double(:)> array←, <integer> propertyType→) Serialize the evolvable quantities to an array.

<void> serializeXML() Generate an XML dump of all properties.

<integer(c_size_t)> sizeOf() Return the size in bytes of a nodeComponentFormationTime component.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<type(varying_string)> type() Returns the type name for the formationTime component class.

nodeComponentFormationTimeCole2000

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a Cole2000 implementation of the formationTime component from a supplied XML definition.

<logical> Cole2000IsActive() Return true if the Cole2000 implementation of the formationTime component is the active choice.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a Cole2000 implementation of the formationTime component from raw (binary) file.

<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→) Deserialize evolvable properties of a Cole2000 implementation of the formationTime component from array.

<void> destroy() Finalize a Cole2000 implementation of the formationTime component.

<void> dumpASCII() Dump the content of a formationTime component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<double precision> formationTime() Returns the default value for the formationTime property for the formationTime component class.

<type(varying_string), allocatable, dimension(:) => matches> formationTimeAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the formationTime class that have the desired attributes for the formationTime property

<logical> formationTimeIsGettable() Returns true if the formationTime property is gettable for the formationTime component class.

<logical> formationTimeIsSettable() Specify whether the formationTime property of the formationTime component is settable.

<double precision> formationTimeRateGet() Returns a zero rate for the formationTime property for the formationTime component class.

<void> formationTimeSet(<double precision> value) Set the formationTime property of the formationTime component.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a Cole2000 member of the formationTime component.

<logical> massFractionIsActive() Return true if the massFraction implementation of the formationTime component is the active choice.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a Cole2000 implementation of the formationTime component class.

<logical> nullIsActive() Return true if the null implementation of the formationTime component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a formationTime component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a Cole2000 implementation of the formationTime component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Return the names of properties to output for a Cole2000 implementation of the formationTime component.

<void> postOutput(<double precision> time→) Perform post-output processing of a formationTime component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→) Compute offsets into serialization arrays for a Cole2000 implementation of the formationTime component.

<void> serializeASCII() Serialize the contents of a Cole2000 implementation of the formationTime component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the serialization of a Cole2000 implementation of the formationTime component.

<void> serializeRaw(<integer> fileHandle→) Serialize the contents of a Cole2000 implementation of the formationTime component to raw (binary) file.

<void> serializeValues(<double precision[:]> array←, <integer> propertyType→) Serialize evolvable properties of a Cole2000 implementation of the formationTime component to array.

<void> serializeXML(<integer> fileHandle→) Serialize the contents of a Cole2000 implementation of the formationTime component to XML.

<integer(c_size_t)> sizeOf() Return the size in bytes of a Cole2000 implementation of the formationTime component.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<type(varying_string)> type() Returns the type name for the Cole2000 implementation of the formationTime component class.

nodeComponentFormationTimeMassFraction

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a massFraction implementation of the formationTime component from a supplied XML definition.

<logical> Cole2000IsActive() Return true if the Cole2000 implementation of the formationTime component is the active choice.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a massFraction implementation of the formationTime component from raw (binary) file.

<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→) Deserialize evolvable properties of a massFraction implementation of the formationTime component from array.

<void> destroy() Finalize a massFraction implementation of the formationTime component.

<void> dumpASCII() Dump the content of a formationTime component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<double precision> formationTime() Get the formationTime property of an massFraction implementation of the formationTime component class.

<type(varying_string), allocatable, dimension(:) => matches> formationTimeAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the formationTime class that have the desired attributes for the formationTime property

<logical> formationTimeIsGettable() Returns true if the formationTime property is gettable for the formationTime component class.

<logical> formationTimeIsSettable() Specify whether the formationTime property of the formationTime component is settable.

<double precision> formationTimeRateGet() Returns a zero rate for the formationTime property for the formationTime component class.

<void> formationTimeSet(<double precision> setValue→) Set the formationTime property of an massFraction implementation of the formationTime component class.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a massFraction member of the formationTime component.

<logical> massFractionIsActive() Return true if the massFraction implementation of the formationTime component is the active choice.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a massFraction implementation of the formationTime component class.

<logical> nullIsActive() Return true if the null implementation of the formationTime component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a formationTime component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a massFraction implementation of the formationTime component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Return the names of properties to output for a massFraction implementation of the formationTime component.

<void> postOutput(<double precision> time→) Perform post-output processing of a formationTime component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→) Compute offsets into serialization arrays for a massFraction implementation of the formationTime component.

<void> serializeASCII() Serialize the contents of a massFraction implementation of the formationTime component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the serialization of a massFraction implementation of the formationTime component.

<void> serializeRaw(<integer> fileHandle→) Serialize the contents of a massFraction implementation of the formationTime component to raw (binary) file.

<void> serializeValues(<double precision[:]> array←, <integer> propertyType→) Serialize evolvable properties of a massFraction implementation of the formationTime component to array.

<void> serializeXML(<integer> fileHandle→) Serialize the contents of a massFraction implementation of the formationTime component to XML.

<integer(c_size_t)> sizeOf() Return the size in bytes of a massFraction implementation of the formationTime component.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<type(varying_string)> type() Returns the type name for the massFraction implementation of the formationTime component class.

nodeComponentFormationTimeNull

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a null implementation of the formationTime component from a supplied XML definition.

<logical> Cole2000IsActive() Return true if the Cole2000 implementation of the formationTime component is the active choice.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a null implementation of the formationTime component from raw (binary) file.

<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→) Deserialize evolvable properties of a null implementation of the formationTime component from array.

<void> destroy() Finalize a null implementation of the formationTime component.

<void> dumpASCII() Dump the content of a formationTime component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<double precision> formationTime() Returns the default value for the formationTime property for the formationTime component class.

<type(varying_string), allocatable, dimension(:) => matches> formationTimeAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the formationTime class that have the desired attributes for the formationTime property

<logical> formationTimeIsGettable() Returns true if the formationTime property is gettable for the formationTime component class.

<logical> formationTimeIsSettable() Specify whether the formationTime property of the formationTime component is settable.

<double precision> formationTimeRateGet() Returns a zero rate for the formationTime property for the formationTime component class.

<void> formationTimeSet(<double precision> value) Set the formationTime property of the formationTime component.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a null member of the formationTime component.

<logical> massFractionIsActive() Return true if the massFraction implementation of the formationTime component is the active choice.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a null implementation of the formationTime component class.

<logical> nullIsActive() Return true if the null implementation of the formationTime component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a formationTime component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a null implementation of the formationTime component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Return the names of properties to output for a null implementation of the formationTime component.

<void> postOutput(<double precision> time→) Perform post-output processing of a formationTime component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→) Compute offsets into serialization arrays for a null implementation of the formationTime component.

<void> serializeASCII() Serialize the contents of a null implementation of the formationTime component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the serialization of a null implementation of the formationTime component.

<void> serializeRaw(<integer> fileHandle→) Serialize the contents of a null implementation of the formationTime component to raw (binary) file.

<void> serializeValues(<double precision[:]> array←, <integer> propertyType→) Serialize evolvable properties of a null implementation of the formationTime component to array.

<void> serializeXML(<integer> fileHandle→) Serialize the contents of a null implementation of the formationTime component to XML.

<integer(c_size_t)> sizeOf() Return the size in bytes of a null implementation of the formationTime component.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<type(varying_string)> type() Returns the type name for the null implementation of the formationTime component class.

nodeComponentHostHistory

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a generic hostHistory component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Read properties from raw file.

<void> deserializeValues(<double(:)> array→, <integer> propertyType→) Deserialize the evolvable quantities from an array.

<void> destroy() Finalize a generic hostHistory component.

<void> dumpASCII() Dump the content of a hostHistory component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<double precision> hostMassMaximum() Returns the default value for the hostMassMaximum property for the hostHistory component class.

<type(varying_string), allocatable, dimension(:) => matches> hostMassMaximumAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hostHistory class that have the desired attributes for the hostMassMaximum property

<logical> hostMassMaximumIsGettable() Returns true if the hostMassMaximum property is gettable for the hostHistory component class.

<logical> hostMassMaximumIsSettable() Specify whether the hostMassMaximum property of the hostHistory component is settable.

<double precision> hostMassMaximumRateGet() Returns a zero rate for the hostMassMaximum property for the hostHistory component class.

<void> hostMassMaximumSet(<double precision> value) Set the hostMassMaximum property of the hostHistory component.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter
[interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a generic hostHistory component.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a nodeComponent object.

<logical> nullIsActive() Return true if the null implementation of the hostHistory component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_-
int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔,
<double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)>
outputInstance→, <integer> instance→) Populate output buffers with properties to output for a hostHistory component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double
precision> time→, <integer> instance→) Increment the count of properties to output for a generic hostHistory component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔,
<character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔,
<integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]>
doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision>
time→, <integer> instance→) Establish the names of properties to output for a generic hostHistory component.

<void> postOutput(<double precision> time→) Perform post-output processing of a hostHistory component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→)
Compute the gravitational potential.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType>
[massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType>
[massType]→) Compute the rotation curve gradient.

<void> serializationOffsets() Set offsets into serialization arrays.

<void> serializeASCII() Serialize the content of a hostHistory component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the number of evolvable quantities to be evolved.

<void> serializeRaw(<integer> fileHandle→) Generate a binary dump of all properties.

<void> serializeValues(<double(:)> array←, <integer> propertyType→) Serialize the evolvable quantities to an array.

<void> serializeXML() Generate an XML dump of all properties.

<integer(c_size_t)> sizeOf() Return the size in bytes of a nodeComponentHostHistory component.

<logical> standardIsActive() Return true if the standard implementation of the hostHistory component is the active choice.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<type(varying_string)> type() Returns the type name for the hostHistory component class.

nodeComponentHostHistoryNull

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a null implementation of the hostHistory component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a null implementation of the hostHistory component from raw (binary) file.

<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→) Deserialize evolvable properties of a null implementation of the hostHistory component from array.

<void> destroy() Finalize a null implementation of the hostHistory component.

<void> dumpASCII() Dump the content of a hostHistory component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<double precision> hostMassMaximum() Returns the default value for the hostMassMaximum property for the hostHistory component class.

<type(varying_string), allocatable, dimension(:) => matches> hostMassMaximumAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hostHistory class that have the desired attributes for the hostMassMaximum property

<logical> hostMassMaximumIsGettable() Returns true if the hostMassMaximum property is gettable for the hostHistory component class.

<logical> hostMassMaximumIsSettable() Specify whether the hostMassMaximum property of the hostHistory component is settable.

<double precision> hostMassMaximumRateGet() Returns a zero rate for the hostMassMaximum property for the hostHistory component class.

<void> hostMassMaximumSet(<double precision> value) Set the hostMassMaximum property of the hostHistory component.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a null member of the hostHistory component.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a null implementation of the hostHistory component class.

<logical> nullIsActive() Return true if the null implementation of the hostHistory component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a hostHistory component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a null implementation of the hostHistory component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Return the names of properties to output for a null implementation of the hostHistory component.

<void> postOutput(<double precision> time→) Perform post-output processing of a hostHistory component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→) Compute offsets into serialization arrays for a null implementation of the hostHistory component.

<void> serializeASCII() Serialize the contents of a null implementation of the hostHistory component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the serialization of a null implementation of the hostHistory component.

<void> serializeRaw(<integer> fileHandle→) Serialize the contents of a null implementation of the hostHistory component to raw (binary) file.

<void> serializeValues(<double precision[:]> array←, <integer> propertyType→) Serialize evolvable properties of a null implementation of the hostHistory component to array.

<void> serializeXML(<integer> fileHandle→) Serialize the contents of a null implementation of the hostHistory component to XML.

<integer(c_size_t)> sizeOf() Return the size in bytes of a null implementation of the hostHistory component.

<logical> standardIsActive() Return true if the standard implementation of the hostHistory component is the active choice.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<type(varying_string)> type() Returns the type name for the null implementation of the hostHistory component class.

nodeComponentHostHistoryStandard

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a standard implementation of the hostHistory component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a standard implementation of the hostHistory component from raw (binary) file.

<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→) Deserialize evolvable properties of a standard implementation of the hostHistory component from array.

<void> destroy() Finalize a standard implementation of the hostHistory component.

<void> dumpASCII() Dump the content of a hostHistory component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<double precision> hostMassMaximum() Get the hostMassMaximum property of an standard implementation of the hostHistory component class.

<type(varying_string), allocatable, dimension(:) => matches> hostMassMaximumAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hostHistory class that have the desired attributes for the hostMassMaximum property

<logical> hostMassMaximumIsGettable() Returns true if the hostMassMaximum property is gettable for the hostHistory component class.

<logical> hostMassMaximumIsSettable() Specify whether the hostMassMaximum property of the hostHistory component is settable.

<double precision> hostMassMaximumRateGet() Returns a zero rate for the hostMassMaximum property for the hostHistory component class.

<void> hostMassMaximumSet(<double precision> setValue→) Set the hostMassMaximum property of an standard implementation of the hostHistory component class.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a standard member of the hostHistory component.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a standard implementation of the hostHistory component class.

<logical> nullIsActive() Return true if the null implementation of the hostHistory component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a hostHistory component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a standard implementation of the hostHistory component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Return the names of properties to output for a standard implementation of the hostHistory component.

<void> postOutput(<double precision> time→) Perform post-output processing of a hostHistory component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→) Compute offsets into serialization arrays for a standard implementation of the hostHistory component.

<void> serializeASCII() Serialize the contents of a standard implementation of the hostHistory component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the serialization of a standard implementation of the hostHistory component.

<void> serializeRaw(<integer> fileHandle→) Serialize the contents of a standard implementation of the hostHistory component to raw (binary) file.

<void> serializeValues(<double precision[:]> array←, <integer> propertyType→) Serialize evolvable properties of a standard implementation of the hostHistory component to array.

<void> serializeXML(<integer> fileHandle→) Serialize the contents of a standard implementation of the hostHistory component to XML.

<integer(c_size_t)> sizeOf() Return the size in bytes of a standard implementation of the hostHistory component.

<logical> standardIsActive() Return true if the standard implementation of the hostHistory component is the active choice.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<type(varying_string)> type() Returns the type name for the standard implementation of the hostHistory component class.

nodeComponentHotHalo

<type(abundances)> abundances() Returns the default value for the abundances property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> abundancesAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the abundances property

<type(abundances)> abundancesCold() Returns the default value for the abundancesCold property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> abundancesColdAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the abundancesCold property

<integer> abundancesColdCount() Compute the count of evolvable quantities in the abundancesCold property of the HotHaloColdMode component.

<logical> abundancesColdIsGettable() Returns true if the abundancesCold property is gettable for the hotHalo component class.

<logical> abundancesColdIsSettable() Specify whether the abundancesCold property of the hotHalo component is settable.

<void> abundancesColdRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interrupt [interruptProcedure]↔) Accept a rate set for the abundancesCold property of the hotHalo component class. Trigger an interrupt to create the component.

<type(abundances)> abundancesColdRateGet() Returns a zero rate for the abundancesCold property for the hotHalo component class.

<void> abundancesColdScale(<type(abundances)> value) Set the scale of the abundancesCold property of the HotHaloColdMode component.

<void> abundancesColdSet(<type(abundances)> value) Set the abundancesCold property of the hotHalo component.

<integer> abundancesCount() Compute the count of evolvable quantities in the abundances property of the HotHaloStandard component.

<logical> abundancesIsGettable() Returns true if the abundances property is gettable for the hotHalo component class.

<logical> abundancesIsSettable() Specify whether the abundances property of the hotHalo component is settable.

<void> abundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask
[interruptProcedure]↔) Accept a rate set for the abundances property of the hotHalo component class. Trigger an interrupt to create the component.

<type(abundances)> abundancesRateGet() Returns a zero rate for the abundances property for the hotHalo component class.

<void> abundancesScale(<type(abundances)> value) Set the scale of the abundances property of the HotHaloStandard component.

<void> abundancesSet(<type(abundances)> value) Set the abundances property of the hotHalo component.

<double precision> angularMomentum() Returns the default value for the angularMomentum property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> angularMomentumAttributeMatch(<logical>
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the hotHalo class that have the desired attributes for the angularMomentum property

<double precision> angularMomentumCold() Returns the default value for the angularMomentumCold property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> angularMomentumColdAttributeMatch(<logica
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the hotHalo class that have the desired attributes for the angularMomentumCold property

<integer> angularMomentumColdCount() Compute the count of evolvable quantities in the angularMomentumCold property of the HotHaloColdMode component.

<logical> angularMomentumColdIsGettable() Returns true if the angularMomentumCold property is gettable for the hotHalo component class.

<logical> angularMomentumColdIsSettable() Specify whether the angularMomentumCold property of the hotHalo component is settable.

<void> angularMomentumColdRate(<double precision> setValue→, <logical> [interrupt]↔,
<*procedure(interruptTask)> [interruptProcedure]↔) Accept a rate set for the angularMomentumCold property of the hotHalo component class. Trigger an interrupt to create the component.

<double precision> angularMomentumColdRateGet() Returns a zero rate for the angularMomentumCold property for the hotHalo component class.

<void> angularMomentumColdScale(<double precision> value) Set the scale of the angularMomentumCold property of the HotHaloColdMode component.

<void> angularMomentumColdSet(<double precision> value) Set the angularMomentumCold property of the hotHalo component.

<integer> angularMomentumCount() Compute the count of evolvable quantities in the angularMomentum property of the HotHaloStandard component.

<logical> angularMomentumIsGettable() Returns true if the angularMomentum property is gettable for the hotHalo component class.

<logical> angularMomentumIsSettable() Specify whether the angularMomentum property of the hotHalo component is settable.

<void> angularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interrup [interruptProcedure]↔) Accept a rate set for the angularMomentum property of the hotHalo component class. Trigger an interrupt to create the component.

<double precision> angularMomentumRateGet() Returns a zero rate for the angularMomentum property for the hotHalo component class.

<void> angularMomentumScale(<double precision> value) Set the scale of the angularMomentum property of the HotHaloStandard component.

<void> angularMomentumSet(<double precision> value) Set the angularMomentum property of the hotHalo component.

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a generic hotHalo component from a supplied XML definition.

<type(chemicalAbundances)> chemicals() Returns the default value for the chemicals property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> chemicalsAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the chemicals property

<integer> chemicalsCount() Compute the count of evolvable quantities in the chemicals property of the HotHaloStandard component.

<logical> chemicalsIsGettable() Returns true if the chemicals property is gettable for the hotHalo component class.

<logical> chemicalsIsSettable() Specify whether the chemicals property of the hotHalo component is settable.

<void> chemicalsRate(<type(chemicalAbundances)> setValue→, <logical> [interrupt]↔, <*procedure(interr [interruptProcedure]↔) Accept a rate set for the chemicals property of the hotHalo component class. Trigger an interrupt to create the component.

<type(chemicalAbundances)> chemicalsRateGet() Returns a zero rate for the chemicals property for the hotHalo component class.

<void> chemicalsScale(<type(chemicalAbundances)> value) Set the scale of the chemicals property of the HotHaloStandard component.

<void> chemicalsSet(<type(chemicalAbundances)> value) Set the chemicals property of the hotHalo component.

<logical> coldModeIsActive() Return true if the coldMode implementation of the hotHalo component is the active choice.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Read properties from raw file.

<void> deserializeValues(<double(:)> array→, <integer> propertyType→) Deserialize the evolvable quantities from an array.

<void> destroy() Finalize a generic hotHalo component.

<void> dumpASCII() Dump the content of a hotHalo component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<double precision> heatSource() Returns the default value for the heatSource property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> heatSourceAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the heatSource property

<integer> heatSourceCount() Compute the count of evolvable quantities in the heatSource property of the HotHaloStandard component.

<logical> heatSourceIsGettable() Returns true if the heatSource property is gettable for the hotHalo component class.

<logical> heatSourceIsSettable() Specify whether the heatSource property of the hotHalo component is settable.

<void> heatSourceRate(<double precision> value) Cumulate to the rate of the heatSource property of the HotHaloStandard component.

<double precision> heatSourceRateGet() Returns a zero rate for the heatSource property for the hotHalo component class.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<type(abundances)> hotHaloCoolingAbundances() Returns the default value for the hotHaloCoolingAbundances property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> hotHaloCoolingAbundancesAttributeMatch(<l [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the hotHaloCoolingAbundances property

<integer> hotHaloCoolingAbundancesCount() Compute the count of evolvable quantities in the hotHaloCoolingAbundan property of the HotHaloStandard component.

<logical> hotHaloCoolingAbundancesIsGettable() Returns true if the hotHaloCoolingAbundances property is gettable for the hotHalo component class.

<logical> hotHaloCoolingAbundancesIsSettable() Specify whether the hotHaloCoolingAbundances property of the hotHalo component is settable.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAbundancesRateFunction() Set the function to be used for the rate method of the hotHaloCoolingAbundances property of the hotHalo component.

<type(abundances)> hotHaloCoolingAbundancesRateGet() Returns a zero rate for the hotHaloCoolingAbundances property for the hotHalo component class.

<logical> hotHaloCoolingAbundancesRateIsAttached() Return true if the deferred function used to rate the hotHaloCoolingAbundances property of the hotHalo component class has been attached.

<double precision> hotHaloCoolingAngularMomentum() Returns the default value for the hotHaloCoolingAngularMome property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> hotHaloCoolingAngularMomentumAttributeMat [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the hotHaloCoolingAngularMomentum property

<integer> hotHaloCoolingAngularMomentumCount() Compute the count of evolvable quantities in the hotHaloCoolingAngularMomentum property of the HotHaloStandard component.

<logical> hotHaloCoolingAngularMomentumIsGettable() Returns true if the hotHaloCoolingAngularMomentum property is gettable for the hotHalo component class.

<logical> hotHaloCoolingAngularMomentumIsSettable() Specify whether the hotHaloCoolingAngularMomentum property of the hotHalo component is settable.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRateFunction() Set the function to be used for the rate method of the hotHaloCoolingAngularMomentum property of the hotHalo component.

<double precision> hotHaloCoolingAngularMomentumRateGet() Returns a zero rate for the hotHaloCoolingAngularMo property for the hotHalo component class.

<logical> hotHaloCoolingAngularMomentumRateIsAttached() Return true if the deferred function used to rate the hotHaloCoolingAngularMomentum property of the hotHalo component class has been attached.

<double precision> hotHaloCoolingMass() Returns the default value for the hotHaloCoolingMass property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> hotHaloCoolingMassAttributeMatch(<logical [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the hotHaloCoolingMass property

<integer> hotHaloCoolingMassCount() Compute the count of evolvable quantities in the hotHaloCoolingMass property of the HotHaloStandard component.

<logical> hotHaloCoolingMassIsGettable() Returns true if the hotHaloCoolingMass property is gettable for the hotHalo component class.

<logical> hotHaloCoolingMassIsSettable() Specify whether the hotHaloCoolingMass property of the hotHalo component is settable.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRateFunction() Set the function to be used for the rate method of the hotHaloCoolingMass property of the hotHalo component.

<double precision> hotHaloCoolingMassRateGet() Returns a zero rate for the hotHaloCoolingMass property for the hotHalo component class.

<logical> hotHaloCoolingMassRateIsAttached() Return true if the deferred function used to rate the hotHaloCoolingMass property of the hotHalo component class has been attached.

<void> initialize() Initialize a generic hotHalo component.

<logical> isInitialized() Returns the default value for the isInitialized property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> isInitializedAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the isInitialized property

<logical> isInitializedIsGettable() Returns true if the isInitialized property is gettable for the hotHalo component class.

<logical> isInitializedIsSettable() Specify whether the isInitialized property of the hotHalo component is settable.

<logical> isInitializedRateGet() Returns a zero rate for the isInitialized property for the hotHalo component class.

<void> isInitializedSet(<logical> value) Set the isInitialized property of the hotHalo component.

<double precision> mass() Returns the default value for the mass property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> massAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the mass property

<double precision> massCold() Returns the default value for the massCold property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> massColdAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the massCold property

<integer> massColdCount() Compute the count of evolvable quantities in the massCold property of the HotHaloColdMode component.

<logical> massColdIsGettable() Returns true if the massCold property is gettable for the hotHalo component class.

<logical> massColdIsSettable() Specify whether the massCold property of the hotHalo component is settable.

<void> massColdRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accept a rate set for the massCold property of the hotHalo component class. Trigger an interrupt to create the component.

<double precision> massColdRateGet() Returns a zero rate for the massCold property for the hotHalo component class.

<void> massColdScale(<double precision> value) Set the scale of the massCold property of the HotHaloColdMode component.

<void> massColdSet(<double precision> value) Set the massCold property of the hotHalo component.

<integer> massCount() Compute the count of evolvable quantities in the mass property of the HotHaloStandard component.

<logical> massIsGettable() Returns true if the mass property is gettable for the hotHalo component class.

<logical> massIsSettable() Specify whether the mass property of the hotHalo component is settable.

<void> massRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accept a rate set for the mass property of the hotHalo component class. Trigger an interrupt to create the component.

<double precision> massRateGet() Returns a zero rate for the mass property for the hotHalo component class.

<void> massScale(<double precision> value) Set the scale of the mass property of the HotHaloStandard component.

<void> massSet(<double precision> value) Set the mass property of the hotHalo component.

<double precision> massSink() Returns the default value for the massSink property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> massSinkAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the massSink property

<integer> massSinkCount() Compute the count of evolvable quantities in the massSink property of the HotHaloStandard component.

<logical> massSinkIsGettable() Returns true if the massSink property is gettable for the hotHalo component class.

<logical> massSinkIsSettable() Specify whether the massSink property of the hotHalo component is settable.

<void> massSinkRate(<double precision> value) Cumulate to the rate of the massSink property of the HotHaloStandard component.

<double precision> massSinkRateGet() Returns a zero rate for the massSink property for the hotHalo component class.

<double precision> massTotal() Returns the default value for the massTotal property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> massTotalAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the massTotal property

<logical> massTotalIsGettable() Returns true if the massTotal property is gettable for the hotHalo component class.

<logical> massTotalIsSettable() Specify whether the massTotal property of the hotHalo component is settable.

<double precision> massTotalRateGet() Returns a zero rate for the massTotal property for the hotHalo component class.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a nodeComponent object.

<logical> nullIsActive() Return true if the null implementation of the hotHalo component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<double precision> outerRadius() Returns the default value for the outerRadius property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> outerRadiusAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the outerRadius property

<integer> outerRadiusCount() Compute the count of evolvable quantities in the outerRadius property of the HotHaloStandard component.

<logical> outerRadiusIsGettable() Returns true if the outerRadius property is gettable for the hotHalo component class.

<logical> outerRadiusIsSettable() Specify whether the outerRadius property of the hotHalo component is settable.

<void> outerRadiusRate(<double precision> value) Cumulate to the rate of the outerRadius property of the HotHaloStandard component.

<double precision> outerRadiusRateGet() Returns a zero rate for the outerRadius property for the hotHalo component class.

<void> outerRadiusScale(<double precision> value) Set the scale of the outerRadius property of the HotHaloStandard component.

<void> outerRadiusSet(<double precision> value) Set the outerRadius property of the hotHalo component.

<type(abundances)> outflowedAbundances() Returns the default value for the outflowedAbundances property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> outflowedAbundancesAttributeMatch(<logica
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the hotHalo class that have the desired attributes for the outflowedAbundances property

<integer> outflowedAbundancesCount() Compute the count of evolvable quantities in the outflowedAbundances property of the HotHaloStandard component.

<logical> outflowedAbundancesIsGettable() Returns true if the outflowedAbundances property is gettable for the hotHalo component class.

<logical> outflowedAbundancesIsSettable() Specify whether the outflowedAbundances property of the hotHalo component is settable.

<void> outflowedAbundancesRate(<type(abundances)> value) Cumulate to the rate of the outflowedAbundances property of the HotHaloStandard component.

<type(abundances)> outflowedAbundancesRateGet() Returns a zero rate for the outflowedAbundances property for the hotHalo component class.

<void> outflowedAbundancesScale(<type(abundances)> value) Set the scale of the outflowedAbundances property of the HotHaloStandard component.

<void> outflowedAbundancesSet(<type(abundances)> value) Set the outflowedAbundances property of the hotHalo component.

<double precision> outflowedAngularMomentum() Returns the default value for the outflowedAngularMomentum property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> outflowedAngularMomentumAttributeMatch(<l
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the hotHalo class that have the desired attributes for the outflowedAngularMomentum property

<integer> outflowedAngularMomentumCount() Compute the count of evolvable quantities in the outflowedAngularMomen
property of the HotHaloStandard component.

<logical> outflowedAngularMomentumIsGettable() Returns true if the outflowedAngularMomentum property is gettable for the hotHalo component class.

<logical> outflowedAngularMomentumIsSettable() Specify whether the outflowedAngularMomentum property of the hotHalo component is settable.

<void> outflowedAngularMomentumRate(<double precision> value) Cumulate to the rate of the outflowedAngularMomentum property of the HotHaloStandard component.

<double precision> outflowedAngularMomentumRateGet() Returns a zero rate for the outflowedAngularMomentum property for the hotHalo component class.

<void> outflowedAngularMomentumScale(<double precision> value) Set the scale of the outflowedAngularMomentum property of the HotHaloStandard component.

<void> outflowedAngularMomentumSet(<double precision> value) Set the outflowedAngularMomentum property of the hotHalo component.

<double precision> outflowedMass() Returns the default value for the outflowedMass property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> outflowedMassAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the outflowedMass property

<integer> outflowedMassCount() Compute the count of evolvable quantities in the outflowedMass property of the HotHaloStandard component.

<logical> outflowedMassIsGettable() Returns true if the outflowedMass property is gettable for the hotHalo component class.

<logical> outflowedMassIsSettable() Specify whether the outflowedMass property of the hotHalo component is settable.

<void> outflowedMassRate(<double precision> value) Cumulate to the rate of the outflowedMass property of the HotHaloStandard component.

<double precision> outflowedMassRateGet() Returns a zero rate for the outflowedMass property for the hotHalo component class.

<void> outflowedMassScale(<double precision> value) Set the scale of the outflowedMass property of the HotHaloStandard component.

<void> outflowedMassSet(<double precision> value) Set the outflowedMass property of the hotHalo component.

<type(abundances)> outflowingAbundances() Returns the default value for the outflowingAbundances property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> outflowingAbundancesAttributeMatch(<logic
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the outflowingAbundances property

<integer> outflowingAbundancesCount() Compute the count of evolvable quantities in the outflowingAbundances property of the HotHaloStandard component.

<logical> outflowingAbundancesIsGettable() Returns true if the outflowingAbundances property is gettable for the hotHalo component class.

<logical> outflowingAbundancesIsSettable() Specify whether the outflowingAbundances property of the hotHalo component is settable.

<void> outflowingAbundancesRate(<type(abundances)> value) Cumulate to the rate of the outflowingAbundances property of the HotHaloStandard component.

<type(abundances)> outflowingAbundancesRateGet() Returns a zero rate for the outflowingAbundances property for the hotHalo component class.

<double precision> outflowingAngularMomentum() Returns the default value for the outflowingAngularMomentum property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> outflowingAngularMomentumAttributeMatch(<
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the hotHalo class that have the desired attributes for the outflowingAngularMomentum property

<integer> outflowingAngularMomentumCount() Compute the count of evolvable quantities in the outflowingAngularMomentum property of the HotHaloStandard component.

<logical> outflowingAngularMomentumIsGettable() Returns true if the outflowingAngularMomentum property is gettable for the hotHalo component class.

<logical> outflowingAngularMomentumIsSettable() Specify whether the outflowingAngularMomentum property of the hotHalo component is settable.

<void> outflowingAngularMomentumRate(<double precision> value) Cumulate to the rate of the outflowingAngularMomentum property of the HotHaloStandard component.

<double precision> outflowingAngularMomentumRateGet() Returns a zero rate for the outflowingAngularMomentum property for the hotHalo component class.

<double precision> outflowingMass() Returns the default value for the outflowingMass property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> outflowingMassAttributeMatch(<logical>
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the hotHalo class that have the desired attributes for the outflowingMass property

<integer> outflowingMassCount() Compute the count of evolvable quantities in the outflowingMass property of the HotHaloStandard component.

<logical> outflowingMassIsGettable() Returns true if the outflowingMass property is gettable for the hotHalo component class.

<logical> outflowingMassIsSettable() Specify whether the outflowingMass property of the hotHalo component is settable.

<void> outflowingMassRate(<double precision> value) Cumulate to the rate of the outflowingMass property of the HotHaloStandard component.

<double precision> outflowingMassRateGet() Returns a zero rate for the outflowingMass property for the hotHalo component class.

<logical> outflowTrackingIsActive() Return true if the outflowTracking implementation of the hotHalo component is the active choice.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a hotHalo component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a generic hotHalo component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Establish the names of properties to output for a generic hotHalo component.

<void> postOutput(<double precision> time→) Perform post-output processing of a hotHalo component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets() Set offsets into serialization arrays.

<void> serializeASCII() Serialize the content of a hotHalo component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the number of evolvable quantities to be evolved.

<void> serializeRaw(<integer> fileHandle→) Generate a binary dump of all properties.

<void> serializeValues(<double(:)> array←, <integer> propertyType→) Serialize the evolvable quantities to an array.

<void> serializeXML() Generate an XML dump of all properties.

<integer(c_size_t)> sizeOf() Return the size in bytes of a nodeComponentHotHalo component.

<logical> standardIsActive() Return true if the standard implementation of the hotHalo component is the active choice.

<type(abundances)> strippedAbundances() Returns the default value for the strippedAbundances property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> strippedAbundancesAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the strippedAbundances property

<integer> strippedAbundancesCount() Compute the count of evolvable quantities in the strippedAbundances property of the HotHaloStandard component.

<logical> strippedAbundancesIsGettable() Returns true if the strippedAbundances property is gettable for the hotHalo component class.

<logical> strippedAbundancesIsSettable() Specify whether the strippedAbundances property of the hotHalo component is settable.

<void> strippedAbundancesRate(<type(abundances)> value) Cumulate to the rate of the strippedAbundances property of the HotHaloStandard component.

<type(abundances)> strippedAbundancesRateGet() Returns a zero rate for the strippedAbundances property for the hotHalo component class.

<void> strippedAbundancesScale(<type(abundances)> value) Set the scale of the strippedAbundances property of the HotHaloStandard component.

<void> strippedAbundancesSet(<type(abundances)> value) Set the strippedAbundances property of the hotHalo component.

<double precision> strippedMass() Returns the default value for the strippedMass property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> strippedMassAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the strippedMass property

<integer> strippedMassCount() Compute the count of evolvable quantities in the strippedMass property of the HotHaloStandard component.

<logical> strippedMassIsGettable() Returns true if the strippedMass property is gettable for the hotHalo component class.

<logical> strippedMassIsSettable() Specify whether the strippedMass property of the hotHalo component is settable.

<void> strippedMassRate(<double precision> value) Cumulate to the rate of the strippedMass property of the HotHaloStandard component.

<double precision> strippedMassRateGet() Returns a zero rate for the strippedMass property for the hotHalo component class.

<void> strippedMassScale(<double precision> value) Set the scale of the strippedMass property of the HotHaloStandard component.

<void> strippedMassSet(<double precision> value) Set the strippedMass property of the hotHalo component.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<type(abundances)> trackedOutflowAbundances() Returns the default value for the trackedOutflowAbundances property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> trackedOutflowAbundancesAttributeMatch(<l [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the trackedOutflowAbundances property

<integer> trackedOutflowAbundancesCount() Compute the count of evolvable quantities in the trackedOutflowAbundan property of the HotHaloOutflowTracking component.

<logical> trackedOutflowAbundancesIsGettable() Returns true if the trackedOutflowAbundances property is gettable for the hotHalo component class.

<logical> trackedOutflowAbundancesIsSettable() Specify whether the trackedOutflowAbundances property of the hotHalo component is settable.

<void> trackedOutflowAbundancesRate(<type(abundances)> value) Cumulate to the rate of the trackedOutflowAbundances property of the HotHaloOutflowTracking component.

<type(abundances)> trackedOutflowAbundancesRateGet() Returns a zero rate for the trackedOutflowAbundances property for the hotHalo component class.

<void> trackedOutflowAbundancesScale(<type(abundances)> value) Set the scale of the trackedOutflowAbundances property of the HotHaloOutflowTracking component.

<void> trackedOutflowAbundancesSet(<type(abundances)> value) Set the trackedOutflowAbundances property of the hotHalo component.

<double precision> trackedOutflowMass() Returns the default value for the trackedOutflowMass property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> trackedOutflowMassAttributeMatch(<logical [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the trackedOutflowMass property

<integer> trackedOutflowMassCount() Compute the count of evolvable quantities in the trackedOutflowMass property of the HotHaloOutflowTracking component.

<logical> trackedOutflowMassIsGettable() Returns true if the trackedOutflowMass property is gettable for the hotHalo component class.

<logical> trackedOutflowMassIsSettable() Specify whether the trackedOutflowMass property of the hotHalo component is settable.

<void> trackedOutflowMassRate(<double precision> value) Cumulate to the rate of the trackedOutflowMass property of the HotHaloOutflowTracking component.

<double precision> trackedOutflowMassRateGet() Returns a zero rate for the trackedOutflowMass property for the hotHalo component class.

<void> trackedOutflowMassScale(<double precision> value) Set the scale of the trackedOutflowMass property of the HotHaloOutflowTracking component.

<void> trackedOutflowMassSet(<double precision> value) Set the trackedOutflowMass property of the hotHalo component.

<type(varying_string)> type() Returns the type name for the hotHalo component class.

<double precision> unaccretedMass() Returns the default value for the unaccretedMass property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> unaccretedMassAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the unaccretedMass property

<integer> unaccretedMassCount() Compute the count of evolvable quantities in the unaccretedMass property of the HotHaloStandard component.

<logical> unaccretedMassIsGettable() Returns true if the unaccretedMass property is gettable for the hotHalo component class.

<logical> unaccretedMassIsSettable() Specify whether the unaccretedMass property of the hotHalo component is settable.

<void> unaccretedMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interrupt [interruptProcedure]↔) Accept a rate set for the unaccretedMass property of the hotHalo component class. Trigger an interrupt to create the component.

<double precision> unaccretedMassRateGet() Returns a zero rate for the unaccretedMass property for the hotHalo component class.

<void> unaccretedMassScale(<double precision> value) Set the scale of the unaccretedMass property of the HotHaloStandard component.

<void> unaccretedMassSet(<double precision> value) Set the unaccretedMass property of the hotHalo component.

<logical> verySimpleDelayedIsActive() Return true if the verySimpleDelayed implementation of the hotHalo component is the active choice.

<logical> verySimpleIsActive() Return true if the verySimple implementation of the hotHalo component is the active choice.

nodeComponentHotHaloColdMode

<type(abundances)> abundances() Get the abundances property of an standard implementation of the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> abundancesAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the abundances property

<type(abundances)> abundancesCold() Get the abundancesCold property of an coldMode implementation of the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> abundancesColdAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the abundancesCold property

<integer> abundancesColdCount() Return a count of the number of scalar properties in the abundancesCold property of an coldMode implementation of the hotHalo component class.

<void> abundancesColdInactive() Indicate that the abundancesCold property of an coldMode implementation of the hotHalo component class is inactive for differential equation solving.

<logical> abundancesColdIsGettable() Returns true if the abundancesCold property is gettable for the hotHalo component class.

<logical> abundancesColdIsSettable() Specify whether the abundancesCold property of the hotHalo component is settable.

<void> abundancesColdRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interrupt [interruptProcedure]↔) Accumulate to the rate of change of the abundancesCold property of an coldMode implementation of the hotHalo component class.

<type(abundances)> abundancesColdRateGet() Get the rate of change of the abundancesCold property of an coldMode implementation of the hotHalo component class.

<void> abundancesColdScale(<type(abundances)> setValue→) Set the absolute scale of the abundancesCold property of an coldMode implementation of the hotHalo component class.

<void> abundancesColdSet(<type(abundances)> setValue→) Set the abundancesCold property of an coldMode implementation of the hotHalo component class.

<integer> abundancesCount() Return a count of the number of scalar properties in the abundances property of an standard implementation of the hotHalo component class.

<void> abundancesInactive() Indicate that the abundances property of an standard implementation of the hotHalo component class is inactive for differential equation solving.

<logical> abundancesIsGettable() Returns true if the abundances property is gettable for the hotHalo component class.

<logical> abundancesIsSettable() Specify whether the abundances property of the hotHalo component is settable.

<void> abundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask [interruptProcedure]↔) Accumulate to the rate of change of the abundances property of an standard implementation of the hotHalo component class.

<type(abundances)> abundancesRateGet() Get the rate of change of the abundances property of an standard implementation of the hotHalo component class.

<void> abundancesScale(<type(abundances)> setValue→) Set the absolute scale of the abundances property of an standard implementation of the hotHalo component class.

<void> abundancesSet(<type(abundances)> setValue→) Set the abundances property of an standard implementation of the hotHalo component class.

<double precision> angularMomentum() Get the angularMomentum property of an standard implementation of the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> angularMomentumAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the angularMomentum property

<double precision> angularMomentumCold() Get the angularMomentumCold property of an coldMode implementation of the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> angularMomentumColdAttributeMatch(<logica [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the angularMomentumCold property

<integer> angularMomentumColdCount() Return a count of the number of scalar properties in the angularMomentumCold property of an coldMode implementation of the hotHalo component class.

<void> angularMomentumColdInactive() Indicate that the angularMomentumCold property of an coldMode implementation of the hotHalo component class is inactive for differential equation solving.

<logical> angularMomentumColdIsGettable() Returns true if the angularMomentumCold property is gettable for the hotHalo component class.

<logical> angularMomentumColdIsSettable() Specify whether the angularMomentumCold property of the hotHalo component is settable.

<void> angularMomentumColdRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate to the rate of change of the angularMomentumCold property of an coldMode implementation of the hotHalo component class.

<double precision> angularMomentumColdRateGet() Get the rate of change of the angularMomentumCold property of an coldMode implementation of the hotHalo component class.

<void> angularMomentumColdScale(<double precision> setValue→) Set the absolute scale of the angularMomentumCold property of an coldMode implementation of the hotHalo component class.

<void> angularMomentumColdSet(<double precision> setValue→) Set the angularMomentumCold property of an coldMode implementation of the hotHalo component class.

<integer> angularMomentumCount() Return a count of the number of scalar properties in the angularMomentum property of an standard implementation of the hotHalo component class.

<void> angularMomentumInactive() Indicate that the angularMomentum property of an standard implementation of the hotHalo component class is inactive for differential equation solving.

<logical> angularMomentumIsGettable() Returns true if the angularMomentum property is gettable for the hotHalo component class.

<logical> angularMomentumIsSettable() Specify whether the angularMomentum property of the hotHalo component is settable.

<void> angularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interrup [interruptProcedure]↔) Accumulate to the rate of change of the angularMomentum property of an standard implementation of the hotHalo component class.

<double precision> angularMomentumRateGet() Get the rate of change of the angularMomentum property of an standard implementation of the hotHalo component class.

<void> angularMomentumScale(<double precision> setValue→) Set the absolute scale of the angularMomentum property of an standard implementation of the hotHalo component class.

<void> angularMomentumSet(<double precision> setValue→) Set the angularMomentum property of an standard implementation of the hotHalo component class.

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a coldMode implementation of the hotHalo component from a supplied XML definition.

<type(chemicalAbundances)> chemicals() Get the chemicals property of an standard implementation of the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> chemicalsAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the chemicals property

<integer> chemicalsCount() Return a count of the number of scalar properties in the chemicals property of an standard implementation of the hotHalo component class.

<void> chemicalsInactive() Indicate that the chemicals property of an standard implementation of the hotHalo component class is inactive for differential equation solving.

<logical> chemicalsIsGettable() Returns true if the chemicals property is gettable for the hotHalo component class.

<logical> chemicalsIsSettable() Specify whether the chemicals property of the hotHalo component is settable.

<void> chemicalsRate(<type(chemicalAbundances)> setValue→, <logical> [interrupt]↔, <*procedure(interr [interruptProcedure]↔) Accumulate to the rate of change of the chemicals property of an standard implementation of the hotHalo component class.

<type(chemicalAbundances)> chemicalsRateGet() Get the rate of change of the chemicals property of an standard implementation of the hotHalo component class.

<void> chemicalsScale(<type(chemicalAbundances)> setValue→) Set the absolute scale of the chemicals property of an standard implementation of the hotHalo component class.

<void> chemicalsSet(<type(chemicalAbundances)> setValue→) Set the chemicals property of an standard implementation of the hotHalo component class.

<logical> coldModeIsActive() Return true if the coldMode implementation of the hotHalo component is the active choice.

<void> createFunctionSet() Set the create function for the standard implementation of the hotHalo component class.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a coldMode implementation of the hotHalo component from raw (binary) file.

<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→) Deserialize evolvable properties of a coldMode implementation of the hotHalo component from array.

<void> destroy() Finalize a coldMode implementation of the hotHalo component.

<void> dumpASCII() Dump the content of a hotHalo component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<double precision> heatSource() Returns the default value for the heatSource property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> heatSourceAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the heatSource property

<integer> heatSourceCount() Compute the count of evolvable quantities in the heatSource property of the HotHaloStandard component.

<logical> heatSourceIsGettable() Returns true if the heatSource property is gettable for the hotHalo component class.

<logical> heatSourceIsSettable() Specify whether the heatSource property of the hotHalo component is settable.

<void> heatSourceRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask [interruptProcedure]↔) Accumulate the rate of change of the heatSource property of the standard implementation of the hotHalo component using a deferred function.

<void> heatSourceRateFunction() Set the function to be used for the rate method of the heatSource property of the HotHaloStandard component.

<double precision> heatSourceRateGet() Returns a zero rate for the heatSource property for the hotHalo component class.

<logical> heatSourceRateIsAttached() Return true if the deferred function used to rate the heatSource property of the HotHaloStandard component class has been attached.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<type(abundances)> hotHaloCoolingAbundances() Returns the default value for the hotHaloCoolingAbundances property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> hotHaloCoolingAbundancesAttributeMatch(<l [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the hotHaloCoolingAbundances property

<integer> hotHaloCoolingAbundancesCount() Compute the count of evolvable quantities in the hotHaloCoolingAbundan property of the HotHaloStandard component.

<logical> hotHaloCoolingAbundancesIsGettable() Returns true if the hotHaloCoolingAbundances property is gettable for the hotHalo component class.

<logical> hotHaloCoolingAbundancesIsSettable() Specify whether the hotHaloCoolingAbundances property of the hotHalo component is settable.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAbundancesRateFunction() Set the function to be used for the rate method of the hotHaloCoolingAbundances property of the hotHalo component.

<type(abundances)> hotHaloCoolingAbundancesRateGet() Returns a zero rate for the hotHaloCoolingAbundances property for the hotHalo component class.

<logical> hotHaloCoolingAbundancesRateIsAttached() Return true if the deferred function used to rate the hotHaloCoolingAbundances property of the hotHalo component class has been attached.

<double precision> hotHaloCoolingAngularMomentum() Returns the default value for the hotHaloCoolingAngularMome property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> hotHaloCoolingAngularMomentumAttributeMat [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the hotHaloCoolingAngularMomentum property

<integer> hotHaloCoolingAngularMomentumCount() Compute the count of evolvable quantities in the hotHaloCoolingAngularMomentum property of the HotHaloStandard component.

<logical> hotHaloCoolingAngularMomentumIsGettable() Returns true if the hotHaloCoolingAngularMomentum property is gettable for the hotHalo component class.

<logical> hotHaloCoolingAngularMomentumIsSettable() Specify whether the hotHaloCoolingAngularMomentum property of the hotHalo component is settable.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRateFunction() Set the function to be used for the rate method of the hotHaloCoolingAngularMomentum property of the hotHalo component.

<double precision> hotHaloCoolingAngularMomentumRateGet() Returns a zero rate for the hotHaloCoolingAngularMo property for the hotHalo component class.

<logical> hotHaloCoolingAngularMomentumRateIsAttached() Return true if the deferred function used to rate the hotHaloCoolingAngularMomentum property of the hotHalo component class has been attached.

<double precision> hotHaloCoolingMass() Returns the default value for the hotHaloCoolingMass property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> hotHaloCoolingMassAttributeMatch(<logical [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the hotHaloCoolingMass property

<integer> hotHaloCoolingMassCount() Compute the count of evolvable quantities in the hotHaloCoolingMass property of the HotHaloStandard component.

<logical> hotHaloCoolingMassIsGettable() Returns true if the hotHaloCoolingMass property is gettable for the hotHalo component class.

<logical> hotHaloCoolingMassIsSettable() Specify whether the hotHaloCoolingMass property of the hotHalo component is settable.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRateFunction() Set the function to be used for the rate method of the hotHaloCoolingMass property of the hotHalo component.

<double precision> hotHaloCoolingMassRateGet() Returns a zero rate for the hotHaloCoolingMass property for the hotHalo component class.

<logical> hotHaloCoolingMassRateIsAttached() Return true if the deferred function used to rate the hotHaloCoolingMass property of the hotHalo component class has been attached.

<void> initialize() Initialize a coldMode member of the hotHalo component.

<logical> isInitialized() Get the isInitialized property of an standard implementation of the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> isInitializedAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the isInitialized property

<logical> isInitializedIsGettable() Returns true if the isInitialized property is gettable for the hotHalo component class.

<logical> isInitializedIsSettable() Specify whether the isInitialized property of the hotHalo component is settable.

<logical> isInitializedRateGet() Returns a zero rate for the isInitialized property for the hotHalo component class.

<void> isInitializedSet(<logical> setValue→) Set the isInitialized property of an standard implementation of the hotHalo component class.

<double precision> mass() Get the mass property of an standard implementation of the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> massAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the mass property

<double precision> massCold() Get the massCold property of an coldMode implementation of the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> massColdAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the massCold property

<integer> massColdCount() Return a count of the number of scalar properties in the massCold property of an coldMode implementation of the hotHalo component class.

<void> massColdInactive() Indicate that the massCold property of an coldMode implementation of the hotHalo component class is inactive for differential equation solving.

<logical> massColdIsGettable() Returns true if the massCold property is gettable for the hotHalo component class.

<logical> massColdIsSettable() Specify whether the massCold property of the hotHalo component is settable.

<void> massColdRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate to the rate of change of the massCold property of an coldMode implementation of the hotHalo component class.

<double precision> massColdRateGet() Get the rate of change of the massCold property of an coldMode implementation of the hotHalo component class.

<void> massColdScale(<double precision> setValue→) Set the absolute scale of the massCold property of an coldMode implementation of the hotHalo component class.

<void> massColdSet(<double precision> setValue→) Set the massCold property of an coldMode implementation of the hotHalo component class.

<integer> massCount() Return a count of the number of scalar properties in the mass property of an standard implementation of the hotHalo component class.

<void> massInactive() Indicate that the mass property of an standard implementation of the hotHalo component class is inactive for differential equation solving.

<logical> massIsGettable() Returns true if the mass property is gettable for the hotHalo component class.

<logical> massIsSettable() Specify whether the mass property of the hotHalo component is settable.

<void> massRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate to the rate of change of the mass property of an standard implementation of the hotHalo component class.

<double precision> massRateGet() Get the rate of change of the mass property of an standard implementation of the hotHalo component class.

<void> massRemovalRate() Called whenever the standard hot halo component removes mass from the halo.

<void> massScale(<double precision> setValue→) Set the absolute scale of the mass property of an standard implementation of the hotHalo component class.

<void> massSet(<double precision> setValue→) Set the mass property of an standard implementation of the hotHalo component class.

<double precision> massSink() Returns the default value for the massSink property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> massSinkAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the massSink property

<integer> massSinkCount() Compute the count of evolvable quantities in the massSink property of the HotHaloStandard component.

<logical> massSinkIsGettable() Returns true if the massSink property is gettable for the hotHalo component class.

<logical> massSinkIsSettable() Specify whether the massSink property of the hotHalo component is settable.

<void> massSinkRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the massSink property of the standard implementation of the hotHalo component using a deferred function.

<void> massSinkRateFunction() Set the function to be used for the rate method of the massSink property of the HotHaloStandard component.

<double precision> massSinkRateGet() Returns a zero rate for the massSink property for the hotHalo component class.

<logical> massSinkRateIsAttached() Return true if the deferred function used to rate the massSink property of the HotHaloStandard component class has been attached.

<double precision> massTotal() Returns the default value for the massTotal property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> massTotalAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the massTotal property

<logical> massTotalIsGettable() Returns true if the massTotal property is gettable for the hotHalo component class.

<logical> massTotalIsSettable() Specify whether the massTotal property of the hotHalo component is settable.

<double precision> massTotalRateGet() Returns a zero rate for the massTotal property for the hotHalo component class.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a coldMode implementation of the hotHalo component class.

<logical> nullIsActive() Return true if the null implementation of the hotHalo component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<double precision> outerRadius() Get the value of the outerRadius property of the standard implementation of the hotHalo component using a deferred function.

<type(varying_string), allocatable, dimension(:) => matches> outerRadiusAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the outerRadius property

<integer> outerRadiusCount() Return a count of the number of scalar properties in the outerRadius property of an standard implementation of the hotHalo component class.

<void> outerRadiusFunction() Set the function to be used for the get method of the outerRadius property of the HotHaloStandard component.

<double precision> outerRadiusGrowthRate() Call the deferred function for the outerRadiusGrowthRate method of the hotHalo component class if it has been set.

<void> outerRadiusGrowthRateFunction() Set the function to be used for the outerRadiusGrowthRate method of the coldMode implementation of the hotHalo component class.

<logical> outerRadiusGrowthRateFunctionIsSet() Return true if the deferred function for the outerRadiusGrowthRate method of the coldMode implementation of the hotHalo component class has been set.

<void> outerRadiusInactive() Indicate that the outerRadius property of an standard implementation of the hotHalo component class is inactive for differential equation solving.

<logical> outerRadiusIsAttached() Return true if the deferred function used to get the outerRadius property of the HotHaloStandard component class has been attached.

<logical> outerRadiusIsGettable() Returns true if the outerRadius property is gettable for the hotHalo component class.

<logical> outerRadiusIsSettable() Specify whether the outerRadius property of the hotHalo component is settable.

<void> outerRadiusRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTas [interruptProcedure]↔) Accumulate to the rate of change of the outerRadius property of an standard implementation of the hotHalo component class.

<double precision> outerRadiusRateGet() Get the rate of change of the outerRadius property of an standard implementation of the hotHalo component class.

<void> outerRadiusScale(<double precision> setValue→) Set the absolute scale of the outerRadius property of an standard implementation of the hotHalo component class.

<void> outerRadiusSet(<double precision> setValue→) Set the outerRadius property of an standard implementation of the hotHalo component class.

<double precision> outerRadiusValue() Get the outerRadius property of an standard implementation of the hotHalo component class.

<type(abundances)> outflowedAbundances() Get the outflowedAbundances property of an standard implementation of the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> outflowedAbundancesAttributeMatch(<logica [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the outflowedAbundances property

<integer> outflowedAbundancesCount() Return a count of the number of scalar properties in the outflowedAbundances property of an standard implementation of the hotHalo component class.

<void> outflowedAbundancesInactive() Indicate that the outflowedAbundances property of an standard implementation of the hotHalo component class is inactive for differential equation solving.

<logical> outflowedAbundancesIsGettable() Returns true if the outflowedAbundances property is gettable for the hotHalo component class.

<logical> outflowedAbundancesIsSettable() Specify whether the outflowedAbundances property of the hotHalo component is settable.

<void> outflowedAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate to the rate of change of the outflowedAbundances property of an standard implementation of the hotHalo component class.

<type(abundances)> outflowedAbundancesRateGet() Get the rate of change of the outflowedAbundances property of an standard implementation of the hotHalo component class.

<void> outflowedAbundancesScale(<type(abundances)> setValue→) Set the absolute scale of the outflowedAbundances property of an standard implementation of the hotHalo component class.

<void> outflowedAbundancesSet(<type(abundances)> setValue→) Set the outflowedAbundances property of an standard implementation of the hotHalo component class.

<double precision> outflowedAngularMomentum() Get the outflowedAngularMomentum property of an standard implementation of the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> outflowedAngularMomentumAttributeMatch(<l [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the outflowedAngularMomentum property

<integer> outflowedAngularMomentumCount() Return a count of the number of scalar properties in the outflowedAngularMomentum property of an standard implementation of the hotHalo component class.

<void> outflowedAngularMomentumInactive() Indicate that the outflowedAngularMomentum property of an standard implementation of the hotHalo component class is inactive for differential equation solving.

<logical> outflowedAngularMomentumIsGettable() Returns true if the outflowedAngularMomentum property is gettable for the hotHalo component class.

<logical> outflowedAngularMomentumIsSettable() Specify whether the outflowedAngularMomentum property of the hotHalo component is settable.

<void> outflowedAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate to the rate of change of the outflowedAngularMomentum property of an standard implementation of the hotHalo component class.

<double precision> outflowedAngularMomentumRateGet() Get the rate of change of the outflowedAngularMomentum property of an standard implementation of the hotHalo component class.

<void> outflowedAngularMomentumScale(<double precision> setValue→) Set the absolute scale of the outflowedAngularMomentum property of an standard implementation of the hotHalo component class.

<void> outflowedAngularMomentumSet(<double precision> setValue→) Set the outflowedAngularMomentum property of an standard implementation of the hotHalo component class.

<double precision> outflowedMass() Get the outflowedMass property of an standard implementation of the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> outflowedMassAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the outflowedMass property

<integer> outflowedMassCount() Return a count of the number of scalar properties in the outflowedMass property of an standard implementation of the hotHalo component class.

<void> outflowedMassInactive() Indicate that the outflowedMass property of an standard implementation of the hotHalo component class is inactive for differential equation solving.

<logical> outflowedMassIsGettable() Returns true if the outflowedMass property is gettable for the hotHalo component class.

<logical> outflowedMassIsSettable() Specify whether the outflowedMass property of the hotHalo component is settable.

<void> outflowedMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptT [interruptProcedure]↔) Accumulate to the rate of change of the outflowedMass property of an standard implementation of the hotHalo component class.

<double precision> outflowedMassRateGet() Get the rate of change of the outflowedMass property of an standard implementation of the hotHalo component class.

<void> outflowedMassScale(<double precision> setValue→) Set the absolute scale of the outflowedMass property of an standard implementation of the hotHalo component class.

<void> outflowedMassSet(<double precision> setValue→) Set the outflowedMass property of an standard implementation of the hotHalo component class.

<type(abundances)> outflowingAbundances() Returns the default value for the outflowingAbundances property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> outflowingAbundancesAttributeMatch(<logic [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the outflowingAbundances property

<integer> outflowingAbundancesCount() Compute the count of evolvable quantities in the outflowingAbundances property of the HotHaloStandard component.

<logical> outflowingAbundancesIsGettable() Returns true if the outflowingAbundances property is gettable for the hotHalo component class.

<logical> outflowingAbundancesIsSettable() Specify whether the outflowingAbundances property of the hotHalo component is settable.

<void> outflowingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the outflowingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> outflowingAbundancesRateFunction() Set the function to be used for the rate method of the outflowingAbundances property of the HotHaloStandard component.

<type(abundances)> outflowingAbundancesRateGet() Returns a zero rate for the outflowingAbundances property for the hotHalo component class.

<logical> outflowingAbundancesRateIsAttached() Return true if the deferred function used to rate the outflowingAbundances property of the HotHaloStandard component class has been attached.

<double precision> outflowingAngularMomentum() Returns the default value for the outflowingAngularMomentum property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> outflowingAngularMomentumAttributeMatch(< [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the outflowingAngularMomentum property

<integer> outflowingAngularMomentumCount() Compute the count of evolvable quantities in the outflowingAngularMomentum property of the HotHaloStandard component.

<logical> outflowingAngularMomentumIsGettable() Returns true if the outflowingAngularMomentum property is gettable for the hotHalo component class.

<logical> outflowingAngularMomentumIsSettable() Specify whether the outflowingAngularMomentum property of the hotHalo component is settable.

<void> outflowingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the outflowingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> outflowingAngularMomentumRateFunction() Set the function to be used for the rate method of the outflowingAngularMomentum property of the HotHaloStandard component.

<double precision> outflowingAngularMomentumRateGet() Returns a zero rate for the outflowingAngularMomentum property for the hotHalo component class.

<logical> outflowingAngularMomentumRateIsAttached() Return true if the deferred function used to rate the outflowingAngularMomentum property of the HotHaloStandard component class has been attached.

<double precision> outflowingMass() Returns the default value for the outflowingMass property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> outflowingMassAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the outflowingMass property

<integer> outflowingMassCount() Compute the count of evolvable quantities in the outflowingMass property of the HotHaloStandard component.

<logical> outflowingMassIsGettable() Returns true if the outflowingMass property is gettable for the hotHalo component class.

<logical> outflowingMassIsSettable() Specify whether the outflowingMass property of the hotHalo component is settable.

<void> outflowingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interrupt [interruptProcedure]↔) Accumulate the rate of change of the outflowingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> outflowingMassRateFunction() Set the function to be used for the rate method of the outflowingMass property of the HotHaloStandard component.

<double precision> outflowingMassRateGet() Returns a zero rate for the outflowingMass property for the hotHalo component class.

<logical> outflowingMassRateIsAttached() Return true if the deferred function used to rate the outflowingMass property of the HotHaloStandard component class has been attached.

<void> outflowReturn(<logical> interrupt↔, <*procedure(interruptTask)> interruptprocedure↔) Call the deferred function for the outflowReturn method of the hotHalo component class if it has been set.

<void> outflowReturnFunction() Set the function to be used for the outflowReturn method of the coldMode implementation of the hotHalo component class.

<logical> outflowReturnFunctionIsSet() Return true if the deferred function for the outflowReturn method of the coldMode implementation of the hotHalo component class has been set.

<logical> outflowTrackingIsActive() Return true if the outflowTracking implementation of the hotHalo component is the active choice.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a hotHalo component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a coldMode implementation of the hotHalo component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Return the names of properties to output for a coldMode implementation of the hotHalo component.

<void> postOutput(<double precision> time→) Perform post-output processing for a coldMode implementation of the hotHalo component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→) Compute offsets into serialization arrays for a coldMode implementation of the hotHalo component.

<void> serializeASCII() Serialize the contents of a coldMode implementation of the hotHalo component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the serialization of a coldMode implementation of the hotHalo component.

<void> serializeRaw(<integer> fileHandle→) Serialize the contents of a coldMode implementation of the hotHalo component to raw (binary) file.

<void> serializeValues(<double precision[:]> array←, <integer> propertyType→) Serialize evolvable properties of a coldMode implementation of the hotHalo component to array.

<void> serializeXML(<integer> fileHandle→) Serialize the contents of a coldMode implementation of the hotHalo component to XML.

<integer(c_size_t)> sizeOf() Return the size in bytes of a coldMode implementation of the hotHalo component.

<logical> standardIsActive() Return true if the standard implementation of the hotHalo component is the active choice.

<type(abundances)> strippedAbundances() Get the strippedAbundances property of an standard implementation of the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> strippedAbundancesAttributeMatch(<logical [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the strippedAbundances property

<integer> strippedAbundancesCount() Return a count of the number of scalar properties in the strippedAbundances property of an standard implementation of the hotHalo component class.

<void> strippedAbundancesInactive() Indicate that the strippedAbundances property of an standard implementation of the hotHalo component class is inactive for differential equation solving.

<logical> strippedAbundancesIsGettable() Returns true if the strippedAbundances property is gettable for the hotHalo component class.

<logical> strippedAbundancesIsSettable() Specify whether the strippedAbundances property of the hotHalo component is settable.

<void> strippedAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate to the rate of change of the strippedAbundances property of an standard implementation of the hotHalo component class.

<type(abundances)> strippedAbundancesRateGet() Get the rate of change of the strippedAbundances property of an standard implementation of the hotHalo component class.

<void> strippedAbundancesScale(<type(abundances)> setValue→) Set the absolute scale of the strippedAbundances property of an standard implementation of the hotHalo component class.

<void> strippedAbundancesSet(<type(abundances)> setValue→) Set the strippedAbundances property of an standard implementation of the hotHalo component class.

<double precision> strippedMass() Get the strippedMass property of an standard implementation of the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> strippedMassAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the strippedMass property

<integer> strippedMassCount() Return a count of the number of scalar properties in the strippedMass property of an standard implementation of the hotHalo component class.

<void> strippedMassInactive() Indicate that the strippedMass property of an standard implementation of the hotHalo component class is inactive for differential equation solving.

<logical> strippedMassIsGettable() Returns true if the strippedMass property is gettable for the hotHalo component class.

<logical> strippedMassIsSettable() Specify whether the strippedMass property of the hotHalo component is settable.

<void> strippedMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTa [interruptProcedure]↔) Accumulate to the rate of change of the strippedMass property of an standard implementation of the hotHalo component class.

<double precision> strippedMassRateGet() Get the rate of change of the strippedMass property of an standard implementation of the hotHalo component class.

<void> strippedMassScale(<double precision> setValue→) Set the absolute scale of the strippedMass property of an standard implementation of the hotHalo component class.

<void> strippedMassSet(<double precision> setValue→) Set the strippedMass property of an standard implementation of the hotHalo component class.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<type(abundances)> trackedOutflowAbundances() Returns the default value for the trackedOutflowAbundances property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> trackedOutflowAbundancesAttributeMatch(<l [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the trackedOutflowAbundances property

<integer> trackedOutflowAbundancesCount() Compute the count of evolvable quantities in the trackedOutflowAbundan property of the HotHaloOutflowTracking component.

<logical> trackedOutflowAbundancesIsGettable() Returns true if the trackedOutflowAbundances property is gettable for the hotHalo component class.

<logical> trackedOutflowAbundancesIsSettable() Specify whether the trackedOutflowAbundances property of the hotHalo component is settable.

<void> trackedOutflowAbundancesRate(<type(abundances)> value) Cumulate to the rate of the trackedOutflowAbundances property of the HotHaloOutflowTracking component.

<type(abundances)> trackedOutflowAbundancesRateGet() Returns a zero rate for the trackedOutflowAbundances property for the hotHalo component class.

<void> trackedOutflowAbundancesScale(<type(abundances)> value) Set the scale of the trackedOutflowAbundances property of the HotHaloOutflowTracking component.

<void> trackedOutflowAbundancesSet(<type(abundances)> value) Set the trackedOutflowAbundances property of the hotHalo component.

<double precision> trackedOutflowMass() Returns the default value for the trackedOutflowMass property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> trackedOutflowMassAttributeMatch(<logical [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the trackedOutflowMass property

<integer> trackedOutflowMassCount() Compute the count of evolvable quantities in the trackedOutflowMass property of the HotHaloOutflowTracking component.

<logical> trackedOutflowMassIsGettable() Returns true if the trackedOutflowMass property is gettable for the hotHalo component class.

<logical> trackedOutflowMassIsSettable() Specify whether the trackedOutflowMass property of the hotHalo component is settable.

<void> trackedOutflowMassRate(<double precision> value) Cumulate to the rate of the trackedOutflowMass property of the HotHaloOutflowTracking component.

<double precision> trackedOutflowMassRateGet() Returns a zero rate for the trackedOutflowMass property for the hotHalo component class.

<void> trackedOutflowMassScale(<double precision> value) Set the scale of the trackedOutflowMass property of the HotHaloOutflowTracking component.

<void> trackedOutflowMassSet(<double precision> value) Set the trackedOutflowMass property of the hotHalo component.

<type(varying_string)> type() Returns the type name for the coldMode implementation of the hotHalo component class.

<double precision> unaccretedMass() Get the unaccretedMass property of an standard implementation of the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> unaccretedMassAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the unaccretedMass property

<integer> unaccretedMassCount() Return a count of the number of scalar properties in the unaccretedMass property of an standard implementation of the hotHalo component class.

<void> unaccretedMassInactive() Indicate that the unaccretedMass property of an standard implementation of the hotHalo component class is inactive for differential equation solving.

<logical> unaccretedMassIsGettable() Returns true if the unaccretedMass property is gettable for the hotHalo component class.

<logical> unaccretedMassIsSettable() Specify whether the unaccretedMass property of the hotHalo component is settable.

<void> unaccretedMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interrupt [interruptProcedure]↔) Accumulate to the rate of change of the unaccretedMass property of an standard implementation of the hotHalo component class.

<double precision> unaccretedMassRateGet() Get the rate of change of the unaccretedMass property of an standard implementation of the hotHalo component class.

<void> unaccretedMassScale(<double precision> setValue→) Set the absolute scale of the unaccretedMass property of an standard implementation of the hotHalo component class.

<void> unaccretedMassSet(<double precision> setValue→) Set the unaccretedMass property of an standard implementation of the hotHalo component class.

<logical> verySimpleDelayedIsActive() Return true if the verySimpleDelayed implementation of the hotHalo component is the active choice.

<logical> verySimpleIsActive() Return true if the verySimple implementation of the hotHalo component is the active choice.

nodeComponentHotHaloNull

<type(abundances)> abundances() Returns the default value for the abundances property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> abundancesAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the abundances property

<type(abundances)> abundancesCold() Returns the default value for the abundancesCold property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> abundancesColdAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the abundancesCold property

<integer> abundancesColdCount() Compute the count of evolvable quantities in the abundancesCold property of the HotHaloColdMode component.

<logical> abundancesColdIsGettable() Returns true if the abundancesCold property is gettable for the hotHalo component class.

<logical> abundancesColdIsSettable() Specify whether the abundancesCold property of the hotHalo component is settable.

<void> abundancesColdRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interrupt [interruptProcedure]↔) Accept a rate set for the abundancesCold property of the hotHalo component class. Trigger an interrupt to create the component.

<type(abundances)> abundancesColdRateGet() Returns a zero rate for the abundancesCold property for the hotHalo component class.

<void> abundancesColdScale(<type(abundances)> value) Set the scale of the abundancesCold property of the HotHaloColdMode component.

<void> abundancesColdSet(<type(abundances)> value) Set the abundancesCold property of the hotHalo component.

<integer> abundancesCount() Compute the count of evolvable quantities in the abundances property of the HotHaloStandard component.

<logical> abundancesIsGettable() Returns true if the abundances property is gettable for the hotHalo component class.

<logical> abundancesIsSettable() Specify whether the abundances property of the hotHalo component is settable.

<void> abundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask [interruptProcedure]↔) Accept a rate set for the abundances property of the hotHalo component class. Trigger an interrupt to create the component.

<type(abundances)> abundancesRateGet() Returns a zero rate for the abundances property for the hotHalo component class.

<void> abundancesScale(<type(abundances)> value) Set the scale of the abundances property of the HotHaloStandard component.

<void> abundancesSet(<type(abundances)> value) Set the abundances property of the hotHalo component.

<double precision> angularMomentum() Returns the default value for the angularMomentum property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> angularMomentumAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the angularMomentum property

<double precision> angularMomentumCold() Returns the default value for the angularMomentumCold property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> angularMomentumColdAttributeMatch(<logica [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the angularMomentumCold property

<integer> angularMomentumColdCount() Compute the count of evolvable quantities in the angularMomentumCold property of the HotHaloColdMode component.

<logical> angularMomentumColdIsGettable() Returns true if the angularMomentumCold property is gettable for the hotHalo component class.

<logical> angularMomentumColdIsSettable() Specify whether the angularMomentumCold property of the hotHalo component is settable.

<void> angularMomentumColdRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accept a rate set for the angularMomentumCold property of the hotHalo component class. Trigger an interrupt to create the component.

<double precision> angularMomentumColdRateGet() Returns a zero rate for the angularMomentumCold property for the hotHalo component class.

<void> angularMomentumColdScale(<double precision> value) Set the scale of the angularMomentumCold property of the HotHaloColdMode component.

<void> angularMomentumColdSet(<double precision> value) Set the angularMomentumCold property of the hotHalo component.

<integer> angularMomentumCount() Compute the count of evolvable quantities in the angularMomentum property of the HotHaloStandard component.

<logical> angularMomentumIsGettable() Returns true if the angularMomentum property is gettable for the hotHalo component class.

<logical> angularMomentumIsSettable() Specify whether the angularMomentum property of the hotHalo component is settable.

<void> angularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interrup [interruptProcedure]↔) Accept a rate set for the angularMomentum property of the hotHalo component class. Trigger an interrupt to create the component.

<double precision> angularMomentumRateGet() Returns a zero rate for the angularMomentum property for the hotHalo component class.

<void> angularMomentumScale(<double precision> value) Set the scale of the angularMomentum property of the HotHaloStandard component.

<void> angularMomentumSet(<double precision> value) Set the angularMomentum property of the hotHalo component.

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a null implementation of the hotHalo component from a supplied XML definition.

<type(chemicalAbundances)> chemicals() Returns the default value for the chemicals property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> chemicalsAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the chemicals property

<integer> chemicalsCount() Compute the count of evolvable quantities in the chemicals property of the HotHaloStandard component.

<logical> chemicalsIsGettable() Returns true if the chemicals property is gettable for the hotHalo component class.

<logical> chemicalsIsSettable() Specify whether the chemicals property of the hotHalo component is settable.

<void> chemicalsRate(<type(chemicalAbundances)> setValue→, <logical> [interrupt]↔, <*procedure(interr [interruptProcedure]↔) Accept a rate set for the chemicals property of the hotHalo component class. Trigger an interrupt to create the component.

<type(chemicalAbundances)> chemicalsRateGet() Returns a zero rate for the chemicals property for the hotHalo component class.

<void> chemicalsScale(<type(chemicalAbundances)> value) Set the scale of the chemicals property of the HotHaloStandard component.

<void> chemicalsSet(<type(chemicalAbundances)> value) Set the chemicals property of the hotHalo component.

<logical> coldModeIsActive() Return true if the coldMode implementation of the hotHalo component is the active choice.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a null implementation of the hotHalo component from raw (binary) file.

<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→) Deserialize evolvable properties of a null implementation of the hotHalo component from array.

<void> destroy() Finalize a null implementation of the hotHalo component.

<void> dumpASCII() Dump the content of a hotHalo component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<double precision> heatSource() Returns the default value for the heatSource property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> heatSourceAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the heatSource property

<integer> heatSourceCount() Compute the count of evolvable quantities in the heatSource property of the HotHaloStandard component.

<logical> heatSourceIsGettable() Returns true if the heatSource property is gettable for the hotHalo component class.

<logical> heatSourceIsSettable() Specify whether the heatSource property of the hotHalo component is settable.

<void> heatSourceRate(<double precision> value) Cumulate to the rate of the heatSource property of the HotHaloStandard component.

<double precision> heatSourceRateGet() Returns a zero rate for the heatSource property for the hotHalo component class.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<type(abundances)> hotHaloCoolingAbundances() Returns the default value for the hotHaloCoolingAbundances property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> hotHaloCoolingAbundancesAttributeMatch(<l [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the hotHaloCoolingAbundances property

<integer> hotHaloCoolingAbundancesCount() Compute the count of evolvable quantities in the hotHaloCoolingAbundan property of the HotHaloStandard component.

<logical> hotHaloCoolingAbundancesIsGettable() Returns true if the hotHaloCoolingAbundances property is gettable for the hotHalo component class.

<logical> hotHaloCoolingAbundancesIsSettable() Specify whether the hotHaloCoolingAbundances property of the hotHalo component is settable.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAbundancesRateFunction() Set the function to be used for the rate method of the hotHaloCoolingAbundances property of the hotHalo component.

<type(abundances)> hotHaloCoolingAbundancesRateGet() Returns a zero rate for the hotHaloCoolingAbundances property for the hotHalo component class.

<logical> hotHaloCoolingAbundancesRateIsAttached() Return true if the deferred function used to rate the hotHaloCoolingAbundances property of the hotHalo component class has been attached.

<double precision> hotHaloCoolingAngularMomentum() Returns the default value for the hotHaloCoolingAngularMome property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> hotHaloCoolingAngularMomentumAttributeMat [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the hotHaloCoolingAngularMomentum property

<integer> hotHaloCoolingAngularMomentumCount() Compute the count of evolvable quantities in the hotHaloCoolingAngularMomentum property of the HotHaloStandard component.

<logical> hotHaloCoolingAngularMomentumIsGettable() Returns true if the hotHaloCoolingAngularMomentum property is gettable for the hotHalo component class.

<logical> hotHaloCoolingAngularMomentumIsSettable() Specify whether the hotHaloCoolingAngularMomentum property of the hotHalo component is settable.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRateFunction() Set the function to be used for the rate method of the hotHaloCoolingAngularMomentum property of the hotHalo component.

<double precision> hotHaloCoolingAngularMomentumRateGet() Returns a zero rate for the hotHaloCoolingAngularMo property for the hotHalo component class.

<logical> hotHaloCoolingAngularMomentumRateIsAttached() Return true if the deferred function used to rate the hotHaloCoolingAngularMomentum property of the hotHalo component class has been attached.

<double precision> hotHaloCoolingMass() Returns the default value for the hotHaloCoolingMass property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> hotHaloCoolingMassAttributeMatch(<logical [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the hotHaloCoolingMass property

<integer> hotHaloCoolingMassCount() Compute the count of evolvable quantities in the hotHaloCoolingMass property of the HotHaloStandard component.

<logical> hotHaloCoolingMassIsGettable() Returns true if the hotHaloCoolingMass property is gettable for the hotHalo component class.

<logical> hotHaloCoolingMassIsSettable() Specify whether the hotHaloCoolingMass property of the hotHalo component is settable.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRateFunction() Set the function to be used for the rate method of the hotHaloCoolingMass property of the hotHalo component.

<double precision> hotHaloCoolingMassRateGet() Returns a zero rate for the hotHaloCoolingMass property for the hotHalo component class.

<logical> hotHaloCoolingMassRateIsAttached() Return true if the deferred function used to rate the hotHaloCoolingMass property of the hotHalo component class has been attached.

<void> initialize() Initialize a null member of the hotHalo component.

<logical> isInitialized() Returns the default value for the isInitialized property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> isInitializedAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the isInitialized property

<logical> isInitializedIsGettable() Returns true if the isInitialized property is gettable for the hotHalo component class.

<logical> isInitializedIsSettable() Specify whether the isInitialized property of the hotHalo component is settable.

<logical> isInitializedRateGet() Returns a zero rate for the isInitialized property for the hotHalo component class.

<void> isInitializedSet(<logical> value) Set the isInitialized property of the hotHalo component.

<double precision> mass() Returns the default value for the mass property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> massAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the mass property

<double precision> massCold() Returns the default value for the massCold property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> massColdAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the massCold property

<integer> massColdCount() Compute the count of evolvable quantities in the massCold property of the HotHaloColdMode component.

<logical> massColdIsGettable() Returns true if the massCold property is gettable for the hotHalo component class.

<logical> massColdIsSettable() Specify whether the massCold property of the hotHalo component is settable.

<void> massColdRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accept a rate set for the massCold property of the hotHalo component class. Trigger an interrupt to create the component.

<double precision> massColdRateGet() Returns a zero rate for the massCold property for the hotHalo component class.

<void> massColdScale(<double precision> value) Set the scale of the massCold property of the HotHaloColdMode component.

<void> massColdSet(<double precision> value) Set the massCold property of the hotHalo component.

<integer> massCount() Compute the count of evolvable quantities in the mass property of the HotHaloStandard component.

<logical> massIsGettable() Returns true if the mass property is gettable for the hotHalo component class.

<logical> massIsSettable() Specify whether the mass property of the hotHalo component is settable.

<void> massRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accept a rate set for the mass property of the hotHalo component class. Trigger an interrupt to create the component.

<double precision> massRateGet() Returns a zero rate for the mass property for the hotHalo component class.

<void> massScale(<double precision> value) Set the scale of the mass property of the HotHaloStandard component.

<void> massSet(<double precision> value) Set the mass property of the hotHalo component.

<double precision> massSink() Returns the default value for the massSink property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> massSinkAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the massSink property

<integer> massSinkCount() Compute the count of evolvable quantities in the massSink property of the HotHaloStandard component.

<logical> massSinkIsGettable() Returns true if the massSink property is gettable for the hotHalo component class.

<logical> massSinkIsSettable() Specify whether the massSink property of the hotHalo component is settable.

<void> massSinkRate(<double precision> value) Cumulate to the rate of the massSink property of the HotHaloStandard component.

<double precision> massSinkRateGet() Returns a zero rate for the massSink property for the hotHalo component class.

<double precision> massTotal() Returns the default value for the massTotal property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> massTotalAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the massTotal property

<logical> massTotalIsGettable() Returns true if the massTotal property is gettable for the hotHalo component class.

<logical> massTotalIsSettable() Specify whether the massTotal property of the hotHalo component is settable.

<double precision> massTotalRateGet() Returns a zero rate for the massTotal property for the hotHalo component class.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a null implementation of the hotHalo component class.

<logical> nullIsActive() Return true if the null implementation of the hotHalo component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<double precision> outerRadius() Returns the default value for the outerRadius property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> outerRadiusAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the outerRadius property

<integer> outerRadiusCount() Compute the count of evolvable quantities in the outerRadius property of the HotHaloStandard component.

<logical> outerRadiusIsGettable() Returns true if the outerRadius property is gettable for the hotHalo component class.

<logical> outerRadiusIsSettable() Specify whether the outerRadius property of the hotHalo component is settable.

<void> outerRadiusRate(<double precision> value) Cumulate to the rate of the outerRadius property of the HotHaloStandard component.

<double precision> outerRadiusRateGet() Returns a zero rate for the outerRadius property for the hotHalo component class.

<void> outerRadiusScale(<double precision> value) Set the scale of the outerRadius property of the HotHaloStandard component.

<void> outerRadiusSet(<double precision> value) Set the outerRadius property of the hotHalo component.

<type(abundances)> outflowedAbundances() Returns the default value for the outflowedAbundances property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> outflowedAbundancesAttributeMatch(<logica [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the outflowedAbundances property

<integer> outflowedAbundancesCount() Compute the count of evolvable quantities in the outflowedAbundances property of the HotHaloStandard component.

<logical> outflowedAbundancesIsGettable() Returns true if the outflowedAbundances property is gettable for the hotHalo component class.

<logical> outflowedAbundancesIsSettable() Specify whether the outflowedAbundances property of the hotHalo component is settable.

<void> outflowedAbundancesRate(<type(abundances)> value) Cumulate to the rate of the outflowedAbundances property of the HotHaloStandard component.

<type(abundances)> outflowedAbundancesRateGet() Returns a zero rate for the outflowedAbundances property for the hotHalo component class.

<void> outflowedAbundancesScale(<type(abundances)> value) Set the scale of the outflowedAbundances property of the HotHaloStandard component.

<void> outflowedAbundancesSet(<type(abundances)> value) Set the outflowedAbundances property of the hotHalo component.

<double precision> outflowedAngularMomentum() Returns the default value for the outflowedAngularMomentum property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> outflowedAngularMomentumAttributeMatch(<l [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the outflowedAngularMomentum property

<integer> outflowedAngularMomentumCount() Compute the count of evolvable quantities in the outflowedAngularMomen property of the HotHaloStandard component.

<logical> outflowedAngularMomentumIsGettable() Returns true if the outflowedAngularMomentum property is gettable for the hotHalo component class.

<logical> outflowedAngularMomentumIsSettable() Specify whether the outflowedAngularMomentum property of the hotHalo component is settable.

<void> outflowedAngularMomentumRate(<double precision> value) Cumulate to the rate of the outflowedAngularMomentum property of the HotHaloStandard component.

<double precision> outflowedAngularMomentumRateGet() Returns a zero rate for the outflowedAngularMomentum property for the hotHalo component class.

<void> outflowedAngularMomentumScale(<double precision> value) Set the scale of the outflowedAngularMomentum property of the HotHaloStandard component.

<void> outflowedAngularMomentumSet(<double precision> value) Set the outflowedAngularMomentum property of the hotHalo component.

<double precision> outflowedMass() Returns the default value for the outflowedMass property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> outflowedMassAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the outflowedMass property

<integer> outflowedMassCount() Compute the count of evolvable quantities in the outflowedMass property of the HotHaloStandard component.

<logical> outflowedMassIsGettable() Returns true if the outflowedMass property is gettable for the hotHalo component class.

<logical> outflowedMassIsSettable() Specify whether the outflowedMass property of the hotHalo component is settable.

<void> outflowedMassRate(<double precision> value) Cumulate to the rate of the outflowedMass property of the HotHaloStandard component.

<double precision> outflowedMassRateGet() Returns a zero rate for the outflowedMass property for the hotHalo component class.

<void> outflowedMassScale(<double precision> value) Set the scale of the outflowedMass property of the HotHaloStandard component.

<void> outflowedMassSet(<double precision> value) Set the outflowedMass property of the hotHalo component.

<type(abundances)> outflowingAbundances() Returns the default value for the outflowingAbundances property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> outflowingAbundancesAttributeMatch(<logi
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the outflowingAbundances property

<integer> outflowingAbundancesCount() Compute the count of evolvable quantities in the outflowingAbundances property of the HotHaloStandard component.

<logical> outflowingAbundancesIsGettable() Returns true if the outflowingAbundances property is gettable for the hotHalo component class.

<logical> outflowingAbundancesIsSettable() Specify whether the outflowingAbundances property of the hotHalo component is settable.

<void> outflowingAbundancesRate(<type(abundances)> value) Cumulate to the rate of the outflowingAbundances property of the HotHaloStandard component.

<type(abundances)> outflowingAbundancesRateGet() Returns a zero rate for the outflowingAbundances property for the hotHalo component class.

<double precision> outflowingAngularMomentum() Returns the default value for the outflowingAngularMomentum property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> outflowingAngularMomentumAttributeMatch(<
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the hotHalo class that have the desired attributes for the outflowingAngularMomentum property

<integer> outflowingAngularMomentumCount() Compute the count of evolvable quantities in the outflowingAngularMomentum property of the HotHaloStandard component.

<logical> outflowingAngularMomentumIsGettable() Returns true if the outflowingAngularMomentum property is gettable for the hotHalo component class.

<logical> outflowingAngularMomentumIsSettable() Specify whether the outflowingAngularMomentum property of the hotHalo component is settable.

<void> outflowingAngularMomentumRate(<double precision> value) Cumulate to the rate of the outflowingAngularMomentum property of the HotHaloStandard component.

<double precision> outflowingAngularMomentumRateGet() Returns a zero rate for the outflowingAngularMomentum property for the hotHalo component class.

<double precision> outflowingMass() Returns the default value for the outflowingMass property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> outflowingMassAttributeMatch(<logical>
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the hotHalo class that have the desired attributes for the outflowingMass property

<integer> outflowingMassCount() Compute the count of evolvable quantities in the outflowingMass property of the HotHaloStandard component.

<logical> outflowingMassIsGettable() Returns true if the outflowingMass property is gettable for the hotHalo component class.

<logical> outflowingMassIsSettable() Specify whether the outflowingMass property of the hotHalo component is settable.

<void> outflowingMassRate(<double precision> value) Cumulate to the rate of the outflowingMass property of the HotHaloStandard component.

<double precision> outflowingMassRateGet() Returns a zero rate for the outflowingMass property for the hotHalo component class.

<logical> outflowTrackingIsActive() Return true if the outflowTracking implementation of the hotHalo component is the active choice.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a hotHalo component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a null implementation of the hotHalo component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Return the names of properties to output for a null implementation of the hotHalo component.

<void> postOutput(<double precision> time→) Perform post-output processing of a hotHalo component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→) Compute offsets into serialization arrays for a null implementation of the hotHalo component.

<void> serializeASCII() Serialize the contents of a null implementation of the hotHalo component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the serialization of a null implementation of the hotHalo component.

<void> serializeRaw(<integer> fileHandle→) Serialize the contents of a null implementation of the hotHalo component to raw (binary) file.

<void> serializeValues(<double precision[:]> array←, <integer> propertyType→) Serialize evolvable properties of a null implementation of the hotHalo component to array.

<void> serializeXML(<integer> fileHandle→) Serialize the contents of a null implementation of the hotHalo component to XML.

<integer(c_size_t)> sizeOf() Return the size in bytes of a null implementation of the hotHalo component.

<logical> standardIsActive() Return true if the standard implementation of the hotHalo component is the active choice.

<type(abundances)> strippedAbundances() Returns the default value for the strippedAbundances property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> strippedAbundancesAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the strippedAbundances property

<integer> strippedAbundancesCount() Compute the count of evolvable quantities in the strippedAbundances property of the HotHaloStandard component.

<logical> strippedAbundancesIsGettable() Returns true if the strippedAbundances property is gettable for the hotHalo component class.

<logical> strippedAbundancesIsSettable() Specify whether the strippedAbundances property of the hotHalo component is settable.

<void> strippedAbundancesRate(<type(abundances)> value) Cumulate to the rate of the strippedAbundances property of the HotHaloStandard component.

<type(abundances)> strippedAbundancesRateGet() Returns a zero rate for the strippedAbundances property for the hotHalo component class.

<void> strippedAbundancesScale(<type(abundances)> value) Set the scale of the strippedAbundances property of the HotHaloStandard component.

<void> strippedAbundancesSet(<type(abundances)> value) Set the strippedAbundances property of the hotHalo component.

<double precision> strippedMass() Returns the default value for the strippedMass property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> strippedMassAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the strippedMass property

<integer> strippedMassCount() Compute the count of evolvable quantities in the strippedMass property of the HotHaloStandard component.

<logical> strippedMassIsGettable() Returns true if the strippedMass property is gettable for the hotHalo component class.

<logical> strippedMassIsSettable() Specify whether the strippedMass property of the hotHalo component is settable.

<void> strippedMassRate(<double precision> value) Cumulate to the rate of the strippedMass property of the HotHaloStandard component.

<double precision> strippedMassRateGet() Returns a zero rate for the strippedMass property for the hotHalo component class.

<void> strippedMassScale(<double precision> value) Set the scale of the strippedMass property of the HotHaloStandard component.

<void> strippedMassSet(<double precision> value) Set the strippedMass property of the hotHalo component.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<type(abundances)> trackedOutflowAbundances() Returns the default value for the trackedOutflowAbundances property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> trackedOutflowAbundancesAttributeMatch(<l [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the trackedOutflowAbundances property

<integer> trackedOutflowAbundancesCount() Compute the count of evolvable quantities in the trackedOutflowAbundan property of the HotHaloOutflowTracking component.

<logical> trackedOutflowAbundancesIsGettable() Returns true if the trackedOutflowAbundances property is gettable for the hotHalo component class.

<logical> trackedOutflowAbundancesIsSettable() Specify whether the trackedOutflowAbundances property of the hotHalo component is settable.

<void> trackedOutflowAbundancesRate(<type(abundances)> value) Cumulate to the rate of the trackedOutflowAbundances property of the HotHaloOutflowTracking component.

<type(abundances)> trackedOutflowAbundancesRateGet() Returns a zero rate for the trackedOutflowAbundances property for the hotHalo component class.

<void> trackedOutflowAbundancesScale(<type(abundances)> value) Set the scale of the trackedOutflowAbundances property of the HotHaloOutflowTracking component.

<void> trackedOutflowAbundancesSet(<type(abundances)> value) Set the trackedOutflowAbundances property of the hotHalo component.

<double precision> trackedOutflowMass() Returns the default value for the trackedOutflowMass property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> trackedOutflowMassAttributeMatch(<logical [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the trackedOutflowMass property

<integer> trackedOutflowMassCount() Compute the count of evolvable quantities in the trackedOutflowMass property of the HotHaloOutflowTracking component.

<logical> trackedOutflowMassIsGettable() Returns true if the trackedOutflowMass property is gettable for the hotHalo component class.

<logical> trackedOutflowMassIsSettable() Specify whether the trackedOutflowMass property of the hotHalo component is settable.

<void> trackedOutflowMassRate(<double precision> value) Cumulate to the rate of the trackedOutflowMass property of the HotHaloOutflowTracking component.

<double precision> trackedOutflowMassRateGet() Returns a zero rate for the trackedOutflowMass property for the hotHalo component class.

<void> trackedOutflowMassScale(<double precision> value) Set the scale of the trackedOutflowMass property of the HotHaloOutflowTracking component.

<void> trackedOutflowMassSet(<double precision> value) Set the trackedOutflowMass property of the hotHalo component.

<type(varying_string)> type() Returns the type name for the null implementation of the hotHalo component class.

<double precision> unaccretedMass() Returns the default value for the unaccretedMass property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> unaccretedMassAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the unaccretedMass property

<integer> unaccretedMassCount() Compute the count of evolvable quantities in the unaccretedMass property of the HotHaloStandard component.

<logical> unaccretedMassIsGettable() Returns true if the unaccretedMass property is gettable for the hotHalo component class.

<logical> unaccretedMassIsSettable() Specify whether the unaccretedMass property of the hotHalo component is settable.

<void> unaccretedMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interrupt [interruptProcedure]↔) Accept a rate set for the unaccretedMass property of the hotHalo component class. Trigger an interrupt to create the component.

<double precision> unaccretedMassRateGet() Returns a zero rate for the unaccretedMass property for the hotHalo component class.

<void> unaccretedMassScale(<double precision> value) Set the scale of the unaccretedMass property of the HotHaloStandard component.

<void> unaccretedMassSet(<double precision> value) Set the unaccretedMass property of the hotHalo component.

<logical> verySimpleDelayedIsActive() Return true if the verySimpleDelayed implementation of the hotHalo component is the active choice.

<logical> verySimpleIsActive() Return true if the verySimple implementation of the hotHalo component is the active choice.

nodeComponentHotHaloOutflowTracking

<type(abundances)> abundances() Get the abundances property of an standard implementation of the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> abundancesAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the abundances property

<type(abundances)> abundancesCold() Returns the default value for the abundancesCold property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> abundancesColdAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the abundancesCold property

<integer> abundancesColdCount() Compute the count of evolvable quantities in the abundancesCold property of the HotHaloColdMode component.

<logical> abundancesColdIsGettable() Returns true if the abundancesCold property is gettable for the hotHalo component class.

<logical> abundancesColdIsSettable() Specify whether the abundancesCold property of the hotHalo component is settable.

<void> abundancesColdRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interrupt [interruptProcedure]↔) Accept a rate set for the abundancesCold property of the hotHalo component class. Trigger an interrupt to create the component.

<type(abundances)> abundancesColdRateGet() Returns a zero rate for the abundancesCold property for the hotHalo component class.

<void> abundancesColdScale(<type(abundances)> value) Set the scale of the abundancesCold property of the HotHaloColdMode component.

<void> abundancesColdSet(<type(abundances)> value) Set the abundancesCold property of the hotHalo component.

<integer> abundancesCount() Return a count of the number of scalar properties in the abundances property of an standard implementation of the hotHalo component class.

<void> abundancesInactive() Indicate that the abundances property of an standard implementation of the hotHalo component class is inactive for differential equation solving.

<logical> abundancesIsGettable() Returns true if the abundances property is gettable for the hotHalo component class.

<logical> abundancesIsSettable() Specify whether the abundances property of the hotHalo component is settable.

<void> abundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask [interruptProcedure]↔) Accumulate to the rate of change of the abundances property of an standard implementation of the hotHalo component class.

<type(abundances)> abundancesRateGet() Get the rate of change of the abundances property of an standard implementation of the hotHalo component class.

<void> abundancesScale(<type(abundances)> setValue→) Set the absolute scale of the abundances property of an standard implementation of the hotHalo component class.

<void> abundancesSet(<type(abundances)> setValue→) Set the abundances property of an standard implementation of the hotHalo component class.

<double precision> angularMomentum() Get the angularMomentum property of an standard implementation of the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> angularMomentumAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the angularMomentum property

<double precision> angularMomentumCold() Returns the default value for the angularMomentumCold property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> angularMomentumColdAttributeMatch(<logica [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the angularMomentumCold property

<integer> angularMomentumColdCount() Compute the count of evolvable quantities in the angularMomentumCold property of the HotHaloColdMode component.

<logical> angularMomentumColdIsGettable() Returns true if the angularMomentumCold property is gettable for the hotHalo component class.

<logical> angularMomentumColdIsSettable() Specify whether the angularMomentumCold property of the hotHalo component is settable.

<void> angularMomentumColdRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accept a rate set for the angularMomentumCold property of the hotHalo component class. Trigger an interrupt to create the component.

<double precision> angularMomentumColdRateGet() Returns a zero rate for the angularMomentumCold property for the hotHalo component class.

<void> angularMomentumColdScale(<double precision> value) Set the scale of the angularMomentumCold property of the HotHaloColdMode component.

<void> angularMomentumColdSet(<double precision> value) Set the angularMomentumCold property of the hotHalo component.

<integer> angularMomentumCount() Return a count of the number of scalar properties in the angularMomentum property of an standard implementation of the hotHalo component class.

<void> angularMomentumInactive() Indicate that the angularMomentum property of an standard implementation of the hotHalo component class is inactive for differential equation solving.

<logical> angularMomentumIsGettable() Returns true if the angularMomentum property is gettable for the hotHalo component class.

<logical> angularMomentumIsSettable() Specify whether the angularMomentum property of the hotHalo component is settable.

<void> angularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interrup [interruptProcedure]↔) Accumulate to the rate of change of the angularMomentum property of an standard implementation of the hotHalo component class.

<double precision> angularMomentumRateGet() Get the rate of change of the angularMomentum property of an standard implementation of the hotHalo component class.

<void> angularMomentumScale(<double precision> setValue→) Set the absolute scale of the angularMomentum property of an standard implementation of the hotHalo component class.

<void> angularMomentumSet(<double precision> setValue→) Set the angularMomentum property of an standard implementation of the hotHalo component class.

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a outflowTracking implementation of the hotHalo component from a supplied XML definition.

<type(chemicalAbundances)> chemicals() Get the chemicals property of an standard implementation of the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> chemicalsAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the chemicals property

<integer> chemicalsCount() Return a count of the number of scalar properties in the chemicals property of an standard implementation of the hotHalo component class.

<void> chemicalsInactive() Indicate that the chemicals property of an standard implementation of the hotHalo component class is inactive for differential equation solving.

<logical> chemicalsIsGettable() Returns true if the chemicals property is gettable for the hotHalo component class.

<logical> chemicalsIsSettable() Specify whether the chemicals property of the hotHalo component is settable.

<void> chemicalsRate(<type(chemicalAbundances)> setValue→, <logical> [interrupt]↔, <*procedure(interr [interruptProcedure]↔) Accumulate to the rate of change of the chemicals property of an standard implementation of the hotHalo component class.

<type(chemicalAbundances)> chemicalsRateGet() Get the rate of change of the chemicals property of an standard implementation of the hotHalo component class.

<void> chemicalsScale(<type(chemicalAbundances)> setValue→) Set the absolute scale of the chemicals property of an standard implementation of the hotHalo component class.

<void> chemicalsSet(<type(chemicalAbundances)> setValue→) Set the chemicals property of an standard implementation of the hotHalo component class.

<logical> coldModeIsActive() Return true if the coldMode implementation of the hotHalo component is the active choice.

<void> createFunctionSet() Set the create function for the standard implementation of the hotHalo component class.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a outflowTracking implementation of the hotHalo component from raw (binary) file.

<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→) Deserialize evolvable properties of a outflowTracking implementation of the hotHalo component from array.

<void> destroy() Finalize a outflowTracking implementation of the hotHalo component.

<void> dumpASCII() Dump the content of a hotHalo component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<double precision> heatSource() Returns the default value for the heatSource property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> heatSourceAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the heatSource property

<integer> heatSourceCount() Compute the count of evolvable quantities in the heatSource property of the HotHaloStandard component.

<logical> heatSourceIsGettable() Returns true if the heatSource property is gettable for the hotHalo component class.

<logical> heatSourceIsSettable() Specify whether the heatSource property of the hotHalo component is settable.

<void> heatSourceRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask [interruptProcedure]↔) Accumulate the rate of change of the heatSource property of the standard implementation of the hotHalo component using a deferred function.

<void> heatSourceRateFunction() Set the function to be used for the rate method of the heatSource property of the HotHaloStandard component.

<double precision> heatSourceRateGet() Returns a zero rate for the heatSource property for the hotHalo component class.

<logical> heatSourceRateIsAttached() Return true if the deferred function used to rate the heatSource property of the HotHaloStandard component class has been attached.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<type(abundances)> hotHaloCoolingAbundances() Returns the default value for the hotHaloCoolingAbundances property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> hotHaloCoolingAbundancesAttributeMatch(<l [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the hotHaloCoolingAbundances property

<integer> hotHaloCoolingAbundancesCount() Compute the count of evolvable quantities in the hotHaloCoolingAbundan property of the HotHaloStandard component.

<logical> hotHaloCoolingAbundancesIsGettable() Returns true if the hotHaloCoolingAbundances property is gettable for the hotHalo component class.

<logical> hotHaloCoolingAbundancesIsSettable() Specify whether the hotHaloCoolingAbundances property of the hotHalo component is settable.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAbundancesRateFunction() Set the function to be used for the rate method of the hotHaloCoolingAbundances property of the hotHalo component.

<type(abundances)> hotHaloCoolingAbundancesRateGet() Returns a zero rate for the hotHaloCoolingAbundances property for the hotHalo component class.

<logical> hotHaloCoolingAbundancesRateIsAttached() Return true if the deferred function used to rate the hotHaloCoolingAbundances property of the hotHalo component class has been attached.

<double precision> hotHaloCoolingAngularMomentum() Returns the default value for the hotHaloCoolingAngularMome property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> hotHaloCoolingAngularMomentumAttributeMat [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the hotHaloCoolingAngularMomentum property

<integer> hotHaloCoolingAngularMomentumCount() Compute the count of evolvable quantities in the hotHaloCoolingAngularMomentum property of the HotHaloStandard component.

<logical> hotHaloCoolingAngularMomentumIsGettable() Returns true if the hotHaloCoolingAngularMomentum property is gettable for the hotHalo component class.

<logical> hotHaloCoolingAngularMomentumIsSettable() Specify whether the hotHaloCoolingAngularMomentum property of the hotHalo component is settable.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRateFunction() Set the function to be used for the rate method of the hotHaloCoolingAngularMomentum property of the hotHalo component.

<double precision> hotHaloCoolingAngularMomentumRateGet() Returns a zero rate for the hotHaloCoolingAngularMo property for the hotHalo component class.

<logical> hotHaloCoolingAngularMomentumRateIsAttached() Return true if the deferred function used to rate the hotHaloCoolingAngularMomentum property of the hotHalo component class has been attached.

<double precision> hotHaloCoolingMass() Returns the default value for the hotHaloCoolingMass property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> hotHaloCoolingMassAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the hotHaloCoolingMass property

<integer> hotHaloCoolingMassCount() Compute the count of evolvable quantities in the hotHaloCoolingMass property of the HotHaloStandard component.

<logical> hotHaloCoolingMassIsGettable() Returns true if the hotHaloCoolingMass property is gettable for the hotHalo component class.

<logical> hotHaloCoolingMassIsSettable() Specify whether the hotHaloCoolingMass property of the hotHalo component is settable.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRateFunction() Set the function to be used for the rate method of the hotHaloCoolingMass property of the hotHalo component.

<double precision> hotHaloCoolingMassRateGet() Returns a zero rate for the hotHaloCoolingMass property for the hotHalo component class.

<logical> hotHaloCoolingMassRateIsAttached() Return true if the deferred function used to rate the hotHaloCoolingMass property of the hotHalo component class has been attached.

<void> initialize() Initialize a outflowTracking member of the hotHalo component.

<logical> isInitialized() Get the isInitialized property of an standard implementation of the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> isInitializedAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the isInitialized property

<logical> isInitializedIsGettable() Returns true if the isInitialized property is gettable for the hotHalo component class.

<logical> isInitializedIsSettable() Specify whether the isInitialized property of the hotHalo component is settable.

<logical> isInitializedRateGet() Returns a zero rate for the isInitialized property for the hotHalo component class.

<void> isInitializedSet(<logical> setValue→) Set the isInitialized property of an standard implementation of the hotHalo component class.

<double precision> mass() Get the mass property of an standard implementation of the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> massAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the mass property

<double precision> massCold() Returns the default value for the massCold property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> massColdAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the massCold property

<integer> massColdCount() Compute the count of evolvable quantities in the massCold property of the HotHaloColdMode component.

<logical> massColdIsGettable() Returns true if the massCold property is gettable for the hotHalo component class.

<logical> massColdIsSettable() Specify whether the massCold property of the hotHalo component is settable.

<void> massColdRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accept a rate set for the massCold property of the hotHalo component class. Trigger an interrupt to create the component.

<double precision> massColdRateGet() Returns a zero rate for the massCold property for the hotHalo component class.

<void> massColdScale(<double precision> value) Set the scale of the massCold property of the HotHaloColdMode component.

<void> massColdSet(<double precision> value) Set the massCold property of the hotHalo component.

<integer> massCount() Return a count of the number of scalar properties in the mass property of an standard implementation of the hotHalo component class.

<void> massInactive() Indicate that the mass property of an standard implementation of the hotHalo component class is inactive for differential equation solving.

<logical> massIsGettable() Returns true if the mass property is gettable for the hotHalo component class.

<logical> massIsSettable() Specify whether the mass property of the hotHalo component is settable.

<void> massRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate to the rate of change of the mass property of an standard implementation of the hotHalo component class.

<double precision> massRateGet() Get the rate of change of the mass property of an standard implementation of the hotHalo component class.

<void> massRemovalRate() Called whenever the standard hot halo component removes mass from the halo.

<void> massScale(<double precision> setValue→) Set the absolute scale of the mass property of an standard implementation of the hotHalo component class.

<void> massSet(<double precision> setValue→) Set the mass property of an standard implementation of the hotHalo component class.

<double precision> massSink() Returns the default value for the massSink property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> massSinkAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the massSink property

<integer> massSinkCount() Compute the count of evolvable quantities in the massSink property of the HotHaloStandard component.

<logical> massSinkIsGettable() Returns true if the massSink property is gettable for the hotHalo component class.

<logical> massSinkIsSettable() Specify whether the massSink property of the hotHalo component is settable.

<void> massSinkRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the massSink property of the standard implementation of the hotHalo component using a deferred function.

<void> massSinkRateFunction() Set the function to be used for the rate method of the massSink property of the HotHaloStandard component.

<double precision> massSinkRateGet() Returns a zero rate for the massSink property for the hotHalo component class.

<logical> massSinkRateIsAttached() Return true if the deferred function used to rate the massSink property of the HotHaloStandard component class has been attached.

<double precision> massTotal() Returns the default value for the massTotal property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> massTotalAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the massTotal property

<logical> massTotalIsGettable() Returns true if the massTotal property is gettable for the hotHalo component class.

<logical> massTotalIsSettable() Specify whether the massTotal property of the hotHalo component is settable.

<double precision> massTotalRateGet() Returns a zero rate for the massTotal property for the hotHalo component class.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a outflowTracking implementation of the hotHalo component class.

<logical> nullIsActive() Return true if the null implementation of the hotHalo component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<double precision> outerRadius() Get the value of the outerRadius property of the standard implementation of the hotHalo component using a deferred function.

<type(varying_string), allocatable, dimension(:) => matches> outerRadiusAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the outerRadius property

<integer> outerRadiusCount() Return a count of the number of scalar properties in the outerRadius property of an standard implementation of the hotHalo component class.

<void> outerRadiusFunction() Set the function to be used for the get method of the outerRadius property of the HotHaloStandard component.

<double precision> outerRadiusGrowthRate() Call the deferred function for the outerRadiusGrowthRate method of the hotHalo component class if it has been set.

<void> outerRadiusGrowthRateFunction() Set the function to be used for the outerRadiusGrowthRate method of the outflowTracking implementation of the hotHalo component class.

<logical> outerRadiusGrowthRateFunctionIsSet() Return true if the deferred function for the outerRadiusGrowthRate method of the outflowTracking implementation of the hotHalo component class has been set.

<void> outerRadiusInactive() Indicate that the outerRadius property of an standard implementation of the hotHalo component class is inactive for differential equation solving.

<logical> outerRadiusIsAttached() Return true if the deferred function used to get the outerRadius property of the HotHaloStandard component class has been attached.

<logical> outerRadiusIsGettable() Returns true if the outerRadius property is gettable for the hotHalo component class.

<logical> outerRadiusIsSettable() Specify whether the outerRadius property of the hotHalo component is settable.

<void> outerRadiusRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTas [interruptProcedure]↔) Accumulate to the rate of change of the outerRadius property of an standard implementation of the hotHalo component class.

<double precision> outerRadiusRateGet() Get the rate of change of the outerRadius property of an standard implementation of the hotHalo component class.

<void> outerRadiusScale(<double precision> setValue→) Set the absolute scale of the outerRadius property of an standard implementation of the hotHalo component class.

<void> outerRadiusSet(<double precision> setValue→) Set the outerRadius property of an standard implementation of the hotHalo component class.

<double precision> outerRadiusValue() Get the outerRadius property of an standard implementation of the hotHalo component class.

<type(abundances)> outflowedAbundances() Get the outflowedAbundances property of an standard implementation of the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> outflowedAbundancesAttributeMatch(<logica
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the hotHalo class that have the desired attributes for the outflowedAbundances property

<integer> outflowedAbundancesCount() Return a count of the number of scalar properties in the outflowedAbundances property of an standard implementation of the hotHalo component class.

<void> outflowedAbundancesInactive() Indicate that the outflowedAbundances property of an standard implementation of the hotHalo component class is inactive for differential equation solving.

<logical> outflowedAbundancesIsGettable() Returns true if the outflowedAbundances property is gettable for the hotHalo component class.

<logical> outflowedAbundancesIsSettable() Specify whether the outflowedAbundances property of the hotHalo component is settable.

<void> outflowedAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate to the rate of change of the outflowedAbundances property of an standard implementation of the hotHalo component class.

<type(abundances)> outflowedAbundancesRateGet() Get the rate of change of the outflowedAbundances property of an standard implementation of the hotHalo component class.

<void> outflowedAbundancesScale(<type(abundances)> setValue→) Set the absolute scale of the outflowedAbundances property of an standard implementation of the hotHalo component class.

<void> outflowedAbundancesSet(<type(abundances)> setValue→) Set the outflowedAbundances property of an standard implementation of the hotHalo component class.

<double precision> outflowedAngularMomentum() Get the outflowedAngularMomentum property of an standard implementation of the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> outflowedAngularMomentumAttributeMatch(<l
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the hotHalo class that have the desired attributes for the outflowedAngularMomentum property

<integer> outflowedAngularMomentumCount() Return a count of the number of scalar properties in the outflowedAngularMomentum property of an standard implementation of the hotHalo component class.

<void> outflowedAngularMomentumInactive() Indicate that the outflowedAngularMomentum property of an standard implementation of the hotHalo component class is inactive for differential equation solving.

<logical> outflowedAngularMomentumIsGettable() Returns true if the outflowedAngularMomentum property is gettable for the hotHalo component class.

<logical> outflowedAngularMomentumIsSettable() Specify whether the outflowedAngularMomentum property of the hotHalo component is settable.

<void> outflowedAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate to the rate of change of the outflowedAngularMomentum property of an standard implementation of the hotHalo component class.

<double precision> outflowedAngularMomentumRateGet() Get the rate of change of the outflowedAngularMomentum property of an standard implementation of the hotHalo component class.

<void> outflowedAngularMomentumScale(<double precision> setValue→) Set the absolute scale of the outflowedAngularMomentum property of an standard implementation of the hotHalo component class.

<void> outflowedAngularMomentumSet(<double precision> setValue→) Set the outflowedAngularMomentum property of an standard implementation of the hotHalo component class.

<double precision> outflowedMass() Get the outflowedMass property of an standard implementation of the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> outflowedMassAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the outflowedMass property

<integer> outflowedMassCount() Return a count of the number of scalar properties in the outflowedMass property of an standard implementation of the hotHalo component class.

<void> outflowedMassInactive() Indicate that the outflowedMass property of an standard implementation of the hotHalo component class is inactive for differential equation solving.

<logical> outflowedMassIsGettable() Returns true if the outflowedMass property is gettable for the hotHalo component class.

<logical> outflowedMassIsSettable() Specify whether the outflowedMass property of the hotHalo component is settable.

<void> outflowedMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptT [interruptProcedure]↔) Accumulate to the rate of change of the outflowedMass property of an standard implementation of the hotHalo component class.

<double precision> outflowedMassRateGet() Get the rate of change of the outflowedMass property of an standard implementation of the hotHalo component class.

<void> outflowedMassScale(<double precision> setValue→) Set the absolute scale of the outflowedMass property of an standard implementation of the hotHalo component class.

<void> outflowedMassSet(<double precision> setValue→) Set the outflowedMass property of an standard implementation of the hotHalo component class.

<type(abundances)> outflowingAbundances() Returns the default value for the outflowingAbundances property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> outflowingAbundancesAttributeMatch(<logic [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the outflowingAbundances property

<integer> outflowingAbundancesCount() Compute the count of evolvable quantities in the outflowingAbundances property of the HotHaloStandard component.

<logical> outflowingAbundancesIsGettable() Returns true if the outflowingAbundances property is gettable for the hotHalo component class.

<logical> outflowingAbundancesIsSettable() Specify whether the outflowingAbundances property of the hotHalo component is settable.

<void> outflowingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the outflowingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> outflowingAbundancesRateFunction() Set the function to be used for the rate method of the outflowingAbundances property of the HotHaloStandard component.

<type(abundances)> outflowingAbundancesRateGet() Returns a zero rate for the outflowingAbundances property for the hotHalo component class.

<logical> outflowingAbundancesRateIsAttached() Return true if the deferred function used to rate the outflowingAbundances property of the HotHaloStandard component class has been attached.

<double precision> outflowingAngularMomentum() Returns the default value for the outflowingAngularMomentum property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> outflowingAngularMomentumAttributeMatch(<
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the hotHalo class that have the desired attributes for the outflowingAngularMomentum property

<integer> outflowingAngularMomentumCount() Compute the count of evolvable quantities in the outflowingAngularMomentum property of the HotHaloStandard component.

<logical> outflowingAngularMomentumIsGettable() Returns true if the outflowingAngularMomentum property is gettable for the hotHalo component class.

<logical> outflowingAngularMomentumIsSettable() Specify whether the outflowingAngularMomentum property of the hotHalo component is settable.

<void> outflowingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the outflowingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> outflowingAngularMomentumRateFunction() Set the function to be used for the rate method of the outflowingAngularMomentum property of the HotHaloStandard component.

<double precision> outflowingAngularMomentumRateGet() Returns a zero rate for the outflowingAngularMomentum property for the hotHalo component class.

<logical> outflowingAngularMomentumRateIsAttached() Return true if the deferred function used to rate the outflowingAngularMomentum property of the HotHaloStandard component class has been attached.

<double precision> outflowingMass() Returns the default value for the outflowingMass property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> outflowingMassAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the outflowingMass property

<integer> outflowingMassCount() Compute the count of evolvable quantities in the outflowingMass property of the HotHaloStandard component.

<logical> outflowingMassIsGettable() Returns true if the outflowingMass property is gettable for the hotHalo component class.

<logical> outflowingMassIsSettable() Specify whether the outflowingMass property of the hotHalo component is settable.

<void> outflowingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interrupt [interruptProcedure]↔) Accumulate the rate of change of the outflowingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> outflowingMassRateFunction() Set the function to be used for the rate method of the outflowingMass property of the HotHaloStandard component.

<double precision> outflowingMassRateGet() Returns a zero rate for the outflowingMass property for the hotHalo component class.

<logical> outflowingMassRateIsAttached() Return true if the deferred function used to rate the outflowingMass property of the HotHaloStandard component class has been attached.

<void> outflowReturn(<logical> interrupt↔, <*procedure(interruptTask)> interruptprocedure↔) Call the deferred function for the outflowReturn method of the hotHalo component class if it has been set.

<void> outflowReturnFunction() Set the function to be used for the outflowReturn method of the outflowTracking implementation of the hotHalo component class.

<logical> outflowReturnFunctionIsSet() Return true if the deferred function for the outflowReturn method of the outflowTracking implementation of the hotHalo component class has been set.

<logical> outflowTrackingIsActive() Return true if the outflowTracking implementation of the hotHalo component is the active choice.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a hotHalo component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a outflowTracking implementation of the hotHalo component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Return the names of properties to output for a outflowTracking implementation of the hotHalo component.

<void> postOutput(<double precision> time→) Perform post-output processing for a outflowTracking implementation of the hotHalo component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→) Compute offsets into serialization arrays for a outflowTracking implementation of the hotHalo component.

<void> serializeASCII() Serialize the contents of a outflowTracking implementation of the hotHalo component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the serialization of a outflowTracking implementation of the hotHalo component.

<void> serializeRaw(<integer> fileHandle→) Serialize the contents of a outflowTracking implementation of the hotHalo component to raw (binary) file.

<void> serializeValues(<double precision[:]> array←, <integer> propertyType→) Serialize evolvable properties of a outflowTracking implementation of the hotHalo component to array.

<void> serializeXML(<integer> fileHandle→) Serialize the contents of a outflowTracking implementation of the hotHalo component to XML.

<integer(c_size_t)> sizeOf() Return the size in bytes of a outflowTracking implementation of the hotHalo component.

<logical> standardIsActive() Return true if the standard implementation of the hotHalo component is the active choice.

<type(abundances)> strippedAbundances() Get the strippedAbundances property of an standard implementation of the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> strippedAbundancesAttributeMatch(<logical [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the strippedAbundances property

<integer> strippedAbundancesCount() Return a count of the number of scalar properties in the strippedAbundances property of an standard implementation of the hotHalo component class.

<void> strippedAbundancesInactive() Indicate that the strippedAbundances property of an standard implementation of the hotHalo component class is inactive for differential equation solving.

<logical> strippedAbundancesIsGettable() Returns true if the strippedAbundances property is gettable for the hotHalo component class.

<logical> strippedAbundancesIsSettable() Specify whether the strippedAbundances property of the hotHalo component is settable.

<void> strippedAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate to the rate of change of the strippedAbundances property of an standard implementation of the hotHalo component class.

<type(abundances)> strippedAbundancesRateGet() Get the rate of change of the strippedAbundances property of an standard implementation of the hotHalo component class.

<void> strippedAbundancesScale(<type(abundances)> setValue→) Set the absolute scale of the strippedAbundances property of an standard implementation of the hotHalo component class.

<void> strippedAbundancesSet(<type(abundances)> setValue→) Set the strippedAbundances property of an standard implementation of the hotHalo component class.

<double precision> strippedMass() Get the strippedMass property of an standard implementation of the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> strippedMassAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the strippedMass property

<integer> strippedMassCount() Return a count of the number of scalar properties in the strippedMass property of an standard implementation of the hotHalo component class.

<void> strippedMassInactive() Indicate that the strippedMass property of an standard implementation of the hotHalo component class is inactive for differential equation solving.

<logical> strippedMassIsGettable() Returns true if the strippedMass property is gettable for the hotHalo component class.

<logical> strippedMassIsSettable() Specify whether the strippedMass property of the hotHalo component is settable.

<void> strippedMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTa [interruptProcedure]↔) Accumulate to the rate of change of the strippedMass property of an standard implementation of the hotHalo component class.

<double precision> strippedMassRateGet() Get the rate of change of the strippedMass property of an standard implementation of the hotHalo component class.

<void> strippedMassScale(<double precision> setValue→) Set the absolute scale of the strippedMass property of an standard implementation of the hotHalo component class.

<void> strippedMassSet(<double precision> setValue→) Set the strippedMass property of an standard implementation of the hotHalo component class.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<type(abundances)> trackedOutflowAbundances() Get the trackedOutflowAbundances property of an outflowTracking implementation of the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> trackedOutflowAbundancesAttributeMatch(<l [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the trackedOutflowAbundances property

<integer> trackedOutflowAbundancesCount() Return a count of the number of scalar properties in the trackedOutflowAbundances property of an outflowTracking implementation of the hotHalo component class.

<void> trackedOutflowAbundancesInactive() Indicate that the trackedOutflowAbundances property of an outflowTracking implementation of the hotHalo component class is inactive for differential equation solving.

<logical> trackedOutflowAbundancesIsGettable() Returns true if the trackedOutflowAbundances property is gettable for the hotHalo component class.

<logical> trackedOutflowAbundancesIsSettable() Specify whether the trackedOutflowAbundances property of the hotHalo component is settable.

<void> trackedOutflowAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate to the rate of change of the trackedOutflowAbundances property of an outflowTracking implementation of the hotHalo component class.

<type(abundances)> trackedOutflowAbundancesRateGet() Get the rate of change of the trackedOutflowAbundances property of an outflowTracking implementation of the hotHalo component class.

<void> trackedOutflowAbundancesScale(<type(abundances)> setValue→) Set the absolute scale of the trackedOutflowAbundances property of an outflowTracking implementation of the hotHalo component class.

<void> trackedOutflowAbundancesSet(<type(abundances)> setValue→) Set the trackedOutflowAbundances property of an outflowTracking implementation of the hotHalo component class.

<double precision> trackedOutflowMass() Get the trackedOutflowMass property of an outflowTracking implementation of the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> trackedOutflowMassAttributeMatch(<logical [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the trackedOutflowMass property

<integer> trackedOutflowMassCount() Return a count of the number of scalar properties in the trackedOutflowMass property of an outflowTracking implementation of the hotHalo component class.

<void> trackedOutflowMassInactive() Indicate that the trackedOutflowMass property of an outflowTracking implementation of the hotHalo component class is inactive for differential equation solving.

<logical> trackedOutflowMassIsGettable() Returns true if the trackedOutflowMass property is gettable for the hotHalo component class.

<logical> trackedOutflowMassIsSettable() Specify whether the trackedOutflowMass property of the hotHalo component is settable.

<void> trackedOutflowMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate to the rate of change of the trackedOutflowMass property of an outflowTracking implementation of the hotHalo component class.

<double precision> trackedOutflowMassRateGet() Get the rate of change of the trackedOutflowMass property of an outflowTracking implementation of the hotHalo component class.

<void> trackedOutflowMassScale(<double precision> setValue→) Set the absolute scale of the trackedOutflowMass property of an outflowTracking implementation of the hotHalo component class.

<void> trackedOutflowMassSet(<double precision> setValue→) Set the trackedOutflowMass property of an outflowTracking implementation of the hotHalo component class.

<type(varying_string)> type() Returns the type name for the outflowTracking implementation of the hotHalo component class.

<double precision> unaccretedMass() Get the unaccretedMass property of an standard implementation of the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> unaccretedMassAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the unaccretedMass property

<integer> unaccretedMassCount() Return a count of the number of scalar properties in the unaccretedMass property of an standard implementation of the hotHalo component class.

<void> unaccretedMassInactive() Indicate that the unaccretedMass property of an standard implementation of the hotHalo component class is inactive for differential equation solving.

<logical> unaccretedMassIsGettable() Returns true if the unaccretedMass property is gettable for the hotHalo component class.

<logical> unaccretedMassIsSettable() Specify whether the unaccretedMass property of the hotHalo component is settable.

<void> unaccretedMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interrupt [interruptProcedure]↔) Accumulate to the rate of change of the unaccretedMass property of an standard implementation of the hotHalo component class.

<double precision> unaccretedMassRateGet() Get the rate of change of the unaccretedMass property of an standard implementation of the hotHalo component class.

<void> unaccretedMassScale(<double precision> setValue→) Set the absolute scale of the unaccretedMass property of an standard implementation of the hotHalo component class.

<void> unaccretedMassSet(<double precision> setValue→) Set the unaccretedMass property of an standard implementation of the hotHalo component class.

<logical> verySimpleDelayedIsActive() Return true if the verySimpleDelayed implementation of the hotHalo component is the active choice.

<logical> verySimpleIsActive() Return true if the verySimple implementation of the hotHalo component is the active choice.

nodeComponentHotHaloStandard

<type(abundances)> abundances() Get the abundances property of an standard implementation of the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> abundancesAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the abundances property

<type(abundances)> abundancesCold() Returns the default value for the abundancesCold property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> abundancesColdAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the abundancesCold property

<integer> abundancesColdCount() Compute the count of evolvable quantities in the abundancesCold property of the HotHaloColdMode component.

<logical> abundancesColdIsGettable() Returns true if the abundancesCold property is gettable for the hotHalo component class.

<logical> abundancesColdIsSettable() Specify whether the abundancesCold property of the hotHalo component is settable.

<void> abundancesColdRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interrupt [interruptProcedure]↔) Accept a rate set for the abundancesCold property of the hotHalo component class. Trigger an interrupt to create the component.

<type(abundances)> abundancesColdRateGet() Returns a zero rate for the abundancesCold property for the hotHalo component class.

<void> abundancesColdScale(<type(abundances)> value) Set the scale of the abundancesCold property of the HotHaloColdMode component.

<void> abundancesColdSet(<type(abundances)> value) Set the abundancesCold property of the hotHalo component.

<integer> abundancesCount() Return a count of the number of scalar properties in the abundances property of an standard implementation of the hotHalo component class.

<void> abundancesInactive() Indicate that the abundances property of an standard implementation of the hotHalo component class is inactive for differential equation solving.

<logical> abundancesIsGettable() Returns true if the abundances property is gettable for the hotHalo component class.

<logical> abundancesIsSettable() Specify whether the abundances property of the hotHalo component is settable.

<void> abundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask [interruptProcedure]↔) Accumulate to the rate of change of the abundances property of an standard implementation of the hotHalo component class.

<type(abundances)> abundancesRateGet() Get the rate of change of the abundances property of an standard implementation of the hotHalo component class.

<void> abundancesScale(<type(abundances)> setValue→) Set the absolute scale of the abundances property of an standard implementation of the hotHalo component class.

<void> abundancesSet(<type(abundances)> setValue→) Set the abundances property of an standard implementation of the hotHalo component class.

<double precision> angularMomentum() Get the angularMomentum property of an standard implementation of the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> angularMomentumAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the angularMomentum property

<double precision> angularMomentumCold() Returns the default value for the angularMomentumCold property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> angularMomentumColdAttributeMatch(<logica [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the angularMomentumCold property

<integer> angularMomentumColdCount() Compute the count of evolvable quantities in the angularMomentumCold property of the HotHaloColdMode component.

<logical> angularMomentumColdIsGettable() Returns true if the angularMomentumCold property is gettable for the hotHalo component class.

<logical> angularMomentumColdIsSettable() Specify whether the angularMomentumCold property of the hotHalo component is settable.

<void> angularMomentumColdRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accept a rate set for the angularMomentumCold property of the hotHalo component class. Trigger an interrupt to create the component.

<double precision> angularMomentumColdRateGet() Returns a zero rate for the angularMomentumCold property for the hotHalo component class.

<void> angularMomentumColdScale(<double precision> value) Set the scale of the angularMomentumCold property of the HotHaloColdMode component.

<void> angularMomentumColdSet(<double precision> value) Set the angularMomentumCold property of the hotHalo component.

<integer> angularMomentumCount() Return a count of the number of scalar properties in the angularMomentum property of an standard implementation of the hotHalo component class.

<void> angularMomentumInactive() Indicate that the angularMomentum property of an standard implementation of the hotHalo component class is inactive for differential equation solving.

<logical> angularMomentumIsGettable() Returns true if the angularMomentum property is gettable for the hotHalo component class.

<logical> angularMomentumIsSettable() Specify whether the angularMomentum property of the hotHalo component is settable.

<void> angularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interrup [interruptProcedure]↔) Accumulate to the rate of change of the angularMomentum property of an standard implementation of the hotHalo component class.

<double precision> angularMomentumRateGet() Get the rate of change of the angularMomentum property of an standard implementation of the hotHalo component class.

<void> angularMomentumScale(<double precision> setValue→) Set the absolute scale of the angularMomentum property of an standard implementation of the hotHalo component class.

<void> angularMomentumSet(<double precision> setValue→) Set the angularMomentum property of an standard implementation of the hotHalo component class.

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a standard implementation of the hotHalo component from a supplied XML definition.

<type(chemicalAbundances)> chemicals() Get the chemicals property of an standard implementation of the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> chemicalsAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the chemicals property

<integer> chemicalsCount() Return a count of the number of scalar properties in the chemicals property of an standard implementation of the hotHalo component class.

<void> chemicalsInactive() Indicate that the chemicals property of an standard implementation of the hotHalo component class is inactive for differential equation solving.

<logical> chemicalsIsGettable() Returns true if the chemicals property is gettable for the hotHalo component class.

<logical> chemicalsIsSettable() Specify whether the chemicals property of the hotHalo component is settable.

<void> chemicalsRate(<type(chemicalAbundances)> setValue→, <logical> [interrupt]↔, <*procedure(interr [interruptProcedure]↔) Accumulate to the rate of change of the chemicals property of an standard implementation of the hotHalo component class.

<type(chemicalAbundances)> chemicalsRateGet() Get the rate of change of the chemicals property of an standard implementation of the hotHalo component class.

<void> chemicalsScale(<type(chemicalAbundances)> setValue→) Set the absolute scale of the chemicals property of an standard implementation of the hotHalo component class.

<void> chemicalsSet(<type(chemicalAbundances)> setValue→) Set the chemicals property of an standard implementation of the hotHalo component class.

<logical> coldModeIsActive() Return true if the coldMode implementation of the hotHalo component is the active choice.

<void> createFunctionSet() Set the create function for the standard implementation of the hotHalo component class.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a standard implementation of the hotHalo component from raw (binary) file.

<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→) Deserialize evolvable properties of a standard implementation of the hotHalo component from array.

<void> destroy() Finalize a standard implementation of the hotHalo component.

<void> dumpASCII() Dump the content of a hotHalo component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<double precision> heatSource() Returns the default value for the heatSource property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> heatSourceAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the heatSource property

<integer> heatSourceCount() Compute the count of evolvable quantities in the heatSource property of the HotHaloStandard component.

<logical> heatSourceIsGettable() Returns true if the heatSource property is gettable for the hotHalo component class.

<logical> heatSourceIsSettable() Specify whether the heatSource property of the hotHalo component is settable.

<void> heatSourceRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask [interruptProcedure]↔) Accumulate the rate of change of the heatSource property of the standard implementation of the hotHalo component using a deferred function.

<void> heatSourceRateFunction() Set the function to be used for the rate method of the heatSource property of the HotHaloStandard component.

<double precision> heatSourceRateGet() Returns a zero rate for the heatSource property for the hotHalo component class.

<logical> heatSourceRateIsAttached() Return true if the deferred function used to rate the heatSource property of the HotHaloStandard component class has been attached.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<type(abundances)> hotHaloCoolingAbundances() Returns the default value for the hotHaloCoolingAbundances property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> hotHaloCoolingAbundancesAttributeMatch(<l [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the hotHaloCoolingAbundances property

<integer> hotHaloCoolingAbundancesCount() Compute the count of evolvable quantities in the hotHaloCoolingAbundan property of the HotHaloStandard component.

<logical> hotHaloCoolingAbundancesIsGettable() Returns true if the hotHaloCoolingAbundances property is gettable for the hotHalo component class.

<logical> hotHaloCoolingAbundancesIsSettable() Specify whether the hotHaloCoolingAbundances property of the hotHalo component is settable.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAbundancesRateFunction() Set the function to be used for the rate method of the hotHaloCoolingAbundances property of the hotHalo component.

<type(abundances)> hotHaloCoolingAbundancesRateGet() Returns a zero rate for the hotHaloCoolingAbundances property for the hotHalo component class.

<logical> hotHaloCoolingAbundancesRateIsAttached() Return true if the deferred function used to rate the hotHaloCoolingAbundances property of the hotHalo component class has been attached.

<double precision> hotHaloCoolingAngularMomentum() Returns the default value for the hotHaloCoolingAngularMome property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> hotHaloCoolingAngularMomentumAttributeMat [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the hotHaloCoolingAngularMomentum property

<integer> hotHaloCoolingAngularMomentumCount() Compute the count of evolvable quantities in the hotHaloCoolingAngularMomentum property of the HotHaloStandard component.

<logical> hotHaloCoolingAngularMomentumIsGettable() Returns true if the hotHaloCoolingAngularMomentum property is gettable for the hotHalo component class.

<logical> hotHaloCoolingAngularMomentumIsSettable() Specify whether the hotHaloCoolingAngularMomentum property of the hotHalo component is settable.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRateFunction() Set the function to be used for the rate method of the hotHaloCoolingAngularMomentum property of the hotHalo component.

<double precision> hotHaloCoolingAngularMomentumRateGet() Returns a zero rate for the hotHaloCoolingAngularMo property for the hotHalo component class.

<logical> hotHaloCoolingAngularMomentumRateIsAttached() Return true if the deferred function used to rate the hotHaloCoolingAngularMomentum property of the hotHalo component class has been attached.

<double precision> hotHaloCoolingMass() Returns the default value for the hotHaloCoolingMass property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> hotHaloCoolingMassAttributeMatch(<logical [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the hotHaloCoolingMass property

<integer> hotHaloCoolingMassCount() Compute the count of evolvable quantities in the hotHaloCoolingMass property of the HotHaloStandard component.

<logical> hotHaloCoolingMassIsGettable() Returns true if the hotHaloCoolingMass property is gettable for the hotHalo component class.

<logical> hotHaloCoolingMassIsSettable() Specify whether the hotHaloCoolingMass property of the hotHalo component is settable.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRateFunction() Set the function to be used for the rate method of the hotHaloCoolingMass property of the hotHalo component.

<double precision> hotHaloCoolingMassRateGet() Returns a zero rate for the hotHaloCoolingMass property for the hotHalo component class.

<logical> hotHaloCoolingMassRateIsAttached() Return true if the deferred function used to rate the hotHaloCoolingMass property of the hotHalo component class has been attached.

<void> initialize() Initialize a standard member of the hotHalo component.

<logical> isInitialized() Get the isInitialized property of an standard implementation of the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> isInitializedAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the isInitialized property

<logical> isInitializedIsGettable() Returns true if the isInitialized property is gettable for the hotHalo component class.

<logical> isInitializedIsSettable() Specify whether the isInitialized property of the hotHalo component is settable.

<logical> isInitializedRateGet() Returns a zero rate for the isInitialized property for the hotHalo component class.

<void> isInitializedSet(<logical> setValue→) Set the isInitialized property of an standard implementation of the hotHalo component class.

<double precision> mass() Get the mass property of an standard implementation of the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> massAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the mass property

<double precision> massCold() Returns the default value for the massCold property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> massColdAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the massCold property

<integer> massColdCount() Compute the count of evolvable quantities in the massCold property of the HotHaloColdMode component.

<logical> massColdIsGettable() Returns true if the massCold property is gettable for the hotHalo component class.

<logical> massColdIsSettable() Specify whether the massCold property of the hotHalo component is settable.

<void> massColdRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accept a rate set for the massCold property of the hotHalo component class. Trigger an interrupt to create the component.

<double precision> massColdRateGet() Returns a zero rate for the massCold property for the hotHalo component class.

<void> massColdScale(<double precision> value) Set the scale of the massCold property of the HotHaloColdMode component.

<void> massColdSet(<double precision> value) Set the massCold property of the hotHalo component.

<integer> massCount() Return a count of the number of scalar properties in the mass property of an standard implementation of the hotHalo component class.

<void> massInactive() Indicate that the mass property of an standard implementation of the hotHalo component class is inactive for differential equation solving.

<logical> massIsGettable() Returns true if the mass property is gettable for the hotHalo component class.

<logical> massIsSettable() Specify whether the mass property of the hotHalo component is settable.

<void> massRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate to the rate of change of the mass property of an standard implementation of the hotHalo component class.

<double precision> massRateGet() Get the rate of change of the mass property of an standard implementation of the hotHalo component class.

<void> massRemovalRate() Called whenever the standard hot halo component removes mass from the halo.

<void> massScale(<double precision> setValue→) Set the absolute scale of the mass property of an standard implementation of the hotHalo component class.

<void> massSet(<double precision> setValue→) Set the mass property of an standard implementation of the hotHalo component class.

<double precision> massSink() Returns the default value for the massSink property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> massSinkAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the massSink property

<integer> massSinkCount() Compute the count of evolvable quantities in the massSink property of the HotHaloStandard component.

<logical> massSinkIsGettable() Returns true if the massSink property is gettable for the hotHalo component class.

<logical> massSinkIsSettable() Specify whether the massSink property of the hotHalo component is settable.

<void> massSinkRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the massSink property of the standard implementation of the hotHalo component using a deferred function.

<void> massSinkRateFunction() Set the function to be used for the rate method of the massSink property of the HotHaloStandard component.

<double precision> massSinkRateGet() Returns a zero rate for the massSink property for the hotHalo component class.

<logical> massSinkRateIsAttached() Return true if the deferred function used to rate the massSink property of the HotHaloStandard component class has been attached.

<double precision> massTotal() Returns the default value for the massTotal property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> massTotalAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the massTotal property

<logical> massTotalIsGettable() Returns true if the massTotal property is gettable for the hotHalo component class.

<logical> massTotalIsSettable() Specify whether the massTotal property of the hotHalo component is settable.

<double precision> massTotalRateGet() Returns a zero rate for the massTotal property for the hotHalo component class.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a standard implementation of the hotHalo component class.

<logical> nullIsActive() Return true if the null implementation of the hotHalo component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<double precision> outerRadius() Get the value of the outerRadius property of the standard implementation of the hotHalo component using a deferred function.

<type(varying_string), allocatable, dimension(:) => matches> outerRadiusAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the outerRadius property

<integer> outerRadiusCount() Return a count of the number of scalar properties in the outerRadius property of an standard implementation of the hotHalo component class.

<void> outerRadiusFunction() Set the function to be used for the get method of the outerRadius property of the HotHaloStandard component.

<double precision> outerRadiusGrowthRate() Call the deferred function for the outerRadiusGrowthRate method of the hotHalo component class if it has been set.

<void> outerRadiusGrowthRateFunction() Set the function to be used for the outerRadiusGrowthRate method of the standard implementation of the hotHalo component class.

<logical> outerRadiusGrowthRateFunctionIsSet() Return true if the deferred function for the outerRadiusGrowthRate method of the standard implementation of the hotHalo component class has been set.

<void> outerRadiusInactive() Indicate that the outerRadius property of an standard implementation of the hotHalo component class is inactive for differential equation solving.

<logical> outerRadiusIsAttached() Return true if the deferred function used to get the outerRadius property of the HotHaloStandard component class has been attached.

<logical> outerRadiusIsGettable() Returns true if the outerRadius property is gettable for the hotHalo component class.

<logical> outerRadiusIsSettable() Specify whether the outerRadius property of the hotHalo component is settable.

<void> outerRadiusRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTas [interruptProcedure]↔) Accumulate to the rate of change of the outerRadius property of an standard implementation of the hotHalo component class.

<double precision> outerRadiusRateGet() Get the rate of change of the outerRadius property of an standard implementation of the hotHalo component class.

<void> outerRadiusScale(<double precision> setValue→) Set the absolute scale of the outerRadius property of an standard implementation of the hotHalo component class.

<void> outerRadiusSet(<double precision> setValue→) Set the outerRadius property of an standard implementation of the hotHalo component class.

<double precision> outerRadiusValue() Get the outerRadius property of an standard implementation of the hotHalo component class.

<type(abundances)> outflowedAbundances() Get the outflowedAbundances property of an standard implementation of the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> outflowedAbundancesAttributeMatch(<logica [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the outflowedAbundances property

<integer> outflowedAbundancesCount() Return a count of the number of scalar properties in the outflowedAbundances property of an standard implementation of the hotHalo component class.

<void> outflowedAbundancesInactive() Indicate that the outflowedAbundances property of an standard implementation of the hotHalo component class is inactive for differential equation solving.

<logical> outflowedAbundancesIsGettable() Returns true if the outflowedAbundances property is gettable for the hotHalo component class.

<logical> outflowedAbundancesIsSettable() Specify whether the outflowedAbundances property of the hotHalo component is settable.

<void> outflowedAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate to the rate of change of the outflowedAbundances property of an standard implementation of the hotHalo component class.

<type(abundances)> outflowedAbundancesRateGet() Get the rate of change of the outflowedAbundances property of an standard implementation of the hotHalo component class.

<void> outflowedAbundancesScale(<type(abundances)> setValue→) Set the absolute scale of the outflowedAbundances property of an standard implementation of the hotHalo component class.

<void> outflowedAbundancesSet(<type(abundances)> setValue→) Set the outflowedAbundances property of an standard implementation of the hotHalo component class.

<double precision> outflowedAngularMomentum() Get the outflowedAngularMomentum property of an standard implementation of the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> outflowedAngularMomentumAttributeMatch(<l
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the hotHalo class that have the desired attributes for the outflowedAngularMomentum property

<integer> outflowedAngularMomentumCount() Return a count of the number of scalar properties in the outflowedAngularMomentum property of an standard implementation of the hotHalo component class.

<void> outflowedAngularMomentumInactive() Indicate that the outflowedAngularMomentum property of an standard implementation of the hotHalo component class is inactive for differential equation solving.

<logical> outflowedAngularMomentumIsGettable() Returns true if the outflowedAngularMomentum property is gettable for the hotHalo component class.

<logical> outflowedAngularMomentumIsSettable() Specify whether the outflowedAngularMomentum property of the hotHalo component is settable.

<void> outflowedAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate to the rate of change of the outflowedAngularMomentum property of an standard implementation of the hotHalo component class.

<double precision> outflowedAngularMomentumRateGet() Get the rate of change of the outflowedAngularMomentum property of an standard implementation of the hotHalo component class.

<void> outflowedAngularMomentumScale(<double precision> setValue→) Set the absolute scale of the outflowedAngularMomentum property of an standard implementation of the hotHalo component class.

<void> outflowedAngularMomentumSet(<double precision> setValue→) Set the outflowedAngularMomentum property of an standard implementation of the hotHalo component class.

<double precision> outflowedMass() Get the outflowedMass property of an standard implementation of the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> outflowedMassAttributeMatch(<logical>
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the hotHalo class that have the desired attributes for the outflowedMass property

<integer> outflowedMassCount() Return a count of the number of scalar properties in the outflowedMass property of an standard implementation of the hotHalo component class.

<void> outflowedMassInactive() Indicate that the outflowedMass property of an standard implementation of the hotHalo component class is inactive for differential equation solving.

<logical> outflowedMassIsGettable() Returns true if the outflowedMass property is gettable for the hotHalo component class.

<logical> outflowedMassIsSettable() Specify whether the outflowedMass property of the hotHalo component is settable.

<void> outflowedMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptT
[interruptProcedure]↔) Accumulate to the rate of change of the outflowedMass property of an standard implementation of the hotHalo component class.

<double precision> outflowedMassRateGet() Get the rate of change of the outflowedMass property of an standard implementation of the hotHalo component class.

<void> outflowedMassScale(<double precision> setValue→) Set the absolute scale of the outflowedMass property of an standard implementation of the hotHalo component class.

<void> outflowedMassSet(<double precision> setValue→) Set the outflowedMass property of an standard implementation of the hotHalo component class.

<type(abundances)> outflowingAbundances() Returns the default value for the outflowingAbundances property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> outflowingAbundancesAttributeMatch(<logic
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the hotHalo class that have the desired attributes for the outflowingAbundances property

<integer> outflowingAbundancesCount() Compute the count of evolvable quantities in the outflowingAbundances property of the HotHaloStandard component.

<logical> outflowingAbundancesIsGettable() Returns true if the outflowingAbundances property is gettable for the hotHalo component class.

<logical> outflowingAbundancesIsSettable() Specify whether the outflowingAbundances property of the hotHalo component is settable.

<void> outflowingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔,
<*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the outflowingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> outflowingAbundancesRateFunction() Set the function to be used for the rate method of the outflowingAbundances property of the HotHaloStandard component.

<type(abundances)> outflowingAbundancesRateGet() Returns a zero rate for the outflowingAbundances property for the hotHalo component class.

<logical> outflowingAbundancesRateIsAttached() Return true if the deferred function used to rate the outflowingAbundances property of the HotHaloStandard component class has been attached.

<double precision> outflowingAngularMomentum() Returns the default value for the outflowingAngularMomentum property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> outflowingAngularMomentumAttributeMatch(<
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the hotHalo class that have the desired attributes for the outflowingAngularMomentum property

<integer> outflowingAngularMomentumCount() Compute the count of evolvable quantities in the outflowingAngularMomentum property of the HotHaloStandard component.

<logical> outflowingAngularMomentumIsGettable() Returns true if the outflowingAngularMomentum property is gettable for the hotHalo component class.

<logical> outflowingAngularMomentumIsSettable() Specify whether the outflowingAngularMomentum property of the hotHalo component is settable.

<void> outflowingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the outflowingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> outflowingAngularMomentumRateFunction() Set the function to be used for the rate method of the outflowingAngularMomentum property of the HotHaloStandard component.

<double precision> outflowingAngularMomentumRateGet() Returns a zero rate for the outflowingAngularMomentum property for the hotHalo component class.

<logical> outflowingAngularMomentumRateIsAttached() Return true if the deferred function used to rate the outflowingAngularMomentum property of the HotHaloStandard component class has been attached.

<double precision> outflowingMass() Returns the default value for the outflowingMass property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> outflowingMassAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the outflowingMass property

<integer> outflowingMassCount() Compute the count of evolvable quantities in the outflowingMass property of the HotHaloStandard component.

<logical> outflowingMassIsGettable() Returns true if the outflowingMass property is gettable for the hotHalo component class.

<logical> outflowingMassIsSettable() Specify whether the outflowingMass property of the hotHalo component is settable.

<void> outflowingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interrupt [interruptProcedure]↔) Accumulate the rate of change of the outflowingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> outflowingMassRateFunction() Set the function to be used for the rate method of the outflowingMass property of the HotHaloStandard component.

<double precision> outflowingMassRateGet() Returns a zero rate for the outflowingMass property for the hotHalo component class.

<logical> outflowingMassRateIsAttached() Return true if the deferred function used to rate the outflowingMass property of the HotHaloStandard component class has been attached.

<void> outflowReturn(<logical> interrupt↔, <*procedure(interruptTask)> interruptprocedure↔) Call the deferred function for the outflowReturn method of the hotHalo component class if it has been set.

<void> outflowReturnFunction() Set the function to be used for the outflowReturn method of the standard implementation of the hotHalo component class.

<logical> outflowReturnFunctionIsSet() Return true if the deferred function for the outflowReturn method of the standard implementation of the hotHalo component class has been set.

<logical> outflowTrackingIsActive() Return true if the outflowTracking implementation of the hotHalo component is the active choice.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a hotHalo component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a standard implementation of the hotHalo component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Return the names of properties to output for a standard implementation of the hotHalo component.

<void> postOutput(<double precision> time→) Perform post-output processing for a standard implementation of the hotHalo component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→) Compute offsets into serialization arrays for a standard implementation of the hotHalo component.

<void> serializeASCII() Serialize the contents of a standard implementation of the hotHalo component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the serialization of a standard implementation of the hotHalo component.

<void> serializeRaw(<integer> fileHandle→) Serialize the contents of a standard implementation of the hotHalo component to raw (binary) file.

<void> serializeValues(<double precision[:]> array←, <integer> propertyType→) Serialize evolvable properties of a standard implementation of the hotHalo component to array.

<void> serializeXML(<integer> fileHandle→) Serialize the contents of a standard implementation of the hotHalo component to XML.

<integer(c_size_t)> sizeOf() Return the size in bytes of a standard implementation of the hotHalo component.

<logical> standardIsActive() Return true if the standard implementation of the hotHalo component is the active choice.

<type(abundances)> strippedAbundances() Get the strippedAbundances property of an standard implementation of the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> strippedAbundancesAttributeMatch(<logical [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the strippedAbundances property

<integer> strippedAbundancesCount() Return a count of the number of scalar properties in the strippedAbundances property of an standard implementation of the hotHalo component class.

<void> strippedAbundancesInactive() Indicate that the strippedAbundances property of an standard implementation of the hotHalo component class is inactive for differential equation solving.

<logical> strippedAbundancesIsGettable() Returns true if the strippedAbundances property is gettable for the hotHalo component class.

<logical> strippedAbundancesIsSettable() Specify whether the strippedAbundances property of the hotHalo component is settable.

<void> strippedAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate to the rate of change of the strippedAbundances property of an standard implementation of the hotHalo component class.

<type(abundances)> strippedAbundancesRateGet() Get the rate of change of the strippedAbundances property of an standard implementation of the hotHalo component class.

<void> strippedAbundancesScale(<type(abundances)> setValue→) Set the absolute scale of the strippedAbundances property of an standard implementation of the hotHalo component class.

<void> strippedAbundancesSet(<type(abundances)> setValue→) Set the strippedAbundances property of an standard implementation of the hotHalo component class.

<double precision> strippedMass() Get the strippedMass property of an standard implementation of the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> strippedMassAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the strippedMass property

<integer> strippedMassCount() Return a count of the number of scalar properties in the strippedMass property of an standard implementation of the hotHalo component class.

<void> strippedMassInactive() Indicate that the strippedMass property of an standard implementation of the hotHalo component class is inactive for differential equation solving.

<logical> strippedMassIsGettable() Returns true if the strippedMass property is gettable for the hotHalo component class.

<logical> strippedMassIsSettable() Specify whether the strippedMass property of the hotHalo component is settable.

<void> strippedMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTa [interruptProcedure]↔) Accumulate to the rate of change of the strippedMass property of an standard implementation of the hotHalo component class.

<double precision> strippedMassRateGet() Get the rate of change of the strippedMass property of an standard implementation of the hotHalo component class.

<void> strippedMassScale(<double precision> setValue→) Set the absolute scale of the strippedMass property of an standard implementation of the hotHalo component class.

<void> strippedMassSet(<double precision> setValue→) Set the strippedMass property of an standard implementation of the hotHalo component class.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<type(abundances)> trackedOutflowAbundances() Returns the default value for the trackedOutflowAbundances property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> trackedOutflowAbundancesAttributeMatch(<l [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the trackedOutflowAbundances property

<integer> trackedOutflowAbundancesCount() Compute the count of evolvable quantities in the trackedOutflowAbundan property of the HotHaloOutflowTracking component.

<logical> trackedOutflowAbundancesIsGettable() Returns true if the trackedOutflowAbundances property is gettable for the hotHalo component class.

<logical> trackedOutflowAbundancesIsSettable() Specify whether the trackedOutflowAbundances property of the hotHalo component is settable.

<void> trackedOutflowAbundancesRate(<type(abundances)> value) Cumulate to the rate of the trackedOutflowAbundances property of the HotHaloOutflowTracking component.

<type(abundances)> trackedOutflowAbundancesRateGet() Returns a zero rate for the trackedOutflowAbundances property for the hotHalo component class.

<void> trackedOutflowAbundancesScale(<type(abundances)> value) Set the scale of the trackedOutflowAbundances property of the HotHaloOutflowTracking component.

<void> trackedOutflowAbundancesSet(<type(abundances)> value) Set the trackedOutflowAbundances property of the hotHalo component.

<double precision> trackedOutflowMass() Returns the default value for the trackedOutflowMass property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> trackedOutflowMassAttributeMatch(<logical [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the trackedOutflowMass property

<integer> trackedOutflowMassCount() Compute the count of evolvable quantities in the trackedOutflowMass property of the HotHaloOutflowTracking component.

<logical> trackedOutflowMassIsGettable() Returns true if the trackedOutflowMass property is gettable for the hotHalo component class.

<logical> trackedOutflowMassIsSettable() Specify whether the trackedOutflowMass property of the hotHalo component is settable.

<void> trackedOutflowMassRate(<double precision> value) Cumulate to the rate of the trackedOutflowMass property of the HotHaloOutflowTracking component.

<double precision> trackedOutflowMassRateGet() Returns a zero rate for the trackedOutflowMass property for the hotHalo component class.

<void> trackedOutflowMassScale(<double precision> value) Set the scale of the trackedOutflowMass property of the HotHaloOutflowTracking component.

<void> trackedOutflowMassSet(<double precision> value) Set the trackedOutflowMass property of the hotHalo component.

<type(varying_string)> type() Returns the type name for the standard implementation of the hotHalo component class.

<double precision> unaccretedMass() Get the unaccretedMass property of an standard implementation of the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> unaccretedMassAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the unaccretedMass property

<integer> unaccretedMassCount() Return a count of the number of scalar properties in the unaccretedMass property of an standard implementation of the hotHalo component class.

<void> unaccretedMassInactive() Indicate that the unaccretedMass property of an standard implementation of the hotHalo component class is inactive for differential equation solving.

<logical> unaccretedMassIsGettable() Returns true if the unaccretedMass property is gettable for the hotHalo component class.

<logical> unaccretedMassIsSettable() Specify whether the unaccretedMass property of the hotHalo component is settable.

<void> unaccretedMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interrupt [interruptProcedure]↔) Accumulate to the rate of change of the unaccretedMass property of an standard implementation of the hotHalo component class.

<double precision> unaccretedMassRateGet() Get the rate of change of the unaccretedMass property of an standard implementation of the hotHalo component class.

<void> unaccretedMassScale(<double precision> setValue→) Set the absolute scale of the unaccretedMass property of an standard implementation of the hotHalo component class.

<void> unaccretedMassSet(<double precision> setValue→) Set the unaccretedMass property of an standard implementation of the hotHalo component class.

<logical> verySimpleDelayedIsActive() Return true if the verySimpleDelayed implementation of the hotHalo component is the active choice.

<logical> verySimpleIsActive() Return true if the verySimple implementation of the hotHalo component is the active choice.

nodeComponentHotHaloVerySimple

<type(abundances)> abundances() Get the abundances property of an verySimple implementation of the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> abundancesAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the abundances property

<type(abundances)> abundancesCold() Returns the default value for the abundancesCold property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> abundancesColdAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the abundancesCold property

<integer> abundancesColdCount() Compute the count of evolvable quantities in the abundancesCold property of the HotHaloColdMode component.

<logical> abundancesColdIsGettable() Returns true if the abundancesCold property is gettable for the hotHalo component class.

<logical> abundancesColdIsSettable() Specify whether the abundancesCold property of the hotHalo component is settable.

<void> abundancesColdRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interrupt [interruptProcedure]↔) Accept a rate set for the abundancesCold property of the hotHalo component class. Trigger an interrupt to create the component.

<type(abundances)> abundancesColdRateGet() Returns a zero rate for the abundancesCold property for the hotHalo component class.

<void> abundancesColdScale(<type(abundances)> value) Set the scale of the abundancesCold property of the HotHaloColdMode component.

<void> abundancesColdSet(<type(abundances)> value) Set the abundancesCold property of the hotHalo component.

<integer> abundancesCount() Return a count of the number of scalar properties in the abundances property of an verySimple implementation of the hotHalo component class.

<void> abundancesInactive() Indicate that the abundances property of an verySimple implementation of the hotHalo component class is inactive for differential equation solving.

<logical> abundancesIsGettable() Returns true if the abundances property is gettable for the hotHalo component class.

<logical> abundancesIsSettable() Specify whether the abundances property of the hotHalo component is settable.

<void> abundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask [interruptProcedure]↔) Accumulate to the rate of change of the abundances property of an verySimple implementation of the hotHalo component class.

<type(abundances)> abundancesRateGet() Get the rate of change of the abundances property of an verySimple implementation of the hotHalo component class.

<void> abundancesScale(<type(abundances)> setValue→) Set the absolute scale of the abundances property of an verySimple implementation of the hotHalo component class.

<void> abundancesSet(<type(abundances)> setValue→) Set the abundances property of an verySimple implementation of the hotHalo component class.

<double precision> angularMomentum() Returns the default value for the angularMomentum property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> angularMomentumAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the angularMomentum property

<double precision> angularMomentumCold() Returns the default value for the angularMomentumCold property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> angularMomentumColdAttributeMatch(<logica [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the angularMomentumCold property

<integer> angularMomentumColdCount() Compute the count of evolvable quantities in the angularMomentumCold property of the HotHaloColdMode component.

<logical> angularMomentumColdIsGettable() Returns true if the angularMomentumCold property is gettable for the hotHalo component class.

<logical> angularMomentumColdIsSettable() Specify whether the angularMomentumCold property of the hotHalo component is settable.

<void> angularMomentumColdRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accept a rate set for the angularMomentumCold property of the hotHalo component class. Trigger an interrupt to create the component.

<double precision> angularMomentumColdRateGet() Returns a zero rate for the angularMomentumCold property for the hotHalo component class.

<void> angularMomentumColdScale(<double precision> value) Set the scale of the angularMomentumCold property of the HotHaloColdMode component.

<void> angularMomentumColdSet(<double precision> value) Set the angularMomentumCold property of the hotHalo component.

<integer> angularMomentumCount() Compute the count of evolvable quantities in the angularMomentum property of the HotHaloStandard component.

<logical> angularMomentumIsGettable() Returns true if the angularMomentum property is gettable for the hotHalo component class.

<logical> angularMomentumIsSettable() Specify whether the angularMomentum property of the hotHalo component is settable.

<void> angularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interrup [interruptProcedure]↔) Accept a rate set for the angularMomentum property of the hotHalo component class. Trigger an interrupt to create the component.

<double precision> angularMomentumRateGet() Returns a zero rate for the angularMomentum property for the hotHalo component class.

<void> angularMomentumScale(<double precision> value) Set the scale of the angularMomentum property of the HotHaloStandard component.

<void> angularMomentumSet(<double precision> value) Set the angularMomentum property of the hotHalo component.

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a verySimple implementation of the hotHalo component from a supplied XML definition.

<type(chemicalAbundances)> chemicals() Returns the default value for the chemicals property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> chemicalsAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the chemicals property

<integer> chemicalsCount() Compute the count of evolvable quantities in the chemicals property of the HotHaloStandard component.

<logical> chemicalsIsGettable() Returns true if the chemicals property is gettable for the hotHalo component class.

<logical> chemicalsIsSettable() Specify whether the chemicals property of the hotHalo component is settable.

<void> chemicalsRate(<type(chemicalAbundances)> setValue→, <logical> [interrupt]↔, <*procedure(interr [interruptProcedure]↔) Accept a rate set for the chemicals property of the hotHalo component class. Trigger an interrupt to create the component.

<type(chemicalAbundances)> chemicalsRateGet() Returns a zero rate for the chemicals property for the hotHalo component class.

<void> chemicalsScale(<type(chemicalAbundances)> value) Set the scale of the chemicals property of the HotHaloStandard component.

<void> chemicalsSet(<type(chemicalAbundances)> value) Set the chemicals property of the hotHalo component.

<logical> coldModeIsActive() Return true if the coldMode implementation of the hotHalo component is the active choice.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a verySimple implementation of the hotHalo component from raw (binary) file.

<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→) Deserialize evolvable properties of a verySimple implementation of the hotHalo component from array.

<void> destroy() Finalize a verySimple implementation of the hotHalo component.

<void> dumpASCII() Dump the content of a hotHalo component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<double precision> heatSource() Returns the default value for the heatSource property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> heatSourceAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the heatSource property

<integer> heatSourceCount() Compute the count of evolvable quantities in the heatSource property of the HotHaloStandard component.

<logical> heatSourceIsGettable() Returns true if the heatSource property is gettable for the hotHalo component class.

<logical> heatSourceIsSettable() Specify whether the heatSource property of the hotHalo component is settable.

<void> heatSourceRate(<double precision> value) Cumulate to the rate of the heatSource property of the HotHaloStandard component.

<double precision> heatSourceRateGet() Returns a zero rate for the heatSource property for the hotHalo component class.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<type(abundances)> hotHaloCoolingAbundances() Returns the default value for the hotHaloCoolingAbundances property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> hotHaloCoolingAbundancesAttributeMatch(<l [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the hotHaloCoolingAbundances property

<integer> hotHaloCoolingAbundancesCount() Compute the count of evolvable quantities in the hotHaloCoolingAbundan property of the HotHaloStandard component.

<logical> hotHaloCoolingAbundancesIsGettable() Returns true if the hotHaloCoolingAbundances property is gettable for the hotHalo component class.

<logical> hotHaloCoolingAbundancesIsSettable() Specify whether the hotHaloCoolingAbundances property of the hotHalo component is settable.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAbundancesRateFunction() Set the function to be used for the rate method of the hotHaloCoolingAbundances property of the hotHalo component.

<type(abundances)> hotHaloCoolingAbundancesRateGet() Returns a zero rate for the hotHaloCoolingAbundances property for the hotHalo component class.

<logical> hotHaloCoolingAbundancesRateIsAttached() Return true if the deferred function used to rate the hotHaloCoolingAbundances property of the hotHalo component class has been attached.

<double precision> hotHaloCoolingAngularMomentum() Returns the default value for the hotHaloCoolingAngularMome property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> hotHaloCoolingAngularMomentumAttributeMat [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the hotHaloCoolingAngularMomentum property

<integer> hotHaloCoolingAngularMomentumCount() Compute the count of evolvable quantities in the hotHaloCoolingAngularMomentum property of the HotHaloStandard component.

<logical> hotHaloCoolingAngularMomentumIsGettable() Returns true if the hotHaloCoolingAngularMomentum property is gettable for the hotHalo component class.

<logical> hotHaloCoolingAngularMomentumIsSettable() Specify whether the hotHaloCoolingAngularMomentum property of the hotHalo component is settable.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRateFunction() Set the function to be used for the rate method of the hotHaloCoolingAngularMomentum property of the hotHalo component.

<double precision> hotHaloCoolingAngularMomentumRateGet() Returns a zero rate for the hotHaloCoolingAngularMo property for the hotHalo component class.

<logical> hotHaloCoolingAngularMomentumRateIsAttached() Return true if the deferred function used to rate the hotHaloCoolingAngularMomentum property of the hotHalo component class has been attached.

<double precision> hotHaloCoolingMass() Returns the default value for the hotHaloCoolingMass property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> hotHaloCoolingMassAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the hotHaloCoolingMass property

<integer> hotHaloCoolingMassCount() Compute the count of evolvable quantities in the hotHaloCoolingMass property of the HotHaloStandard component.

<logical> hotHaloCoolingMassIsGettable() Returns true if the hotHaloCoolingMass property is gettable for the hotHalo component class.

<logical> hotHaloCoolingMassIsSettable() Specify whether the hotHaloCoolingMass property of the hotHalo component is settable.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRateFunction() Set the function to be used for the rate method of the hotHaloCoolingMass property of the hotHalo component.

<double precision> hotHaloCoolingMassRateGet() Returns a zero rate for the hotHaloCoolingMass property for the hotHalo component class.

<logical> hotHaloCoolingMassRateIsAttached() Return true if the deferred function used to rate the hotHaloCoolingMass property of the hotHalo component class has been attached.

<void> initialize() Initialize a verySimple member of the hotHalo component.

<logical> isInitialized() Returns the default value for the isInitialized property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> isInitializedAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the isInitialized property

<logical> isInitializedIsGettable() Returns true if the isInitialized property is gettable for the hotHalo component class.

<logical> isInitializedIsSettable() Specify whether the isInitialized property of the hotHalo component is settable.

<logical> isInitializedRateGet() Returns a zero rate for the isInitialized property for the hotHalo component class.

<void> isInitializedSet(<logical> value) Set the isInitialized property of the hotHalo component.

<double precision> mass() Get the mass property of an verySimple implementation of the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> massAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the mass property

<double precision> massCold() Returns the default value for the massCold property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> massColdAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the massCold property

<integer> massColdCount() Compute the count of evolvable quantities in the massCold property of the HotHaloColdMode component.

<logical> massColdIsGettable() Returns true if the massCold property is gettable for the hotHalo component class.

<logical> massColdIsSettable() Specify whether the massCold property of the hotHalo component is settable.

<void> massColdRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accept a rate set for the massCold property of the hotHalo component class. Trigger an interrupt to create the component.

<double precision> massColdRateGet() Returns a zero rate for the massCold property for the hotHalo component class.

<void> massColdScale(<double precision> value) Set the scale of the massCold property of the HotHaloColdMode component.

<void> massColdSet(<double precision> value) Set the massCold property of the hotHalo component.

<integer> massCount() Return a count of the number of scalar properties in the mass property of an verySimple implementation of the hotHalo component class.

<void> massInactive() Indicate that the mass property of an verySimple implementation of the hotHalo component class is inactive for differential equation solving.

<logical> massIsGettable() Returns true if the mass property is gettable for the hotHalo component class.

<logical> massIsSettable() Specify whether the mass property of the hotHalo component is settable.

<void> massRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate to the rate of change of the mass property of an verySimple implementation of the hotHalo component class.

<double precision> massRateGet() Get the rate of change of the mass property of an verySimple implementation of the hotHalo component class.

<void> massScale(<double precision> setValue→) Set the absolute scale of the mass property of an verySimple implementation of the hotHalo component class.

<void> massSet(<double precision> setValue→) Set the mass property of an verySimple implementation of the hotHalo component class.

<double precision> massSink() Returns the default value for the massSink property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> massSinkAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the massSink property

<integer> massSinkCount() Compute the count of evolvable quantities in the massSink property of the HotHaloStandard component.

<logical> massSinkIsGettable() Returns true if the massSink property is gettable for the hotHalo component class.

<logical> massSinkIsSettable() Specify whether the massSink property of the hotHalo component is settable.

<void> massSinkRate(<double precision> value) Cumulate to the rate of the massSink property of the HotHaloStandard component.

<double precision> massSinkRateGet() Returns a zero rate for the massSink property for the hotHalo component class.

<double precision> massTotal() Returns the default value for the massTotal property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> massTotalAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the massTotal property

<logical> massTotalIsGettable() Returns true if the massTotal property is gettable for the hotHalo component class.

<logical> massTotalIsSettable() Specify whether the massTotal property of the hotHalo component is settable.

<double precision> massTotalRateGet() Returns a zero rate for the massTotal property for the hotHalo component class.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a verySimple implementation of the hotHalo component class.

<logical> nullIsActive() Return true if the null implementation of the hotHalo component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<double precision> outerRadius() Get the value of the outerRadius property of the verySimple implementation of the hotHalo component using a deferred function.

<type(varying_string), allocatable, dimension(:) => matches> outerRadiusAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the outerRadius property

<integer> outerRadiusCount() Compute the count of evolvable quantities in the outerRadius property of the HotHaloStandard component.

<void> outerRadiusFunction() Set the function to be used for the get method of the outerRadius property of the HotHaloVerySimple component.

<logical> outerRadiusIsAttached() Return true if the deferred function used to get the outerRadius property of the HotHaloVerySimple component class has been attached.

<logical> outerRadiusIsGettable() Returns true if the outerRadius property is gettable for the hotHalo component class.

<logical> outerRadiusIsSettable() Specify whether the outerRadius property of the hotHalo component is settable.

<void> outerRadiusRate(<double precision> value) Cumulate to the rate of the outerRadius property of the HotHaloStandard component.

<double precision> outerRadiusRateGet() Returns a zero rate for the outerRadius property for the hotHalo component class.

<void> outerRadiusScale(<double precision> value) Set the scale of the outerRadius property of the HotHaloStandard component.

<void> outerRadiusSet(<double precision> value) Set the outerRadius property of the hotHalo component.

<type(abundances)> outflowedAbundances() Returns the default value for the outflowedAbundances property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> outflowedAbundancesAttributeMatch(<logica
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the hotHalo class that have the desired attributes for the outflowedAbundances property

<integer> outflowedAbundancesCount() Compute the count of evolvable quantities in the outflowedAbundances property of the HotHaloStandard component.

<logical> outflowedAbundancesIsGettable() Returns true if the outflowedAbundances property is gettable for the hotHalo component class.

<logical> outflowedAbundancesIsSettable() Specify whether the outflowedAbundances property of the hotHalo component is settable.

<void> outflowedAbundancesRate(<type(abundances)> value) Cumulate to the rate of the outflowedAbundances property of the HotHaloStandard component.

<type(abundances)> outflowedAbundancesRateGet() Returns a zero rate for the outflowedAbundances property for the hotHalo component class.

<void> outflowedAbundancesScale(<type(abundances)> value) Set the scale of the outflowedAbundances property of the HotHaloStandard component.

<void> outflowedAbundancesSet(<type(abundances)> value) Set the outflowedAbundances property of the hotHalo component.

<double precision> outflowedAngularMomentum() Returns the default value for the outflowedAngularMomentum property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> outflowedAngularMomentumAttributeMatch(<l [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the outflowedAngularMomentum property

<integer> outflowedAngularMomentumCount() Compute the count of evolvable quantities in the outflowedAngularMomen property of the HotHaloStandard component.

<logical> outflowedAngularMomentumIsGettable() Returns true if the outflowedAngularMomentum property is gettable for the hotHalo component class.

<logical> outflowedAngularMomentumIsSettable() Specify whether the outflowedAngularMomentum property of the hotHalo component is settable.

<void> outflowedAngularMomentumRate(<double precision> value) Cumulate to the rate of the outflowedAngularMomentum property of the HotHaloStandard component.

<double precision> outflowedAngularMomentumRateGet() Returns a zero rate for the outflowedAngularMomentum property for the hotHalo component class.

<void> outflowedAngularMomentumScale(<double precision> value) Set the scale of the outflowedAngularMomentum property of the HotHaloStandard component.

<void> outflowedAngularMomentumSet(<double precision> value) Set the outflowedAngularMomentum property of the hotHalo component.

<double precision> outflowedMass() Returns the default value for the outflowedMass property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> outflowedMassAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the outflowedMass property

<integer> outflowedMassCount() Compute the count of evolvable quantities in the outflowedMass property of the HotHaloStandard component.

<logical> outflowedMassIsGettable() Returns true if the outflowedMass property is gettable for the hotHalo component class.

<logical> outflowedMassIsSettable() Specify whether the outflowedMass property of the hotHalo component is settable.

<void> outflowedMassRate(<double precision> value) Cumulate to the rate of the outflowedMass property of the HotHaloStandard component.

<double precision> outflowedMassRateGet() Returns a zero rate for the outflowedMass property for the hotHalo component class.

<void> outflowedMassScale(<double precision> value) Set the scale of the outflowedMass property of the HotHaloStandard component.

<void> outflowedMassSet(<double precision> value) Set the outflowedMass property of the hotHalo component.

<type(abundances)> outflowingAbundances() Returns the default value for the outflowingAbundances property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> outflowingAbundancesAttributeMatch(<logic [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the outflowingAbundances property

<integer> outflowingAbundancesCount() Compute the count of evolvable quantities in the outflowingAbundances property of the HotHaloStandard component.

<logical> outflowingAbundancesIsGettable() Returns true if the outflowingAbundances property is gettable for the hotHalo component class.

<logical> outflowingAbundancesIsSettable() Specify whether the outflowingAbundances property of the hotHalo component is settable.

<void> outflowingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the outflowingAbundances property of the verySimple implementation of the hotHalo component using a deferred function.

<void> outflowingAbundancesRateFunction() Set the function to be used for the rate method of the outflowingAbundances property of the HotHaloVerySimple component.

<type(abundances)> outflowingAbundancesRateGet() Returns a zero rate for the outflowingAbundances property for the hotHalo component class.

<logical> outflowingAbundancesRateIsAttached() Return true if the deferred function used to rate the outflowingAbundances property of the HotHaloVerySimple component class has been attached.

<double precision> outflowingAngularMomentum() Returns the default value for the outflowingAngularMomentum property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> outflowingAngularMomentumAttributeMatch(< [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the outflowingAngularMomentum property

<integer> outflowingAngularMomentumCount() Compute the count of evolvable quantities in the outflowingAngularMomentum property of the HotHaloStandard component.

<logical> outflowingAngularMomentumIsGettable() Returns true if the outflowingAngularMomentum property is gettable for the hotHalo component class.

<logical> outflowingAngularMomentumIsSettable() Specify whether the outflowingAngularMomentum property of the hotHalo component is settable.

<void> outflowingAngularMomentumRate(<double precision> value) Cumulate to the rate of the outflowingAngularMomentum property of the HotHaloStandard component.

<double precision> outflowingAngularMomentumRateGet() Returns a zero rate for the outflowingAngularMomentum property for the hotHalo component class.

<double precision> outflowingMass() Returns the default value for the outflowingMass property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> outflowingMassAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the outflowingMass property

<integer> outflowingMassCount() Compute the count of evolvable quantities in the outflowingMass property of the HotHaloStandard component.

<logical> outflowingMassIsGettable() Returns true if the outflowingMass property is gettable for the hotHalo component class.

<logical> outflowingMassIsSettable() Specify whether the outflowingMass property of the hotHalo component is settable.

<void> outflowingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interrupt [interruptProcedure]↔) Accumulate the rate of change of the outflowingMass property of the verySimple implementation of the hotHalo component using a deferred function.

<void> outflowingMassRateFunction() Set the function to be used for the rate method of the outflowingMass property of the HotHaloVerySimple component.

<double precision> outflowingMassRateGet() Returns a zero rate for the outflowingMass property for the hotHalo component class.

<logical> outflowingMassRateIsAttached() Return true if the deferred function used to rate the outflowingMass property of the HotHaloVerySimple component class has been attached.

<logical> outflowTrackingIsActive() Return true if the outflowTracking implementation of the hotHalo component is the active choice.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a hotHalo component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a verySimple implementation of the hotHalo component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Return the names of properties to output for a verySimple implementation of the hotHalo component.

<void> postOutput(<double precision> time→) Perform post-output processing for a verySimple implementation of the hotHalo component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→) Compute offsets into serialization arrays for a verySimple implementation of the hotHalo component.

<void> serializeASCII() Serialize the contents of a verySimple implementation of the hotHalo component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the serialization of a verySimple implementation of the hotHalo component.

<void> serializeRaw(<integer> fileHandle→) Serialize the contents of a verySimple implementation of the hotHalo component to raw (binary) file.

<void> serializeValues(<double precision[:]> array←, <integer> propertyType→) Serialize evolvable properties of a verySimple implementation of the hotHalo component to array.

<void> serializeXML(<integer> fileHandle→) Serialize the contents of a verySimple implementation of the hotHalo component to XML.

<integer(c_size_t)> sizeOf() Return the size in bytes of a verySimple implementation of the hotHalo component.

<logical> standardIsActive() Return true if the standard implementation of the hotHalo component is the active choice.

<type(abundances)> strippedAbundances() Returns the default value for the strippedAbundances property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> strippedAbundancesAttributeMatch(<logical [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the strippedAbundances property

<integer> strippedAbundancesCount() Compute the count of evolvable quantities in the strippedAbundances property of the HotHaloStandard component.

<logical> strippedAbundancesIsGettable() Returns true if the strippedAbundances property is gettable for the hotHalo component class.

<logical> strippedAbundancesIsSettable() Specify whether the strippedAbundances property of the hotHalo component is settable.

<void> strippedAbundancesRate(<type(abundances)> value) Cumulate to the rate of the strippedAbundances property of the HotHaloStandard component.

<type(abundances)> strippedAbundancesRateGet() Returns a zero rate for the strippedAbundances property for the hotHalo component class.

<void> strippedAbundancesScale(<type(abundances)> value) Set the scale of the strippedAbundances property of the HotHaloStandard component.

<void> strippedAbundancesSet(<type(abundances)> value) Set the strippedAbundances property of the hotHalo component.

<double precision> strippedMass() Returns the default value for the strippedMass property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> strippedMassAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the strippedMass property

<integer> strippedMassCount() Compute the count of evolvable quantities in the strippedMass property of the HotHaloStandard component.

<logical> strippedMassIsGettable() Returns true if the strippedMass property is gettable for the hotHalo component class.

<logical> strippedMassIsSettable() Specify whether the strippedMass property of the hotHalo component is settable.

<void> strippedMassRate(<double precision> value) Cumulate to the rate of the strippedMass property of the HotHaloStandard component.

<double precision> strippedMassRateGet() Returns a zero rate for the strippedMass property for the hotHalo component class.

<void> strippedMassScale(<double precision> value) Set the scale of the strippedMass property of the HotHaloStandard component.

<void> strippedMassSet(<double precision> value) Set the strippedMass property of the hotHalo component.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<type(abundances)> trackedOutflowAbundances() Returns the default value for the trackedOutflowAbundances property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> trackedOutflowAbundancesAttributeMatch(<l [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the trackedOutflowAbundances property

<integer> trackedOutflowAbundancesCount() Compute the count of evolvable quantities in the trackedOutflowAbundan property of the HotHaloOutflowTracking component.

<logical> trackedOutflowAbundancesIsGettable() Returns true if the trackedOutflowAbundances property is gettable for the hotHalo component class.

<logical> trackedOutflowAbundancesIsSettable() Specify whether the trackedOutflowAbundances property of the hotHalo component is settable.

<void> trackedOutflowAbundancesRate(<type(abundances)> value) Cumulate to the rate of the trackedOutflowAbundances property of the HotHaloOutflowTracking component.

<type(abundances)> trackedOutflowAbundancesRateGet() Returns a zero rate for the trackedOutflowAbundances property for the hotHalo component class.

<void> trackedOutflowAbundancesScale(<type(abundances)> value) Set the scale of the trackedOutflowAbundances property of the HotHaloOutflowTracking component.

<void> trackedOutflowAbundancesSet(<type(abundances)> value) Set the trackedOutflowAbundances property of the hotHalo component.

<double precision> trackedOutflowMass() Returns the default value for the trackedOutflowMass property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> trackedOutflowMassAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the trackedOutflowMass property

<integer> trackedOutflowMassCount() Compute the count of evolvable quantities in the trackedOutflowMass property of the HotHaloOutflowTracking component.

<logical> trackedOutflowMassIsGettable() Returns true if the trackedOutflowMass property is gettable for the hotHalo component class.

<logical> trackedOutflowMassIsSettable() Specify whether the trackedOutflowMass property of the hotHalo component is settable.

<void> trackedOutflowMassRate(<double precision> value) Cumulate to the rate of the trackedOutflowMass property of the HotHaloOutflowTracking component.

<double precision> trackedOutflowMassRateGet() Returns a zero rate for the trackedOutflowMass property for the hotHalo component class.

<void> trackedOutflowMassScale(<double precision> value) Set the scale of the trackedOutflowMass property of the HotHaloOutflowTracking component.

<void> trackedOutflowMassSet(<double precision> value) Set the trackedOutflowMass property of the hotHalo component.

<type(varying_string)> type() Returns the type name for the verySimple implementation of the hotHalo component class.

<double precision> unaccretedMass() Get the unaccretedMass property of an verySimple implementation of the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> unaccretedMassAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the unaccretedMass property

<integer> unaccretedMassCount() Return a count of the number of scalar properties in the unaccretedMass property of an verySimple implementation of the hotHalo component class.

<void> unaccretedMassInactive() Indicate that the unaccretedMass property of an verySimple implementation of the hotHalo component class is inactive for differential equation solving.

<logical> unaccretedMassIsGettable() Returns true if the unaccretedMass property is gettable for the hotHalo component class.

<logical> unaccretedMassIsSettable() Specify whether the unaccretedMass property of the hotHalo component is settable.

<void> unaccretedMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interrupt [interruptProcedure]↔) Accumulate to the rate of change of the unaccretedMass property of an verySimple implementation of the hotHalo component class.

<double precision> unaccretedMassRateGet() Get the rate of change of the unaccretedMass property of an verySimple implementation of the hotHalo component class.

<void> unaccretedMassScale(<double precision> setValue→) Set the absolute scale of the unaccretedMass property of an verySimple implementation of the hotHalo component class.

<void> unaccretedMassSet(<double precision> setValue→) Set the unaccretedMass property of an verySimple implementation of the hotHalo component class.

<logical> verySimpleDelayedIsActive() Return true if the verySimpleDelayed implementation of the hotHalo component is the active choice.

<logical> verySimpleIsActive() Return true if the verySimple implementation of the hotHalo component is the active choice.

nodeComponentHotHaloVerySimpleDelayed

<type(abundances)> abundances() Get the abundances property of an verySimple implementation of the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> abundancesAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the abundances property

<type(abundances)> abundancesCold() Returns the default value for the abundancesCold property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> abundancesColdAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the abundancesCold property

<integer> abundancesColdCount() Compute the count of evolvable quantities in the abundancesCold property of the HotHaloColdMode component.

<logical> abundancesColdIsGettable() Returns true if the abundancesCold property is gettable for the hotHalo component class.

<logical> abundancesColdIsSettable() Specify whether the abundancesCold property of the hotHalo component is settable.

<void> abundancesColdRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interrupt
[interruptProcedure]↔) Accept a rate set for the abundancesCold property of the hotHalo component class. Trigger an interrupt to create the component.

<type(abundances)> abundancesColdRateGet() Returns a zero rate for the abundancesCold property for the hotHalo component class.

<void> abundancesColdScale(<type(abundances)> value) Set the scale of the abundancesCold property of the HotHaloColdMode component.

<void> abundancesColdSet(<type(abundances)> value) Set the abundancesCold property of the hotHalo component.

<integer> abundancesCount() Return a count of the number of scalar properties in the abundances property of an verySimple implementation of the hotHalo component class.

<void> abundancesInactive() Indicate that the abundances property of an verySimple implementation of the hotHalo component class is inactive for differential equation solving.

<logical> abundancesIsGettable() Returns true if the abundances property is gettable for the hotHalo component class.

<logical> abundancesIsSettable() Specify whether the abundances property of the hotHalo component is settable.

<void> abundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask
[interruptProcedure]↔) Accumulate to the rate of change of the abundances property of an verySimple implementation of the hotHalo component class.

<type(abundances)> abundancesRateGet() Get the rate of change of the abundances property of an verySimple implementation of the hotHalo component class.

<void> abundancesScale(<type(abundances)> setValue→) Set the absolute scale of the abundances property of an verySimple implementation of the hotHalo component class.

<void> abundancesSet(<type(abundances)> setValue→) Set the abundances property of an verySimple implementation of the hotHalo component class.

<double precision> angularMomentum() Returns the default value for the angularMomentum property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> angularMomentumAttributeMatch(<logical>
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the hotHalo class that have the desired attributes for the angularMomentum property

<double precision> angularMomentumCold() Returns the default value for the angularMomentumCold property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> angularMomentumColdAttributeMatch(<logica
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the hotHalo class that have the desired attributes for the angularMomentumCold property

<integer> angularMomentumColdCount() Compute the count of evolvable quantities in the angularMomentumCold property of the HotHaloColdMode component.

<logical> angularMomentumColdIsGettable() Returns true if the angularMomentumCold property is gettable for the hotHalo component class.

<logical> angularMomentumColdIsSettable() Specify whether the angularMomentumCold property of the hotHalo component is settable.

<void> angularMomentumColdRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accept a rate set for the angularMomentumCold property of the hotHalo component class. Trigger an interrupt to create the component.

<double precision> angularMomentumColdRateGet() Returns a zero rate for the angularMomentumCold property for the hotHalo component class.

<void> angularMomentumColdScale(<double precision> value) Set the scale of the angularMomentumCold property of the HotHaloColdMode component.

<void> angularMomentumColdSet(<double precision> value) Set the angularMomentumCold property of the hotHalo component.

<integer> angularMomentumCount() Compute the count of evolvable quantities in the angularMomentum property of the HotHaloStandard component.

<logical> angularMomentumIsGettable() Returns true if the angularMomentum property is gettable for the hotHalo component class.

<logical> angularMomentumIsSettable() Specify whether the angularMomentum property of the hotHalo component is settable.

<void> angularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interrup [interruptProcedure]↔) Accept a rate set for the angularMomentum property of the hotHalo component class. Trigger an interrupt to create the component.

<double precision> angularMomentumRateGet() Returns a zero rate for the angularMomentum property for the hotHalo component class.

<void> angularMomentumScale(<double precision> value) Set the scale of the angularMomentum property of the HotHaloStandard component.

<void> angularMomentumSet(<double precision> value) Set the angularMomentum property of the hotHalo component.

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a verySimpleDelayed implementation of the hotHalo component from a supplied XML definition.

<type(chemicalAbundances)> chemicals() Returns the default value for the chemicals property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> chemicalsAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the chemicals property

<integer> chemicalsCount() Compute the count of evolvable quantities in the chemicals property of the HotHaloStandard component.

<logical> chemicalsIsGettable() Returns true if the chemicals property is gettable for the hotHalo component class.

<logical> chemicalsIsSettable() Specify whether the chemicals property of the hotHalo component is settable.

<void> chemicalsRate(<type(chemicalAbundances)> setValue→, <logical> [interrupt]↔, <*procedure(interr
[interruptProcedure]↔) Accept a rate set for the chemicals property of the hotHalo component class. Trigger an interrupt to create the component.

<type(chemicalAbundances)> chemicalsRateGet() Returns a zero rate for the chemicals property for the hotHalo component class.

<void> chemicalsScale(<type(chemicalAbundances)> value) Set the scale of the chemicals property of the HotHaloStandard component.

<void> chemicalsSet(<type(chemicalAbundances)> value) Set the chemicals property of the hotHalo component.

<logical> coldModeIsActive() Return true if the coldMode implementation of the hotHalo component is the active choice.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a verySimpleDelayed implementation of the hotHalo component from raw (binary) file.

<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→) Deserialize evolvable properties of a verySimpleDelayed implementation of the hotHalo component from array.

<void> destroy() Finalize a verySimpleDelayed implementation of the hotHalo component.

<void> dumpASCII() Dump the content of a hotHalo component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<double precision> heatSource() Returns the default value for the heatSource property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> heatSourceAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the heatSource property

<integer> heatSourceCount() Compute the count of evolvable quantities in the heatSource property of the HotHaloStandard component.

<logical> heatSourceIsGettable() Returns true if the heatSource property is gettable for the hotHalo component class.

<logical> heatSourceIsSettable() Specify whether the heatSource property of the hotHalo component is settable.

<void> heatSourceRate(<double precision> value) Cumulate to the rate of the heatSource property of the HotHaloStandard component.

<double precision> heatSourceRateGet() Returns a zero rate for the heatSource property for the hotHalo component class.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<type(abundances)> hotHaloCoolingAbundances() Returns the default value for the hotHaloCoolingAbundances property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> hotHaloCoolingAbundancesAttributeMatch(<l
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the hotHalo class that have the desired attributes for the hotHaloCoolingAbundances property

<integer> hotHaloCoolingAbundancesCount() Compute the count of evolvable quantities in the hotHaloCoolingAbundan
property of the HotHaloStandard component.

<logical> hotHaloCoolingAbundancesIsGettable() Returns true if the hotHaloCoolingAbundances property is gettable for the hotHalo component class.

<logical> hotHaloCoolingAbundancesIsSettable() Specify whether the hotHaloCoolingAbundances property of the hotHalo component is settable.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔,
<*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAbundancesRateFunction() Set the function to be used for the rate method of the hotHaloCoolingAbundances property of the hotHalo component.

<type(abundances)> hotHaloCoolingAbundancesRateGet() Returns a zero rate for the hotHaloCoolingAbundances property for the hotHalo component class.

<logical> hotHaloCoolingAbundancesRateIsAttached() Return true if the deferred function used to rate the hotHaloCoolingAbundances property of the hotHalo component class has been attached.

<double precision> hotHaloCoolingAngularMomentum() Returns the default value for the hotHaloCoolingAngularMome
property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> hotHaloCoolingAngularMomentumAttributeMat
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the hotHalo class that have the desired attributes for the hotHaloCoolingAngularMomentum property

<integer> hotHaloCoolingAngularMomentumCount() Compute the count of evolvable quantities in the hotHaloCoolingAngularMomentum property of the HotHaloStandard component.

<logical> hotHaloCoolingAngularMomentumIsGettable() Returns true if the hotHaloCoolingAngularMomentum property is gettable for the hotHalo component class.

<logical> hotHaloCoolingAngularMomentumIsSettable() Specify whether the hotHaloCoolingAngularMomentum property of the hotHalo component is settable.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRateFunction() Set the function to be used for the rate method of the hotHaloCoolingAngularMomentum property of the hotHalo component.

<double precision> hotHaloCoolingAngularMomentumRateGet() Returns a zero rate for the hotHaloCoolingAngularMo property for the hotHalo component class.

<logical> hotHaloCoolingAngularMomentumRateIsAttached() Return true if the deferred function used to rate the hotHaloCoolingAngularMomentum property of the hotHalo component class has been attached.

<double precision> hotHaloCoolingMass() Returns the default value for the hotHaloCoolingMass property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> hotHaloCoolingMassAttributeMatch(<logical [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the hotHaloCoolingMass property

<integer> hotHaloCoolingMassCount() Compute the count of evolvable quantities in the hotHaloCoolingMass property of the HotHaloStandard component.

<logical> hotHaloCoolingMassIsGettable() Returns true if the hotHaloCoolingMass property is gettable for the hotHalo component class.

<logical> hotHaloCoolingMassIsSettable() Specify whether the hotHaloCoolingMass property of the hotHalo component is settable.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRateFunction() Set the function to be used for the rate method of the hotHaloCoolingMass property of the hotHalo component.

<double precision> hotHaloCoolingMassRateGet() Returns a zero rate for the hotHaloCoolingMass property for the hotHalo component class.

<logical> hotHaloCoolingMassRateIsAttached() Return true if the deferred function used to rate the hotHaloCoolingMass property of the hotHalo component class has been attached.

<void> initialize() Initialize a verySimpleDelayed member of the hotHalo component.

<logical> isInitialized() Returns the default value for the isInitialized property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> isInitializedAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the isInitialized property

<logical> isInitializedIsGettable() Returns true if the isInitialized property is gettable for the hotHalo component class.

<logical> isInitializedIsSettable() Specify whether the isInitialized property of the hotHalo component is settable.

<logical> isInitializedRateGet() Returns a zero rate for the isInitialized property for the hotHalo component class.

<void> isInitializedSet(<logical> value) Set the isInitialized property of the hotHalo component.

<double precision> mass() Get the mass property of an verySimple implementation of the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> massAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the mass property

<double precision> massCold() Returns the default value for the massCold property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> massColdAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the massCold property

<integer> massColdCount() Compute the count of evolvable quantities in the massCold property of the HotHaloColdMode component.

<logical> massColdIsGettable() Returns true if the massCold property is gettable for the hotHalo component class.

<logical> massColdIsSettable() Specify whether the massCold property of the hotHalo component is settable.

<void> massColdRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accept a rate set for the massCold property of the hotHalo component class. Trigger an interrupt to create the component.

<double precision> massColdRateGet() Returns a zero rate for the massCold property for the hotHalo component class.

<void> massColdScale(<double precision> value) Set the scale of the massCold property of the HotHaloColdMode component.

<void> massColdSet(<double precision> value) Set the massCold property of the hotHalo component.

<integer> massCount() Return a count of the number of scalar properties in the mass property of an verySimple implementation of the hotHalo component class.

<void> massInactive() Indicate that the mass property of an verySimple implementation of the hotHalo component class is inactive for differential equation solving.

<logical> massIsGettable() Returns true if the mass property is gettable for the hotHalo component class.

<logical> massIsSettable() Specify whether the mass property of the hotHalo component is settable.

<void> massRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate to the rate of change of the mass property of an verySimple implementation of the hotHalo component class.

<double precision> massRateGet() Get the rate of change of the mass property of an verySimple implementation of the hotHalo component class.

<void> massScale(<double precision> setValue→) Set the absolute scale of the mass property of an verySimple implementation of the hotHalo component class.

<void> massSet(<double precision> setValue→) Set the mass property of an verySimple implementation of the hotHalo component class.

<double precision> massSink() Returns the default value for the massSink property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> massSinkAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the massSink property

<integer> massSinkCount() Compute the count of evolvable quantities in the massSink property of the HotHaloStandard component.

<logical> massSinkIsGettable() Returns true if the massSink property is gettable for the hotHalo component class.

<logical> massSinkIsSettable() Specify whether the massSink property of the hotHalo component is settable.

<void> massSinkRate(<double precision> value) Cumulate to the rate of the massSink property of the HotHaloStandard component.

<double precision> massSinkRateGet() Returns a zero rate for the massSink property for the hotHalo component class.

<double precision> massTotal() Returns the default value for the massTotal property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> massTotalAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the massTotal property

<logical> massTotalIsGettable() Returns true if the massTotal property is gettable for the hotHalo component class.

<logical> massTotalIsSettable() Specify whether the massTotal property of the hotHalo component is settable.

<double precision> massTotalRateGet() Returns a zero rate for the massTotal property for the hotHalo component class.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a verySimpleDelayed implementation of the hotHalo component class.

<logical> nullIsActive() Return true if the null implementation of the hotHalo component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<double precision> outerRadius() Get the value of the outerRadius property of the verySimple implementation of the hotHalo component using a deferred function.

<type(varying_string), allocatable, dimension(:) => matches> outerRadiusAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the outerRadius property

<integer> outerRadiusCount() Compute the count of evolvable quantities in the outerRadius property of the HotHaloStandard component.

<void> outerRadiusFunction() Set the function to be used for the get method of the outerRadius property of the HotHaloVerySimple component.

<logical> outerRadiusIsAttached() Return true if the deferred function used to get the outerRadius property of the HotHaloVerySimple component class has been attached.

<logical> outerRadiusIsGettable() Returns true if the outerRadius property is gettable for the hotHalo component class.

<logical> outerRadiusIsSettable() Specify whether the outerRadius property of the hotHalo component is settable.

<void> outerRadiusRate(<double precision> value) Cumulate to the rate of the outerRadius property of the HotHaloStandard component.

<double precision> outerRadiusRateGet() Returns a zero rate for the outerRadius property for the hotHalo component class.

<void> outerRadiusScale(<double precision> value) Set the scale of the outerRadius property of the HotHaloStandard component.

<void> outerRadiusSet(<double precision> value) Set the outerRadius property of the hotHalo component.

<type(abundances)> outflowedAbundances() Get the outflowedAbundances property of an verySimpleDelayed implementation of the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> outflowedAbundancesAttributeMatch(<logica
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the hotHalo class that have the desired attributes for the outflowedAbundances property

<integer> outflowedAbundancesCount() Return a count of the number of scalar properties in the outflowedAbundances property of an verySimpleDelayed implementation of the hotHalo component class.

<void> outflowedAbundancesInactive() Indicate that the outflowedAbundances property of an verySimpleDelayed implementation of the hotHalo component class is inactive for differential equation solving.

<logical> outflowedAbundancesIsGettable() Returns true if the outflowedAbundances property is gettable for the hotHalo component class.

<logical> outflowedAbundancesIsSettable() Specify whether the outflowedAbundances property of the hotHalo component is settable.

<void> outflowedAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔,
<*procedure(interruptTask)> [interruptProcedure]↔) Accumulate to the rate of change of the outflowedAbundances property of an verySimpleDelayed implementation of the hotHalo component class.

<type(abundances)> outflowedAbundancesRateGet() Get the rate of change of the outflowedAbundances property of an verySimpleDelayed implementation of the hotHalo component class.

<void> outflowedAbundancesScale(<type(abundances)> setValue→) Set the absolute scale of the outflowedAbundances property of an verySimpleDelayed implementation of the hotHalo component class.

<void> outflowedAbundancesSet(<type(abundances)> setValue→) Set the outflowedAbundances property of an verySimpleDelayed implementation of the hotHalo component class.

<double precision> outflowedAngularMomentum() Returns the default value for the outflowedAngularMomentum property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> outflowedAngularMomentumAttributeMatch(<
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the hotHalo class that have the desired attributes for the outflowedAngularMomentum property

<integer> outflowedAngularMomentumCount() Compute the count of evolvable quantities in the outflowedAngularMomen
property of the HotHaloStandard component.

<logical> outflowedAngularMomentumIsGettable() Returns true if the outflowedAngularMomentum property is gettable for the hotHalo component class.

<logical> outflowedAngularMomentumIsSettable() Specify whether the outflowedAngularMomentum property of the hotHalo component is settable.

<void> outflowedAngularMomentumRate(<double precision> value) Cumulate to the rate of the outflowedAngularMomentum property of the HotHaloStandard component.

<double precision> outflowedAngularMomentumRateGet() Returns a zero rate for the outflowedAngularMomentum property for the hotHalo component class.

<void> outflowedAngularMomentumScale(<double precision> value) Set the scale of the outflowedAngularMomentum property of the HotHaloStandard component.

<void> outflowedAngularMomentumSet(<double precision> value) Set the outflowedAngularMomentum property of the hotHalo component.

<double precision> outflowedMass() Get the outflowedMass property of an verySimpleDelayed implementation of the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> outflowedMassAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the outflowedMass property

<integer> outflowedMassCount() Return a count of the number of scalar properties in the outflowedMass property of an verySimpleDelayed implementation of the hotHalo component class.

<void> outflowedMassInactive() Indicate that the outflowedMass property of an verySimpleDelayed implementation of the hotHalo component class is inactive for differential equation solving.

<logical> outflowedMassIsGettable() Returns true if the outflowedMass property is gettable for the hotHalo component class.

<logical> outflowedMassIsSettable() Specify whether the outflowedMass property of the hotHalo component is settable.

<void> outflowedMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptT [interruptProcedure]↔) Accumulate to the rate of change of the outflowedMass property of an verySimpleDelayed implementation of the hotHalo component class.

<double precision> outflowedMassRateGet() Get the rate of change of the outflowedMass property of an verySimpleDelayed implementation of the hotHalo component class.

<void> outflowedMassScale(<double precision> setValue→) Set the absolute scale of the outflowedMass property of an verySimpleDelayed implementation of the hotHalo component class.

<void> outflowedMassSet(<double precision> setValue→) Set the outflowedMass property of an verySimpleDelayed implementation of the hotHalo component class.

<type(abundances)> outflowingAbundances() Returns the default value for the outflowingAbundances property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> outflowingAbundancesAttributeMatch(<logic [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the outflowingAbundances property

<integer> outflowingAbundancesCount() Compute the count of evolvable quantities in the outflowingAbundances property of the HotHaloStandard component.

<logical> outflowingAbundancesIsGettable() Returns true if the outflowingAbundances property is gettable for the hotHalo component class.

<logical> outflowingAbundancesIsSettable() Specify whether the outflowingAbundances property of the hotHalo component is settable.

<void> outflowingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the outflowingAbundances property of the verySimple implementation of the hotHalo component using a deferred function.

<void> outflowingAbundancesRateFunction() Set the function to be used for the rate method of the outflowingAbundances property of the HotHaloVerySimple component.

<type(abundances)> outflowingAbundancesRateGet() Returns a zero rate for the outflowingAbundances property for the hotHalo component class.

<logical> outflowingAbundancesRateIsAttached() Return true if the deferred function used to rate the outflowingAbundances property of the HotHaloVerySimple component class has been attached.

<double precision> outflowingAngularMomentum() Returns the default value for the outflowingAngularMomentum property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> outflowingAngularMomentumAttributeMatch(<
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the hotHalo class that have the desired attributes for the outflowingAngularMomentum property

<integer> outflowingAngularMomentumCount() Compute the count of evolvable quantities in the outflowingAngularMomentum property of the HotHaloStandard component.

<logical> outflowingAngularMomentumIsGettable() Returns true if the outflowingAngularMomentum property is gettable for the hotHalo component class.

<logical> outflowingAngularMomentumIsSettable() Specify whether the outflowingAngularMomentum property of the hotHalo component is settable.

<void> outflowingAngularMomentumRate(<double precision> value) Cumulate to the rate of the outflowingAngularMomentum property of the HotHaloStandard component.

<double precision> outflowingAngularMomentumRateGet() Returns a zero rate for the outflowingAngularMomentum property for the hotHalo component class.

<double precision> outflowingMass() Returns the default value for the outflowingMass property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> outflowingMassAttributeMatch(<logical>
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the hotHalo class that have the desired attributes for the outflowingMass property

<integer> outflowingMassCount() Compute the count of evolvable quantities in the outflowingMass property of the HotHaloStandard component.

<logical> outflowingMassIsGettable() Returns true if the outflowingMass property is gettable for the hotHalo component class.

<logical> outflowingMassIsSettable() Specify whether the outflowingMass property of the hotHalo component is settable.

<void> outflowingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interrupt [interruptProcedure]↔) Accumulate the rate of change of the outflowingMass property of the verySimple implementation of the hotHalo component using a deferred function.

<void> outflowingMassRateFunction() Set the function to be used for the rate method of the outflowingMass property of the HotHaloVerySimple component.

<double precision> outflowingMassRateGet() Returns a zero rate for the outflowingMass property for the hotHalo component class.

<logical> outflowingMassRateIsAttached() Return true if the deferred function used to rate the outflowingMass property of the HotHaloVerySimple component class has been attached.

<logical> outflowTrackingIsActive() Return true if the outflowTracking implementation of the hotHalo component is the active choice.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a hotHalo component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a verySimpleDelayed implementation of the hotHalo component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Return the names of properties to output for a verySimpleDelayed implementation of the hotHalo component.

<void> postOutput(<double precision> time→) Perform post-output processing for a verySimpleDelayed implementation of the hotHalo component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→) Compute offsets into serialization arrays for a verySimpleDelayed implementation of the hotHalo component.

<void> serializeASCII() Serialize the contents of a verySimpleDelayed implementation of the hotHalo component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the serialization of a verySimpleDelayed implementation of the hotHalo component.

<void> serializeRaw(<integer> fileHandle→) Serialize the contents of a verySimpleDelayed implementation of the hotHalo component to raw (binary) file.

<void> serializeValues(<double precision[:]> array←, <integer> propertyType→) Serialize evolvable properties of a verySimpleDelayed implementation of the hotHalo component to array.

<void> serializeXML(<integer> fileHandle→) Serialize the contents of a verySimpleDelayed implementation of the hotHalo component to XML.

<integer(c_size_t)> sizeOf() Return the size in bytes of a verySimpleDelayed implementation of the hotHalo component.

<logical> standardIsActive() Return true if the standard implementation of the hotHalo component is the active choice.

<type(abundances)> strippedAbundances() Returns the default value for the strippedAbundances property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> strippedAbundancesAttributeMatch(<logical [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the strippedAbundances property

<integer> strippedAbundancesCount() Compute the count of evolvable quantities in the strippedAbundances property of the HotHaloStandard component.

<logical> strippedAbundancesIsGettable() Returns true if the strippedAbundances property is gettable for the hotHalo component class.

<logical> strippedAbundancesIsSettable() Specify whether the strippedAbundances property of the hotHalo component is settable.

<void> strippedAbundancesRate(<type(abundances)> value) Cumulate to the rate of the strippedAbundances property of the HotHaloStandard component.

<type(abundances)> strippedAbundancesRateGet() Returns a zero rate for the strippedAbundances property for the hotHalo component class.

<void> strippedAbundancesScale(<type(abundances)> value) Set the scale of the strippedAbundances property of the HotHaloStandard component.

<void> strippedAbundancesSet(<type(abundances)> value) Set the strippedAbundances property of the hotHalo component.

<double precision> strippedMass() Returns the default value for the strippedMass property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> strippedMassAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the strippedMass property

<integer> strippedMassCount() Compute the count of evolvable quantities in the strippedMass property of the HotHaloStandard component.

<logical> strippedMassIsGettable() Returns true if the strippedMass property is gettable for the hotHalo component class.

<logical> strippedMassIsSettable() Specify whether the strippedMass property of the hotHalo component is settable.

<void> strippedMassRate(<double precision> value) Cumulate to the rate of the strippedMass property of the HotHaloStandard component.

<double precision> strippedMassRateGet() Returns a zero rate for the strippedMass property for the hotHalo component class.

<void> strippedMassScale(<double precision> value) Set the scale of the strippedMass property of the HotHaloStandard component.

<void> strippedMassSet(<double precision> value) Set the strippedMass property of the hotHalo component.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<type(abundances)> trackedOutflowAbundances() Returns the default value for the trackedOutflowAbundances property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> trackedOutflowAbundancesAttributeMatch(<l [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the trackedOutflowAbundances property

<integer> trackedOutflowAbundancesCount() Compute the count of evolvable quantities in the trackedOutflowAbundan property of the HotHaloOutflowTracking component.

<logical> trackedOutflowAbundancesIsGettable() Returns true if the trackedOutflowAbundances property is gettable for the hotHalo component class.

<logical> trackedOutflowAbundancesIsSettable() Specify whether the trackedOutflowAbundances property of the hotHalo component is settable.

<void> trackedOutflowAbundancesRate(<type(abundances)> value) Cumulate to the rate of the trackedOutflowAbundances property of the HotHaloOutflowTracking component.

<type(abundances)> trackedOutflowAbundancesRateGet() Returns a zero rate for the trackedOutflowAbundances property for the hotHalo component class.

<void> trackedOutflowAbundancesScale(<type(abundances)> value) Set the scale of the trackedOutflowAbundances property of the HotHaloOutflowTracking component.

<void> trackedOutflowAbundancesSet(<type(abundances)> value) Set the trackedOutflowAbundances property of the hotHalo component.

<double precision> trackedOutflowMass() Returns the default value for the trackedOutflowMass property for the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> trackedOutflowMassAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the trackedOutflowMass property

<integer> trackedOutflowMassCount() Compute the count of evolvable quantities in the trackedOutflowMass property of the HotHaloOutflowTracking component.

<logical> trackedOutflowMassIsGettable() Returns true if the trackedOutflowMass property is gettable for the hotHalo component class.

<logical> trackedOutflowMassIsSettable() Specify whether the trackedOutflowMass property of the hotHalo component is settable.

<void> trackedOutflowMassRate(<double precision> value) Cumulate to the rate of the trackedOutflowMass property of the HotHaloOutflowTracking component.

<double precision> trackedOutflowMassRateGet() Returns a zero rate for the trackedOutflowMass property for the hotHalo component class.

<void> trackedOutflowMassScale(<double precision> value) Set the scale of the trackedOutflowMass property of the HotHaloOutflowTracking component.

<void> trackedOutflowMassSet(<double precision> value) Set the trackedOutflowMass property of the hotHalo component.

<type(varying_string)> type() Returns the type name for the verySimpleDelayed implementation of the hotHalo component class.

<double precision> unaccretedMass() Get the unaccretedMass property of an verySimple implementation of the hotHalo component class.

<type(varying_string), allocatable, dimension(:) => matches> unaccretedMassAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the hotHalo class that have the desired attributes for the unaccretedMass property

<integer> unaccretedMassCount() Return a count of the number of scalar properties in the unaccretedMass property of an verySimple implementation of the hotHalo component class.

<void> unaccretedMassInactive() Indicate that the unaccretedMass property of an verySimple implementation of the hotHalo component class is inactive for differential equation solving.

<logical> unaccretedMassIsGettable() Returns true if the unaccretedMass property is gettable for the hotHalo component class.

<logical> unaccretedMassIsSettable() Specify whether the unaccretedMass property of the hotHalo component is settable.

<void> unaccretedMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interrupt [interruptProcedure]↔) Accumulate to the rate of change of the unaccretedMass property of an verySimple implementation of the hotHalo component class.

<double precision> unaccretedMassRateGet() Get the rate of change of the unaccretedMass property of an verySimple implementation of the hotHalo component class.

<void> unaccretedMassScale(<double precision> setValue→) Set the absolute scale of the unaccretedMass property of an verySimple implementation of the hotHalo component class.

<void> unaccretedMassSet(<double precision> setValue→) Set the unaccretedMass property of an verySimple implementation of the hotHalo component class.

<logical> verySimpleDelayedIsActive() Return true if the verySimpleDelayed implementation of the hotHalo component is the active choice.

<logical> verySimpleIsActive() Return true if the verySimple implementation of the hotHalo component is the active choice.

nodeComponentIndices

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<integer(kind=kind_int8) => classDefault> branchTip() Returns the default value for the branchTip property for the indices component class.

<type(varying_string), allocatable, dimension(:) => matches> branchTipAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the indices class that have the desired attributes for the branchTip property

<logical> branchTipIsGettable() Returns true if the branchTip property is gettable for the indices component class.

<logical> branchTipIsSettable() Specify whether the branchTip property of the indices component is settable.

<integer(kind=kind_int8) => classDefault> branchTipRateGet() Returns a zero rate for the branchTip property for the indices component class.

<void> branchTipSet(<integer(kind=kind_int8)> value) Set the branchTip property of the indices component.

<void> builder(<*type(node)> componentDefinition→) Build a generic indices component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Read properties from raw file.

<void> deserializeValues(<double(:)> array→, <integer> propertyType→) Deserialize the evolvable quantities from an array.

<void> destroy() Finalize a generic indices component.

<void> dumpASCII() Dump the content of a indices component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a generic indices component.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a nodeComponent object.

<logical> nullIsActive() Return true if the null implementation of the indices component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a indices component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a generic indices component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Establish the names of properties to output for a generic indices component.

<void> postOutput(<double precision> time→) Perform post-output processing of a indices component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets() Set offsets into serialization arrays.

<void> serializeASCII() Serialize the content of a indices component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the number of evolvable quantities to be evolved.

<void> serializeRaw(<integer> fileHandle→) Generate a binary dump of all properties.

<void> serializeValues(<double(:)> array←, <integer> propertyType→) Serialize the evolvable quantities to an array.

<void> serializeXML() Generate an XML dump of all properties.

<integer(c_size_t)> sizeOf() Return the size in bytes of a nodeComponentIndices component.

<logical> standardIsActive() Return true if the standard implementation of the indices component is the active choice.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<type(varying_string)> type() Returns the type name for the indices component class.

nodeComponentIndicesNull

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<integer(kind=kind_int8) => classDefault> branchTip() Returns the default value for the branchTip property for the indices component class.

<type(varying_string), allocatable, dimension(:) => matches> branchTipAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the indices class that have the desired attributes for the branchTip property

<logical> branchTipIsGettable() Returns true if the branchTip property is gettable for the indices component class.

<logical> branchTipIsSettable() Specify whether the branchTip property of the indices component is settable.

<integer(kind=kind_int8) => classDefault> branchTipRateGet() Returns a zero rate for the branchTip property for the indices component class.

<void> branchTipSet(<integer(kind=kind_int8)> value) Set the branchTip property of the indices component.

<void> builder(<*type(node)> componentDefinition→) Build a null implementation of the indices component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a null implementation of the indices component from raw (binary) file.

<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→) Deserialize evolvable properties of a null implementation of the indices component from array.

<void> destroy() Finalize a null implementation of the indices component.

<void> dumpASCII() Dump the content of a indices component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a null member of the indices component.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a null implementation of the indices component class.

<logical> nullIsActive() Return true if the null implementation of the indices component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a indices component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a null implementation of the indices component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Return the names of properties to output for a null implementation of the indices component.

<void> postOutput(<double precision> time→) Perform post-output processing of a indices component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→) Compute offsets into serialization arrays for a null implementation of the indices component.

<void> serializeASCII() Serialize the contents of a null implementation of the indices component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the serialization of a null implementation of the indices component.

<void> serializeRaw(<integer> fileHandle→) Serialize the contents of a null implementation of the indices component to raw (binary) file.

<void> serializeValues(<double precision[:]> array←, <integer> propertyType→) Serialize evolvable properties of a null implementation of the indices component to array.

<void> serializeXML(<integer> fileHandle→) Serialize the contents of a null implementation of the indices component to XML.

<integer(c_size_t)> sizeOf() Return the size in bytes of a null implementation of the indices component.

<logical> standardIsActive() Return true if the standard implementation of the indices component is the active choice.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<type(varying_string)> type() Returns the type name for the null implementation of the indices component class.

nodeComponentIndicesStandard

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<integer(kind=kind_int8) => propertyValue> branchTip() Get the branchTip property of an standard implementation of the indices component class.

<type(varying_string), allocatable, dimension(:) => matches> branchTipAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the indices class that have the desired attributes for the branchTip property

<logical> branchTipIsGettable() Returns true if the branchTip property is gettable for the indices component class.

<logical> branchTipIsSettable() Specify whether the branchTip property of the indices component is settable.

<integer(kind=kind_int8) => classDefault> branchTipRateGet() Returns a zero rate for the branchTip property for the indices component class.

<void> branchTipSet(<integer(kind=kind_int8)> setValue→) Set the branchTip property of an standard implementation of the indices component class.

<void> builder(<*type(node)> componentDefinition→) Build a standard implementation of the indices component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a standard implementation of the indices component from raw (binary) file.

<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→) Deserialize evolvable properties of a standard implementation of the indices component from array.

<void> destroy() Finalize a standard implementation of the indices component.

<void> dumpASCII() Dump the content of a indices component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a standard member of the indices component.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a standard implementation of the indices component class.

<logical> nullIsActive() Return true if the null implementation of the indices component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a indices component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a standard implementation of the indices component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Return the names of properties to output for a standard implementation of the indices component.

<void> postOutput(<double precision> time→) Perform post-output processing of a indices component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→) Compute offsets into serialization arrays for a standard implementation of the indices component.

<void> serializeASCII() Serialize the contents of a standard implementation of the indices component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the serialization of a standard implementation of the indices component.

<void> serializeRaw(<integer> fileHandle→) Serialize the contents of a standard implementation of the indices component to raw (binary) file.

<void> serializeValues(<double precision[:]> array←, <integer> propertyType→) Serialize evolvable properties of a standard implementation of the indices component to array.

<void> serializeXML(<integer> fileHandle→) Serialize the contents of a standard implementation of the indices component to XML.

<integer(c_size_t)> sizeOf() Return the size in bytes of a standard implementation of the indices component.

<logical> standardIsActive() Return true if the standard implementation of the indices component is the active choice.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<type(varying_string)> type() Returns the type name for the standard implementation of the indices component class.

nodeComponentInterOutput

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a generic interOutput component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Read properties from raw file.

<void> deserializeValues(<double(:)> array→, <integer> propertyType→) Deserialize the evolvable quantities from an array.

<void> destroy() Finalize a generic interOutput component.

<double precision> diskStarFormationRate() Returns the default value for the diskStarFormationRate property for the interOutput component class.

<type(varying_string), allocatable, dimension(:) => matches> diskStarFormationRateAttributeMatch(<logi [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the interOutput class that have the desired attributes for the diskStarFormationRate property

<integer> diskStarFormationRateCount() Compute the count of evolvable quantities in the diskStarFormationRate property of the InterOutputStandard component.

<logical> diskStarFormationRateIsGettable() Returns true if the diskStarFormationRate property is gettable for the interOutput component class.

<logical> diskStarFormationRateIsSettable() Specify whether the diskStarFormationRate property of the interOutput component is settable.

<void> diskStarFormationRateRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accept a rate set for the diskStarFormationRate property of the interOutput component class. Trigger an interrupt to create the component.

<double precision> diskStarFormationRateRateGet() Returns a zero rate for the diskStarFormationRate property for the interOutput component class.

<void> diskStarFormationRateScale(<double precision> value) Set the scale of the diskStarFormationRate property of the InterOutputStandard component.

<void> diskStarFormationRateSet(<double precision> value) Set the diskStarFormationRate property of the interOutput component.

<void> dumpASCII() Dump the content of a interOutput component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a generic interOutput component.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a nodeComponent object.

<logical> nullIsActive() Return true if the null implementation of the interOutput component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a interOutput component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a generic interOutput component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Establish the names of properties to output for a generic interOutput component.

<void> postOutput(<double precision> time→) Perform post-output processing of a interOutput component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets() Set offsets into serialization arrays.

<void> serializeASCII() Serialize the content of a interOutput component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the number of evolvable quantities to be evolved.

<void> serializeRaw(<integer> fileHandle→) Generate a binary dump of all properties.

<void> serializeValues(<double(:)> array←, <integer> propertyType→) Serialize the evolvable quantities to an array.

<void> serializeXML() Generate an XML dump of all properties.

<integer(c_size_t)> sizeOf() Return the size in bytes of a nodeComponentInterOutput component.

<double precision> spheroidStarFormationRate() Returns the default value for the spheroidStarFormationRate property for the interOutput component class.

<type(varying_string), allocatable, dimension(:) => matches> spheroidStarFormationRateAttributeMatch(< [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the interOutput class that have the desired attributes for the spheroidStarFormationRate property

<integer> spheroidStarFormationRateCount() Compute the count of evolvable quantities in the spheroidStarFormationRate property of the InterOutputStandard component.

<logical> spheroidStarFormationRateIsGettable() Returns true if the spheroidStarFormationRate property is gettable for the interOutput component class.

<logical> spheroidStarFormationRateIsSettable() Specify whether the spheroidStarFormationRate property of the interOutput component is settable.

<void> spheroidStarFormationRateRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accept a rate set for the spheroidStarFormationRate property of the interOutput component class. Trigger an interrupt to create the component.

<double precision> spheroidStarFormationRateRateGet() Returns a zero rate for the spheroidStarFormationRate property for the interOutput component class.

<void> spheroidStarFormationRateScale(<double precision> value) Set the scale of the spheroidStarFormationRat property of the InterOutputStandard component.

<void> spheroidStarFormationRateSet(<double precision> value) Set the spheroidStarFormationRate property of the interOutput component.

<logical> standardIsActive() Return true if the standard implementation of the interOutput component is the active choice.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<type(varying_string)> type() Returns the type name for the interOutput component class.

nodeComponentInterOutputNull

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a null implementation of the interOutput component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a null implementation of the interOutput component from raw (binary) file.

<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→) Deserialize evolvable properties of a null implementation of the interOutput component from array.

<void> destroy() Finalize a null implementation of the interOutput component.

<double precision> diskStarFormationRate() Returns the default value for the diskStarFormationRate property for the interOutput component class.

<type(varying_string), allocatable, dimension(:) => matches> diskStarFormationRateAttributeMatch(<logi [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the interOutput class that have the desired attributes for the diskStarFormationRate property

<integer> diskStarFormationRateCount() Compute the count of evolvable quantities in the diskStarFormationRate property of the InterOutputStandard component.

<logical> diskStarFormationRateIsGettable() Returns true if the diskStarFormationRate property is gettable for the interOutput component class.

<logical> diskStarFormationRateIsSettable() Specify whether the diskStarFormationRate property of the interOutput component is settable.

<void> diskStarFormationRateRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accept a rate set for the diskStarFormationRate property of the interOutput component class. Trigger an interrupt to create the component.

<double precision> diskStarFormationRateRateGet() Returns a zero rate for the diskStarFormationRate property for the interOutput component class.

<void> diskStarFormationRateScale(<double precision> value) Set the scale of the diskStarFormationRate property of the InterOutputStandard component.

<void> diskStarFormationRateSet(<double precision> value) Set the diskStarFormationRate property of the interOutput component.

<void> dumpASCII() Dump the content of a interOutput component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a null member of the interOutput component.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a null implementation of the interOutput component class.

<logical> nullIsActive() Return true if the null implementation of the interOutput component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a interOutput component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a null implementation of the interOutput component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Return the names of properties to output for a null implementation of the interOutput component.

<void> postOutput(<double precision> time→) Perform post-output processing of a interOutput component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→) Compute offsets into serialization arrays for a null implementation of the interOutput component.

<void> serializeASCII() Serialize the contents of a null implementation of the interOutput component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the serialization of a null implementation of the interOutput component.

<void> serializeRaw(<integer> fileHandle→) Serialize the contents of a null implementation of the interOutput component to raw (binary) file.

<void> serializeValues(<double precision[:]> array←, <integer> propertyType→) Serialize evolvable properties of a null implementation of the interOutput component to array.

<void> serializeXML(<integer> fileHandle→) Serialize the contents of a null implementation of the interOutput component to XML.

<integer(c_size_t)> sizeOf() Return the size in bytes of a null implementation of the interOutput component.

<double precision> spheroidStarFormationRate() Returns the default value for the spheroidStarFormationRate property for the interOutput component class.

<type(varying_string), allocatable, dimension(:) => matches> spheroidStarFormationRateAttributeMatch(<[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the interOutput class that have the desired attributes for the spheroidStarFormationRate property

<integer> spheroidStarFormationRateCount() Compute the count of evolvable quantities in the spheroidStarFormationRate property of the InterOutputStandard component.

<logical> spheroidStarFormationRateIsGettable() Returns true if the spheroidStarFormationRate property is gettable for the interOutput component class.

<logical> spheroidStarFormationRateIsSettable() Specify whether the spheroidStarFormationRate property of the interOutput component is settable.

<void> spheroidStarFormationRateRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accept a rate set for the spheroidStarFormationRate property of the interOutput component class. Trigger an interrupt to create the component.

<double precision> spheroidStarFormationRateRateGet() Returns a zero rate for the spheroidStarFormationRate property for the interOutput component class.

<void> spheroidStarFormationRateScale(<double precision> value) Set the scale of the spheroidStarFormationRat property of the InterOutputStandard component.

<void> spheroidStarFormationRateSet(<double precision> value) Set the spheroidStarFormationRate property of the interOutput component.

<logical> standardIsActive() Return true if the standard implementation of the interOutput component is the active choice.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<type(varying_string)> type() Returns the type name for the null implementation of the interOutput component class.

nodeComponentInterOutputStandard

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a standard implementation of the interOutput component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a standard implementation of the interOutput component from raw (binary) file.

<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→) Deserialize evolvable properties of a standard implementation of the interOutput component from array.

<void> destroy() Finalize a standard implementation of the interOutput component.

<double precision> diskStarFormationRate() Get the diskStarFormationRate property of an standard implementation of the interOutput component class.

<type(varying_string), allocatable, dimension(:) => matches> diskStarFormationRateAttributeMatch(<logi [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the interOutput class that have the desired attributes for the diskStarFormationRate property

<integer> diskStarFormationRateCount() Return a count of the number of scalar properties in the diskStarFormationRate property of an standard implementation of the interOutput component class.

<void> diskStarFormationRateInactive() Indicate that the diskStarFormationRate property of an standard implementation of the interOutput component class is inactive for differential equation solving.

<logical> diskStarFormationRateIsGettable() Returns true if the diskStarFormationRate property is gettable for the interOutput component class.

<logical> diskStarFormationRateIsSettable() Specify whether the diskStarFormationRate property of the interOutput component is settable.

<void> diskStarFormationRateRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate to the rate of change of the diskStarFormationRate property of an standard implementation of the interOutput component class.

<double precision> diskStarFormationRateRateGet() Get the rate of change of the diskStarFormationRate property of an standard implementation of the interOutput component class.

<void> diskStarFormationRateScale(<double precision> setValue→) Set the absolute scale of the diskStarFormationRate property of an standard implementation of the interOutput component class.

<void> diskStarFormationRateSet(<double precision> setValue→) Set the diskStarFormationRate property of an standard implementation of the interOutput component class.

<void> dumpASCII() Dump the content of a interOutput component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a standard member of the interOutput component.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a standard implementation of the interOutput component class.

<logical> nullIsActive() Return true if the null implementation of the interOutput component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a interOutput component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a standard implementation of the interOutput component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Return the names of properties to output for a standard implementation of the interOutput component.

<void> postOutput(<double precision> time→) Perform post-output processing of a interOutput component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→) Compute offsets into serialization arrays for a standard implementation of the interOutput component.

<void> serializeASCII() Serialize the contents of a standard implementation of the interOutput component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the serialization of a standard implementation of the interOutput component.

<void> serializeRaw(<integer> fileHandle→) Serialize the contents of a standard implementation of the interOutput component to raw (binary) file.

<void> serializeValues(<double precision[:]> array←, <integer> propertyType→) Serialize evolvable properties of a standard implementation of the interOutput component to array.

<void> serializeXML(<integer> fileHandle→) Serialize the contents of a standard implementation of the interOutput component to XML.

<integer(c_size_t)> sizeOf() Return the size in bytes of a standard implementation of the interOutput component.

<double precision> spheroidStarFormationRate() Get the spheroidStarFormationRate property of an standard implementation of the interOutput component class.

<type(varying_string), allocatable, dimension(:) => matches> spheroidStarFormationRateAttributeMatch([requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the interOutput class that have the desired attributes for the spheroidStarFormationRate property

<integer> spheroidStarFormationRateCount() Return a count of the number of scalar properties in the spheroidStarFormationRate property of an standard implementation of the interOutput component class.

<void> spheroidStarFormationRateInactive() Indicate that the spheroidStarFormationRate property of an standard implementation of the interOutput component class is inactive for differential equation solving.

<logical> spheroidStarFormationRateIsGettable() Returns true if the spheroidStarFormationRate property is gettable for the interOutput component class.

<logical> spheroidStarFormationRateIsSettable() Specify whether the spheroidStarFormationRate property of the interOutput component is settable.

<void> spheroidStarFormationRateRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate to the rate of change of the spheroidStarFormationRate property of an standard implementation of the interOutput component class.

<double precision> spheroidStarFormationRateRateGet() Get the rate of change of the spheroidStarFormationRate property of an standard implementation of the interOutput component class.

<void> spheroidStarFormationRateScale(<double precision> setValue→) Set the absolute scale of the spheroidStarFormationRate property of an standard implementation of the interOutput component class.

<void> spheroidStarFormationRateSet(<double precision> setValue→) Set the spheroidStarFormationRate property of an standard implementation of the interOutput component class.

<logical> standardIsActive() Return true if the standard implementation of the interOutput component is the active choice.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<type(varying_string)> type() Returns the type name for the standard implementation of the interOutput component class.

nodeComponentMassFlowStatistics

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a generic massFlowStatistics component from a supplied XML definition.

<double precision> cooledMass() Returns the default value for the cooledMass property for the massFlowStatistics component class.

<type(varying_string), allocatable, dimension(:) => matches> cooledMassAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the massFlowStatistics class that have the desired attributes for the cooledMass property

<integer> cooledMassCount() Compute the count of evolvable quantities in the cooledMass property of the MassFlowStatisticsStandard component.

<logical> cooledMassIsGettable() Returns true if the cooledMass property is gettable for the massFlowStatistics component class.

<logical> cooledMassIsSettable() Specify whether the cooledMass property of the massFlowStatistics component is settable.

<void> cooledMassRate(<double precision> value) Cumulate to the rate of the cooledMass property of the MassFlowStatisticsStandard component.

<double precision> cooledMassRateGet() Returns a zero rate for the cooledMass property for the massFlowStatistics component class.

<void> cooledMassScale(<double precision> value) Set the scale of the cooledMass property of the MassFlowStatisticsStandard component.

<void> cooledMassSet(<double precision> value) Set the cooledMass property of the massFlowStatistics component.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Read properties from raw file.

<void> deserializeValues(<double(:)> array→, <integer> propertyType→) Deserialize the evolvable quantities from an array.

<void> destroy() Finalize a generic massFlowStatistics component.

<void> dumpASCII() Dump the content of a massFlowStatistics component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a generic massFlowStatistics component.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a nodeComponent object.

<logical> nullIsActive() Return true if the null implementation of the massFlowStatistics component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a massFlowStatistics component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a generic massFlowStatistics component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Establish the names of properties to output for a generic massFlowStatistics component.

<void> postOutput(<double precision> time→) Perform post-output processing of a massFlowStatistics component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets() Set offsets into serialization arrays.

<void> serializeASCII() Serialize the content of a massFlowStatistics component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the number of evolvable quantities to be evolved.

<void> serializeRaw(<integer> fileHandle→) Generate a binary dump of all properties.

<void> serializeValues(<double(:)> array←, <integer> propertyType→) Serialize the evolvable quantities to an array.

<void> serializeXML() Generate an XML dump of all properties.

<integer(c_size_t)> sizeOf() Return the size in bytes of a nodeComponentMassFlowStatistics component.

<logical> standardIsActive() Return true if the standard implementation of the massFlowStatistics component is the active choice.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<type(varying_string)> type() Returns the type name for the massFlowStatistics component class.

nodeComponentMassFlowStatisticsNull

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a null implementation of the massFlowStatistics component from a supplied XML definition.

<double precision> cooledMass() Returns the default value for the cooledMass property for the massFlowStatistics component class.

<type(varying_string), allocatable, dimension(:) => matches> cooledMassAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the massFlowStatistics class that have the desired attributes for the cooledMass property

<integer> cooledMassCount() Compute the count of evolvable quantities in the cooledMass property of the MassFlowStatisticsStandard component.

<logical> cooledMassIsGettable() Returns true if the cooledMass property is gettable for the massFlowStatistics component class.

<logical> cooledMassIsSettable() Specify whether the cooledMass property of the massFlowStatistics component is settable.

<void> cooledMassRate(<double precision> value) Cumulate to the rate of the cooledMass property of the MassFlowStatisticsStandard component.

<double precision> cooledMassRateGet() Returns a zero rate for the cooledMass property for the massFlowStatistics component class.

<void> cooledMassScale(<double precision> value) Set the scale of the cooledMass property of the MassFlowStatisticsStandard component.

<void> cooledMassSet(<double precision> value) Set the cooledMass property of the massFlowStatistics component.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a null implementation of the massFlowStatistics component from raw (binary) file.

<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→) Deserialize evolvable properties of a null implementation of the massFlowStatistics component from array.

<void> destroy() Finalize a null implementation of the massFlowStatistics component.

<void> dumpASCII() Dump the content of a massFlowStatistics component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a null member of the massFlowStatistics component.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a null implementation of the massFlowStatistics component class.

<logical> nullIsActive() Return true if the null implementation of the massFlowStatistics component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_-int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a massFlowStatistics component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a null implementation of the massFlowStatistics component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Return the names of properties to output for a null implementation of the massFlowStatistics component.

<void> postOutput(<double precision> time→) Perform post-output processing of a massFlowStatistics component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→) Compute offsets into serialization arrays for a null implementation of the massFlowStatistics component.

<void> serializeASCII() Serialize the contents of a null implementation of the massFlowStatistics component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the serialization of a null implementation of the massFlowStatistics component.

<void> serializeRaw(<integer> fileHandle→) Serialize the contents of a null implementation of the massFlowStatistics component to raw (binary) file.

<void> serializeValues(<double precision[:]> array←, <integer> propertyType→) Serialize evolvable properties of a null implementation of the massFlowStatistics component to array.

<void> serializeXML(<integer> fileHandle→) Serialize the contents of a null implementation of the massFlowStatistics component to XML.

<integer(c_size_t)> sizeOf() Return the size in bytes of a null implementation of the massFlowStatistics component.

<logical> standardIsActive() Return true if the standard implementation of the massFlowStatistics component is the active choice.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<type(varying_string)> type() Returns the type name for the null implementation of the massFlowStatistics component class.

nodeComponentMassFlowStatisticsStandard

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a standard implementation of the massFlowStatistics component from a supplied XML definition.

<double precision> cooledMass() Get the cooledMass property of an standard implementation of the massFlowStatistics component class.

<type(varying_string), allocatable, dimension(:) => matches> cooledMassAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the massFlowStatistics class that have the desired attributes for the cooledMass property

<integer> cooledMassCount() Return a count of the number of scalar properties in the cooledMass property of an standard implementation of the massFlowStatistics component class.

<void> cooledMassInactive() Indicate that the cooledMass property of an standard implementation of the massFlowStatistics component class is inactive for differential equation solving.

<logical> cooledMassIsGettable() Returns true if the cooledMass property is gettable for the massFlowStatistics component class.

<logical> cooledMassIsSettable() Specify whether the cooledMass property of the massFlowStatistics component is settable.

<void> cooledMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask [interruptProcedure]↔) Accumulate to the rate of change of the cooledMass property of an standard implementation of the massFlowStatistics component class.

<double precision> cooledMassRateGet() Get the rate of change of the cooledMass property of an standard implementation of the massFlowStatistics component class.

<void> cooledMassScale(<double precision> setValue→) Set the absolute scale of the cooledMass property of an standard implementation of the massFlowStatistics component class.

<void> cooledMassSet(<double precision> setValue→) Set the cooledMass property of an standard implementation of the massFlowStatistics component class.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a standard implementation of the massFlowStatistics component from raw (binary) file.

<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→) Deserialize evolvable properties of a standard implementation of the massFlowStatistics component from array.

<void> destroy() Finalize a standard implementation of the massFlowStatistics component.

<void> dumpASCII() Dump the content of a massFlowStatistics component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter
[interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a standard member of the massFlowStatistics component.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a standard implementation of the massFlowStatistics component class.

<logical> nullIsActive() Return true if the null implementation of the massFlowStatistics component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a massFlowStatistics component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a standard implementation of the massFlowStatistics component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision>

time→, <integer> instance→) Return the names of properties to output for a standard implementation of the massFlowStatistics component.

<void> postOutput(<double precision> time→) Perform post-output processing of a massFlowStatistics component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→) Compute offsets into serialization arrays for a standard implementation of the massFlowStatistics component.

<void> serializeASCII() Serialize the contents of a standard implementation of the massFlowStatistics component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the serialization of a standard implementation of the massFlowStatistics component.

<void> serializeRaw(<integer> fileHandle→) Serialize the contents of a standard implementation of the massFlowStatistics component to raw (binary) file.

<void> serializeValues(<double precision[:]> array←, <integer> propertyType→) Serialize evolvable properties of a standard implementation of the massFlowStatistics component to array.

<void> serializeXML(<integer> fileHandle→) Serialize the contents of a standard implementation of the massFlowStatistics component to XML.

<integer(c_size_t)> sizeOf() Return the size in bytes of a standard implementation of the massFlowStatistics component.

<logical> standardIsActive() Return true if the standard implementation of the massFlowStatistics component is the active choice.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<type(varying_string)> type() Returns the type name for the standard implementation of the massFlowStatistics component class.

nodeComponentMergingStatistics

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a generic mergingStatistics component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Read properties from raw file.

<void> deserializeValues(<double(:)> array→, <integer> propertyType→) Deserialize the evolvable quantities from an array.

<void> destroy() Finalize a generic mergingStatistics component.

<void> dumpASCII() Dump the content of a mergingStatistics component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<double precision> galaxyMajorMergerTime() Returns the default value for the galaxyMajorMergerTime property for the mergingStatistics component class.

<type(varying_string), allocatable, dimension(:) => matches> galaxyMajorMergerTimeAttributeMatch(<logi [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the mergingStatistics class that have the desired attributes for the galaxyMajorMergerTime property

<logical> galaxyMajorMergerTimeIsGettable() Returns true if the galaxyMajorMergerTime property is gettable for the mergingStatistics component class.

<logical> galaxyMajorMergerTimeIsSettable() Specify whether the galaxyMajorMergerTime property of the mergingStatistics component is settable.

<double precision> galaxyMajorMergerTimeRateGet() Returns a zero rate for the galaxyMajorMergerTime property for the mergingStatistics component class.

<void> galaxyMajorMergerTimeSet(<double precision> value) Set the galaxyMajorMergerTime property of the mergingStatistics component.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a generic mergingStatistics component.

<logical> majorIsActive() Return true if the major implementation of the mergingStatistics component is the active choice.

<double precision, dimension(:), allocatable => classDefault> majorMergerTime() Returns the default value for the majorMergerTime property for the mergingStatistics component class.

<type(varying_string), allocatable, dimension(:) => matches> majorMergerTimeAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the mergingStatistics class that have the desired attributes for the majorMergerTime property

<logical> majorMergerTimeIsGettable() Returns true if the majorMergerTime property is gettable for the mergingStatistics component class.

<logical> majorMergerTimeIsSettable() Specify whether the majorMergerTime property of the mergingStatistics component is settable.

<double precision, dimension(:), allocatable => classDefault> majorMergerTimeRateGet() Returns a zero rate for the majorMergerTime property for the mergingStatistics component class.

<void> majorMergerTimeSet(<double precision[:]> value) Set the majorMergerTime property of the mergingStatistics component.

<double precision> massWhenFirstIsolated() Returns the default value for the massWhenFirstIsolated property for the mergingStatistics component class.

<type(varying_string), allocatable, dimension(:) => matches> massWhenFirstIsolatedAttributeMatch(<logi [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the mergingStatistics class that have the desired attributes for the massWhenFirstIsolated property

<logical> massWhenFirstIsolatedIsGettable() Returns true if the massWhenFirstIsolated property is gettable for the mergingStatistics component class.

<logical> massWhenFirstIsolatedIsSettable() Specify whether the massWhenFirstIsolated property of the mergingStatistics component is settable.

<double precision> massWhenFirstIsolatedRateGet() Returns a zero rate for the massWhenFirstIsolated property for the mergingStatistics component class.

<void> massWhenFirstIsolatedSet(<double precision> value) Set the massWhenFirstIsolated property of the mergingStatistics component.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a nodeComponent object.

<double precision> nodeFormationTime() Returns the default value for the nodeFormationTime property for the mergingStatistics component class.

<type(varying_string), allocatable, dimension(:) => matches> nodeFormationTimeAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the mergingStatistics class that have the desired attributes for the nodeFormationTime property

<logical> nodeFormationTimeIsGettable() Returns true if the nodeFormationTime property is gettable for the mergingStatistics component class.

<logical> nodeFormationTimeIsSettable() Specify whether the nodeFormationTime property of the mergingStatistics component is settable.

<double precision> nodeFormationTimeRateGet() Returns a zero rate for the nodeFormationTime property for the mergingStatistics component class.

<void> nodeFormationTimeSet(<double precision> value) Set the nodeFormationTime property of the mergingStatistics component.

<integer> nodeHierarchyLevel() Returns the default value for the nodeHierarchyLevel property for the mergingStatistics component class.

<type(varying_string), allocatable, dimension(:) => matches> nodeHierarchyLevelAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the mergingStatistics class that have the desired attributes for the nodeHierarchyLevel property

<logical> nodeHierarchyLevelIsGettable() Returns true if the nodeHierarchyLevel property is gettable for the mergingStatistics component class.

<logical> nodeHierarchyLevelIsSettable() Specify whether the nodeHierarchyLevel property of the mergingStatistics component is settable.

<integer> nodeHierarchyLevelMaximum() Returns the default value for the nodeHierarchyLevelMaximum property for the mergingStatistics component class.

<type(varying_string), allocatable, dimension(:) => matches> nodeHierarchyLevelMaximumAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the mergingStatistics class that have the desired attributes for the nodeHierarchyLevelMaximum property

<logical> nodeHierarchyLevelMaximumIsGettable() Returns true if the nodeHierarchyLevelMaximum property is gettable for the mergingStatistics component class.

<logical> nodeHierarchyLevelMaximumIsSettable() Specify whether the nodeHierarchyLevelMaximum property of the mergingStatistics component is settable.

<integer> nodeHierarchyLevelMaximumRateGet() Returns a zero rate for the nodeHierarchyLevelMaximum property for the mergingStatistics component class.

<void> nodeHierarchyLevelMaximumSet(<integer> value) Set the nodeHierarchyLevelMaximum property of the mergingStatistics component.

<integer> nodeHierarchyLevelRateGet() Returns a zero rate for the nodeHierarchyLevel property for the mergingStatistics component class.

<void> nodeHierarchyLevelSet(<integer> value) Set the nodeHierarchyLevel property of the mergingStatistics component.

<double precision> nodeMajorMergerTime() Returns the default value for the nodeMajorMergerTime property for the mergingStatistics component class.

<type(varying_string), allocatable, dimension(:) => matches> nodeMajorMergerTimeAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the mergingStatistics class that have the desired attributes for the nodeMajorMergerTime property

<logical> nodeMajorMergerTimeIsGettable() Returns true if the nodeMajorMergerTime property is gettable for the mergingStatistics component class.

<logical> nodeMajorMergerTimeIsSettable() Specify whether the nodeMajorMergerTime property of the mergingStatistics component is settable.

<double precision> nodeMajorMergerTimeRateGet() Returns a zero rate for the nodeMajorMergerTime property for the mergingStatistics component class.

<void> nodeMajorMergerTimeSet(<double precision> value) Set the nodeMajorMergerTime property of the mergingStatistics component.

<logical> nullIsActive() Return true if the null implementation of the mergingStatistics component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a mergingStatistics component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a generic mergingStatistics component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Establish the names of properties to output for a generic mergingStatistics component.

<void> postOutput(<double precision> time→) Perform post-output processing of a mergingStatistics component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<logical> recentIsActive() Return true if the recent implementation of the mergingStatistics component is the active choice.

<integer, dimension(:), allocatable => classDefault> recentMajorMergerCount() Returns the default value for the recentMajorMergerCount property for the mergingStatistics component class.

<type(varying_string), allocatable, dimension(:) => matches> recentMajorMergerCountAttributeMatch(<log [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the mergingStatistics class that have the desired attributes for the recentMajorMergerCount property

<logical> recentMajorMergerCountIsGettable() Returns true if the recentMajorMergerCount property is gettable for the mergingStatistics component class.

<logical> recentMajorMergerCountIsSettable() Specify whether the recentMajorMergerCount property of the mergingStatistics component is settable.

<integer, dimension(:), allocatable => classDefault> recentMajorMergerCountRateGet() Returns a zero rate for the recentMajorMergerCount property for the mergingStatistics component class.

<void> recentMajorMergerCountSet(<integer[:]> value) Set the recentMajorMergerCount property of the mergingStatistics component.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets() Set offsets into serialization arrays.

<void> serializeASCII() Serialize the content of a mergingStatistics component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the number of evolvable quantities to be evolved.

<void> serializeRaw(<integer> fileHandle→) Generate a binary dump of all properties.

<void> serializeValues(<double(:)> array←, <integer> propertyType→) Serialize the evolvable quantities to an array.

<void> serializeXML() Generate an XML dump of all properties.

<integer(c_size_t)> sizeOf() Return the size in bytes of a nodeComponentMergingStatistics component.

<logical> standardIsActive() Return true if the standard implementation of the mergingStatistics component is the active choice.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<type(varying_string)> type() Returns the type name for the mergingStatistics component class.

nodeComponentMergingStatisticsMajor

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a major implementation of the mergingStatistics component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a major implementation of the mergingStatistics component from raw (binary) file.

<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→) Deserialize evolvable properties of a major implementation of the mergingStatistics component from array.

<void> destroy() Finalize a major implementation of the mergingStatistics component.

<void> dumpASCII() Dump the content of a mergingStatistics component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<double precision> galaxyMajorMergerTime() Returns the default value for the galaxyMajorMergerTime property for the mergingStatistics component class.

<type(varying_string), allocatable, dimension(:) => matches> galaxyMajorMergerTimeAttributeMatch(<logi [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the mergingStatistics class that have the desired attributes for the galaxyMajorMergerTime property

<logical> galaxyMajorMergerTimeIsGettable() Returns true if the galaxyMajorMergerTime property is gettable for the mergingStatistics component class.

<logical> galaxyMajorMergerTimeIsSettable() Specify whether the galaxyMajorMergerTime property of the mergingStatistics component is settable.

<double precision> galaxyMajorMergerTimeRateGet() Returns a zero rate for the galaxyMajorMergerTime property for the mergingStatistics component class.

<void> galaxyMajorMergerTimeSet(<double precision> value) Set the galaxyMajorMergerTime property of the mergingStatistics component.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a major member of the mergingStatistics component.

<logical> majorIsActive() Return true if the major implementation of the mergingStatistics component is the active choice.

<double precision, dimension(:), allocatable => propertyValue> majorMergerTime() Get the majorMergerTime property of an major implementation of the mergingStatistics component class.

<type(varying_string), allocatable, dimension(:) => matches> majorMergerTimeAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the mergingStatistics class that have the desired attributes for the majorMergerTime property

<logical> majorMergerTimeIsGettable() Returns true if the majorMergerTime property is gettable for the mergingStatistics component class.

<logical> majorMergerTimeIsSettable() Specify whether the majorMergerTime property of the mergingStatistics component is settable.

<double precision, dimension(:), allocatable => classDefault> majorMergerTimeRateGet()
Returns a zero rate for the majorMergerTime property for the mergingStatistics component class.

<void> majorMergerTimeSet(<double precision[:]> setValue→) Set the majorMergerTime property of an major implementation of the mergingStatistics component class.

<double precision> massWhenFirstIsolated() Returns the default value for the massWhenFirstIsolated property for the mergingStatistics component class.

<type(varying_string), allocatable, dimension(:) => matches> massWhenFirstIsolatedAttributeMatch(<logi
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the mergingStatistics class that have the desired attributes for the massWhenFirstIsolated property

<logical> massWhenFirstIsolatedIsGettable() Returns true if the massWhenFirstIsolated property is gettable for the mergingStatistics component class.

<logical> massWhenFirstIsolatedIsSettable() Specify whether the massWhenFirstIsolated property of the mergingStatistics component is settable.

<double precision> massWhenFirstIsolatedRateGet() Returns a zero rate for the massWhenFirstIsolated property for the mergingStatistics component class.

<void> massWhenFirstIsolatedSet(<double precision> value) Set the massWhenFirstIsolated property of the mergingStatistics component.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a major implementation of the mergingStatistics component class.

<double precision> nodeFormationTime() Returns the default value for the nodeFormationTime property for the mergingStatistics component class.

<type(varying_string), allocatable, dimension(:) => matches> nodeFormationTimeAttributeMatch(<logical>
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the mergingStatistics class that have the desired attributes for the nodeFormationTime property

<logical> nodeFormationTimeIsGettable() Returns true if the nodeFormationTime property is gettable for the mergingStatistics component class.

<logical> nodeFormationTimeIsSettable() Specify whether the nodeFormationTime property of the mergingStatistics component is settable.

<double precision> nodeFormationTimeRateGet() Returns a zero rate for the nodeFormationTime property for the mergingStatistics component class.

<void> nodeFormationTimeSet(<double precision> value) Set the nodeFormationTime property of the mergingStatistics component.

<integer> nodeHierarchyLevel() Returns the default value for the nodeHierarchyLevel property for the mergingStatistics component class.

<type(varying_string), allocatable, dimension(:) => matches> nodeHierarchyLevelAttributeMatch(<logical [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the mergingStatistics class that have the desired attributes for the nodeHierarchyLevel property

<logical> nodeHierarchyLevelIsGettable() Returns true if the nodeHierarchyLevel property is gettable for the mergingStatistics component class.

<logical> nodeHierarchyLevelIsSettable() Specify whether the nodeHierarchyLevel property of the mergingStatistics component is settable.

<integer> nodeHierarchyLevelMaximum() Returns the default value for the nodeHierarchyLevelMaximum property for the mergingStatistics component class.

<type(varying_string), allocatable, dimension(:) => matches> nodeHierarchyLevelMaximumAttributeMatch(< [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the mergingStatistics class that have the desired attributes for the nodeHierarchyLevelMaximum property

<logical> nodeHierarchyLevelMaximumIsGettable() Returns true if the nodeHierarchyLevelMaximum property is gettable for the mergingStatistics component class.

<logical> nodeHierarchyLevelMaximumIsSettable() Specify whether the nodeHierarchyLevelMaximum property of the mergingStatistics component is settable.

<integer> nodeHierarchyLevelMaximumRateGet() Returns a zero rate for the nodeHierarchyLevelMaximum property for the mergingStatistics component class.

<void> nodeHierarchyLevelMaximumSet(<integer> value) Set the nodeHierarchyLevelMaximum property of the mergingStatistics component.

<integer> nodeHierarchyLevelRateGet() Returns a zero rate for the nodeHierarchyLevel property for the mergingStatistics component class.

<void> nodeHierarchyLevelSet(<integer> value) Set the nodeHierarchyLevel property of the mergingStatistics component.

<double precision> nodeMajorMergerTime() Returns the default value for the nodeMajorMergerTime property for the mergingStatistics component class.

<type(varying_string), allocatable, dimension(:) => matches> nodeMajorMergerTimeAttributeMatch(<logica [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the mergingStatistics class that have the desired attributes for the nodeMajorMergerTime property

<logical> nodeMajorMergerTimeIsGettable() Returns true if the nodeMajorMergerTime property is gettable for the mergingStatistics component class.

<logical> nodeMajorMergerTimeIsSettable() Specify whether the nodeMajorMergerTime property of the mergingStatistics component is settable.

<double precision> nodeMajorMergerTimeRateGet() Returns a zero rate for the nodeMajorMergerTime property for the mergingStatistics component class.

<void> nodeMajorMergerTimeSet(<double precision> value) Set the nodeMajorMergerTime property of the mergingStatistics component.

<logical> nullIsActive() Return true if the null implementation of the mergingStatistics component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_-int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a mergingStatistics component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a major implementation of the mergingStatistics component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Return the names of properties to output for a major implementation of the mergingStatistics component.

<void> postOutput(<double precision> time→) Perform post-output processing of a mergingStatistics component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<logical> recentIsActive() Return true if the recent implementation of the mergingStatistics component is the active choice.

<integer, dimension(:), allocatable => classDefault> recentMajorMergerCount() Returns the default value for the recentMajorMergerCount property for the mergingStatistics component class.

<type(varying_string), allocatable, dimension(:) => matches> recentMajorMergerCountAttributeMatch(<log [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the mergingStatistics class that have the desired attributes for the recentMajorMergerCount property

<logical> recentMajorMergerCountIsGettable() Returns true if the recentMajorMergerCount property is gettable for the mergingStatistics component class.

`<logical> recentMajorMergerCountIsSettable()` Specify whether the `recentMajorMergerCount` property of the `mergingStatistics` component is settable.

`<integer, dimension(:), allocatable => classDefault> recentMajorMergerCountRateGet()` Returns a zero rate for the `recentMajorMergerCount` property for the `mergingStatistics` component class.

`<void> recentMajorMergerCountSet(<integer[:]> value)` Set the `recentMajorMergerCount` property of the `mergingStatistics` component.

`<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→)` Compute the rotation curve.

`<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→)` Compute the rotation curve gradient.

`<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→)` Compute offsets into serialization arrays for a `major` implementation of the `mergingStatistics` component.

`<void> serializeASCII()` Serialize the contents of a major implementation of the mergingStatistics component to ASCII.

`<integer> serializeCount(<integer> propertyType→)` Return a count of the serialization of a major implementation of the mergingStatistics component.

`<void> serializeRaw(<integer> fileHandle→)` Serialize the contents of a major implementation of the mergingStatistics component to raw (binary) file.

`<void> serializeValues(<double precision[:]> array←, <integer> propertyType→)` Serialize evolvable properties of a `major` implementation of the `mergingStatistics` component to array.

`<void> serializeXML(<integer> fileHandle→)` Serialize the contents of a major implementation of the mergingStatistics component to XML.

`<integer(c_size_t)> sizeOf()` Return the size in bytes of a major implementation of the mergingStatistics component.

`<logical> standardIsActive()` Return true if the standard implementation of the mergingStatistics component is the active choice.

`<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→)` Compute the surface density.

`<type(varying_string)> type()` Returns the type name for the major implementation of the mergingStatistics component class.

nodeComponentMergingStatisticsNull

`<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→)` Assign a node component to another node component.

`<void> builder(<*type(node)> componentDefinition→)` Build a `null` implementation of the `mergingStatistics` component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a null implementation of the mergingStatistics component from raw (binary) file.

<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→) Deserialize evolvable properties of a null implementation of the mergingStatistics component from array.

<void> destroy() Finalize a null implementation of the mergingStatistics component.

<void> dumpASCII() Dump the content of a mergingStatistics component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<double precision> galaxyMajorMergerTime() Returns the default value for the galaxyMajorMergerTime property for the mergingStatistics component class.

<type(varying_string), allocatable, dimension(:) => matches> galaxyMajorMergerTimeAttributeMatch(<logi [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the mergingStatistics class that have the desired attributes for the galaxyMajorMergerTime property

<logical> galaxyMajorMergerTimeIsGettable() Returns true if the galaxyMajorMergerTime property is gettable for the mergingStatistics component class.

<logical> galaxyMajorMergerTimeIsSettable() Specify whether the galaxyMajorMergerTime property of the mergingStatistics component is settable.

<double precision> galaxyMajorMergerTimeRateGet() Returns a zero rate for the galaxyMajorMergerTime property for the mergingStatistics component class.

<void> galaxyMajorMergerTimeSet(<double precision> value) Set the galaxyMajorMergerTime property of the mergingStatistics component.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a null member of the mergingStatistics component.

<logical> majorIsActive() Return true if the major implementation of the mergingStatistics component is the active choice.

<double precision, dimension(:), allocatable => classDefault> majorMergerTime() Returns the default value for the majorMergerTime property for the mergingStatistics component class.

<type(varying_string), allocatable, dimension(:) => matches> majorMergerTimeAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the mergingStatistics class that have the desired attributes for the majorMergerTime property

<logical> majorMergerTimeIsGettable() Returns true if the majorMergerTime property is gettable for the mergingStatistics component class.

<logical> majorMergerTimeIsSettable() Specify whether the majorMergerTime property of the mergingStatistics component is settable.

<double precision, dimension(:), allocatable => classDefault> majorMergerTimeRateGet() Returns a zero rate for the majorMergerTime property for the mergingStatistics component class.

<void> majorMergerTimeSet(<double precision[:]> value) Set the majorMergerTime property of the mergingStatistics component.

<double precision> massWhenFirstIsolated() Returns the default value for the massWhenFirstIsolated property for the mergingStatistics component class.

<type(varying_string), allocatable, dimension(:) => matches> massWhenFirstIsolatedAttributeMatch(<logi [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the mergingStatistics class that have the desired attributes for the massWhenFirstIsolated property

<logical> massWhenFirstIsolatedIsGettable() Returns true if the massWhenFirstIsolated property is gettable for the mergingStatistics component class.

<logical> massWhenFirstIsolatedIsSettable() Specify whether the massWhenFirstIsolated property of the mergingStatistics component is settable.

<double precision> massWhenFirstIsolatedRateGet() Returns a zero rate for the massWhenFirstIsolated property for the mergingStatistics component class.

<void> massWhenFirstIsolatedSet(<double precision> value) Set the massWhenFirstIsolated property of the mergingStatistics component.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a null implementation of the mergingStatistics component class.

<double precision> nodeFormationTime() Returns the default value for the nodeFormationTime property for the mergingStatistics component class.

<type(varying_string), allocatable, dimension(:) => matches> nodeFormationTimeAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the mergingStatistics class that have the desired attributes for the nodeFormationTime property

<logical> nodeFormationTimeIsGettable() Returns true if the nodeFormationTime property is gettable for the mergingStatistics component class.

<logical> nodeFormationTimeIsSettable() Specify whether the nodeFormationTime property of the mergingStatistics component is settable.

<double precision> nodeFormationTimeRateGet() Returns a zero rate for the nodeFormationTime property for the mergingStatistics component class.

<void> nodeFormationTimeSet(<double precision> value) Set the nodeFormationTime property of the mergingStatistics component.

<integer> nodeHierarchyLevel() Returns the default value for the nodeHierarchyLevel property for the mergingStatistics component class.

<type(varying_string), allocatable, dimension(:) => matches> nodeHierarchyLevelAttributeMatch(<logical [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the mergingStatistics class that have the desired attributes for the nodeHierarchyLevel property

<logical> nodeHierarchyLevelIsGettable() Returns true if the nodeHierarchyLevel property is gettable for the mergingStatistics component class.

<logical> nodeHierarchyLevelIsSettable() Specify whether the nodeHierarchyLevel property of the mergingStatistics component is settable.

<integer> nodeHierarchyLevelMaximum() Returns the default value for the nodeHierarchyLevelMaximum property for the mergingStatistics component class.

<type(varying_string), allocatable, dimension(:) => matches> nodeHierarchyLevelMaximumAttributeMatch(< [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the mergingStatistics class that have the desired attributes for the nodeHierarchyLevelMaximum property

<logical> nodeHierarchyLevelMaximumIsGettable() Returns true if the nodeHierarchyLevelMaximum property is gettable for the mergingStatistics component class.

<logical> nodeHierarchyLevelMaximumIsSettable() Specify whether the nodeHierarchyLevelMaximum property of the mergingStatistics component is settable.

<integer> nodeHierarchyLevelMaximumRateGet() Returns a zero rate for the nodeHierarchyLevelMaximum property for the mergingStatistics component class.

<void> nodeHierarchyLevelMaximumSet(<integer> value) Set the nodeHierarchyLevelMaximum property of the mergingStatistics component.

<integer> nodeHierarchyLevelRateGet() Returns a zero rate for the nodeHierarchyLevel property for the mergingStatistics component class.

<void> nodeHierarchyLevelSet(<integer> value) Set the nodeHierarchyLevel property of the mergingStatistics component.

<double precision> nodeMajorMergerTime() Returns the default value for the nodeMajorMergerTime property for the mergingStatistics component class.

<type(varying_string), allocatable, dimension(:) => matches> nodeMajorMergerTimeAttributeMatch(<logica
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the mergingStatistics class that have the desired attributes for the nodeMajorMergerTime property

<logical> nodeMajorMergerTimeIsGettable() Returns true if the nodeMajorMergerTime property is gettable for the mergingStatistics component class.

<logical> nodeMajorMergerTimeIsSettable() Specify whether the nodeMajorMergerTime property of the mergingStatistics component is settable.

<double precision> nodeMajorMergerTimeRateGet() Returns a zero rate for the nodeMajorMergerTime property for the mergingStatistics component class.

<void> nodeMajorMergerTimeSet(<double precision> value) Set the nodeMajorMergerTime property of the mergingStatistics component.

<logical> nullIsActive() Return true if the null implementation of the mergingStatistics component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a mergingStatistics component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a null implementation of the mergingStatistics component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Return the names of properties to output for a null implementation of the mergingStatistics component.

<void> postOutput(<double precision> time→) Perform post-output processing of a mergingStatistics component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→)
Compute the gravitational potential.

<logical> recentIsActive() Return true if the recent implementation of the mergingStatistics component is the active choice.

<integer, dimension(:), allocatable => classDefault> recentMajorMergerCount() Returns the default value for the recentMajorMergerCount property for the mergingStatistics component class.

<type(varying_string), allocatable, dimension(:) => matches> recentMajorMergerCountAttributeMatch(<log [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the mergingStatistics class that have the desired attributes for the recentMajorMergerCount property

<logical> recentMajorMergerCountIsGettable() Returns true if the recentMajorMergerCount property is gettable for the mergingStatistics component class.

<logical> recentMajorMergerCountIsSettable() Specify whether the recentMajorMergerCount property of the mergingStatistics component is settable.

<integer, dimension(:), allocatable => classDefault> recentMajorMergerCountRateGet() Returns a zero rate for the recentMajorMergerCount property for the mergingStatistics component class.

<void> recentMajorMergerCountSet(<integer[:]> value) Set the recentMajorMergerCount property of the mergingStatistics component.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→) Compute offsets into serialization arrays for a null implementation of the mergingStatistics component.

<void> serializeASCII() Serialize the contents of a null implementation of the mergingStatistics component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the serialization of a null implementation of the mergingStatistics component.

<void> serializeRaw(<integer> fileHandle→) Serialize the contents of a null implementation of the mergingStatistics component to raw (binary) file.

<void> serializeValues(<double precision[:]> array←, <integer> propertyType→) Serialize evolvable properties of a null implementation of the mergingStatistics component to array.

<void> serializeXML(<integer> fileHandle→) Serialize the contents of a null implementation of the mergingStatistics component to XML.

<integer(c_size_t)> sizeOf() Return the size in bytes of a null implementation of the mergingStatistics component.

<logical> standardIsActive() Return true if the standard implementation of the mergingStatistics component is the active choice.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<type(varying_string)> type() Returns the type name for the null implementation of the mergingStatistics component class.

nodeComponentMergingStatisticsRecent

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a recent implementation of the mergingStatistics component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a recent implementation of the mergingStatistics component from raw (binary) file.

<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→) Deserialize evolvable properties of a recent implementation of the mergingStatistics component from array.

<void> destroy() Finalize a recent implementation of the mergingStatistics component.

<void> dumpASCII() Dump the content of a mergingStatistics component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<double precision> galaxyMajorMergerTime() Returns the default value for the galaxyMajorMergerTime property for the mergingStatistics component class.

<type(varying_string), allocatable, dimension(:) => matches> galaxyMajorMergerTimeAttributeMatch(<logi [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the mergingStatistics class that have the desired attributes for the galaxyMajorMergerTime property

<logical> galaxyMajorMergerTimeIsGettable() Returns true if the galaxyMajorMergerTime property is gettable for the mergingStatistics component class.

<logical> galaxyMajorMergerTimeIsSettable() Specify whether the galaxyMajorMergerTime property of the mergingStatistics component is settable.

<double precision> galaxyMajorMergerTimeRateGet() Returns a zero rate for the galaxyMajorMergerTime property for the mergingStatistics component class.

<void> galaxyMajorMergerTimeSet(<double precision> value) Set the galaxyMajorMergerTime property of the mergingStatistics component.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter
[interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a recent member of the mergingStatistics component.

<logical> majorIsActive() Return true if the major implementation of the mergingStatistics component is the active choice.

<double precision, dimension(:), allocatable => classDefault> majorMergerTime() Returns the default value for the majorMergerTime property for the mergingStatistics component class.

<type(varying_string), allocatable, dimension(:) => matches> majorMergerTimeAttributeMatch(<logical>
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the mergingStatistics class that have the desired attributes for the majorMergerTime property

<logical> majorMergerTimeIsGettable() Returns true if the majorMergerTime property is gettable for the mergingStatistics component class.

<logical> majorMergerTimeIsSettable() Specify whether the majorMergerTime property of the mergingStatistics component is settable.

<double precision, dimension(:), allocatable => classDefault> majorMergerTimeRateGet()
Returns a zero rate for the majorMergerTime property for the mergingStatistics component class.

<void> majorMergerTimeSet(<double precision[:]> value) Set the majorMergerTime property of the mergingStatistics component.

<double precision> massWhenFirstIsolated() Returns the default value for the massWhenFirstIsolated property for the mergingStatistics component class.

<type(varying_string), allocatable, dimension(:) => matches> massWhenFirstIsolatedAttributeMatch(<logi
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the mergingStatistics class that have the desired attributes for the massWhenFirstIsolated property

<logical> massWhenFirstIsolatedIsGettable() Returns true if the massWhenFirstIsolated property is gettable for the mergingStatistics component class.

<logical> massWhenFirstIsolatedIsSettable() Specify whether the massWhenFirstIsolated property of the mergingStatistics component is settable.

<double precision> massWhenFirstIsolatedRateGet() Returns a zero rate for the massWhenFirstIsolated property for the mergingStatistics component class.

<void> massWhenFirstIsolatedSet(<double precision> value) Set the massWhenFirstIsolated property of the mergingStatistics component.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a recent implementation of the mergingStatistics component class.

<double precision> nodeFormationTime() Returns the default value for the nodeFormationTime property for the mergingStatistics component class.

<type(varying_string), allocatable, dimension(:) => matches> nodeFormationTimeAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the mergingStatistics class that have the desired attributes for the nodeFormationTime property

<logical> nodeFormationTimeIsGettable() Returns true if the nodeFormationTime property is gettable for the mergingStatistics component class.

<logical> nodeFormationTimeIsSettable() Specify whether the nodeFormationTime property of the mergingStatistics component is settable.

<double precision> nodeFormationTimeRateGet() Returns a zero rate for the nodeFormationTime property for the mergingStatistics component class.

<void> nodeFormationTimeSet(<double precision> value) Set the nodeFormationTime property of the mergingStatistics component.

<integer> nodeHierarchyLevel() Returns the default value for the nodeHierarchyLevel property for the mergingStatistics component class.

<type(varying_string), allocatable, dimension(:) => matches> nodeHierarchyLevelAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the mergingStatistics class that have the desired attributes for the nodeHierarchyLevel property

<logical> nodeHierarchyLevelIsGettable() Returns true if the nodeHierarchyLevel property is gettable for the mergingStatistics component class.

<logical> nodeHierarchyLevelIsSettable() Specify whether the nodeHierarchyLevel property of the mergingStatistics component is settable.

<integer> nodeHierarchyLevelMaximum() Returns the default value for the nodeHierarchyLevelMaximum property for the mergingStatistics component class.

<type(varying_string), allocatable, dimension(:) => matches> nodeHierarchyLevelMaximumAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the mergingStatistics class that have the desired attributes for the nodeHierarchyLevelMaximum property

<logical> nodeHierarchyLevelMaximumIsGettable() Returns true if the nodeHierarchyLevelMaximum property is gettable for the mergingStatistics component class.

<logical> nodeHierarchyLevelMaximumIsSettable() Specify whether the nodeHierarchyLevelMaximum property of the mergingStatistics component is settable.

<integer> nodeHierarchyLevelMaximumRateGet() Returns a zero rate for the nodeHierarchyLevelMaximum property for the mergingStatistics component class.

<void> nodeHierarchyLevelMaximumSet(<integer> value) Set the nodeHierarchyLevelMaximum property of the mergingStatistics component.

<integer> nodeHierarchyLevelRateGet() Returns a zero rate for the nodeHierarchyLevel property for the mergingStatistics component class.

<void> nodeHierarchyLevelSet(<integer> value) Set the nodeHierarchyLevel property of the mergingStatistics component.

<double precision> nodeMajorMergerTime() Returns the default value for the nodeMajorMergerTime property for the mergingStatistics component class.

<type(varying_string), allocatable, dimension(:) => matches> nodeMajorMergerTimeAttributeMatch(<logica [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the mergingStatistics class that have the desired attributes for the nodeMajorMergerTime property

<logical> nodeMajorMergerTimeIsGettable() Returns true if the nodeMajorMergerTime property is gettable for the mergingStatistics component class.

<logical> nodeMajorMergerTimeIsSettable() Specify whether the nodeMajorMergerTime property of the mergingStatistics component is settable.

<double precision> nodeMajorMergerTimeRateGet() Returns a zero rate for the nodeMajorMergerTime property for the mergingStatistics component class.

<void> nodeMajorMergerTimeSet(<double precision> value) Set the nodeMajorMergerTime property of the mergingStatistics component.

<logical> nullIsActive() Return true if the null implementation of the mergingStatistics component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_-int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a mergingStatistics component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a recent implementation of the mergingStatistics component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Return the names of properties to output for a recent implementation of the mergingStatistics component.

<void> postOutput(<double precision> time→) Perform post-output processing of a mergingStatistics component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<logical> recentIsActive() Return true if the recent implementation of the mergingStatistics component is the active choice.

<integer, dimension(:), allocatable => propertyValue> recentMajorMergerCount() Get the recentMajorMergerCount property of an recent implementation of the mergingStatistics component class.

<type(varying_string), allocatable, dimension(:) => matches> recentMajorMergerCountAttributeMatch(<log
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the mergingStatistics class that have the desired attributes for the recentMajorMergerCount property

<logical> recentMajorMergerCountIsGettable() Returns true if the recentMajorMergerCount property is gettable for the mergingStatistics component class.

<logical> recentMajorMergerCountIsSettable() Specify whether the recentMajorMergerCount property of the mergingStatistics component is settable.

<integer, dimension(:), allocatable => classDefault> recentMajorMergerCountRateGet() Returns a zero rate for the recentMajorMergerCount property for the mergingStatistics component class.

<void> recentMajorMergerCountSet(<integer[:]> setValue→) Set the recentMajorMergerCount property of an recent implementation of the mergingStatistics component class.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→) Compute offsets into serialization arrays for a recent implementation of the mergingStatistics component.

<void> serializeASCII() Serialize the contents of a recent implementation of the mergingStatistics component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the serialization of a recent implementation of the mergingStatistics component.

<void> serializeRaw(<integer> fileHandle→) Serialize the contents of a recent implementation of the mergingStatistics component to raw (binary) file.

<void> serializeValues(<double precision[:]> array←, <integer> propertyType→) Serialize evolvable properties of a recent implementation of the mergingStatistics component to array.

<void> serializeXML(<integer> fileHandle→) Serialize the contents of a recent implementation of the mergingStatistics component to XML.

<integer(c_size_t)> sizeOf() Return the size in bytes of a recent implementation of the mergingStatistics component.

<logical> standardIsActive() Return true if the standard implementation of the mergingStatistics component is the active choice.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<type(varying_string)> type() Returns the type name for the recent implementation of the mergingStatistics component class.

nodeComponentMergingStatisticsStandard

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a standard implementation of the mergingStatistics component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a standard implementation of the mergingStatistics component from raw (binary) file.

<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→) Deserialize evolvable properties of a standard implementation of the mergingStatistics component from array.

<void> destroy() Finalize a standard implementation of the mergingStatistics component.

<void> dumpASCII() Dump the content of a mergingStatistics component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<double precision> galaxyMajorMergerTime() Get the galaxyMajorMergerTime property of an standard implementation of the mergingStatistics component class.

<type(varying_string), allocatable, dimension(:) => matches> galaxyMajorMergerTimeAttributeMatch(<logi [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the mergingStatistics class that have the desired attributes for the galaxyMajorMergerTime property

<logical> galaxyMajorMergerTimeIsGettable() Returns true if the galaxyMajorMergerTime property is gettable for the mergingStatistics component class.

<logical> galaxyMajorMergerTimeIsSettable() Specify whether the galaxyMajorMergerTime property of the mergingStatistics component is settable.

<double precision> galaxyMajorMergerTimeRateGet() Returns a zero rate for the galaxyMajorMergerTime property for the mergingStatistics component class.

<void> galaxyMajorMergerTimeSet(<double precision> setValue→) Set the galaxyMajorMergerTime property of an standard implementation of the mergingStatistics component class.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a standard member of the mergingStatistics component.

<logical> majorIsActive() Return true if the major implementation of the mergingStatistics component is the active choice.

<double precision, dimension(:), allocatable => classDefault> majorMergerTime() Returns the default value for the majorMergerTime property for the mergingStatistics component class.

<type(varying_string), allocatable, dimension(:) => matches> majorMergerTimeAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the mergingStatistics class that have the desired attributes for the majorMergerTime property

<logical> majorMergerTimeIsGettable() Returns true if the majorMergerTime property is gettable for the mergingStatistics component class.

<logical> majorMergerTimeIsSettable() Specify whether the majorMergerTime property of the mergingStatistics component is settable.

<double precision, dimension(:), allocatable => classDefault> majorMergerTimeRateGet() Returns a zero rate for the majorMergerTime property for the mergingStatistics component class.

<void> majorMergerTimeSet(<double precision[:]> value) Set the majorMergerTime property of the mergingStatistics component.

<double precision> massWhenFirstIsolated() Get the massWhenFirstIsolated property of an standard implementation of the mergingStatistics component class.

<type(varying_string), allocatable, dimension(:) => matches> massWhenFirstIsolatedAttributeMatch(<logi [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the mergingStatistics class that have the desired attributes for the massWhenFirstIsolated property

<logical> massWhenFirstIsolatedIsGettable() Returns true if the massWhenFirstIsolated property is gettable for the mergingStatistics component class.

<logical> massWhenFirstIsolatedIsSettable() Specify whether the massWhenFirstIsolated property of the mergingStatistics component is settable.

<double precision> massWhenFirstIsolatedRateGet() Returns a zero rate for the massWhenFirstIsolated property for the mergingStatistics component class.

<void> massWhenFirstIsolatedSet(<double precision> setValue→) Set the massWhenFirstIsolated property of an standard implementation of the mergingStatistics component class.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a standard implementation of the mergingStatistics component class.

<double precision> nodeFormationTime() Get the nodeFormationTime property of an standard implementation of the mergingStatistics component class.

<type(varying_string), allocatable, dimension(:) => matches> nodeFormationTimeAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the mergingStatistics class that have the desired attributes for the nodeFormationTime property

<logical> nodeFormationTimeIsGettable() Returns true if the nodeFormationTime property is gettable for the mergingStatistics component class.

<logical> nodeFormationTimeIsSettable() Specify whether the nodeFormationTime property of the mergingStatistics component is settable.

<double precision> nodeFormationTimeRateGet() Returns a zero rate for the nodeFormationTime property for the mergingStatistics component class.

<void> nodeFormationTimeSet(<double precision> setValue→) Set the nodeFormationTime property of an standard implementation of the mergingStatistics component class.

<integer> nodeHierarchyLevel() Get the value of the nodeHierarchyLevel property of the standard implementation of the mergingStatistics component using a deferred function.

<type(varying_string), allocatable, dimension(:) => matches> nodeHierarchyLevelAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the mergingStatistics class that have the desired attributes for the nodeHierarchyLevel property

<void> nodeHierarchyLevelFunction() Set the function to be used for the get method of the nodeHierarchyLevel property of the MergingStatisticsStandard component.

<logical> nodeHierarchyLevelIsAttached() Return true if the deferred function used to get the nodeHierarchyLevel property of the MergingStatisticsStandard component class has been attached.

<logical> nodeHierarchyLevelIsGettable() Returns true if the nodeHierarchyLevel property is gettable for the mergingStatistics component class.

<logical> nodeHierarchyLevelIsSettable() Specify whether the nodeHierarchyLevel property of the mergingStatistics component is settable.

<integer> nodeHierarchyLevelMaximum() Get the value of the nodeHierarchyLevelMaximum property of the standard implementation of the mergingStatistics component using a deferred function.

<type(varying_string), allocatable, dimension(:) => matches> nodeHierarchyLevelMaximumAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the mergingStatistics class that have the desired attributes for the nodeHierarchyLevelMaximum property

<void> nodeHierarchyLevelMaximumFunction() Set the function to be used for the get method of the nodeHierarchyLevelMaximum property of the MergingStatisticsStandard component.

<logical> nodeHierarchyLevelMaximumIsAttached() Return true if the deferred function used to get the nodeHierarchyLevelMaximum property of the MergingStatisticsStandard component class has been attached.

<logical> nodeHierarchyLevelMaximumIsGettable() Returns true if the nodeHierarchyLevelMaximum property is gettable for the mergingStatistics component class.

<logical> nodeHierarchyLevelMaximumIsSettable() Specify whether the nodeHierarchyLevelMaximum property of the mergingStatistics component is settable.

<integer> nodeHierarchyLevelMaximumRateGet() Returns a zero rate for the nodeHierarchyLevelMaximum property for the mergingStatistics component class.

<void> nodeHierarchyLevelMaximumSet(<integer> setValue→) Set the nodeHierarchyLevelMaximum property of an standard implementation of the mergingStatistics component class.

<integer> nodeHierarchyLevelMaximumValue() Get the nodeHierarchyLevelMaximum property of an standard implementation of the mergingStatistics component class.

<integer> nodeHierarchyLevelRateGet() Returns a zero rate for the nodeHierarchyLevel property for the mergingStatistics component class.

<void> nodeHierarchyLevelSet(<integer> setValue→) Set the nodeHierarchyLevel property of an standard implementation of the mergingStatistics component class.

<integer> nodeHierarchyLevelValue() Get the nodeHierarchyLevel property of an standard implementation of the mergingStatistics component class.

<double precision> nodeMajorMergerTime() Get the nodeMajorMergerTime property of an standard implementation of the mergingStatistics component class.

<type(varying_string), allocatable, dimension(:) => matches> nodeMajorMergerTimeAttributeMatch(<logica [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the mergingStatistics class that have the desired attributes for the nodeMajorMergerTime property

<logical> nodeMajorMergerTimeIsGettable() Returns true if the nodeMajorMergerTime property is gettable for the mergingStatistics component class.

<logical> nodeMajorMergerTimeIsSettable() Specify whether the nodeMajorMergerTime property of the mergingStatistics component is settable.

<double precision> nodeMajorMergerTimeRateGet() Returns a zero rate for the nodeMajorMergerTime property for the mergingStatistics component class.

<void> nodeMajorMergerTimeSet(<double precision> setValue→) Set the nodeMajorMergerTime property of an standard implementation of the mergingStatistics component class.

<logical> nullIsActive() Return true if the null implementation of the mergingStatistics component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a mergingStatistics component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a standard implementation of the mergingStatistics component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Return the names of properties to output for a standard implementation of the mergingStatistics component.

<void> postOutput(<double precision> time→) Perform post-output processing of a mergingStatistics component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<logical> recentIsActive() Return true if the recent implementation of the mergingStatistics component is the active choice.

<integer, dimension(:), allocatable => classDefault> recentMajorMergerCount() Returns the default value for the recentMajorMergerCount property for the mergingStatistics component class.

<type(varying_string), allocatable, dimension(:) => matches> recentMajorMergerCountAttributeMatch(<log [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the mergingStatistics class that have the desired attributes for the recentMajorMergerCount property

<logical> recentMajorMergerCountIsGettable() Returns true if the recentMajorMergerCount property is gettable for the mergingStatistics component class.

<logical> recentMajorMergerCountIsSettable() Specify whether the recentMajorMergerCount property of the mergingStatistics component is settable.

<integer, dimension(:), allocatable => classDefault> recentMajorMergerCountRateGet() Returns a zero rate for the recentMajorMergerCount property for the mergingStatistics component class.

<void> recentMajorMergerCountSet(<integer[:]> value) Set the recentMajorMergerCount property of the mergingStatistics component.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→) Compute offsets into serialization arrays for a standard implementation of the mergingStatistics component.

<void> serializeASCII() Serialize the contents of a standard implementation of the mergingStatistics component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the serialization of a standard implementation of the mergingStatistics component.

<void> serializeRaw(<integer> fileHandle→) Serialize the contents of a standard implementation of the mergingStatistics component to raw (binary) file.

<void> serializeValues(<double precision[:]> array←, <integer> propertyType→) Serialize evolvable properties of a standard implementation of the mergingStatistics component to array.

<void> serializeXML(<integer> fileHandle→) Serialize the contents of a standard implementation of the mergingStatistics component to XML.

<integer(c_size_t)> sizeOf() Return the size in bytes of a standard implementation of the mergingStatistics component.

<logical> standardIsActive() Return true if the standard implementation of the mergingStatistics component is the active choice.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<type(varying_string)> type() Returns the type name for the standard implementation of the mergingStatistics component class.

nodeComponentNBody

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a generic nBody component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Read properties from raw file.

<void> deserializeValues(<double(:)> array→, <integer> propertyType→) Deserialize the evolvable quantities from an array.

<void> destroy() Finalize a generic nBody component.

<void> dumpASCII() Dump the content of a nBody component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<logical> genericIsActive() Return true if the generic implementation of the nBody component is the active choice.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a generic nBody component.

<integer(kind=kind_int8), dimension(:), allocatable => classDefault> integers() Returns the default value for the integers property for the nBody component class.

<type(varying_string), allocatable, dimension(:) => matches> integersAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the nBody class that have the desired attributes for the integers property

<logical> integersIsGettable() Returns true if the integers property is gettable for the nBody component class.

<logical> integersIsSettable() Specify whether the integers property of the nBody component is settable.

<integer(kind=kind_int8), dimension(:), allocatable => classDefault> integersRateGet() Returns a zero rate for the integers property for the nBody component class.

<void> integersSet(<integer(kind=kind_int8)[:]> value) Set the integers property of the nBody component.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a nodeComponent object.

<logical> nullIsActive() Return true if the null implementation of the nBody component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a nBody component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a generic nBody component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Establish the names of properties to output for a generic nBody component.

<void> postOutput(<double precision> time→) Perform post-output processing of a nBody component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<double precision, dimension(:), allocatable => classDefault> reals() Returns the default value for the reals property for the nBody component class.

<type(varying_string), allocatable, dimension(:) => matches> realsAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the nBody class that have the desired attributes for the reals property

<logical> realsIsGettable() Returns true if the reals property is gettable for the nBody component class.

<logical> realsIsSettable() Specify whether the reals property of the nBody component is settable.

<double precision, dimension(:), allocatable => classDefault> realsRateGet() Returns a zero rate for the reals property for the nBody component class.

<void> realsSet(<double precision[:]> value) Set the reals property of the nBody component.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets() Set offsets into serialization arrays.

<void> serializeASCII() Serialize the content of a nBody component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the number of evolvable quantities to be evolved.

<void> serializeRaw(<integer> fileHandle→) Generate a binary dump of all properties.

<void> serializeValues(<double(:)> array←, <integer> propertyType→) Serialize the evolvable quantities to an array.

<void> serializeXML() Generate an XML dump of all properties.

<integer(c_size_t)> sizeOf() Return the size in bytes of a nodeComponentNBody component.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<type(varying_string)> type() Returns the type name for the nBody component class.

nodeComponentNBodyGeneric

<integer> addIntegerProperty(<character(len=*)> propertyname→) Call the deferred function for the addIntegerProperty method of the nBody component class if it has been set.

<void> addIntegerPropertyFunction() Set the function to be used for the addIntegerProperty method of the generic implementation of the nBody component class.

<logical> addIntegerPropertyFunctionIsSet() Return true if the deferred function for the addIntegerProperty method of the generic implementation of the nBody component class has been set.

<integer> addRealProperty(<character(len=*)> propertyname→) Call the deferred function for the addRealProperty method of the nBody component class if it has been set.

<void> addRealPropertyFunction() Set the function to be used for the addRealProperty method of the generic implementation of the nBody component class.

<logical> addRealPropertyFunctionIsSet() Return true if the deferred function for the addRealProperty method of the generic implementation of the nBody component class has been set.

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a generic implementation of the nBody component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a generic implementation of the nBody component from raw (binary) file.

<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→) Deserialize evolvable properties of a generic implementation of the nBody component from array.

<void> destroy() Finalize a generic implementation of the nBody component.

<void> dumpASCII() Dump the content of a nBody component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<logical> genericIsActive() Return true if the generic implementation of the nBody component is the active choice.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter
[interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a generic member of the nBody component.

<integer(kind=kind_int8), dimension(:), allocatable => propertyValue> integers() Get the integers property of an generic implementation of the nBody component class.

<type(varying_string), allocatable, dimension(:) => matches> integersAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the nBody class that have the desired attributes for the integers property

<logical> integersIsGettable() Returns true if the integers property is gettable for the nBody component class.

<logical> integersIsSettable() Specify whether the integers property of the nBody component is settable.

<integer(kind=kind_int8), dimension(:), allocatable => classDefault> integersRateGet() Returns a zero rate for the integers property for the nBody component class.

<void> integersSet(<integer(kind=kind_int8)[:]> setValue→) Set the integers property of an generic implementation of the nBody component class.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a generic implementation of the nBody component class.

<logical> nullIsActive() Return true if the null implementation of the nBody component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a nBody component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a generic implementation of the nBody component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Return the names of properties to output for a generic implementation of the nBody component.

<void> postOutput(<double precision> time→) Perform post-output processing of a nBody component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<double precision, dimension(:), allocatable => propertyValue> reals() Get the reals property of an generic implementation of the nBody component class.

<type(varying_string), allocatable, dimension(:) => matches> realsAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the nBody class that have the desired attributes for the reals property

<logical> realsIsGettable() Returns true if the reals property is gettable for the nBody component class.

<logical> realsIsSettable() Specify whether the reals property of the nBody component is settable.

<double precision, dimension(:), allocatable => classDefault> realsRateGet() Returns a zero rate for the reals property for the nBody component class.

<void> realsSet(<double precision[:]> setValue→) Set the reals property of an generic implementation of the nBody component class.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→) Compute offsets into serialization arrays for a generic implementation of the nBody component.

<void> serializeASCII() Serialize the contents of a generic implementation of the nBody component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the serialization of a generic implementation of the nBody component.

<void> serializeRaw(<integer> fileHandle→) Serialize the contents of a generic implementation of the nBody component to raw (binary) file.

<void> serializeValues(<double precision[:]> array←, <integer> propertyType→) Serialize evolvable properties of a generic implementation of the nBody component to array.

<void> serializeXML(<integer> fileHandle→) Serialize the contents of a generic implementation of the nBody component to XML.

<void> setIntegerProperty(<integer> propertyindex→, <integer(kind_int8)> propertyvalue→) Call the deferred function for the setIntegerProperty method of the nBody component class if it has been set.

<void> setIntegerPropertyFunction() Set the function to be used for the setIntegerProperty method of the generic implementation of the nBody component class.

<logical> setIntegerPropertyFunctionIsSet() Return true if the deferred function for the setIntegerProperty method of the generic implementation of the nBody component class has been set.

<void> setRealProperty(<integer> propertyindex→, <double precision> propertyvalue→) Call the deferred function for the setRealProperty method of the nBody component class if it has been set.

<void> setRealPropertyFunction() Set the function to be used for the setRealProperty method of the generic implementation of the nBody component class.

<logical> setRealPropertyFunctionIsSet() Return true if the deferred function for the setRealProperty method of the generic implementation of the nBody component class has been set.

<integer(c_size_t)> sizeOf() Return the size in bytes of a generic implementation of the nBody component.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<type(varying_string)> type() Returns the type name for the generic implementation of the nBody component class.

nodeComponentNBodyNull

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a null implementation of the nBody component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a null implementation of the nBody component from raw (binary) file.

<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→) Deserialize evolvable properties of a null implementation of the nBody component from array.

<void> destroy() Finalize a null implementation of the nBody component.

<void> dumpASCII() Dump the content of a nBody component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<logical> genericIsActive() Return true if the generic implementation of the nBody component is the active choice.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a null member of the nBody component.

<integer(kind=kind_int8), dimension(:), allocatable => classDefault> integers() Returns the default value for the integers property for the nBody component class.

<type(varying_string), allocatable, dimension(:) => matches> integersAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the nBody class that have the desired attributes for the integers property

<logical> integersIsGettable() Returns true if the integers property is gettable for the nBody component class.

<logical> integersIsSettable() Specify whether the integers property of the nBody component is settable.

<integer(kind=kind_int8), dimension(:), allocatable => classDefault> integersRateGet() Returns a zero rate for the integers property for the nBody component class.

<void> integersSet(<integer(kind=kind_int8)[:]> value) Set the integers property of the nBody component.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a null implementation of the nBody component class.

<logical> nullIsActive() Return true if the null implementation of the nBody component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a nBody component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a null implementation of the nBody component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision>

time→, <integer> instance→) Return the names of properties to output for a null implementation of the nBody component.

<void> postOutput(<double precision> time→) Perform post-output processing of a nBody component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<double precision, dimension(:), allocatable => classDefault> reals() Returns the default value for the reals property for the nBody component class.

<type(varying_string), allocatable, dimension(:) => matches> realsAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the nBody class that have the desired attributes for the reals property

<logical> realsIsGettable() Returns true if the reals property is gettable for the nBody component class.

<logical> realsIsSettable() Specify whether the reals property of the nBody component is settable.

<double precision, dimension(:), allocatable => classDefault> realsRateGet() Returns a zero rate for the reals property for the nBody component class.

<void> realsSet(<double precision[:]> value) Set the reals property of the nBody component.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→) Compute offsets into serialization arrays for a null implementation of the nBody component.

<void> serializeASCII() Serialize the contents of a null implementation of the nBody component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the serialization of a null implementation of the nBody component.

<void> serializeRaw(<integer> fileHandle→) Serialize the contents of a null implementation of the nBody component to raw (binary) file.

<void> serializeValues(<double precision[:]> array←, <integer> propertyType→) Serialize evolvable properties of a null implementation of the nBody component to array.

<void> serializeXML(<integer> fileHandle→) Serialize the contents of a null implementation of the nBody component to XML.

<integer(c_size_t)> sizeOf() Return the size in bytes of a null implementation of the nBody component.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<type(varying_string)> type() Returns the type name for the null implementation of the nBody component class.

nodeComponentPosition

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a generic position component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Read properties from raw file.

<void> deserializeValues(<double(:)> array→, <integer> propertyType→) Deserialize the evolvable quantities from an array.

<void> destroy() Finalize a generic position component.

<void> dumpASCII() Dump the content of a position component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a generic position component.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a nodeComponent object.

<logical> nullIsActive() Return true if the null implementation of the position component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a position component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a generic position component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Establish the names of properties to output for a generic position component.

<double precision, dimension(:), allocatable => classDefault> position() Returns the default value for the position property for the position component class.

<type(varying_string), allocatable, dimension(:) => matches> positionAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the position class that have the desired attributes for the position property

<type(history)> positionHistory() Returns the default value for the positionHistory property for the position component class.

<type(varying_string), allocatable, dimension(:) => matches> positionHistoryAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the position class that have the desired attributes for the positionHistory property

<logical> positionHistoryIsGettable() Returns true if the positionHistory property is gettable for the position component class.

<logical> positionHistoryIsSettable() Specify whether the positionHistory property of the position component is settable.

<type(history)> positionHistoryRateGet() Returns a zero rate for the positionHistory property for the position component class.

<void> positionHistorySet(<type(history)> value) Set the positionHistory property of the position component.

<logical> positionIsGettable() Returns true if the position property is gettable for the position component class.

<logical> positionIsSettable() Specify whether the position property of the position component is settable.

<double precision, dimension(:), allocatable => classDefault> positionOrphan() Returns the default value for the positionOrphan property for the position component class.

<type(varying_string), allocatable, dimension(:) => matches> positionOrphanAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the position class that have the desired attributes for the positionOrphan property

<logical> positionOrphanIsGettable() Returns true if the positionOrphan property is gettable for the position component class.

<logical> positionOrphanIsSettable() Specify whether the positionOrphan property of the position component is settable.

<double precision, dimension(:), allocatable => classDefault> positionOrphanRateGet() Returns a zero rate for the positionOrphan property for the position component class.

<void> positionOrphanSet(<double precision[:]> value) Set the positionOrphan property of the position component.

<double precision, dimension(:), allocatable => classDefault> positionRateGet() Returns a zero rate for the position property for the position component class.

<void> positionSet(<double precision[:]> value) Set the position property of the position component.

<void> postOutput(<double precision> time→) Perform post-output processing of a position component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<logical> presetIsActive() Return true if the preset implementation of the position component is the active choice.

<logical> presetOrphansIsActive() Return true if the presetOrphans implementation of the position component is the active choice.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets() Set offsets into serialization arrays.

<void> serializeASCII() Serialize the content of a position component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the number of evolvable quantities to be evolved.

<void> serializeRaw(<integer> fileHandle→) Generate a binary dump of all properties.

<void> serializeValues(<double(:)> array←, <integer> propertyType→) Serialize the evolvable quantities to an array.

<void> serializeXML() Generate an XML dump of all properties.

<integer(c_size_t)> sizeOf() Return the size in bytes of a nodeComponentPosition component.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<double precision> timeAssign() Returns the default value for the timeAssign property for the position component class.

<type(varying_string), allocatable, dimension(:) => matches> timeAssignAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the position class that have the desired attributes for the timeAssign property

<logical> timeAssignIsGettable() Returns true if the timeAssign property is gettable for the position component class.

<logical> timeAssignIsSettable() Specify whether the timeAssign property of the position component is settable.

<double precision> timeAssignRateGet() Returns a zero rate for the timeAssign property for the position component class.

<void> timeAssignSet(<double precision> value) Set the timeAssign property of the position component.

<logical> traceDarkMatterIsActive() Return true if the traceDarkMatter implementation of the position component is the active choice.

<type(varying_string)> type() Returns the type name for the position component class.

<double precision, dimension(:), allocatable => classDefault> velocity() Returns the default value for the velocity property for the position component class.

<type(varying_string), allocatable, dimension(:) => matches> velocityAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the position class that have the desired attributes for the velocity property

<logical> velocityIsGettable() Returns true if the velocity property is gettable for the position component class.

<logical> velocityIsSettable() Specify whether the velocity property of the position component is settable.

<double precision, dimension(:), allocatable => classDefault> velocityOrphan() Returns the default value for the velocityOrphan property for the position component class.

<type(varying_string), allocatable, dimension(:) => matches> velocityOrphanAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the position class that have the desired attributes for the velocityOrphan property

<logical> velocityOrphanIsGettable() Returns true if the velocityOrphan property is gettable for the position component class.

<logical> velocityOrphanIsSettable() Specify whether the velocityOrphan property of the position component is settable.

<double precision, dimension(:), allocatable => classDefault> velocityOrphanRateGet() Returns a zero rate for the velocityOrphan property for the position component class.

<void> velocityOrphanSet(<double precision[:]> value) Set the velocityOrphan property of the position component.

<double precision, dimension(:), allocatable => classDefault> velocityRateGet() Returns a zero rate for the velocity property for the position component class.

<void> velocitySet(<double precision[:]> value) Set the velocity property of the position component.

nodeComponentPositionNull

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a null implementation of the position component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a null implementation of the position component from raw (binary) file.

<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→) Deserialize evolvable properties of a null implementation of the position component from array.

<void> destroy() Finalize a null implementation of the position component.

<void> dumpASCII() Dump the content of a position component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a null member of the position component.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a null implementation of the position component class.

<logical> nullIsActive() Return true if the null implementation of the position component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a position component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a null implementation of the position component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Return the names of properties to output for a null implementation of the position component.

<double precision, dimension(:), allocatable => classDefault> position() Returns the default value for the position property for the position component class.

<type(varying_string), allocatable, dimension(:) => matches> positionAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the position class that have the desired attributes for the position property

<type(history)> positionHistory() Returns the default value for the positionHistory property for the position component class.

<type(varying_string), allocatable, dimension(:) => matches> positionHistoryAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the position class that have the desired attributes for the positionHistory property

<logical> positionHistoryIsGettable() Returns true if the positionHistory property is gettable for the position component class.

<logical> positionHistoryIsSettable() Specify whether the positionHistory property of the position component is settable.

<type(history)> positionHistoryRateGet() Returns a zero rate for the positionHistory property for the position component class.

<void> positionHistorySet(<type(history)> value) Set the positionHistory property of the position component.

<logical> positionIsGettable() Returns true if the position property is gettable for the position component class.

<logical> positionIsSettable() Specify whether the position property of the position component is settable.

<double precision, dimension(:), allocatable => classDefault> positionOrphan() Returns the default value for the positionOrphan property for the position component class.

<type(varying_string), allocatable, dimension(:) => matches> positionOrphanAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the position class that have the desired attributes for the positionOrphan property

<logical> positionOrphanIsGettable() Returns true if the positionOrphan property is gettable for the position component class.

<logical> positionOrphanIsSettable() Specify whether the positionOrphan property of the position component is settable.

<double precision, dimension(:), allocatable => classDefault> positionOrphanRateGet() Returns a zero rate for the positionOrphan property for the position component class.

<void> positionOrphanSet(<double precision[:]> value) Set the positionOrphan property of the position component.

<double precision, dimension(:), allocatable => classDefault> positionRateGet() Returns a zero rate for the position property for the position component class.

<void> positionSet(<double precision[:]> value) Set the position property of the position component.

<void> postOutput(<double precision> time→) Perform post-output processing of a position component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<logical> presetIsActive() Return true if the preset implementation of the position component is the active choice.

<logical> presetOrphansIsActive() Return true if the presetOrphans implementation of the position component is the active choice.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→) Compute offsets into serialization arrays for a null implementation of the position component.

<void> serializeASCII() Serialize the contents of a null implementation of the position component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the serialization of a null implementation of the position component.

<void> serializeRaw(<integer> fileHandle→) Serialize the contents of a null implementation of the position component to raw (binary) file.

<void> serializeValues(<double precision[:]> array←, <integer> propertyType→) Serialize evolvable properties of a null implementation of the position component to array.

<void> serializeXML(<integer> fileHandle→) Serialize the contents of a null implementation of the position component to XML.

<integer(c_size_t)> sizeOf() Return the size in bytes of a null implementation of the position component.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<double precision> timeAssign() Returns the default value for the timeAssign property for the position component class.

<type(varying_string), allocatable, dimension(:) => matches> timeAssignAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the position class that have the desired attributes for the timeAssign property

<logical> timeAssignIsGettable() Returns true if the timeAssign property is gettable for the position component class.

<logical> timeAssignIsSettable() Specify whether the timeAssign property of the position component is settable.

<double precision> timeAssignRateGet() Returns a zero rate for the timeAssign property for the position component class.

<void> timeAssignSet(<double precision> value) Set the timeAssign property of the position component.

<logical> traceDarkMatterIsActive() Return true if the traceDarkMatter implementation of the position component is the active choice.

<type(varying_string)> type() Returns the type name for the null implementation of the position component class.

<double precision, dimension(:), allocatable => classDefault> velocity() Returns the default value for the velocity property for the position component class.

<type(varying_string), allocatable, dimension(:) => matches> velocityAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the position class that have the desired attributes for the velocity property

<logical> velocityIsGettable() Returns true if the velocity property is gettable for the position component class.

<logical> velocityIsSettable() Specify whether the velocity property of the position component is settable.

<double precision, dimension(:), allocatable => classDefault> velocityOrphan() Returns the default value for the velocityOrphan property for the position component class.

<type(varying_string), allocatable, dimension(:) => matches> velocityOrphanAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the position class that have the desired attributes for the velocityOrphan property

<logical> velocityOrphanIsGettable() Returns true if the velocityOrphan property is gettable for the position component class.

<logical> velocityOrphanIsSettable() Specify whether the velocityOrphan property of the position component is settable.

<double precision, dimension(:), allocatable => classDefault> velocityOrphanRateGet() Returns a zero rate for the velocityOrphan property for the position component class.

<void> velocityOrphanSet(<double precision[:]> value) Set the velocityOrphan property of the position component.

<double precision, dimension(:), allocatable => classDefault> velocityRateGet() Returns a zero rate for the velocity property for the position component class.

<void> velocitySet(<double precision[:]> value) Set the velocity property of the position component.

nodeComponentPositionPreset

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a preset implementation of the position component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a preset implementation of the position component from raw (binary) file.

<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→) Deserialize evolvable properties of a preset implementation of the position component from array.

<void> destroy() Finalize a preset implementation of the position component.

<void> dumpASCII() Dump the content of a position component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a preset member of the position component.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a preset implementation of the position component class.

<logical> nullIsActive() Return true if the null implementation of the position component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a position component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a preset implementation of the position component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Return the names of properties to output for a preset implementation of the position component.

<double precision, dimension(:), allocatable => classDefault> position() Returns the default value for the position property for the position component class.

<type(varying_string), allocatable, dimension(:) => matches> positionAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the position class that have the desired attributes for the position property

<type(history)> positionHistory() Get the positionHistory property of an preset implementation of the position component class.

<type(varying_string), allocatable, dimension(:) => matches> positionHistoryAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the position class that have the desired attributes for the positionHistory property

<logical> positionHistoryIsGettable() Returns true if the positionHistory property is gettable for the position component class.

<logical> positionHistoryIsSettable() Specify whether the positionHistory property of the position component is settable.

<type(history)> positionHistoryRateGet() Returns a zero rate for the positionHistory property for the position component class.

<void> positionHistorySet(<type(history)> setValue→) Set the positionHistory property of an preset implementation of the position component class.

<logical> positionIsGettable() Returns true if the position property is gettable for the position component class.

<logical> positionIsSettable() Specify whether the position property of the position component is settable.

<double precision, dimension(:), allocatable => classDefault> positionOrphan() Returns the default value for the positionOrphan property for the position component class.

<type(varying_string), allocatable, dimension(:) => matches> positionOrphanAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the position class that have the desired attributes for the positionOrphan property

<logical> positionOrphanIsGettable() Returns true if the positionOrphan property is gettable for the position component class.

<logical> positionOrphanIsSettable() Specify whether the positionOrphan property of the position component is settable.

<double precision, dimension(:), allocatable => classDefault> positionOrphanRateGet() Returns a zero rate for the positionOrphan property for the position component class.

<void> positionOrphanSet(<double precision[:]> value) Set the positionOrphan property of the position component.

<double precision, dimension(:), allocatable => classDefault> positionRateGet() Returns a zero rate for the position property for the position component class.

<void> positionSet(<double precision[:]> setValue→) Set the position property of an preset implementation of the position component class.

<void> postOutput(<double precision> time→) Perform post-output processing of a position component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<logical> presetIsActive() Return true if the preset implementation of the position component is the active choice.

<logical> presetOrphansIsActive() Return true if the presetOrphans implementation of the position component is the active choice.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→) Compute offsets into serialization arrays for a preset implementation of the position component.

<void> serializeASCII() Serialize the contents of a preset implementation of the position component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the serialization of a preset implementation of the position component.

<void> serializeRaw(<integer> fileHandle→) Serialize the contents of a preset implementation of the position component to raw (binary) file.

<void> serializeValues(<double precision[:]> array←, <integer> propertyType→) Serialize evolvable properties of a preset implementation of the position component to array.

<void> serializeXML(<integer> fileHandle→) Serialize the contents of a preset implementation of the position component to XML.

<integer(c_size_t)> sizeOf() Return the size in bytes of a preset implementation of the position component.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<double precision> timeAssign() Returns the default value for the timeAssign property for the position component class.

<type(varying_string), allocatable, dimension(:) => matches> timeAssignAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the position class that have the desired attributes for the timeAssign property

<logical> timeAssignIsGettable() Returns true if the timeAssign property is gettable for the position component class.

<logical> timeAssignIsSettable() Specify whether the timeAssign property of the position component is settable.

<double precision> timeAssignRateGet() Returns a zero rate for the timeAssign property for the position component class.

<void> timeAssignSet(<double precision> value) Set the timeAssign property of the position component.

<logical> traceDarkMatterIsActive() Return true if the traceDarkMatter implementation of the position component is the active choice.

<type(varying_string)> type() Returns the type name for the preset implementation of the position component class.

<double precision, dimension(:), allocatable => classDefault> velocity() Returns the default value for the velocity property for the position component class.

<type(varying_string), allocatable, dimension(:) => matches> velocityAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the position class that have the desired attributes for the velocity property

<logical> velocityIsGettable() Returns true if the velocity property is gettable for the position component class.

<logical> velocityIsSettable() Specify whether the velocity property of the position component is settable.

<double precision, dimension(:), allocatable => classDefault> velocityOrphan() Returns the default value for the velocityOrphan property for the position component class.

<type(varying_string), allocatable, dimension(:) => matches> velocityOrphanAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the position class that have the desired attributes for the velocityOrphan property

<logical> velocityOrphanIsGettable() Returns true if the velocityOrphan property is gettable for the position component class.

<logical> velocityOrphanIsSettable() Specify whether the velocityOrphan property of the position component is settable.

<double precision, dimension(:), allocatable => classDefault> velocityOrphanRateGet() Returns a zero rate for the velocityOrphan property for the position component class.

<void> velocityOrphanSet(<double precision[:]> value) Set the velocityOrphan property of the position component.

<double precision, dimension(:), allocatable => classDefault> velocityRateGet() Returns a zero rate for the velocity property for the position component class.

<void> velocitySet(<double precision[:]> setValue→) Set the velocity property of an preset implementation of the position component class.

nodeComponentPositionPresetOrphans

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a presetOrphans implementation of the position component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a presetOrphans implementation of the position component from raw (binary) file.

<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→) Deserialize evolvable properties of a presetOrphans implementation of the position component from array.

<void> destroy() Finalize a presetOrphans implementation of the position component.

<void> dumpASCII() Dump the content of a position component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a presetOrphans member of the position component.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a presetOrphans implementation of the position component class.

<logical> nullIsActive() Return true if the null implementation of the position component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a position component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a presetOrphans implementation of the position component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Return the names of properties to output for a presetOrphans implementation of the position component.

<double precision, dimension(:), allocatable => classDefault> position() Returns the default value for the position property for the position component class.

<type(varying_string), allocatable, dimension(:) => matches> positionAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the position class that have the desired attributes for the position property

<type(history)> positionHistory() Get the positionHistory property of an preset implementation of the position component class.

<type(varying_string), allocatable, dimension(:) => matches> positionHistoryAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the position class that have the desired attributes for the positionHistory property

<logical> positionHistoryIsGettable() Returns true if the positionHistory property is gettable for the position component class.

<logical> positionHistoryIsSettable() Specify whether the positionHistory property of the position component is settable.

<type(history)> positionHistoryRateGet() Returns a zero rate for the positionHistory property for the position component class.

<void> positionHistorySet(<type(history)> setValue→) Set the positionHistory property of an preset implementation of the position component class.

<logical> positionIsGettable() Returns true if the position property is gettable for the position component class.

<logical> positionIsSettable() Specify whether the position property of the position component is settable.

<double precision, dimension(:), allocatable => propertyValue> positionOrphan() Get the value of the positionOrphan property of the presetOrphans implementation of the position component using a deferred function.

<type(varying_string), allocatable, dimension(:) => matches> positionOrphanAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the position class that have the desired attributes for the positionOrphan property

<void> positionOrphanFunction() Set the function to be used for the get method of the positionOrphan property of the PositionPresetOrphans component.

<logical> positionOrphanIsAttached() Return true if the deferred function used to get the positionOrphan property of the PositionPresetOrphans component class has been attached.

<logical> positionOrphanIsGettable() Returns true if the positionOrphan property is gettable for the position component class.

<logical> positionOrphanIsSettable() Specify whether the positionOrphan property of the position component is settable.

<double precision, dimension(:), allocatable => classDefault> positionOrphanRateGet() Returns a zero rate for the positionOrphan property for the position component class.

<void> positionOrphanSet(<double precision[:]> setValue→) Set the positionOrphan property of an presetOrphans implementation of the position component class.

<double precision, dimension(:), allocatable => propertyValue> positionOrphanValue() Get the positionOrphan property of an presetOrphans implementation of the position component class.

<double precision, dimension(:), allocatable => classDefault> positionRateGet() Returns a zero rate for the position property for the position component class.

<void> positionSet(<double precision[:]> setValue→) Set the position property of an presetOrphans implementation of the position component class.

<void> postOutput(<double precision> time→) Perform post-output processing for a presetOrphans implementation of the position component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<logical> presetIsActive() Return true if the preset implementation of the position component is the active choice.

<logical> presetOrphansIsActive() Return true if the presetOrphans implementation of the position component is the active choice.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→) Compute offsets into serialization arrays for a presetOrphans implementation of the position component.

<void> serializeASCII() Serialize the contents of a presetOrphans implementation of the position component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the serialization of a presetOrphans implementation of the position component.

<void> serializeRaw(<integer> fileHandle→) Serialize the contents of a presetOrphans implementation of the position component to raw (binary) file.

<void> serializeValues(<double precision[:]> array←, <integer> propertyType→) Serialize evolvable properties of a presetOrphans implementation of the position component to array.

<void> serializeXML(<integer> fileHandle→) Serialize the contents of a presetOrphans implementation of the position component to XML.

<integer(c_size_t)> sizeOf() Return the size in bytes of a presetOrphans implementation of the position component.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<double precision> timeAssign() Get the timeAssign property of an presetOrphans implementation of the position component class.

<type(varying_string), allocatable, dimension(:) => matches> timeAssignAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the position class that have the desired attributes for the timeAssign property

<logical> timeAssignIsGettable() Returns true if the timeAssign property is gettable for the position component class.

<logical> timeAssignIsSettable() Specify whether the timeAssign property of the position component is settable.

<double precision> timeAssignRateGet() Returns a zero rate for the timeAssign property for the position component class.

<void> timeAssignSet(<double precision> setValue→) Set the timeAssign property of an presetOrphans implementation of the position component class.

<logical> traceDarkMatterIsActive() Return true if the traceDarkMatter implementation of the position component is the active choice.

<type(varying_string)> type() Returns the type name for the presetOrphans implementation of the position component class.

<double precision, dimension(:), allocatable => classDefault> velocity() Returns the default value for the velocity property for the position component class.

<type(varying_string), allocatable, dimension(:) => matches> velocityAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the position class that have the desired attributes for the velocity property

<logical> velocityIsGettable() Returns true if the velocity property is gettable for the position component class.

<logical> velocityIsSettable() Specify whether the velocity property of the position component is settable.

<double precision, dimension(:), allocatable => propertyValue> velocityOrphan() Get the value of the velocityOrphan property of the presetOrphans implementation of the position component using a deferred function.

<type(varying_string), allocatable, dimension(:) => matches> velocityOrphanAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the position class that have the desired attributes for the velocityOrphan property

<void> velocityOrphanFunction() Set the function to be used for the get method of the velocityOrphan property of the PositionPresetOrphans component.

<logical> velocityOrphanIsAttached() Return true if the deferred function used to get the velocityOrphan property of the PositionPresetOrphans component class has been attached.

<logical> velocityOrphanIsGettable() Returns true if the velocityOrphan property is gettable for the position component class.

<logical> velocityOrphanIsSettable() Specify whether the velocityOrphan property of the position component is settable.

<double precision, dimension(:), allocatable => classDefault> velocityOrphanRateGet() Returns a zero rate for the velocityOrphan property for the position component class.

<void> velocityOrphanSet(<double precision[:]> setValue→) Set the velocityOrphan property of an presetOrphans implementation of the position component class.

<double precision, dimension(:), allocatable => propertyValue> velocityOrphanValue() Get the velocityOrphan property of an presetOrphans implementation of the position component class.

<double precision, dimension(:), allocatable => classDefault> velocityRateGet() Returns a zero rate for the velocity property for the position component class.

<void> velocitySet(<double precision[:]> setValue→) Set the velocity property of an presetOrphans implementation of the position component class.

nodeComponentPositionTraceDarkMatter

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a traceDarkMatter implementation of the position component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a traceDarkMatter implementation of the position component from raw (binary) file.

<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→) Deserialize evolvable properties of a traceDarkMatter implementation of the position component from array.

<void> destroy() Finalize a traceDarkMatter implementation of the position component.

<void> dumpASCII() Dump the content of a position component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a traceDarkMatter member of the position component.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a traceDarkMatter implementation of the position component class.

<logical> nullIsActive() Return true if the null implementation of the position component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a position component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a traceDarkMatter implementation of the position component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Return the names of properties to output for a traceDarkMatter implementation of the position component.

<double precision, dimension(:), allocatable => propertyValue> position() Get the position property of an traceDarkMatter implementation of the position component class.

<type(varying_string), allocatable, dimension(:) => matches> positionAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the position class that have the desired attributes for the position property

<type(history)> positionHistory() Returns the default value for the positionHistory property for the position component class.

<type(varying_string), allocatable, dimension(:) => matches> positionHistoryAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the position class that have the desired attributes for the positionHistory property

<logical> positionHistoryIsGettable() Returns true if the positionHistory property is gettable for the position component class.

<logical> positionHistoryIsSettable() Specify whether the positionHistory property of the position component is settable.

<type(history)> positionHistoryRateGet() Returns a zero rate for the positionHistory property for the position component class.

<void> positionHistorySet(<type(history)> value) Set the positionHistory property of the position component.

<logical> positionIsGettable() Returns true if the position property is gettable for the position component class.

<logical> positionIsSettable() Specify whether the position property of the position component is settable.

<double precision, dimension(:), allocatable => classDefault> positionOrphan() Returns the default value for the positionOrphan property for the position component class.

<type(varying_string), allocatable, dimension(:) => matches> positionOrphanAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the position class that have the desired attributes for the positionOrphan property

<logical> positionOrphanIsGettable() Returns true if the positionOrphan property is gettable for the position component class.

<logical> positionOrphanIsSettable() Specify whether the positionOrphan property of the position component is settable.

<double precision, dimension(:), allocatable => classDefault> positionOrphanRateGet() Returns a zero rate for the positionOrphan property for the position component class.

<void> positionOrphanSet(<double precision[:]> value) Set the positionOrphan property of the position component.

<double precision, dimension(:), allocatable => classDefault> positionRateGet() Returns a zero rate for the position property for the position component class.

<void> positionSet(<double precision[:]> setValue→) Set the position property of an traceDarkMatter implementation of the position component class.

<void> postOutput(<double precision> time→) Perform post-output processing of a position component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<logical> presetIsActive() Return true if the preset implementation of the position component is the active choice.

<logical> presetOrphansIsActive() Return true if the presetOrphans implementation of the position component is the active choice.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→) Compute offsets into serialization arrays for a traceDarkMatter implementation of the position component.

<void> serializeASCII() Serialize the contents of a traceDarkMatter implementation of the position component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the serialization of a traceDarkMatter implementation of the position component.

<void> serializeRaw(<integer> fileHandle→) Serialize the contents of a traceDarkMatter implementation of the position component to raw (binary) file.

<void> serializeValues(<double precision[:]> array←, <integer> propertyType→) Serialize evolvable properties of a traceDarkMatter implementation of the position component to array.

<void> serializeXML(<integer> fileHandle→) Serialize the contents of a traceDarkMatter implementation of the position component to XML.

<integer(c_size_t)> sizeOf() Return the size in bytes of a traceDarkMatter implementation of the position component.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<double precision> timeAssign() Returns the default value for the timeAssign property for the position component class.

<type(varying_string), allocatable, dimension(:) => matches> timeAssignAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the position class that have the desired attributes for the timeAssign property

<logical> timeAssignIsGettable() Returns true if the timeAssign property is gettable for the position component class.

<logical> timeAssignIsSettable() Specify whether the timeAssign property of the position component is settable.

<double precision> timeAssignRateGet() Returns a zero rate for the timeAssign property for the position component class.

<void> timeAssignSet(<double precision> value) Set the timeAssign property of the position component.

<logical> traceDarkMatterIsActive() Return true if the traceDarkMatter implementation of the position component is the active choice.

<type(varying_string)> type() Returns the type name for the traceDarkMatter implementation of the position component class.

<double precision, dimension(:), allocatable => classDefault> velocity() Returns the default value for the velocity property for the position component class.

<type(varying_string), allocatable, dimension(:) => matches> velocityAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the position class that have the desired attributes for the velocity property

<logical> velocityIsGettable() Returns true if the velocity property is gettable for the position component class.

<logical> velocityIsSettable() Specify whether the velocity property of the position component is settable.

<double precision, dimension(:), allocatable => classDefault> velocityOrphan() Returns the default value for the velocityOrphan property for the position component class.

<type(varying_string), allocatable, dimension(:) => matches> velocityOrphanAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the position class that have the desired attributes for the velocityOrphan property

<logical> velocityOrphanIsGettable() Returns true if the velocityOrphan property is gettable for the position component class.

<logical> velocityOrphanIsSettable() Specify whether the velocityOrphan property of the position component is settable.

<double precision, dimension(:), allocatable => classDefault> velocityOrphanRateGet() Returns a zero rate for the velocityOrphan property for the position component class.

<void> velocityOrphanSet(<double precision[:]> value) Set the velocityOrphan property of the position component.

<double precision, dimension(:), allocatable => classDefault> velocityRateGet() Returns a zero rate for the velocity property for the position component class.

<void> velocitySet(<double precision[:]> value) Set the velocity property of the position component.

nodeComponentSatellite

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<double precision> boundMass() Returns the default value for the boundMass property for the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> boundMassAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the boundMass property

<integer> boundMassCount() Compute the count of evolvable quantities in the boundMass property of the SatelliteOrbiting component.

<type(history)> boundMassHistory() Returns the default value for the boundMassHistory property for the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> boundMassHistoryAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the boundMassHistory property

<logical> boundMassHistoryIsGettable() Returns true if the boundMassHistory property is gettable for the satellite component class.

<logical> boundMassHistoryIsSettable() Specify whether the boundMassHistory property of the satellite component is settable.

<type(history)> boundMassHistoryRateGet() Returns a zero rate for the boundMassHistory property for the satellite component class.

<void> boundMassHistorySet(<type(history)> value) Set the boundMassHistory property of the satellite component.

<logical> boundMassIsGettable() Returns true if the boundMass property is gettable for the satellite component class.

<logical> boundMassIsSettable() Specify whether the boundMass property of the satellite component is settable.

<void> boundMassRate(<double precision> value) Cumulate to the rate of the boundMass property of the SatelliteOrbiting component.

<double precision> boundMassRateGet() Returns a zero rate for the boundMass property for the satellite component class.

<void> boundMassScale(<double precision> value) Set the scale of the boundMass property of the SatelliteOrbiting component.

<void> boundMassSet(<double precision> value) Set the boundMass property of the satellite component.

<void> builder(<*type(node)> componentDefinition→) Build a generic satellite component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Read properties from raw file.

<void> deserializeValues(<double(:)> array→, <integer> propertyType→) Deserialize the evolvable quantities from an array.

<void> destroy() Finalize a generic satellite component.

<void> dumpASCII() Dump the content of a satellite component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a generic satellite component.

<logical> isOrphan() Returns the default value for the isOrphan property for the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> isOrphanAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the isOrphan property

<logical> isOrphanIsGettable() Returns true if the isOrphan property is gettable for the satellite component class.

<logical> isOrphanIsSettable() Specify whether the isOrphan property of the satellite component is settable.

<logical> isOrphanRateGet() Returns a zero rate for the isOrphan property for the satellite component class.

<void> isOrphanSet(<logical> value) Set the isOrphan property of the satellite component.

<double precision> mergeTime() Returns the default value for the mergeTime property for the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> mergeTimeAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the mergeTime property

<integer> mergeTimeCount() Compute the count of evolvable quantities in the mergeTime property of the SatelliteStandard component.

<logical> mergeTimeIsGettable() Returns true if the mergeTime property is gettable for the satellite component class.

<logical> mergeTimeIsSettable() Specify whether the mergeTime property of the satellite component is settable.

<void> mergeTimeRate(<double precision> value) Cumulate to the rate of the mergeTime property of the SatelliteStandard component.

<double precision> mergeTimeRateGet() Returns a zero rate for the mergeTime property for the satellite component class.

<void> mergeTimeScale(<double precision> value) Set the scale of the mergeTime property of the SatelliteStandard component.

<void> mergeTimeSet(<double precision> value) Set the mergeTime property of the satellite component.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a nodeComponent object.

<integer(kind=kind_int8) => classDefault> nodeIndex() Returns the default value for the nodeIndex property for the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> nodeIndexAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the nodeIndex property

<type(longIntegerHistory)> nodeIndexHistory() Returns the default value for the nodeIndexHistory property for the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> nodeIndexHistoryAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the nodeIndexHistory property

<logical> nodeIndexHistoryIsGettable() Returns true if the nodeIndexHistory property is gettable for the satellite component class.

<logical> nodeIndexHistoryIsSettable() Specify whether the nodeIndexHistory property of the satellite component is settable.

<type(longIntegerHistory)> nodeIndexHistoryRateGet() Returns a zero rate for the nodeIndexHistory property for the satellite component class.

<void> nodeIndexHistorySet(<type(longIntegerHistory)> value) Set the nodeIndexHistory property of the satellite component.

<logical> nodeIndexIsGettable() Returns true if the nodeIndex property is gettable for the satellite component class.

<logical> nodeIndexIsSettable() Specify whether the nodeIndex property of the satellite component is settable.

<integer(kind=kind_int8) => classDefault> nodeIndexRateGet() Returns a zero rate for the nodeIndex property for the satellite component class.

<logical> nullIsActive() Return true if the null implementation of the satellite component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<logical> orbitingIsActive() Return true if the orbiting implementation of the satellite component is the active choice.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a satellite component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a generic satellite component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Establish the names of properties to output for a generic satellite component.

<double precision, dimension(:), allocatable => classDefault> position() Returns the default value for the position property for the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> positionAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the position property

<integer> positionCount() Compute the count of evolvable quantities in the position property of the SatelliteOrbiting component.

<logical> positionIsGettable() Returns true if the position property is gettable for the satellite component class.

<logical> positionIsSettable() Specify whether the position property of the satellite component is settable.

<void> positionRate(<double precision[:]> value) Cumulate to the rate of the position property of the SatelliteOrbiting component.

<double precision, dimension(:), allocatable => classDefault> positionRateGet() Returns a zero rate for the position property for the satellite component class.

<void> positionScale(<double precision[:]> value) Set the scale of the position property of the SatelliteOrbiting component.

<void> positionSet(<double precision[:]> value) Set the position property of the satellite component.

<void> postOutput(<double precision> time→) Perform post-output processing of a satellite component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<logical> presetIsActive() Return true if the preset implementation of the satellite component is the active choice.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets() Set offsets into serialization arrays.

<void> serializeASCII() Serialize the content of a satellite component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the number of evolvable quantities to be evolved.

<void> serializeRaw(<integer> fileHandle→) Generate a binary dump of all properties.

<void> serializeValues(<double(:)> array←, <integer> propertyType→) Serialize the evolvable quantities to an array.

<void> serializeXML() Generate an XML dump of all properties.

<integer(c_size_t)> sizeOf() Return the size in bytes of a nodeComponentSatellite component.

<logical> standardIsActive() Return true if the standard implementation of the satellite component is the active choice.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<double precision> tidalHeatingNormalized() Returns the default value for the tidalHeatingNormalized property for the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> tidalHeatingNormalizedAttributeMatch(<log [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the tidalHeatingNormalized property

<integer> tidalHeatingNormalizedCount() Compute the count of evolvable quantities in the tidalHeatingNormalized property of the SatelliteOrbiting component.

<logical> tidalHeatingNormalizedIsGettable() Returns true if the tidalHeatingNormalized property is gettable for the satellite component class.

<logical> tidalHeatingNormalizedIsSettable() Specify whether the tidalHeatingNormalized property of the satellite component is settable.

<void> tidalHeatingNormalizedRate(<double precision> value) Cumulate to the rate of the tidalHeatingNormalize property of the SatelliteOrbiting component.

<double precision> tidalHeatingNormalizedRateGet() Returns a zero rate for the tidalHeatingNormalized property for the satellite component class.

<void> tidalHeatingNormalizedScale(<double precision> value) Set the scale of the tidalHeatingNormalized property of the SatelliteOrbiting component.

<void> tidalHeatingNormalizedSet(<double precision> value) Set the tidalHeatingNormalized property of the satellite component.

<type(tensorRank2Dimension3Symmetric)> tidalTensorPathIntegrated() Returns the default value for the tidalTensorPathIntegrated property for the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> tidalTensorPathIntegratedAttributeMatch(<
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the satellite class that have the desired attributes for the tidalTensorPathIntegrated property

<integer> tidalTensorPathIntegratedCount() Compute the count of evolvable quantities in the tidalTensorPathIntegrated property of the SatelliteOrbiting component.

<logical> tidalTensorPathIntegratedIsGettable() Returns true if the tidalTensorPathIntegrated property is gettable for the satellite component class.

<logical> tidalTensorPathIntegratedIsSettable() Specify whether the tidalTensorPathIntegrated property of the satellite component is settable.

<void> tidalTensorPathIntegratedRate(<type(tensorRank2Dimension3Symmetric)> value) Cumulate to the rate of the tidalTensorPathIntegrated property of the SatelliteOrbiting component.

<type(tensorRank2Dimension3Symmetric)> tidalTensorPathIntegratedRateGet() Returns a zero rate for the tidalTensorPathIntegrated property for the satellite component class.

<void> tidalTensorPathIntegratedScale(<type(tensorRank2Dimension3Symmetric)> value) Set the scale of the tidalTensorPathIntegrated property of the SatelliteOrbiting component.

<void> tidalTensorPathIntegratedSet(<type(tensorRank2Dimension3Symmetric)> value) Set the tidalTensorPathIntegrated property of the satellite component.

<double precision> timeOfMerging() Returns the default value for the timeOfMerging property for the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> timeOfMergingAttributeMatch(<logical>
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the satellite class that have the desired attributes for the timeOfMerging property

<logical> timeOfMergingIsGettable() Returns true if the timeOfMerging property is gettable for the satellite component class.

<logical> timeOfMergingIsSettable() Specify whether the timeOfMerging property of the satellite component is settable.

<double precision> timeOfMergingRateGet() Returns a zero rate for the timeOfMerging property for the satellite component class.

<void> timeOfMergingSet(<double precision> value) Set the timeOfMerging property of the satellite component.

<type(varying_string)> type() Returns the type name for the satellite component class.

<double precision, dimension(:), allocatable => classDefault> velocity() Returns the default value for the velocity property for the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> velocityAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the velocity property

<integer> velocityCount() Compute the count of evolvable quantities in the velocity property of the SatelliteOrbiting component.

<logical> velocityIsGettable() Returns true if the velocity property is gettable for the satellite component class.

<logical> velocityIsSettable() Specify whether the velocity property of the satellite component is settable.

<void> velocityRate(<double precision[:]> value) Cumulate to the rate of the velocity property of the SatelliteOrbiting component.

<double precision, dimension(:), allocatable => classDefault> velocityRateGet() Returns a zero rate for the velocity property for the satellite component class.

<void> velocityScale(<double precision[:]> value) Set the scale of the velocity property of the SatelliteOrbiting component.

<void> velocitySet(<double precision[:]> value) Set the velocity property of the satellite component.

<logical> verySimpleIsActive() Return true if the verySimple implementation of the satellite component is the active choice.

<type(keplerOrbit)> virialOrbit() Returns the default value for the virialOrbit property for the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> virialOrbitAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the virialOrbit property

<logical> virialOrbitIsGettable() Returns true if the virialOrbit property is gettable for the satellite component class.

<logical> virialOrbitIsSettable() Specify whether the virialOrbit property of the satellite component is settable.

<type(keplerOrbit)> virialOrbitRateGet() Returns a zero rate for the virialOrbit property for the satellite component class.

<void> virialOrbitSet(<type(keplerOrbit)> value) Set the virialOrbit property of the satellite component.

nodeComponentSatelliteNull

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<double precision> boundMass() Returns the default value for the boundMass property for the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> boundMassAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the boundMass property

<integer> boundMassCount() Compute the count of evolvable quantities in the boundMass property of the SatelliteOrbiting component.

<type(history)> boundMassHistory() Returns the default value for the boundMassHistory property for the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> boundMassHistoryAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the boundMassHistory property

<logical> boundMassHistoryIsGettable() Returns true if the boundMassHistory property is gettable for the satellite component class.

<logical> boundMassHistoryIsSettable() Specify whether the boundMassHistory property of the satellite component is settable.

<type(history)> boundMassHistoryRateGet() Returns a zero rate for the boundMassHistory property for the satellite component class.

<void> boundMassHistorySet(<type(history)> value) Set the boundMassHistory property of the satellite component.

<logical> boundMassIsGettable() Returns true if the boundMass property is gettable for the satellite component class.

<logical> boundMassIsSettable() Specify whether the boundMass property of the satellite component is settable.

<void> boundMassRate(<double precision> value) Cumulate to the rate of the boundMass property of the SatelliteOrbiting component.

<double precision> boundMassRateGet() Returns a zero rate for the boundMass property for the satellite component class.

<void> boundMassScale(<double precision> value) Set the scale of the boundMass property of the SatelliteOrbiting component.

<void> boundMassSet(<double precision> value) Set the boundMass property of the satellite component.

<void> builder(<*type(node)> componentDefinition→) Build a null implementation of the satellite component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a null implementation of the satellite component from raw (binary) file.

<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→) Deserialize evolvable properties of a null implementation of the satellite component from array.

<void> destroy() Finalize a null implementation of the satellite component.

<void> dumpASCII() Dump the content of a satellite component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a null member of the satellite component.

<logical> isOrphan() Returns the default value for the isOrphan property for the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> isOrphanAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the isOrphan property

<logical> isOrphanIsGettable() Returns true if the isOrphan property is gettable for the satellite component class.

<logical> isOrphanIsSettable() Specify whether the isOrphan property of the satellite component is settable.

<logical> isOrphanRateGet() Returns a zero rate for the isOrphan property for the satellite component class.

<void> isOrphanSet(<logical> value) Set the isOrphan property of the satellite component.

<double precision> mergeTime() Returns the default value for the mergeTime property for the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> mergeTimeAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the mergeTime property

<integer> mergeTimeCount() Compute the count of evolvable quantities in the mergeTime property of the SatelliteStandard component.

<logical> mergeTimeIsGettable() Returns true if the mergeTime property is gettable for the satellite component class.

<logical> mergeTimeIsSettable() Specify whether the mergeTime property of the satellite component is settable.

<void> mergeTimeRate(<double precision> value) Cumulate to the rate of the mergeTime property of the SatelliteStandard component.

<double precision> mergeTimeRateGet() Returns a zero rate for the mergeTime property for the satellite component class.

<void> mergeTimeScale(<double precision> value) Set the scale of the mergeTime property of the SatelliteStandard component.

<void> mergeTimeSet(<double precision> value) Set the mergeTime property of the satellite component.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a null implementation of the satellite component class.

<integer(kind=kind_int8) => classDefault> nodeIndex() Returns the default value for the nodeIndex property for the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> nodeIndexAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the nodeIndex property

<type(longIntegerHistory)> nodeIndexHistory() Returns the default value for the nodeIndexHistory property for the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> nodeIndexHistoryAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the nodeIndexHistory property

<logical> nodeIndexHistoryIsGettable() Returns true if the nodeIndexHistory property is gettable for the satellite component class.

<logical> nodeIndexHistoryIsSettable() Specify whether the nodeIndexHistory property of the satellite component is settable.

<type(longIntegerHistory)> nodeIndexHistoryRateGet() Returns a zero rate for the nodeIndexHistory property for the satellite component class.

<void> nodeIndexHistorySet(<type(longIntegerHistory)> value) Set the nodeIndexHistory property of the satellite component.

<logical> nodeIndexIsGettable() Returns true if the nodeIndex property is gettable for the satellite component class.

<logical> nodeIndexIsSettable() Specify whether the nodeIndex property of the satellite component is settable.

<integer(kind=kind_int8) => classDefault> nodeIndexRateGet() Returns a zero rate for the nodeIndex property for the satellite component class.

<logical> nullIsActive() Return true if the null implementation of the satellite component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<logical> orbitingIsActive() Return true if the orbiting implementation of the satellite component is the active choice.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a satellite component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a null implementation of the satellite component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Return the names of properties to output for a null implementation of the satellite component.

<double precision, dimension(:), allocatable => classDefault> position() Returns the default value for the position property for the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> positionAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the position property

`<integer> positionCount()` Compute the count of evolvable quantities in the `position` property of the `SatelliteOrbiting` component.

`<logical> positionIsGettable()` Returns true if the `position` property is gettable for the `satellite` component class.

`<logical> positionIsSettable()` Specify whether the `position` property of the `satellite` component is settable.

`<void> positionRate(<double precision[:]> value)` Cumulate to the rate of the `position` property of the `SatelliteOrbiting` component.

`<double precision, dimension(:), allocatable => classDefault> positionRateGet()` Returns a zero rate for the `position` property for the `satellite` component class.

`<void> positionScale(<double precision[:]> value)` Set the scale of the `position` property of the `SatelliteOrbiting` component.

`<void> positionSet(<double precision[:]> value)` Set the `position` property of the `satellite` component.

`<void> postOutput(<double precision> time→)` Perform post-output processing of a `satellite` component.

`<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→)` Compute the gravitational potential.

`<logical> presetIsActive()` Return true if the preset implementation of the satellite component is the active choice.

`<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→)` Compute the rotation curve.

`<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→)` Compute the rotation curve gradient.

`<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→)` Compute offsets into serialization arrays for a `null` implementation of the `satellite` component.

`<void> serializeASCII()` Serialize the contents of a null implementation of the satellite component to ASCII.

`<integer> serializeCount(<integer> propertyType→)` Return a count of the serialization of a null implementation of the satellite component.

`<void> serializeRaw(<integer> fileHandle→)` Serialize the contents of a null implementation of the satellite component to raw (binary) file.

`<void> serializeValues(<double precision[:]> array←, <integer> propertyType→)` Serialize evolvable properties of a `null` implementation of the `satellite` component to array.

`<void> serializeXML(<integer> fileHandle→)` Serialize the contents of a null implementation of the satellite component to XML.

`<integer(c_size_t)> sizeOf()` Return the size in bytes of a null implementation of the satellite component.

<logical> standardIsActive() Return true if the standard implementation of the satellite component is the active choice.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<double precision> tidalHeatingNormalized() Returns the default value for the tidalHeatingNormalized property for the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> tidalHeatingNormalizedAttributeMatch(<log [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the tidalHeatingNormalized property

<integer> tidalHeatingNormalizedCount() Compute the count of evolvable quantities in the tidalHeatingNormalized property of the SatelliteOrbiting component.

<logical> tidalHeatingNormalizedIsGettable() Returns true if the tidalHeatingNormalized property is gettable for the satellite component class.

<logical> tidalHeatingNormalizedIsSettable() Specify whether the tidalHeatingNormalized property of the satellite component is settable.

<void> tidalHeatingNormalizedRate(<double precision> value) Cumulate to the rate of the tidalHeatingNormalize property of the SatelliteOrbiting component.

<double precision> tidalHeatingNormalizedRateGet() Returns a zero rate for the tidalHeatingNormalized property for the satellite component class.

<void> tidalHeatingNormalizedScale(<double precision> value) Set the scale of the tidalHeatingNormalized property of the SatelliteOrbiting component.

<void> tidalHeatingNormalizedSet(<double precision> value) Set the tidalHeatingNormalized property of the satellite component.

<type(tensorRank2Dimension3Symmetric)> tidalTensorPathIntegrated() Returns the default value for the tidalTensorPathIntegrated property for the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> tidalTensorPathIntegratedAttributeMatch(< [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the tidalTensorPathIntegrated property

<integer> tidalTensorPathIntegratedCount() Compute the count of evolvable quantities in the tidalTensorPathIntegrated property of the SatelliteOrbiting component.

<logical> tidalTensorPathIntegratedIsGettable() Returns true if the tidalTensorPathIntegrated property is gettable for the satellite component class.

<logical> tidalTensorPathIntegratedIsSettable() Specify whether the tidalTensorPathIntegrated property of the satellite component is settable.

<void> tidalTensorPathIntegratedRate(<type(tensorRank2Dimension3Symmetric)> value) Cumulate to the rate of the tidalTensorPathIntegrated property of the SatelliteOrbiting component.

<type(tensorRank2Dimension3Symmetric)> tidalTensorPathIntegratedRateGet() Returns a zero rate for the tidalTensorPathIntegrated property for the satellite component class.

<void> tidalTensorPathIntegratedScale(<type(tensorRank2Dimension3Symmetric)> value) Set the scale of the tidalTensorPathIntegrated property of the SatelliteOrbiting component.

<void> tidalTensorPathIntegratedSet(<type(tensorRank2Dimension3Symmetric)> value) Set the tidalTensorPathIntegrated property of the satellite component.

<double precision> timeOfMerging() Returns the default value for the timeOfMerging property for the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> timeOfMergingAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the timeOfMerging property

<logical> timeOfMergingIsGettable() Returns true if the timeOfMerging property is gettable for the satellite component class.

<logical> timeOfMergingIsSettable() Specify whether the timeOfMerging property of the satellite component is settable.

<double precision> timeOfMergingRateGet() Returns a zero rate for the timeOfMerging property for the satellite component class.

<void> timeOfMergingSet(<double precision> value) Set the timeOfMerging property of the satellite component.

<type(varying_string)> type() Returns the type name for the null implementation of the satellite component class.

<double precision, dimension(:), allocatable => classDefault> velocity() Returns the default value for the velocity property for the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> velocityAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the velocity property

<integer> velocityCount() Compute the count of evolvable quantities in the velocity property of the SatelliteOrbiting component.

<logical> velocityIsGettable() Returns true if the velocity property is gettable for the satellite component class.

<logical> velocityIsSettable() Specify whether the velocity property of the satellite component is settable.

<void> velocityRate(<double precision[:]> value) Cumulate to the rate of the velocity property of the SatelliteOrbiting component.

<double precision, dimension(:), allocatable => classDefault> velocityRateGet() Returns a zero rate for the velocity property for the satellite component class.

<void> velocityScale(<double precision[:]> value) Set the scale of the velocity property of the SatelliteOrbiting component.

<void> velocitySet(<double precision[:]> value) Set the velocity property of the satellite component.

<logical> verySimpleIsActive() Return true if the verySimple implementation of the satellite component is the active choice.

<type(keplerOrbit)> virialOrbit() Returns the default value for the virialOrbit property for the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> virialOrbitAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the virialOrbit property

<logical> virialOrbitIsGettable() Returns true if the virialOrbit property is gettable for the satellite component class.

<logical> virialOrbitIsSettable() Specify whether the virialOrbit property of the satellite component is settable.

<type(keplerOrbit)> virialOrbitRateGet() Returns a zero rate for the virialOrbit property for the satellite component class.

<void> virialOrbitSet(<type(keplerOrbit)> value) Set the virialOrbit property of the satellite component.

nodeComponentSatelliteOrbiting

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<double precision> boundMass() Get the boundMass property of an orbiting implementation of the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> boundMassAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the boundMass property

<integer> boundMassCount() Return a count of the number of scalar properties in the boundMass property of an orbiting implementation of the satellite component class.

<type(history)> boundMassHistory() Returns the default value for the boundMassHistory property for the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> boundMassHistoryAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the boundMassHistory property

<logical> boundMassHistoryIsGettable() Returns true if the boundMassHistory property is gettable for the satellite component class.

<logical> boundMassHistoryIsSettable() Specify whether the boundMassHistory property of the satellite component is settable.

<type(history)> boundMassHistoryRateGet() Returns a zero rate for the boundMassHistory property for the satellite component class.

<void> boundMassHistorySet(<type(history)> value) Set the boundMassHistory property of the satellite component.

<void> boundMassInactive() Indicate that the boundMass property of an orbiting implementation of the satellite component class is inactive for differential equation solving.

<logical> boundMassIsGettable() Returns true if the boundMass property is gettable for the satellite component class.

<logical> boundMassIsSettable() Specify whether the boundMass property of the satellite component is settable.

<void> boundMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate to the rate of change of the boundMass property of an orbiting implementation of the satellite component class.

<double precision> boundMassRateGet() Get the rate of change of the boundMass property of an orbiting implementation of the satellite component class.

<void> boundMassScale(<double precision> setValue→) Set the absolute scale of the boundMass property of an orbiting implementation of the satellite component class.

<void> boundMassSet(<double precision> setValue→) Set the boundMass property of an orbiting implementation of the satellite component class.

<void> builder(<*type(node)> componentDefinition→) Build a orbiting implementation of the satellite component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a orbiting implementation of the satellite component from raw (binary) file.

<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→) Deserialize evolvable properties of a orbiting implementation of the satellite component from array.

<void> destroy() Finalize a orbiting implementation of the satellite component.

<void> dumpASCII() Dump the content of a satellite component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a orbiting member of the satellite component.

<logical> isOrphan() Returns the default value for the isOrphan property for the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> isOrphanAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the isOrphan property

<logical> isOrphanIsGettable() Returns true if the isOrphan property is gettable for the satellite component class.

<logical> isOrphanIsSettable() Specify whether the isOrphan property of the satellite component is settable.

<logical> isOrphanRateGet() Returns a zero rate for the isOrphan property for the satellite component class.

<void> isOrphanSet(<logical> value) Set the isOrphan property of the satellite component.

<double precision> mergeTime() Get the mergeTime property of an orbiting implementation of the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> mergeTimeAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the mergeTime property

<integer> mergeTimeCount() Compute the count of evolvable quantities in the mergeTime property of the SatelliteStandard component.

<logical> mergeTimeIsGettable() Returns true if the mergeTime property is gettable for the satellite component class.

<logical> mergeTimeIsSettable() Specify whether the mergeTime property of the satellite component is settable.

<void> mergeTimeRate(<double precision> value) Cumulate to the rate of the mergeTime property of the SatelliteStandard component.

<double precision> mergeTimeRateGet() Returns a zero rate for the mergeTime property for the satellite component class.

<void> mergeTimeScale(<double precision> value) Set the scale of the mergeTime property of the SatelliteStandard component.

<void> mergeTimeSet(<double precision> setValue→) Set the mergeTime property of an orbiting implementation of the satellite component class.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a orbiting implementation of the satellite component class.

<integer(kind=kind_int8) => classDefault> nodeIndex() Returns the default value for the nodeIndex property for the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> nodeIndexAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the nodeIndex property

<type(longIntegerHistory)> nodeIndexHistory() Returns the default value for the nodeIndexHistory property for the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> nodeIndexHistoryAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the nodeIndexHistory property

<logical> nodeIndexHistoryIsGettable() Returns true if the nodeIndexHistory property is gettable for the satellite component class.

<logical> nodeIndexHistoryIsSettable() Specify whether the nodeIndexHistory property of the satellite component is settable.

<type(longIntegerHistory)> nodeIndexHistoryRateGet() Returns a zero rate for the nodeIndexHistory property for the satellite component class.

<void> nodeIndexHistorySet(<type(longIntegerHistory)> value) Set the nodeIndexHistory property of the satellite component.

<logical> nodeIndexIsGettable() Returns true if the nodeIndex property is gettable for the satellite component class.

<logical> nodeIndexIsSettable() Specify whether the nodeIndex property of the satellite component is settable.

<integer(kind=kind_int8) => classDefault> nodeIndexRateGet() Returns a zero rate for the nodeIndex property for the satellite component class.

<logical> nullIsActive() Return true if the null implementation of the satellite component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<logical> orbitingIsActive() Return true if the orbiting implementation of the satellite component is the active choice.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_-int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a satellite component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a orbiting implementation of the satellite component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Return the names of properties to output for a orbiting implementation of the satellite component.

<double precision, dimension(:), allocatable => propertyValue> position() Get the position property of an orbiting implementation of the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> positionAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the position property

<integer> positionCount() Return a count of the number of scalar properties in the position property of an orbiting implementation of the satellite component class.

<void> positionInactive() Indicate that the position property of an orbiting implementation of the satellite component class is inactive for differential equation solving.

<logical> positionIsGettable() Returns true if the position property is gettable for the satellite component class.

<logical> positionIsSettable() Specify whether the position property of the satellite component is settable.

<void> positionRate(<double precision[:]> setValue→, <logical> [interrupt]↔, <*procedure(interruptTas [interruptProcedure]↔) Accumulate to the rate of change of the position property of an orbiting implementation of the satellite component class.

<double precision, dimension(:), allocatable => propertyRate> positionRateGet() Get the rate of change of the position property of an orbiting implementation of the satellite component class.

<void> positionScale(<double precision[:]> setValue→) Set the absolute scale of the position property of an orbiting implementation of the satellite component class.

<void> positionSet(<double precision[:]> setValue→) Set the position property of an orbiting implementation of the satellite component class.

<void> postOutput(<double precision> time→) Perform post-output processing of a satellite component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<logical> presetIsActive() Return true if the preset implementation of the satellite component is the active choice.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→) Compute offsets into serialization arrays for a orbiting implementation of the satellite component.

<void> serializeASCII() Serialize the contents of a orbiting implementation of the satellite component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the serialization of a orbiting implementation of the satellite component.

<void> serializeRaw(<integer> fileHandle→) Serialize the contents of a orbiting implementation of the satellite component to raw (binary) file.

<void> serializeValues(<double precision[:]> array←, <integer> propertyType→) Serialize evolvable properties of a orbiting implementation of the satellite component to array.

<void> serializeXML(<integer> fileHandle→) Serialize the contents of a orbiting implementation of the satellite component to XML.

<integer(c_size_t)> sizeOf() Return the size in bytes of a orbiting implementation of the satellite component.

<logical> standardIsActive() Return true if the standard implementation of the satellite component is the active choice.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<double precision> tidalHeatingNormalized() Get the tidalHeatingNormalized property of an orbiting implementation of the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> tidalHeatingNormalizedAttributeMatch(<log [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the tidalHeatingNormalized property

<integer> tidalHeatingNormalizedCount() Return a count of the number of scalar properties in the tidalHeatingNormalized property of an orbiting implementation of the satellite component class.

<void> tidalHeatingNormalizedInactive() Indicate that the tidalHeatingNormalized property of an orbiting implementation of the satellite component class is inactive for differential equation solving.

<logical> tidalHeatingNormalizedIsGettable() Returns true if the tidalHeatingNormalized property is gettable for the satellite component class.

<logical> tidalHeatingNormalizedIsSettable() Specify whether the tidalHeatingNormalized property of the satellite component is settable.

<void> tidalHeatingNormalizedRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate to the rate of change of the tidalHeatingNormalized property of an orbiting implementation of the satellite component class.

<double precision> tidalHeatingNormalizedRateGet() Get the rate of change of the tidalHeatingNormalized property of an orbiting implementation of the satellite component class.

<void> tidalHeatingNormalizedScale(<double precision> setValue→) Set the absolute scale of the tidalHeatingNormalized property of an orbiting implementation of the satellite component class.

<void> tidalHeatingNormalizedSet(<double precision> setValue→) Set the tidalHeatingNormalized property of an orbiting implementation of the satellite component class.

<type(tensorRank2Dimension3Symmetric)> tidalTensorPathIntegrated() Get the tidalTensorPathIntegrated property of an orbiting implementation of the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> tidalTensorPathIntegratedAttributeMatch(<
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the satellite class that have the desired attributes for the tidalTensorPathIntegrated property

<integer> tidalTensorPathIntegratedCount() Return a count of the number of scalar properties in the tidalTensorPathIntegrated property of an orbiting implementation of the satellite component class.

<void> tidalTensorPathIntegratedInactive() Indicate that the tidalTensorPathIntegrated property of an orbiting implementation of the satellite component class is inactive for differential equation solving.

<logical> tidalTensorPathIntegratedIsGettable() Returns true if the tidalTensorPathIntegrated property is gettable for the satellite component class.

<logical> tidalTensorPathIntegratedIsSettable() Specify whether the tidalTensorPathIntegrated property of the satellite component is settable.

<void> tidalTensorPathIntegratedRate(<type(tensorRank2Dimension3Symmetric)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate to the rate of change of the tidalTensorPathIntegrated property of an orbiting implementation of the satellite component class.

<type(tensorRank2Dimension3Symmetric)> tidalTensorPathIntegratedRateGet() Get the rate of change of the tidalTensorPathIntegrated property of an orbiting implementation of the satellite component class.

<void> tidalTensorPathIntegratedScale(<type(tensorRank2Dimension3Symmetric)> setValue→) Set the absolute scale of the tidalTensorPathIntegrated property of an orbiting implementation of the satellite component class.

<void> tidalTensorPathIntegratedSet(<type(tensorRank2Dimension3Symmetric)> setValue→) Set the tidalTensorPathIntegrated property of an orbiting implementation of the satellite component class.

<double precision> timeOfMerging() Returns the default value for the timeOfMerging property for the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> timeOfMergingAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the timeOfMerging property

<logical> timeOfMergingIsGettable() Returns true if the timeOfMerging property is gettable for the satellite component class.

<logical> timeOfMergingIsSettable() Specify whether the timeOfMerging property of the satellite component is settable.

<double precision> timeOfMergingRateGet() Returns a zero rate for the timeOfMerging property for the satellite component class.

<void> timeOfMergingSet(<double precision> value) Set the timeOfMerging property of the satellite component.

<type(varying_string)> type() Returns the type name for the orbiting implementation of the satellite component class.

<double precision, dimension(:), allocatable => propertyValue> velocity() Get the velocity property of an orbiting implementation of the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> velocityAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the velocity property

<integer> velocityCount() Return a count of the number of scalar properties in the velocity property of an orbiting implementation of the satellite component class.

<void> velocityInactive() Indicate that the velocity property of an orbiting implementation of the satellite component class is inactive for differential equation solving.

<logical> velocityIsGettable() Returns true if the velocity property is gettable for the satellite component class.

<logical> velocityIsSettable() Specify whether the velocity property of the satellite component is settable.

<void> velocityRate(<double precision[:]> setValue→, <logical> [interrupt]↔, <*procedure(interruptTas [interruptProcedure]↔) Accumulate to the rate of change of the velocity property of an orbiting implementation of the satellite component class.

<double precision, dimension(:), allocatable => propertyRate> velocityRateGet() Get the rate of change of the velocity property of an orbiting implementation of the satellite component class.

<void> velocityScale(<double precision[:]> setValue→) Set the absolute scale of the velocity property of an orbiting implementation of the satellite component class.

<void> velocitySet(<double precision[:]> setValue→) Set the velocity property of an orbiting implementation of the satellite component class.

<logical> verySimpleIsActive() Return true if the verySimple implementation of the satellite component is the active choice.

<type(keplerOrbit)> virialOrbit() Get the virialOrbit property of an orbiting implementation of the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> virialOrbitAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the virialOrbit property

<logical> virialOrbitIsGettable() Returns true if the virialOrbit property is gettable for the satellite component class.

<logical> virialOrbitIsSettable() Specify whether the virialOrbit property of the satellite component is settable.

<type(keplerOrbit)> virialOrbitRateGet() Returns a zero rate for the virialOrbit property for the satellite component class.

<void> virialOrbitSet(<type(keplerOrbit)> setValue→) Set the value of the virialOrbit property of the orbiting implementation of the satellite component using a deferred function.

<void> virialOrbitSetFunction() Set the function to be used for the set method of the virialOrbit property of the SatelliteOrbiting component.

<logical> virialOrbitSetIsAttached() Return true if the deferred function used to set the virialOrbit property of the SatelliteOrbiting component class has been attached.

<void> virialOrbitSetValue(<type(keplerOrbit)> setValue→) Set the virialOrbit property of an orbiting implementation of the satellite component class.

nodeComponentSatellitePreset

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<double precision> boundMass() Returns the default value for the boundMass property for the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> boundMassAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the boundMass property

<integer> boundMassCount() Compute the count of evolvable quantities in the boundMass property of the SatelliteOrbiting component.

<type(history)> boundMassHistory() Get the boundMassHistory property of an preset implementation of the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> boundMassHistoryAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the boundMassHistory property

<logical> boundMassHistoryIsGettable() Returns true if the boundMassHistory property is gettable for the satellite component class.

<logical> boundMassHistoryIsSettable() Specify whether the boundMassHistory property of the satellite component is settable.

<type(history)> boundMassHistoryRateGet() Returns a zero rate for the boundMassHistory property for the satellite component class.

<void> boundMassHistorySet(<type(history)> setValue→) Set the boundMassHistory property of an preset implementation of the satellite component class.

<logical> boundMassIsGettable() Returns true if the boundMass property is gettable for the satellite component class.

<logical> boundMassIsSettable() Specify whether the boundMass property of the satellite component is settable.

<void> boundMassRate(<double precision> value) Cumulate to the rate of the boundMass property of the SatelliteOrbiting component.

<double precision> boundMassRateGet() Returns a zero rate for the boundMass property for the satellite component class.

<void> boundMassScale(<double precision> value) Set the scale of the boundMass property of the SatelliteOrbiting component.

<void> boundMassSet(<double precision> value) Set the boundMass property of the satellite component.

<void> builder(<*type(node)> componentDefinition→) Build a preset implementation of the satellite component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a preset implementation of the satellite component from raw (binary) file.

<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→) Deserialize evolvable properties of a preset implementation of the satellite component from array.

<void> destroy() Finalize a preset implementation of the satellite component.

<void> dumpASCII() Dump the content of a satellite component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a preset member of the satellite component.

<logical> isOrphan() Get the isOrphan property of an preset implementation of the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> isOrphanAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the isOrphan property

<logical> isOrphanIsGettable() Returns true if the isOrphan property is gettable for the satellite component class.

<logical> isOrphanIsSettable() Specify whether the isOrphan property of the satellite component is settable.

<logical> isOrphanRateGet() Returns a zero rate for the isOrphan property for the satellite component class.

<void> isOrphanSet(<logical> setValue→) Set the isOrphan property of an preset implementation of the satellite component class.

<double precision> mergeTime() Returns the default value for the mergeTime property for the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> mergeTimeAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the mergeTime property

<integer> mergeTimeCount() Compute the count of evolvable quantities in the mergeTime property of the SatelliteStandard component.

<logical> mergeTimeIsGettable() Returns true if the mergeTime property is gettable for the satellite component class.

<logical> mergeTimeIsSettable() Specify whether the mergeTime property of the satellite component is settable.

<void> mergeTimeRate(<double precision> value) Cumulate to the rate of the mergeTime property of the SatelliteStandard component.

<double precision> mergeTimeRateGet() Returns a zero rate for the mergeTime property for the satellite component class.

<void> mergeTimeScale(<double precision> value) Set the scale of the mergeTime property of the SatelliteStandard component.

<void> mergeTimeSet(<double precision> value) Set the mergeTime property of the satellite component.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a preset implementation of the satellite component class.

<integer(kind=kind_int8) => classDefault> nodeIndex() Returns the default value for the nodeIndex property for the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> nodeIndexAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the nodeIndex property

<type(longIntegerHistory)> nodeIndexHistory() Get the nodeIndexHistory property of an preset implementation of the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> nodeIndexHistoryAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the nodeIndexHistory property

<logical> nodeIndexHistoryIsGettable() Returns true if the nodeIndexHistory property is gettable for the satellite component class.

<logical> nodeIndexHistoryIsSettable() Specify whether the nodeIndexHistory property of the satellite component is settable.

<type(longIntegerHistory)> nodeIndexHistoryRateGet() Returns a zero rate for the nodeIndexHistory property for the satellite component class.

<void> nodeIndexHistorySet(<type(longIntegerHistory)> setValue→) Set the nodeIndexHistory property of an preset implementation of the satellite component class.

<logical> nodeIndexIsGettable() Returns true if the nodeIndex property is gettable for the satellite component class.

<logical> nodeIndexIsSettable() Specify whether the nodeIndex property of the satellite component is settable.

<integer(kind=kind_int8) => classDefault> nodeIndexRateGet() Returns a zero rate for the nodeIndex property for the satellite component class.

<logical> nullIsActive() Return true if the null implementation of the satellite component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<logical> orbitingIsActive() Return true if the orbiting implementation of the satellite component is the active choice.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_-int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a satellite component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a preset implementation of the satellite component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Return the names of properties to output for a preset implementation of the satellite component.

<double precision, dimension(:), allocatable => classDefault> position() Returns the default value for the position property for the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> positionAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the position property

<integer> positionCount() Compute the count of evolvable quantities in the position property of the SatelliteOrbiting component.

<logical> positionIsGettable() Returns true if the position property is gettable for the satellite component class.

<logical> positionIsSettable() Specify whether the position property of the satellite component is settable.

<void> positionRate(<double precision[:]> value) Cumulate to the rate of the position property of the SatelliteOrbiting component.

<double precision, dimension(:), allocatable => classDefault> positionRateGet() Returns a zero rate for the position property for the satellite component class.

<void> positionScale(<double precision[:]> value) Set the scale of the position property of the SatelliteOrbiting component.

<void> positionSet(<double precision[:]> value) Set the position property of the satellite component.

<void> postOutput(<double precision> time→) Perform post-output processing of a satellite component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<logical> presetIsActive() Return true if the preset implementation of the satellite component is the active choice.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→) Compute offsets into serialization arrays for a preset implementation of the satellite component.

<void> serializeASCII() Serialize the contents of a preset implementation of the satellite component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the serialization of a preset implementation of the satellite component.

<void> serializeRaw(<integer> fileHandle→) Serialize the contents of a preset implementation of the satellite component to raw (binary) file.

<void> serializeValues(<double precision[:]> array←, <integer> propertyType→) Serialize evolvable properties of a preset implementation of the satellite component to array.

<void> serializeXML(<integer> fileHandle→) Serialize the contents of a preset implementation of the satellite component to XML.

<integer(c_size_t)> sizeOf() Return the size in bytes of a preset implementation of the satellite component.

<logical> standardIsActive() Return true if the standard implementation of the satellite component is the active choice.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<double precision> tidalHeatingNormalized() Returns the default value for the tidalHeatingNormalized property for the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> tidalHeatingNormalizedAttributeMatch(<log [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the tidalHeatingNormalized property

<integer> tidalHeatingNormalizedCount() Compute the count of evolvable quantities in the tidalHeatingNormalized property of the SatelliteOrbiting component.

<logical> tidalHeatingNormalizedIsGettable() Returns true if the tidalHeatingNormalized property is gettable for the satellite component class.

<logical> tidalHeatingNormalizedIsSettable() Specify whether the tidalHeatingNormalized property of the satellite component is settable.

<void> tidalHeatingNormalizedRate(<double precision> value) Cumulate to the rate of the tidalHeatingNormalize property of the SatelliteOrbiting component.

<double precision> tidalHeatingNormalizedRateGet() Returns a zero rate for the tidalHeatingNormalized property for the satellite component class.

<void> tidalHeatingNormalizedScale(<double precision> value) Set the scale of the tidalHeatingNormalized property of the SatelliteOrbiting component.

<void> tidalHeatingNormalizedSet(<double precision> value) Set the tidalHeatingNormalized property of the satellite component.

<type(tensorRank2Dimension3Symmetric)> tidalTensorPathIntegrated() Returns the default value for the tidalTensorPathIntegrated property for the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> tidalTensorPathIntegratedAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the tidalTensorPathIntegrated property

<integer> tidalTensorPathIntegratedCount() Compute the count of evolvable quantities in the tidalTensorPathIntegrated property of the SatelliteOrbiting component.

<logical> tidalTensorPathIntegratedIsGettable() Returns true if the tidalTensorPathIntegrated property is gettable for the satellite component class.

<logical> tidalTensorPathIntegratedIsSettable() Specify whether the tidalTensorPathIntegrated property of the satellite component is settable.

<void> tidalTensorPathIntegratedRate(<type(tensorRank2Dimension3Symmetric)> value) Cumulate to the rate of the tidalTensorPathIntegrated property of the SatelliteOrbiting component.

<type(tensorRank2Dimension3Symmetric)> tidalTensorPathIntegratedRateGet() Returns a zero rate for the tidalTensorPathIntegrated property for the satellite component class.

<void> tidalTensorPathIntegratedScale(<type(tensorRank2Dimension3Symmetric)> value) Set the scale of the tidalTensorPathIntegrated property of the SatelliteOrbiting component.

<void> tidalTensorPathIntegratedSet(<type(tensorRank2Dimension3Symmetric)> value) Set the tidalTensorPathIntegrated property of the satellite component.

<double precision> timeOfMerging() Get the timeOfMerging property of an preset implementation of the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> timeOfMergingAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the timeOfMerging property

<logical> timeOfMergingIsGettable() Returns true if the timeOfMerging property is gettable for the satellite component class.

<logical> timeOfMergingIsSettable() Specify whether the timeOfMerging property of the satellite component is settable.

<double precision> timeOfMergingRateGet() Returns a zero rate for the timeOfMerging property for the satellite component class.

<void> timeOfMergingSet(<double precision> setValue→) Set the timeOfMerging property of an preset implementation of the satellite component class.

<type(varying_string)> type() Returns the type name for the preset implementation of the satellite component class.

<double precision, dimension(:), allocatable => classDefault> velocity() Returns the default value for the velocity property for the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> velocityAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the velocity property

<integer> velocityCount() Compute the count of evolvable quantities in the velocity property of the SatelliteOrbiting component.

<logical> velocityIsGettable() Returns true if the velocity property is gettable for the satellite component class.

<logical> velocityIsSettable() Specify whether the velocity property of the satellite component is settable.

<void> velocityRate(<double precision[:]> value) Cumulate to the rate of the velocity property of the SatelliteOrbiting component.

<double precision, dimension(:), allocatable => classDefault> velocityRateGet() Returns a zero rate for the velocity property for the satellite component class.

<void> velocityScale(<double precision[:]> value) Set the scale of the velocity property of the SatelliteOrbiting component.

<void> velocitySet(<double precision[:]> value) Set the velocity property of the satellite component.

<logical> verySimpleIsActive() Return true if the verySimple implementation of the satellite component is the active choice.

<type(keplerOrbit)> virialOrbit() Get the virialOrbit property of an preset implementation of the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> virialOrbitAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the virialOrbit property

<logical> virialOrbitIsGettable() Returns true if the virialOrbit property is gettable for the satellite component class.

<logical> virialOrbitIsSettable() Specify whether the virialOrbit property of the satellite component is settable.

<type(keplerOrbit)> virialOrbitRateGet() Returns a zero rate for the virialOrbit property for the satellite component class.

<void> virialOrbitSet(<type(keplerOrbit)> setValue→) Set the virialOrbit property of an preset implementation of the satellite component class.

nodeComponentSatelliteStandard

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<double precision> boundMass() Get the boundMass property of an standard implementation of the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> boundMassAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the boundMass property

<integer> boundMassCount() Return a count of the number of scalar properties in the boundMass property of an standard implementation of the satellite component class.

<type(history)> boundMassHistory() Returns the default value for the boundMassHistory property for the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> boundMassHistoryAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the boundMassHistory property

<logical> boundMassHistoryIsGettable() Returns true if the boundMassHistory property is gettable for the satellite component class.

<logical> boundMassHistoryIsSettable() Specify whether the boundMassHistory property of the satellite component is settable.

<type(history)> boundMassHistoryRateGet() Returns a zero rate for the boundMassHistory property for the satellite component class.

<void> boundMassHistorySet(<type(history)> value) Set the boundMassHistory property of the satellite component.

<void> boundMassInactive() Indicate that the boundMass property of an standard implementation of the satellite component class is inactive for differential equation solving.

<logical> boundMassIsGettable() Returns true if the boundMass property is gettable for the satellite component class.

<logical> boundMassIsSettable() Specify whether the boundMass property of the satellite component is settable.

<void> boundMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask) [interruptProcedure]↔) Accumulate to the rate of change of the boundMass property of an standard implementation of the satellite component class.

<double precision> boundMassRateGet() Get the rate of change of the boundMass property of an standard implementation of the satellite component class.

<void> boundMassScale(<double precision> setValue→) Set the absolute scale of the boundMass property of an standard implementation of the satellite component class.

<void> boundMassSet(<double precision> setValue→) Set the boundMass property of an standard implementation of the satellite component class.

<void> builder(<*type(node)> componentDefinition→) Build a standard implementation of the satellite component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a standard implementation of the satellite component from raw (binary) file.

<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→) Deserialize evolvable properties of a standard implementation of the satellite component from array.

<void> destroy() Finalize a standard implementation of the satellite component.

<void> dumpASCII() Dump the content of a satellite component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a standard member of the satellite component.

<logical> isOrphan() Returns the default value for the isOrphan property for the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> isOrphanAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the isOrphan property

<logical> isOrphanIsGettable() Returns true if the isOrphan property is gettable for the satellite component class.

<logical> isOrphanIsSettable() Specify whether the isOrphan property of the satellite component is settable.

<logical> isOrphanRateGet() Returns a zero rate for the isOrphan property for the satellite component class.

<void> isOrphanSet(<logical> value) Set the isOrphan property of the satellite component.

<double precision> mergeTime() Returns the default value for the mergeTime property for the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> mergeTimeAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the mergeTime property

<integer> mergeTimeCount() Return a count of the number of scalar properties in the mergeTime property of an standard implementation of the satellite component class.

<void> mergeTimeInactive() Indicate that the mergeTime property of an standard implementation of the satellite component class is inactive for differential equation solving.

<logical> mergeTimeIsGettable() Returns true if the mergeTime property is gettable for the satellite component class.

<logical> mergeTimeIsSettable() Specify whether the mergeTime property of the satellite component is settable.

<void> mergeTimeRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask) [interruptProcedure]↔) Accumulate to the rate of change of the mergeTime property of an standard implementation of the satellite component class.

<double precision> mergeTimeRateGet() Get the rate of change of the mergeTime property of an standard implementation of the satellite component class.

<void> mergeTimeScale(<double precision> setValue→) Set the absolute scale of the mergeTime property of an standard implementation of the satellite component class.

<void> mergeTimeSet(<double precision> setValue→) Set the mergeTime property of an standard implementation of the satellite component class.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a standard implementation of the satellite component class.

<integer(kind=kind_int8) => classDefault> nodeIndex() Returns the default value for the nodeIndex property for the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> nodeIndexAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the nodeIndex property

<type(longIntegerHistory)> nodeIndexHistory() Returns the default value for the nodeIndexHistory property for the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> nodeIndexHistoryAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the nodeIndexHistory property

<logical> nodeIndexHistoryIsGettable() Returns true if the nodeIndexHistory property is gettable for the satellite component class.

<logical> nodeIndexHistoryIsSettable() Specify whether the nodeIndexHistory property of the satellite component is settable.

<type(longIntegerHistory)> nodeIndexHistoryRateGet() Returns a zero rate for the nodeIndexHistory property for the satellite component class.

<void> nodeIndexHistorySet(<type(longIntegerHistory)> value) Set the nodeIndexHistory property of the satellite component.

<logical> nodeIndexIsGettable() Returns true if the nodeIndex property is gettable for the satellite component class.

<logical> nodeIndexIsSettable() Specify whether the nodeIndex property of the satellite component is settable.

<integer(kind=kind_int8) => classDefault> nodeIndexRateGet() Returns a zero rate for the nodeIndex property for the satellite component class.

<logical> nullIsActive() Return true if the null implementation of the satellite component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<logical> orbitingIsActive() Return true if the orbiting implementation of the satellite component is the active choice.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a satellite component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a standard implementation of the satellite component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Return the names of properties to output for a standard implementation of the satellite component.

<double precision, dimension(:), allocatable => classDefault> position() Returns the default value for the position property for the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> positionAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the position property

<integer> positionCount() Compute the count of evolvable quantities in the position property of the SatelliteOrbiting component.

<logical> positionIsGettable() Returns true if the position property is gettable for the satellite component class.

<logical> positionIsSettable() Specify whether the position property of the satellite component is settable.

<void> positionRate(<double precision[:]> value) Cumulate to the rate of the position property of the SatelliteOrbiting component.

<double precision, dimension(:), allocatable => classDefault> positionRateGet() Returns a zero rate for the position property for the satellite component class.

<void> positionScale(<double precision[:]> value) Set the scale of the position property of the SatelliteOrbiting component.

<void> positionSet(<double precision[:]> value) Set the position property of the satellite component.

<void> postOutput(<double precision> time→) Perform post-output processing for a standard implementation of the satellite component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<logical> presetIsActive() Return true if the preset implementation of the satellite component is the active choice.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→) Compute offsets into serialization arrays for a standard implementation of the satellite component.

<void> serializeASCII() Serialize the contents of a standard implementation of the satellite component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the serialization of a standard implementation of the satellite component.

<void> serializeRaw(<integer> fileHandle→) Serialize the contents of a standard implementation of the satellite component to raw (binary) file.

<void> serializeValues(<double precision[:]> array←, <integer> propertyType→) Serialize evolvable properties of a standard implementation of the satellite component to array.

`<void> serializeXML(<integer> fileHandle→)` Serialize the contents of a standard implementation of the satellite component to XML.

`<integer(c_size_t)> sizeOf()` Return the size in bytes of a standard implementation of the satellite component.

`<logical> standardIsActive()` Return true if the standard implementation of the satellite component is the active choice.

`<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→)` Compute the surface density.

`<double precision> tidalHeatingNormalized()` Returns the default value for the `tidalHeatingNormalized` property for the `satellite` component class.

`<type(varying_string), allocatable, dimension(:) => matches> tidalHeatingNormalizedAttributeMatch(<log [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)` Return a text list of component implementations in the `satellite` class that have the desired attributes for the `tidalHeatingNormalized` property

`<integer> tidalHeatingNormalizedCount()` Compute the count of evolvable quantities in the `tidalHeatingNormalized` property of the `SatelliteOrbiting` component.

`<logical> tidalHeatingNormalizedIsGettable()` Returns true if the `tidalHeatingNormalized` property is gettable for the `satellite` component class.

`<logical> tidalHeatingNormalizedIsSettable()` Specify whether the `tidalHeatingNormalized` property of the `satellite` component is settable.

`<void> tidalHeatingNormalizedRate(<double precision> value)` Cumulate to the rate of the `tidalHeatingNormalize` property of the `SatelliteOrbiting` component.

`<double precision> tidalHeatingNormalizedRateGet()` Returns a zero rate for the `tidalHeatingNormalized` property for the `satellite` component class.

`<void> tidalHeatingNormalizedScale(<double precision> value)` Set the scale of the `tidalHeatingNormalized` property of the `SatelliteOrbiting` component.

`<void> tidalHeatingNormalizedSet(<double precision> value)` Set the `tidalHeatingNormalized` property of the `satellite` component.

`<type(tensorRank2Dimension3Symmetric)> tidalTensorPathIntegrated()` Returns the default value for the `tidalTensorPathIntegrated` property for the `satellite` component class.

`<type(varying_string), allocatable, dimension(:) => matches> tidalTensorPathIntegratedAttributeMatch(< [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)` Return a text list of component implementations in the `satellite` class that have the desired attributes for the `tidalTensorPathIntegrated` property

`<integer> tidalTensorPathIntegratedCount()` Compute the count of evolvable quantities in the `tidalTensorPathIntegrated` property of the `SatelliteOrbiting` component.

`<logical> tidalTensorPathIntegratedIsGettable()` Returns true if the `tidalTensorPathIntegrated` property is gettable for the `satellite` component class.

<logical> tidalTensorPathIntegratedIsSettable() Specify whether the tidalTensorPathIntegrated property of the satellite component is settable.

<void> tidalTensorPathIntegratedRate(<type(tensorRank2Dimension3Symmetric)> value) Cumulate to the rate of the tidalTensorPathIntegrated property of the SatelliteOrbiting component.

<type(tensorRank2Dimension3Symmetric)> tidalTensorPathIntegratedRateGet() Returns a zero rate for the tidalTensorPathIntegrated property for the satellite component class.

<void> tidalTensorPathIntegratedScale(<type(tensorRank2Dimension3Symmetric)> value) Set the scale of the tidalTensorPathIntegrated property of the SatelliteOrbiting component.

<void> tidalTensorPathIntegratedSet(<type(tensorRank2Dimension3Symmetric)> value) Set the tidalTensorPathIntegrated property of the satellite component.

<double precision> timeOfMerging() Returns the default value for the timeOfMerging property for the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> timeOfMergingAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the timeOfMerging property

<logical> timeOfMergingIsGettable() Returns true if the timeOfMerging property is gettable for the satellite component class.

<logical> timeOfMergingIsSettable() Specify whether the timeOfMerging property of the satellite component is settable.

<double precision> timeOfMergingRateGet() Returns a zero rate for the timeOfMerging property for the satellite component class.

<void> timeOfMergingSet(<double precision> value) Set the timeOfMerging property of the satellite component.

<type(varying_string)> type() Returns the type name for the standard implementation of the satellite component class.

<double precision, dimension(:), allocatable => classDefault> velocity() Returns the default value for the velocity property for the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> velocityAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the velocity property

<integer> velocityCount() Compute the count of evolvable quantities in the velocity property of the SatelliteOrbiting component.

<logical> velocityIsGettable() Returns true if the velocity property is gettable for the satellite component class.

<logical> velocityIsSettable() Specify whether the velocity property of the satellite component is settable.

<void> velocityRate(<double precision[:]> value) Cumulate to the rate of the velocity property of the SatelliteOrbiting component.

<double precision, dimension(:), allocatable => classDefault> velocityRateGet() Returns a zero rate for the velocity property for the satellite component class.

<void> velocityScale(<double precision[:]> value) Set the scale of the velocity property of the SatelliteOrbiting component.

<void> velocitySet(<double precision[:]> value) Set the velocity property of the satellite component.

<logical> verySimpleIsActive() Return true if the verySimple implementation of the satellite component is the active choice.

<type(keplerOrbit)> virialOrbit() Get the value of the virialOrbit property of the standard implementation of the satellite component using a deferred function.

<type(varying_string), allocatable, dimension(:) => matches> virialOrbitAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the virialOrbit property

<void> virialOrbitFunction() Set the function to be used for the get method of the virialOrbit property of the SatelliteStandard component.

<logical> virialOrbitIsAttached() Return true if the deferred function used to get the virialOrbit property of the SatelliteStandard component class has been attached.

<logical> virialOrbitIsGettable() Returns true if the virialOrbit property is gettable for the satellite component class.

<logical> virialOrbitIsSettable() Specify whether the virialOrbit property of the satellite component is settable.

<type(keplerOrbit)> virialOrbitRateGet() Returns a zero rate for the virialOrbit property for the satellite component class.

<void> virialOrbitSet(<type(keplerOrbit)> setValue→) Set the value of the virialOrbit property of the standard implementation of the satellite component using a deferred function.

<void> virialOrbitSetFunction() Set the function to be used for the set method of the virialOrbit property of the SatelliteStandard component.

<logical> virialOrbitSetIsAttached() Return true if the deferred function used to set the virialOrbit property of the SatelliteStandard component class has been attached.

<void> virialOrbitSetValue(<type(keplerOrbit)> setValue→) Set the virialOrbit property of an standard implementation of the satellite component class.

<type(keplerOrbit)> virialOrbitValue() Get the virialOrbit property of an standard implementation of the satellite component class.

nodeComponentSatelliteVerySimple

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<double precision> boundMass() Returns the default value for the boundMass property for the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> boundMassAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the boundMass property

<integer> boundMassCount() Compute the count of evolvable quantities in the boundMass property of the SatelliteOrbiting component.

<type(history)> boundMassHistory() Returns the default value for the boundMassHistory property for the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> boundMassHistoryAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the boundMassHistory property

<logical> boundMassHistoryIsGettable() Returns true if the boundMassHistory property is gettable for the satellite component class.

<logical> boundMassHistoryIsSettable() Specify whether the boundMassHistory property of the satellite component is settable.

<type(history)> boundMassHistoryRateGet() Returns a zero rate for the boundMassHistory property for the satellite component class.

<void> boundMassHistorySet(<type(history)> value) Set the boundMassHistory property of the satellite component.

<logical> boundMassIsGettable() Returns true if the boundMass property is gettable for the satellite component class.

<logical> boundMassIsSettable() Specify whether the boundMass property of the satellite component is settable.

<void> boundMassRate(<double precision> value) Cumulate to the rate of the boundMass property of the SatelliteOrbiting component.

<double precision> boundMassRateGet() Returns a zero rate for the boundMass property for the satellite component class.

<void> boundMassScale(<double precision> value) Set the scale of the boundMass property of the SatelliteOrbiting component.

<void> boundMassSet(<double precision> value) Set the boundMass property of the satellite component.

<void> builder(<*type(node)> componentDefinition→) Build a verySimple implementation of the satellite component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a verySimple implementation of the satellite component from raw (binary) file.

<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→) Deserialize evolvable properties of a verySimple implementation of the satellite component from array.

<void> destroy() Finalize a verySimple implementation of the satellite component.

<void> dumpASCII() Dump the content of a satellite component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a verySimple member of the satellite component.

<logical> isOrphan() Returns the default value for the isOrphan property for the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> isOrphanAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the isOrphan property

<logical> isOrphanIsGettable() Returns true if the isOrphan property is gettable for the satellite component class.

<logical> isOrphanIsSettable() Specify whether the isOrphan property of the satellite component is settable.

<logical> isOrphanRateGet() Returns a zero rate for the isOrphan property for the satellite component class.

<void> isOrphanSet(<logical> value) Set the isOrphan property of the satellite component.

<double precision> mergeTime() Returns the default value for the mergeTime property for the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> mergeTimeAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the mergeTime property

<integer> mergeTimeCount() Return a count of the number of scalar properties in the mergeTime property of an verySimple implementation of the satellite component class.

<void> mergeTimeInactive() Indicate that the mergeTime property of an verySimple implementation of the satellite component class is inactive for differential equation solving.

<logical> mergeTimeIsGettable() Returns true if the mergeTime property is gettable for the satellite component class.

<logical> mergeTimeIsSettable() Specify whether the mergeTime property of the satellite component is settable.

<void> mergeTimeRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask) [interruptProcedure]↔) Accumulate to the rate of change of the mergeTime property of an verySimple implementation of the satellite component class.

<double precision> mergeTimeRateGet() Get the rate of change of the mergeTime property of an verySimple implementation of the satellite component class.

<void> mergeTimeScale(<double precision> setValue→) Set the absolute scale of the mergeTime property of an verySimple implementation of the satellite component class.

<void> mergeTimeSet(<double precision> setValue→) Set the mergeTime property of an verySimple implementation of the satellite component class.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a verySimple implementation of the satellite component class.

<integer(kind=kind_int8) => classDefault> nodeIndex() Returns the default value for the nodeIndex property for the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> nodeIndexAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the nodeIndex property

<type(longIntegerHistory)> nodeIndexHistory() Returns the default value for the nodeIndexHistory property for the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> nodeIndexHistoryAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the nodeIndexHistory property

<logical> nodeIndexHistoryIsGettable() Returns true if the nodeIndexHistory property is gettable for the satellite component class.

<logical> nodeIndexHistoryIsSettable() Specify whether the nodeIndexHistory property of the satellite component is settable.

<type(longIntegerHistory)> nodeIndexHistoryRateGet() Returns a zero rate for the nodeIndexHistory property for the satellite component class.

<void> nodeIndexHistorySet(<type(longIntegerHistory)> value) Set the nodeIndexHistory property of the satellite component.

<logical> nodeIndexIsGettable() Returns true if the nodeIndex property is gettable for the satellite component class.

<logical> nodeIndexIsSettable() Specify whether the nodeIndex property of the satellite component is settable.

<integer(kind=kind_int8) => classDefault> nodeIndexRateGet() Returns a zero rate for the nodeIndex property for the satellite component class.

<logical> nullIsActive() Return true if the null implementation of the satellite component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<logical> orbitingIsActive() Return true if the orbiting implementation of the satellite component is the active choice.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a satellite component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a verySimple implementation of the satellite component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Return the names of properties to output for a verySimple implementation of the satellite component.

<double precision, dimension(:), allocatable => classDefault> position() Returns the default value for the position property for the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> positionAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the position property

<integer> positionCount() Compute the count of evolvable quantities in the position property of the SatelliteOrbiting component.

<logical> positionIsGettable() Returns true if the position property is gettable for the satellite component class.

<logical> positionIsSettable() Specify whether the position property of the satellite component is settable.

<void> positionRate(<double precision[:]> value) Cumulate to the rate of the position property of the SatelliteOrbiting component.

<double precision, dimension(:), allocatable => classDefault> positionRateGet() Returns a zero rate for the position property for the satellite component class.

<void> positionScale(<double precision[:]> value) Set the scale of the position property of the SatelliteOrbiting component.

<void> positionSet(<double precision[:]> value) Set the position property of the satellite component.

<void> postOutput(<double precision> time→) Perform post-output processing of a satellite component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<logical> presetIsActive() Return true if the preset implementation of the satellite component is the active choice.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→) Compute offsets into serialization arrays for a verySimple implementation of the satellite component.

<void> serializeASCII() Serialize the contents of a verySimple implementation of the satellite component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the serialization of a verySimple implementation of the satellite component.

<void> serializeRaw(<integer> fileHandle→) Serialize the contents of a verySimple implementation of the satellite component to raw (binary) file.

<void> serializeValues(<double precision[:]> array←, <integer> propertyType→) Serialize evolvable properties of a verySimple implementation of the satellite component to array.

<void> serializeXML(<integer> fileHandle→) Serialize the contents of a verySimple implementation of the satellite component to XML.

<integer(c_size_t)> sizeOf() Return the size in bytes of a verySimple implementation of the satellite component.

<logical> standardIsActive() Return true if the standard implementation of the satellite component is the active choice.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<double precision> tidalHeatingNormalized() Returns the default value for the tidalHeatingNormalized property for the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> tidalHeatingNormalizedAttributeMatch(<log [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the tidalHeatingNormalized property

<integer> tidalHeatingNormalizedCount() Compute the count of evolvable quantities in the tidalHeatingNormalized property of the SatelliteOrbiting component.

<logical> tidalHeatingNormalizedIsGettable() Returns true if the tidalHeatingNormalized property is gettable for the satellite component class.

<logical> tidalHeatingNormalizedIsSettable() Specify whether the tidalHeatingNormalized property of the satellite component is settable.

<void> tidalHeatingNormalizedRate(<double precision> value) Cumulate to the rate of the tidalHeatingNormalize property of the SatelliteOrbiting component.

<double precision> tidalHeatingNormalizedRateGet() Returns a zero rate for the tidalHeatingNormalized property for the satellite component class.

<void> tidalHeatingNormalizedScale(<double precision> value) Set the scale of the tidalHeatingNormalized property of the SatelliteOrbiting component.

<void> tidalHeatingNormalizedSet(<double precision> value) Set the tidalHeatingNormalized property of the satellite component.

<type(tensorRank2Dimension3Symmetric)> tidalTensorPathIntegrated() Returns the default value for the tidalTensorPathIntegrated property for the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> tidalTensorPathIntegratedAttributeMatch(< [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the tidalTensorPathIntegrated property

<integer> tidalTensorPathIntegratedCount() Compute the count of evolvable quantities in the tidalTensorPathIntegrated property of the SatelliteOrbiting component.

<logical> tidalTensorPathIntegratedIsGettable() Returns true if the tidalTensorPathIntegrated property is gettable for the satellite component class.

<logical> tidalTensorPathIntegratedIsSettable() Specify whether the tidalTensorPathIntegrated property of the satellite component is settable.

<void> tidalTensorPathIntegratedRate(<type(tensorRank2Dimension3Symmetric)> value) Cumulate to the rate of the tidalTensorPathIntegrated property of the SatelliteOrbiting component.

<type(tensorRank2Dimension3Symmetric)> tidalTensorPathIntegratedRateGet() Returns a zero rate for the tidalTensorPathIntegrated property for the satellite component class.

<void> tidalTensorPathIntegratedScale(<type(tensorRank2Dimension3Symmetric)> value) Set the scale of the tidalTensorPathIntegrated property of the SatelliteOrbiting component.

<void> tidalTensorPathIntegratedSet(<type(tensorRank2Dimension3Symmetric)> value) Set the tidalTensorPathIntegrated property of the satellite component.

<double precision> timeOfMerging() Returns the default value for the timeOfMerging property for the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> timeOfMergingAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the timeOfMerging property

<logical> timeOfMergingIsGettable() Returns true if the timeOfMerging property is gettable for the satellite component class.

<logical> timeOfMergingIsSettable() Specify whether the timeOfMerging property of the satellite component is settable.

<double precision> timeOfMergingRateGet() Returns a zero rate for the timeOfMerging property for the satellite component class.

<void> timeOfMergingSet(<double precision> value) Set the timeOfMerging property of the satellite component.

<type(varying_string)> type() Returns the type name for the verySimple implementation of the satellite component class.

<double precision, dimension(:), allocatable => classDefault> velocity() Returns the default value for the velocity property for the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> velocityAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the velocity property

<integer> velocityCount() Compute the count of evolvable quantities in the velocity property of the SatelliteOrbiting component.

<logical> velocityIsGettable() Returns true if the velocity property is gettable for the satellite component class.

<logical> velocityIsSettable() Specify whether the velocity property of the satellite component is settable.

<void> velocityRate(<double precision[:]> value) Cumulate to the rate of the velocity property of the SatelliteOrbiting component.

<double precision, dimension(:), allocatable => classDefault> velocityRateGet() Returns a zero rate for the velocity property for the satellite component class.

<void> velocityScale(<double precision[:]> value) Set the scale of the velocity property of the SatelliteOrbiting component.

<void> velocitySet(<double precision[:]> value) Set the velocity property of the satellite component.

<logical> verySimpleIsActive() Return true if the verySimple implementation of the satellite component is the active choice.

<type(keplerOrbit)> virialOrbit() Returns the default value for the virialOrbit property for the satellite component class.

<type(varying_string), allocatable, dimension(:) => matches> virialOrbitAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the satellite class that have the desired attributes for the virialOrbit property

<logical> virialOrbitIsGettable() Returns true if the virialOrbit property is gettable for the satellite component class.

<logical> virialOrbitIsSettable() Specify whether the virialOrbit property of the satellite component is settable.

<type(keplerOrbit)> virialOrbitRateGet() Returns a zero rate for the virialOrbit property for the satellite component class.

<void> virialOrbitSet(<type(keplerOrbit)> value) Set the virialOrbit property of the satellite component.

nodeComponentSpheroid

<type(abundances)> abundancesGas() Returns the default value for the abundancesGas property for the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> abundancesGasAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spheroid class that have the desired attributes for the abundancesGas property

<integer> abundancesGasCount() Compute the count of evolvable quantities in the abundancesGas property of the SpheroidStandard component.

<logical> abundancesGasIsGettable() Returns true if the abundancesGas property is gettable for the spheroid component class.

<logical> abundancesGasIsSettable() Specify whether the abundancesGas property of the spheroid component is settable.

<void> abundancesGasRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptT [interruptProcedure]↔) Accept a rate set for the abundancesGas property of the spheroid component class. Trigger an interrupt to create the component.

<type(abundances)> abundancesGasRateGet() Returns a zero rate for the abundancesGas property for the spheroid component class.

<void> abundancesGasScale(<type(abundances)> value) Set the scale of the abundancesGas property of the SpheroidStandard component.

<void> abundancesGasSet(<type(abundances)> value) Set the abundancesGas property of the spheroid component.

<type(abundances)> abundancesStellar() Returns the default value for the abundancesStellar property for the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> abundancesStellarAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spheroid class that have the desired attributes for the abundancesStellar property

<integer> abundancesStellarCount() Compute the count of evolvable quantities in the abundancesStellar property of the SpheroidStandard component.

<logical> abundancesStellarIsGettable() Returns true if the abundancesStellar property is gettable for the spheroid component class.

<logical> abundancesStellarIsSettable() Specify whether the abundancesStellar property of the spheroid component is settable.

<void> abundancesStellarRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interr [interruptProcedure]↔) Accept a rate set for the abundancesStellar property of the spheroid component class. Trigger an interrupt to create the component.

<type(abundances)> abundancesStellarRateGet() Returns a zero rate for the abundancesStellar property for the spheroid component class.

<void> abundancesStellarScale(<type(abundances)> value) Set the scale of the abundancesStellar property of the SpheroidStandard component.

<void> abundancesStellarSet(<type(abundances)> value) Set the abundancesStellar property of the spheroid component.

<double precision> angularMomentum() Returns the default value for the angularMomentum property for the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> angularMomentumAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spheroid class that have the desired attributes for the angularMomentum property

<integer> angularMomentumCount() Compute the count of evolvable quantities in the angularMomentum property of the SpheroidStandard component.

<logical> angularMomentumIsGettable() Returns true if the angularMomentum property is gettable for the spheroid component class.

<logical> angularMomentumIsSettable() Specify whether the angularMomentum property of the spheroid component is settable.

<void> angularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interrup [interruptProcedure]↔) Accept a rate set for the angularMomentum property of the spheroid component class. Trigger an interrupt to create the component.

<double precision> angularMomentumRateGet() Returns a zero rate for the angularMomentum property for the spheroid component class.

<void> angularMomentumScale(<double precision> value) Set the scale of the angularMomentum property of the SpheroidStandard component.

<void> angularMomentumSet(<double precision> value) Set the angularMomentum property of the spheroid component.

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a generic spheroid component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Read properties from raw file.

<void> deserializeValues(<double(:)> array→, <integer> propertyType→) Deserialize the evolvable quantities from an array.

<void> destroy() Finalize a generic spheroid component.

<void> dumpASCII() Dump the content of a spheroid component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<double precision> energyGasInput() Returns the default value for the energyGasInput property for the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> energyGasInputAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spheroid class that have the desired attributes for the energyGasInput property

<integer> energyGasInputCount() Compute the count of evolvable quantities in the energyGasInput property of the SpheroidStandard component.

<logical> energyGasInputIsGettable() Returns true if the energyGasInput property is gettable for the spheroid component class.

<logical> energyGasInputIsSettable() Specify whether the energyGasInput property of the spheroid component is settable.

<void> energyGasInputRate(<double precision> value) Cumulate to the rate of the energyGasInput property of the SpheroidStandard component.

<double precision> energyGasInputRateGet() Returns a zero rate for the energyGasInput property for the spheroid component class.

<double precision> halfMassRadius() Returns the default value for the halfMassRadius property for the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> halfMassRadiusAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spheroid class that have the desired attributes for the halfMassRadius property

<logical> halfMassRadiusIsGettable() Returns true if the halfMassRadius property is gettable for the spheroid component class.

<logical> halfMassRadiusIsSettable() Specify whether the halfMassRadius property of the spheroid component is settable.

<double precision> halfMassRadiusRateGet() Returns a zero rate for the halfMassRadius property for the spheroid component class.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a generic spheroid component.

<logical> isInitialized() Returns the default value for the isInitialized property for the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> isInitializedAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spheroid class that have the desired attributes for the isInitialized property

<logical> isInitializedIsGettable() Returns true if the isInitialized property is gettable for the spheroid component class.

<logical> isInitializedIsSettable() Specify whether the isInitialized property of the spheroid component is settable.

<logical> isInitializedRateGet() Returns a zero rate for the isInitialized property for the spheroid component class.

<void> isInitializedSet(<logical> value) Set the isInitialized property of the spheroid component.

<type(stellarLuminosities)> luminositiesStellar() Returns the default value for the luminositiesStellar property for the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> luminositiesStellarAttributeMatch(<logica
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the spheroid class that have the desired attributes for the luminositiesStellar property

<integer> luminositiesStellarCount() Compute the count of evolvable quantities in the luminositiesStellar property of the SpheroidStandard component.

<logical> luminositiesStellarIsGettable() Returns true if the luminositiesStellar property is gettable for the spheroid component class.

<logical> luminositiesStellarIsSettable() Specify whether the luminositiesStellar property of the spheroid component is settable.

<void> luminositiesStellarRate(<type(stellarLuminosities)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accept a rate set for the luminositiesStellar property of the spheroid component class. Trigger an interrupt to create the component.

<type(stellarLuminosities)> luminositiesStellarRateGet() Returns a zero rate for the luminositiesStellar property for the spheroid component class.

<void> luminositiesStellarScale(<type(stellarLuminosities)> value) Set the scale of the luminositiesStellar property of the SpheroidStandard component.

<void> luminositiesStellarSet(<type(stellarLuminosities)> value) Set the luminositiesStellar property of the spheroid component.

<double precision> massGas() Returns the default value for the massGas property for the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> massGasAttributeMatch(<logical>
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the spheroid class that have the desired attributes for the massGas property

<integer> massGasCount() Compute the count of evolvable quantities in the massGas property of the SpheroidStandard component.

<logical> massGasIsGettable() Returns true if the massGas property is gettable for the spheroid component class.

<logical> massGasIsSettable() Specify whether the massGas property of the spheroid component is settable.

<void> massGasRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)>
[interruptProcedure]↔) Accept a rate set for the massGas property of the spheroid component class. Trigger an interrupt to create the component.

<double precision> massGasRateGet() Returns a zero rate for the massGas property for the spheroid component class.

<void> massGasScale(<double precision> value) Set the scale of the massGas property of the SpheroidStandard component.

<void> massGasSet(<double precision> value) Set the massGas property of the spheroid component.

<double precision> massGasSink() Returns the default value for the massGasSink property for the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> massGasSinkAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spheroid class that have the desired attributes for the massGasSink property

<integer> massGasSinkCount() Compute the count of evolvable quantities in the massGasSink property of the SpheroidStandard component.

<logical> massGasSinkIsGettable() Returns true if the massGasSink property is gettable for the spheroid component class.

<logical> massGasSinkIsSettable() Specify whether the massGasSink property of the spheroid component is settable.

<void> massGasSinkRate(<double precision> value) Cumulate to the rate of the massGasSink property of the SpheroidStandard component.

<double precision> massGasSinkRateGet() Returns a zero rate for the massGasSink property for the spheroid component class.

<double precision> massStellar() Returns the default value for the massStellar property for the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> massStellarAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spheroid class that have the desired attributes for the massStellar property

<integer> massStellarCount() Compute the count of evolvable quantities in the massStellar property of the SpheroidStandard component.

<double precision> massStellarFormed() Returns the default value for the massStellarFormed property for the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> massStellarFormedAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spheroid class that have the desired attributes for the massStellarFormed property

<integer> massStellarFormedCount() Compute the count of evolvable quantities in the massStellarFormed property of the SpheroidStandard component.

<logical> massStellarFormedIsGettable() Returns true if the massStellarFormed property is gettable for the spheroid component class.

<logical> massStellarFormedIsSettable() Specify whether the massStellarFormed property of the spheroid component is settable.

<void> massStellarFormedRate(<double precision> value) Cumulate to the rate of the massStellarFormed property of the SpheroidStandard component.

<double precision> massStellarFormedRateGet() Returns a zero rate for the massStellarFormed property for the spheroid component class.

<void> massStellarFormedScale(<double precision> value) Set the scale of the massStellarFormed property of the SpheroidStandard component.

<void> massStellarFormedSet(<double precision> value) Set the massStellarFormed property of the spheroid component.

<logical> massStellarIsGettable() Returns true if the massStellar property is gettable for the spheroid component class.

<logical> massStellarIsSettable() Specify whether the massStellar property of the spheroid component is settable.

<void> massStellarRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTas [interruptProcedure]↔) Accept a rate set for the massStellar property of the spheroid component class. Trigger an interrupt to create the component.

<double precision> massStellarRateGet() Returns a zero rate for the massStellar property for the spheroid component class.

<void> massStellarScale(<double precision> value) Set the scale of the massStellar property of the SpheroidStandard component.

<void> massStellarSet(<double precision> value) Set the massStellar property of the spheroid component.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a nodeComponent object.

<logical> nullIsActive() Return true if the null implementation of the spheroid component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a spheroid component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a generic spheroid component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Establish the names of properties to output for a generic spheroid component.

<void> postOutput(<double precision> time→) Perform post-output processing of a spheroid component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<double precision> radius() Returns the default value for the radius property for the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> radiusAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spheroid class that have the desired attributes for the radius property

<logical> radiusIsGettable() Returns true if the radius property is gettable for the spheroid component class.

<logical> radiusIsSettable() Specify whether the radius property of the spheroid component is settable.

<double precision> radiusRateGet() Returns a zero rate for the radius property for the spheroid component class.

<void> radiusSet(<double precision> value) Set the radius property of the spheroid component.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets() Set offsets into serialization arrays.

<void> serializeASCII() Serialize the content of a spheroid component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the number of evolvable quantities to be evolved.

<void> serializeRaw(<integer> fileHandle→) Generate a binary dump of all properties.

<void> serializeValues(<double(:)> array←, <integer> propertyType→) Serialize the evolvable quantities to an array.

<void> serializeXML() Generate an XML dump of all properties.

<integer(c_size_t)> sizeOf() Return the size in bytes of a nodeComponentSpheroid component.

<logical> standardIsActive() Return true if the standard implementation of the spheroid component is the active choice.

<type(history)> starFormationHistory() Returns the default value for the starFormationHistory property for the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> starFormationHistoryAttributeMatch(<logic
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spheroid class that have the desired attributes for the starFormationHistory property

<integer> starFormationHistoryCount() Compute the count of evolvable quantities in the starFormationHistory property of the SpheroidStandard component.

<logical> starFormationHistoryIsGettable() Returns true if the starFormationHistory property is gettable for the spheroid component class.

<logical> starFormationHistoryIsSettable() Specify whether the starFormationHistory property of the spheroid component is settable.

<void> starFormationHistoryRate(<type(history)> setValue→, <logical> [interrupt]↔, <*procedure(interr [interruptProcedure]↔) Accept a rate set for the starFormationHistory property of the spheroid component class. Trigger an interrupt to create the component.

<type(history)> starFormationHistoryRateGet() Returns a zero rate for the starFormationHistory property for the spheroid component class.

<void> starFormationHistoryScale(<type(history)> value) Set the scale of the starFormationHistory property of the SpheroidStandard component.

<void> starFormationHistorySet(<type(history)> value) Set the starFormationHistory property of the spheroid component.

<double precision> starFormationRate() Returns the default value for the starFormationRate property for the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> starFormationRateAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spheroid class that have the desired attributes for the starFormationRate property

<logical> starFormationRateIsGettable() Returns true if the starFormationRate property is gettable for the spheroid component class.

<logical> starFormationRateIsSettable() Specify whether the starFormationRate property of the spheroid component is settable.

<double precision> starFormationRateRateGet() Returns a zero rate for the starFormationRate property for the spheroid component class.

<type(history)> stellarPropertiesHistory() Returns the default value for the stellarPropertiesHistory property for the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> stellarPropertiesHistoryAttributeMatch(<l [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spheroid class that have the desired attributes for the stellarPropertiesHistory property

<integer> stellarPropertiesHistoryCount() Compute the count of evolvable quantities in the stellarPropertiesHist property of the SpheroidStandard component.

<logical> stellarPropertiesHistoryIsGettable() Returns true if the stellarPropertiesHistory property is gettable for the spheroid component class.

<logical> stellarPropertiesHistoryIsSettable() Specify whether the stellarPropertiesHistory property of the spheroid component is settable.

<void> stellarPropertiesHistoryRate(<type(history)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accept a rate set for the stellarPropertiesHistory property of the spheroid component class. Trigger an interrupt to create the component.

<type(history)> stellarPropertiesHistoryRateGet() Returns a zero rate for the stellarPropertiesHistory property for the spheroid component class.

<void> stellarPropertiesHistoryScale(<type(history)> value) Set the scale of the stellarPropertiesHistory property of the SpheroidStandard component.

<void> stellarPropertiesHistorySet(<type(history)> value) Set the stellarPropertiesHistory property of the spheroid component.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<type(varying_string)> type() Returns the type name for the spheroid component class.

<double precision> velocity() Returns the default value for the velocity property for the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> velocityAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spheroid class that have the desired attributes for the velocity property

<logical> velocityIsGettable() Returns true if the velocity property is gettable for the spheroid component class.

<logical> velocityIsSettable() Specify whether the velocity property of the spheroid component is settable.

<double precision> velocityRateGet() Returns a zero rate for the velocity property for the spheroid component class.

<void> velocitySet(<double precision> value) Set the velocity property of the spheroid component.

<logical> verySimpleIsActive() Return true if the verySimple implementation of the spheroid component is the active choice.

nodeComponentSpheroidNull

<type(abundances)> abundancesGas() Returns the default value for the abundancesGas property for the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> abundancesGasAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spheroid class that have the desired attributes for the abundancesGas property

<integer> abundancesGasCount() Compute the count of evolvable quantities in the abundancesGas property of the SpheroidStandard component.

<logical> abundancesGasIsGettable() Returns true if the abundancesGas property is gettable for the spheroid component class.

<logical> abundancesGasIsSettable() Specify whether the abundancesGas property of the spheroid component is settable.

<void> abundancesGasRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptT
[interruptProcedure]↔) Accept a rate set for the abundancesGas property of the spheroid component class. Trigger an interrupt to create the component.

<type(abundances)> abundancesGasRateGet() Returns a zero rate for the abundancesGas property for the spheroid component class.

<void> abundancesGasScale(<type(abundances)> value) Set the scale of the abundancesGas property of the SpheroidStandard component.

<void> abundancesGasSet(<type(abundances)> value) Set the abundancesGas property of the spheroid component.

<type(abundances)> abundancesStellar() Returns the default value for the abundancesStellar property for the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> abundancesStellarAttributeMatch(<logical>
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the spheroid class that have the desired attributes for the abundancesStellar property

<integer> abundancesStellarCount() Compute the count of evolvable quantities in the abundancesStellar property of the SpheroidStandard component.

<logical> abundancesStellarIsGettable() Returns true if the abundancesStellar property is gettable for the spheroid component class.

<logical> abundancesStellarIsSettable() Specify whether the abundancesStellar property of the spheroid component is settable.

<void> abundancesStellarRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interr
[interruptProcedure]↔) Accept a rate set for the abundancesStellar property of the spheroid component class. Trigger an interrupt to create the component.

<type(abundances)> abundancesStellarRateGet() Returns a zero rate for the abundancesStellar property for the spheroid component class.

<void> abundancesStellarScale(<type(abundances)> value) Set the scale of the abundancesStellar property of the SpheroidStandard component.

<void> abundancesStellarSet(<type(abundances)> value) Set the abundancesStellar property of the spheroid component.

<double precision> angularMomentum() Returns the default value for the angularMomentum property for the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> angularMomentumAttributeMatch(<logical>
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the spheroid class that have the desired attributes for the angularMomentum property

<integer> angularMomentumCount() Compute the count of evolvable quantities in the angularMomentum property of the SpheroidStandard component.

<logical> angularMomentumIsGettable() Returns true if the angularMomentum property is gettable for the spheroid component class.

<logical> angularMomentumIsSettable() Specify whether the angularMomentum property of the spheroid component is settable.

<void> angularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interrup [interruptProcedure]↔) Accept a rate set for the angularMomentum property of the spheroid component class. Trigger an interrupt to create the component.

<double precision> angularMomentumRateGet() Returns a zero rate for the angularMomentum property for the spheroid component class.

<void> angularMomentumScale(<double precision> value) Set the scale of the angularMomentum property of the SpheroidStandard component.

<void> angularMomentumSet(<double precision> value) Set the angularMomentum property of the spheroid component.

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a null implementation of the spheroid component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a null implementation of the spheroid component from raw (binary) file.

<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→) Deserialize evolvable properties of a null implementation of the spheroid component from array.

<void> destroy() Finalize a null implementation of the spheroid component.

<void> dumpASCII() Dump the content of a spheroid component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<double precision> energyGasInput() Returns the default value for the energyGasInput property for the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> energyGasInputAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spheroid class that have the desired attributes for the energyGasInput property

<integer> energyGasInputCount() Compute the count of evolvable quantities in the energyGasInput property of the SpheroidStandard component.

<logical> energyGasInputIsGettable() Returns true if the energyGasInput property is gettable for the spheroid component class.

<logical> energyGasInputIsSettable() Specify whether the energyGasInput property of the spheroid component is settable.

<void> energyGasInputRate(<double precision> value) Cumulate to the rate of the energyGasInput property of the SpheroidStandard component.

<double precision> energyGasInputRateGet() Returns a zero rate for the energyGasInput property for the spheroid component class.

<double precision> halfMassRadius() Returns the default value for the halfMassRadius property for the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> halfMassRadiusAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spheroid class that have the desired attributes for the halfMassRadius property

<logical> halfMassRadiusIsGettable() Returns true if the halfMassRadius property is gettable for the spheroid component class.

<logical> halfMassRadiusIsSettable() Specify whether the halfMassRadius property of the spheroid component is settable.

<double precision> halfMassRadiusRateGet() Returns a zero rate for the halfMassRadius property for the spheroid component class.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a null member of the spheroid component.

<logical> isInitialized() Returns the default value for the isInitialized property for the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> isInitializedAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spheroid class that have the desired attributes for the isInitialized property

<logical> isInitializedIsGettable() Returns true if the isInitialized property is gettable for the spheroid component class.

<logical> isInitializedIsSettable() Specify whether the isInitialized property of the spheroid component is settable.

<logical> isInitializedRateGet() Returns a zero rate for the isInitialized property for the spheroid component class.

<void> isInitializedSet(<logical> value) Set the isInitialized property of the spheroid component.

<type(stellarLuminosities)> luminositiesStellar() Returns the default value for the luminositiesStellar property for the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> luminositiesStellarAttributeMatch(<logica [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spheroid class that have the desired attributes for the luminositiesStellar property

<integer> luminositiesStellarCount() Compute the count of evolvable quantities in the luminositiesStellar property of the SpheroidStandard component.

<logical> luminositiesStellarIsGettable() Returns true if the luminositiesStellar property is gettable for the spheroid component class.

<logical> luminositiesStellarIsSettable() Specify whether the luminositiesStellar property of the spheroid component is settable.

<void> luminositiesStellarRate(<type(stellarLuminosities)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accept a rate set for the luminositiesStellar property of the spheroid component class. Trigger an interrupt to create the component.

<type(stellarLuminosities)> luminositiesStellarRateGet() Returns a zero rate for the luminositiesStellar property for the spheroid component class.

<void> luminositiesStellarScale(<type(stellarLuminosities)> value) Set the scale of the luminositiesStellar property of the SpheroidStandard component.

<void> luminositiesStellarSet(<type(stellarLuminosities)> value) Set the luminositiesStellar property of the spheroid component.

<double precision> massGas() Returns the default value for the massGas property for the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> massGasAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spheroid class that have the desired attributes for the massGas property

<integer> massGasCount() Compute the count of evolvable quantities in the massGas property of the SpheroidStandard component.

<logical> massGasIsGettable() Returns true if the massGas property is gettable for the spheroid component class.

<logical> massGasIsSettable() Specify whether the massGas property of the spheroid component is settable.

<void> massGasRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accept a rate set for the massGas property of the spheroid component class. Trigger an interrupt to create the component.

<double precision> massGasRateGet() Returns a zero rate for the massGas property for the spheroid component class.

<void> massGasScale(<double precision> value) Set the scale of the massGas property of the SpheroidStandard component.

<void> massGasSet(<double precision> value) Set the massGas property of the spheroid component.

<double precision> massGasSink() Returns the default value for the massGasSink property for the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> massGasSinkAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spheroid class that have the desired attributes for the massGasSink property

<integer> massGasSinkCount() Compute the count of evolvable quantities in the massGasSink property of the SpheroidStandard component.

<logical> massGasSinkIsGettable() Returns true if the massGasSink property is gettable for the spheroid component class.

<logical> massGasSinkIsSettable() Specify whether the massGasSink property of the spheroid component is settable.

<void> massGasSinkRate(<double precision> value) Cumulate to the rate of the massGasSink property of the SpheroidStandard component.

<double precision> massGasSinkRateGet() Returns a zero rate for the massGasSink property for the spheroid component class.

<double precision> massStellar() Returns the default value for the massStellar property for the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> massStellarAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spheroid class that have the desired attributes for the massStellar property

<integer> massStellarCount() Compute the count of evolvable quantities in the massStellar property of the SpheroidStandard component.

<double precision> massStellarFormed() Returns the default value for the massStellarFormed property for the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> massStellarFormedAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spheroid class that have the desired attributes for the massStellarFormed property

<integer> massStellarFormedCount() Compute the count of evolvable quantities in the massStellarFormed property of the SpheroidStandard component.

<logical> massStellarFormedIsGettable() Returns true if the massStellarFormed property is gettable for the spheroid component class.

<logical> massStellarFormedIsSettable() Specify whether the massStellarFormed property of the spheroid component is settable.

<void> massStellarFormedRate(<double precision> value) Cumulate to the rate of the massStellarFormed property of the SpheroidStandard component.

<double precision> massStellarFormedRateGet() Returns a zero rate for the massStellarFormed property for the spheroid component class.

<void> massStellarFormedScale(<double precision> value) Set the scale of the massStellarFormed property of the SpheroidStandard component.

<void> massStellarFormedSet(<double precision> value) Set the massStellarFormed property of the spheroid component.

<logical> massStellarIsGettable() Returns true if the massStellar property is gettable for the spheroid component class.

<logical> massStellarIsSettable() Specify whether the massStellar property of the spheroid component is settable.

<void> massStellarRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTas [interruptProcedure]↔) Accept a rate set for the massStellar property of the spheroid component class. Trigger an interrupt to create the component.

<double precision> massStellarRateGet() Returns a zero rate for the massStellar property for the spheroid component class.

<void> massStellarScale(<double precision> value) Set the scale of the massStellar property of the SpheroidStandard component.

<void> massStellarSet(<double precision> value) Set the massStellar property of the spheroid component.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a null implementation of the spheroid component class.

<logical> nullIsActive() Return true if the null implementation of the spheroid component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_- int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a spheroid component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a null implementation of the spheroid component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Return the names of properties to output for a null implementation of the spheroid component.

<void> postOutput(<double precision> time→) Perform post-output processing of a spheroid component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<double precision> radius() Returns the default value for the radius property for the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> radiusAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spheroid class that have the desired attributes for the radius property

<logical> radiusIsGettable() Returns true if the radius property is gettable for the spheroid component class.

<logical> radiusIsSettable() Specify whether the radius property of the spheroid component is settable.

<double precision> radiusRateGet() Returns a zero rate for the radius property for the spheroid component class.

<void> radiusSet(<double precision> value) Set the radius property of the spheroid component.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→) Compute offsets into serialization arrays for a null implementation of the spheroid component.

<void> serializeASCII() Serialize the contents of a null implementation of the spheroid component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the serialization of a null implementation of the spheroid component.

<void> serializeRaw(<integer> fileHandle→) Serialize the contents of a null implementation of the spheroid component to raw (binary) file.

<void> serializeValues(<double precision[:]> array←, <integer> propertyType→) Serialize evolvable properties of a null implementation of the spheroid component to array.

<void> serializeXML(<integer> fileHandle→) Serialize the contents of a null implementation of the spheroid component to XML.

<integer(c_size_t)> sizeOf() Return the size in bytes of a null implementation of the spheroid component.

<logical> standardIsActive() Return true if the standard implementation of the spheroid component is the active choice.

<type(history)> starFormationHistory() Returns the default value for the starFormationHistory property for the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> starFormationHistoryAttributeMatch(<logic [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spheroid class that have the desired attributes for the starFormationHistory property

<integer> starFormationHistoryCount() Compute the count of evolvable quantities in the starFormationHistory property of the SpheroidStandard component.

<logical> starFormationHistoryIsGettable() Returns true if the starFormationHistory property is gettable for the spheroid component class.

<logical> starFormationHistoryIsSettable() Specify whether the starFormationHistory property of the spheroid component is settable.

<void> starFormationHistoryRate(<type(history)> setValue→, <logical> [interrupt]↔, <*procedure(interr [interruptProcedure]↔) Accept a rate set for the starFormationHistory property of the spheroid component class. Trigger an interrupt to create the component.

<type(history)> starFormationHistoryRateGet() Returns a zero rate for the starFormationHistory property for the spheroid component class.

<void> starFormationHistoryScale(<type(history)> value) Set the scale of the starFormationHistory property of the SpheroidStandard component.

<void> starFormationHistorySet(<type(history)> value) Set the starFormationHistory property of the spheroid component.

<double precision> starFormationRate() Returns the default value for the starFormationRate property for the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> starFormationRateAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spheroid class that have the desired attributes for the starFormationRate property

<logical> starFormationRateIsGettable() Returns true if the starFormationRate property is gettable for the spheroid component class.

<logical> starFormationRateIsSettable() Specify whether the starFormationRate property of the spheroid component is settable.

<double precision> starFormationRateRateGet() Returns a zero rate for the starFormationRate property for the spheroid component class.

<type(history)> stellarPropertiesHistory() Returns the default value for the stellarPropertiesHistory property for the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> stellarPropertiesHistoryAttributeMatch(<l
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the spheroid class that have the desired attributes for the stellarPropertiesHistory property

<integer> stellarPropertiesHistoryCount() Compute the count of evolvable quantities in the stellarPropertiesHist
property of the SpheroidStandard component.

<logical> stellarPropertiesHistoryIsGettable() Returns true if the stellarPropertiesHistory property is gettable for the spheroid component class.

<logical> stellarPropertiesHistoryIsSettable() Specify whether the stellarPropertiesHistory property of the spheroid component is settable.

<void> stellarPropertiesHistoryRate(<type(history)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accept a rate set for the stellarPropertiesHistory property of the spheroid component class. Trigger an interrupt to create the component.

<type(history)> stellarPropertiesHistoryRateGet() Returns a zero rate for the stellarPropertiesHistory property for the spheroid component class.

<void> stellarPropertiesHistoryScale(<type(history)> value) Set the scale of the stellarPropertiesHistory property of the SpheroidStandard component.

<void> stellarPropertiesHistorySet(<type(history)> value) Set the stellarPropertiesHistory property of the spheroid component.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<type(varying_string)> type() Returns the type name for the null implementation of the spheroid component class.

<double precision> velocity() Returns the default value for the velocity property for the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> velocityAttributeMatch(<logical>
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the spheroid class that have the desired attributes for the velocity property

<logical> velocityIsGettable() Returns true if the velocity property is gettable for the spheroid component class.

<logical> velocityIsSettable() Specify whether the velocity property of the spheroid component is settable.

<double precision> velocityRateGet() Returns a zero rate for the velocity property for the spheroid component class.

<void> velocitySet(<double precision> value) Set the velocity property of the spheroid component.

<logical> verySimpleIsActive() Return true if the verySimple implementation of the spheroid component is the active choice.

nodeComponentSpheroidStandard

<type(abundances)> abundancesGas() Get the abundancesGas property of an standard implementation of the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> abundancesGasAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spheroid class that have the desired attributes for the abundancesGas property

<integer> abundancesGasCount() Return a count of the number of scalar properties in the abundancesGas property of an standard implementation of the spheroid component class.

<void> abundancesGasInactive() Indicate that the abundancesGas property of an standard implementation of the spheroid component class is inactive for differential equation solving.

<logical> abundancesGasIsGettable() Returns true if the abundancesGas property is gettable for the spheroid component class.

<logical> abundancesGasIsSettable() Specify whether the abundancesGas property of the spheroid component is settable.

<void> abundancesGasRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptT [interruptProcedure]↔) Accumulate to the rate of change of the abundancesGas property of an standard implementation of the spheroid component class.

<type(abundances)> abundancesGasRateGet() Get the rate of change of the abundancesGas property of an standard implementation of the spheroid component class.

<void> abundancesGasScale(<type(abundances)> setValue→) Set the absolute scale of the abundancesGas property of an standard implementation of the spheroid component class.

<void> abundancesGasSet(<type(abundances)> setValue→) Set the abundancesGas property of an standard implementation of the spheroid component class.

<type(abundances)> abundancesStellar() Get the abundancesStellar property of an standard implementation of the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> abundancesStellarAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spheroid class that have the desired attributes for the abundancesStellar property

<integer> abundancesStellarCount() Return a count of the number of scalar properties in the abundancesStellar property of an standard implementation of the spheroid component class.

<void> abundancesStellarInactive() Indicate that the abundancesStellar property of an standard implementation of the spheroid component class is inactive for differential equation solving.

<logical> abundancesStellarIsGettable() Returns true if the abundancesStellar property is gettable for the spheroid component class.

<logical> abundancesStellarIsSettable() Specify whether the abundancesStellar property of the spheroid component is settable.

<void> abundancesStellarRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interr
[interruptProcedure]↔) Accumulate to the rate of change of the abundancesStellar property of an standard implementation of the spheroid component class.

<type(abundances)> abundancesStellarRateGet() Get the rate of change of the abundancesStellar property of an standard implementation of the spheroid component class.

<void> abundancesStellarScale(<type(abundances)> setValue→) Set the absolute scale of the abundancesStellar property of an standard implementation of the spheroid component class.

<void> abundancesStellarSet(<type(abundances)> setValue→) Set the abundancesStellar property of an standard implementation of the spheroid component class.

<double precision> angularMomentum() Get the angularMomentum property of an standard implementation of the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> angularMomentumAttributeMatch(<logical>
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the spheroid class that have the desired attributes for the angularMomentum property

<integer> angularMomentumCount() Return a count of the number of scalar properties in the angularMomentum property of an standard implementation of the spheroid component class.

<void> angularMomentumInactive() Indicate that the angularMomentum property of an standard implementation of the spheroid component class is inactive for differential equation solving.

<logical> angularMomentumIsGettable() Returns true if the angularMomentum property is gettable for the spheroid component class.

<logical> angularMomentumIsSettable() Specify whether the angularMomentum property of the spheroid component is settable.

<void> angularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interrup
[interruptProcedure]↔) Accumulate to the rate of change of the angularMomentum property of an standard implementation of the spheroid component class.

<double precision> angularMomentumRateGet() Get the rate of change of the angularMomentum property of an standard implementation of the spheroid component class.

<void> angularMomentumScale(<double precision> setValue→) Set the absolute scale of the angularMomentum property of an standard implementation of the spheroid component class.

<void> angularMomentumSet(<double precision> setValue→) Set the angularMomentum property of an standard implementation of the spheroid component class.

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a standard implementation of the spheroid component from a supplied XML definition.

<void> createFunctionSet() Set the create function for the standard implementation of the spheroid component class.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a standard implementation of the spheroid component from raw (binary) file.

<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→) Deserialize evolvable properties of a standard implementation of the spheroid component from array.

<void> destroy() Finalize a standard implementation of the spheroid component.

<void> dumpASCII() Dump the content of a spheroid component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<double precision> energyGasInput() Returns the default value for the energyGasInput property for the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> energyGasInputAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spheroid class that have the desired attributes for the energyGasInput property

<integer> energyGasInputCount() Compute the count of evolvable quantities in the energyGasInput property of the SpheroidStandard component.

<logical> energyGasInputIsGettable() Returns true if the energyGasInput property is gettable for the spheroid component class.

<logical> energyGasInputIsSettable() Specify whether the energyGasInput property of the spheroid component is settable.

<void> energyGasInputRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interrupt [interruptProcedure]↔) Accumulate the rate of change of the energyGasInput property of the standard implementation of the spheroid component using a deferred function.

<void> energyGasInputRateFunction() Set the function to be used for the rate method of the energyGasInput property of the SpheroidStandard component.

<double precision> energyGasInputRateGet() Returns a zero rate for the energyGasInput property for the spheroid component class.

<logical> energyGasInputRateIsAttached() Return true if the deferred function used to rate the energyGasInput property of the SpheroidStandard component class has been attached.

<double precision> halfMassRadius() Returns the default value for the halfMassRadius property for the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> halfMassRadiusAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spheroid class that have the desired attributes for the halfMassRadius property

<logical> halfMassRadiusIsGettable() Returns true if the halfMassRadius property is gettable for the spheroid component class.

<logical> halfMassRadiusIsSettable() Specify whether the halfMassRadius property of the spheroid component is settable.

<double precision> halfMassRadiusRateGet() Returns a zero rate for the halfMassRadius property for the spheroid component class.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a standard member of the spheroid component.

<logical> isInitialized() Get the isInitialized property of an standard implementation of the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> isInitializedAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spheroid class that have the desired attributes for the isInitialized property

<logical> isInitializedIsGettable() Returns true if the isInitialized property is gettable for the spheroid component class.

<logical> isInitializedIsSettable() Specify whether the isInitialized property of the spheroid component is settable.

<logical> isInitializedRateGet() Returns a zero rate for the isInitialized property for the spheroid component class.

<void> isInitializedSet(<logical> setValue→) Set the isInitialized property of an standard implementation of the spheroid component class.

<type(stellarLuminosities)> luminositiesStellar() Get the luminositiesStellar property of an standard implementation of the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> luminositiesStellarAttributeMatch(<logica [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spheroid class that have the desired attributes for the luminositiesStellar property

<integer> luminositiesStellarCount() Return a count of the number of scalar properties in the luminositiesStellar property of an standard implementation of the spheroid component class.

<void> luminositiesStellarInactive() Indicate that the luminositiesStellar property of an standard implementation of the spheroid component class is inactive for differential equation solving.

<logical> luminositiesStellarIsGettable() Returns true if the luminositiesStellar property is gettable for the spheroid component class.

<logical> luminositiesStellarIsSettable() Specify whether the luminositiesStellar property of the spheroid component is settable.

<void> luminositiesStellarRate(<type(stellarLuminosities)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate to the rate of change of the luminositiesStellar property of an standard implementation of the spheroid component class.

<type(stellarLuminosities)> luminositiesStellarRateGet() Get the rate of change of the luminositiesStellar property of an standard implementation of the spheroid component class.

<void> luminositiesStellarScale(<type(stellarLuminosities)> setValue→) Set the absolute scale of the luminositiesStellar property of an standard implementation of the spheroid component class.

<void> luminositiesStellarSet(<type(stellarLuminosities)> setValue→) Set the luminositiesStellar property of an standard implementation of the spheroid component class.

<double precision> massGas() Get the massGas property of an standard implementation of the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> massGasAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spheroid class that have the desired attributes for the massGas property

<integer> massGasCount() Return a count of the number of scalar properties in the massGas property of an standard implementation of the spheroid component class.

<void> massGasInactive() Indicate that the massGas property of an standard implementation of the spheroid component class is inactive for differential equation solving.

<logical> massGasIsGettable() Returns true if the massGas property is gettable for the spheroid component class.

<logical> massGasIsSettable() Specify whether the massGas property of the spheroid component is settable.

<void> massGasRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate to the rate of change of the massGas property of an standard implementation of the spheroid component class.

<double precision> massGasRateGet() Get the rate of change of the massGas property of an standard implementation of the spheroid component class.

<void> massGasScale(<double precision> setValue→) Set the absolute scale of the massGas property of an standard implementation of the spheroid component class.

<void> massGasSet(<double precision> setValue→) Set the massGas property of an standard implementation of the spheroid component class.

<double precision> massGasSink() Returns the default value for the massGasSink property for the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> massGasSinkAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spheroid class that have the desired attributes for the massGasSink property

<integer> massGasSinkCount() Compute the count of evolvable quantities in the massGasSink property of the SpheroidStandard component.

<logical> massGasSinkIsGettable() Returns true if the massGasSink property is gettable for the spheroid component class.

<logical> massGasSinkIsSettable() Specify whether the massGasSink property of the spheroid component is settable.

<void> massGasSinkRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTas [interruptProcedure]↔) Accumulate the rate of change of the massGasSink property of the standard implementation of the spheroid component using a deferred function.

<void> massGasSinkRateFunction() Set the function to be used for the rate method of the massGasSink property of the SpheroidStandard component.

<double precision> massGasSinkRateGet() Returns a zero rate for the massGasSink property for the spheroid component class.

<logical> massGasSinkRateIsAttached() Return true if the deferred function used to rate the massGasSink property of the SpheroidStandard component class has been attached.

<double precision> massStellar() Get the massStellar property of an standard implementation of the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> massStellarAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spheroid class that have the desired attributes for the massStellar property

<integer> massStellarCount() Return a count of the number of scalar properties in the massStellar property of an standard implementation of the spheroid component class.

<double precision> massStellarFormed() Get the massStellarFormed property of an standard implementation of the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> massStellarFormedAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spheroid class that have the desired attributes for the massStellarFormed property

<integer> massStellarFormedCount() Return a count of the number of scalar properties in the massStellarFormed property of an standard implementation of the spheroid component class.

<void> massStellarFormedInactive() Indicate that the massStellarFormed property of an standard implementation of the spheroid component class is inactive for differential equation solving.

<logical> massStellarFormedIsGettable() Returns true if the massStellarFormed property is gettable for the spheroid component class.

<logical> massStellarFormedIsSettable() Specify whether the massStellarFormed property of the spheroid component is settable.

<void> massStellarFormedRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interr [interruptProcedure]↔) Accumulate to the rate of change of the massStellarFormed property of an standard implementation of the spheroid component class.

<double precision> massStellarFormedRateGet() Get the rate of change of the massStellarFormed property of an standard implementation of the spheroid component class.

<void> massStellarFormedScale(<double precision> setValue→) Set the absolute scale of the massStellarFormed property of an standard implementation of the spheroid component class.

<void> massStellarFormedSet(<double precision> setValue→) Set the massStellarFormed property of an standard implementation of the spheroid component class.

<void> massStellarInactive() Indicate that the massStellar property of an standard implementation of the spheroid component class is inactive for differential equation solving.

<logical> massStellarIsGettable() Returns true if the massStellar property is gettable for the spheroid component class.

<logical> massStellarIsSettable() Specify whether the massStellar property of the spheroid component is settable.

<void> massStellarRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTas [interruptProcedure]↔) Accumulate to the rate of change of the massStellar property of an standard implementation of the spheroid component class.

<double precision> massStellarRateGet() Get the rate of change of the massStellar property of an standard implementation of the spheroid component class.

<void> massStellarScale(<double precision> setValue→) Set the absolute scale of the massStellar property of an standard implementation of the spheroid component class.

<void> massStellarSet(<double precision> setValue→) Set the massStellar property of an standard implementation of the spheroid component class.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a standard implementation of the spheroid component class.

<logical> nullIsActive() Return true if the null implementation of the spheroid component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a spheroid component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a standard implementation of the spheroid component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Return the names of properties to output for a standard implementation of the spheroid component.

<void> postOutput(<double precision> time→) Perform post-output processing for a standard implementation of the spheroid component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<double precision> radius() Get the radius property of an standard implementation of the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> radiusAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spheroid class that have the desired attributes for the radius property

<logical> radiusIsGettable() Returns true if the radius property is gettable for the spheroid component class.

<logical> radiusIsSettable() Specify whether the radius property of the spheroid component is settable.

<double precision> radiusRateGet() Returns a zero rate for the radius property for the spheroid component class.

<void> radiusSet(<double precision> setValue→) Set the radius property of an standard implementation of the spheroid component class.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→) Compute offsets into serialization arrays for a standard implementation of the spheroid component.

<void> serializeASCII() Serialize the contents of a standard implementation of the spheroid component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the serialization of a standard implementation of the spheroid component.

<void> serializeRaw(<integer> fileHandle→) Serialize the contents of a standard implementation of the spheroid component to raw (binary) file.

<void> serializeValues(<double precision[:]> array←, <integer> propertyType→) Serialize evolvable properties of a standard implementation of the spheroid component to array.

<void> serializeXML(<integer> fileHandle→) Serialize the contents of a standard implementation of the spheroid component to XML.

<integer(c_size_t)> sizeOf() Return the size in bytes of a standard implementation of the spheroid component.

<logical> standardIsActive() Return true if the standard implementation of the spheroid component is the active choice.

<type(history)> starFormationHistory() Get the starFormationHistory property of an standard implementation of the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> starFormationHistoryAttributeMatch(<logic
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the spheroid class that have the desired attributes for the starFormationHistory property

<integer> starFormationHistoryCount() Return a count of the number of scalar properties in the starFormationHistory property of an standard implementation of the spheroid component class.

<void> starFormationHistoryInactive() Indicate that the starFormationHistory property of an standard implementation of the spheroid component class is inactive for differential equation solving.

<logical> starFormationHistoryIsGettable() Returns true if the starFormationHistory property is gettable for the spheroid component class.

<logical> starFormationHistoryIsSettable() Specify whether the starFormationHistory property of the spheroid component is settable.

<void> starFormationHistoryRate(<type(history)> setValue→, <logical> [interrupt]↔, <*procedure(interr
[interruptProcedure]↔) Accumulate the rate of change of the starFormationHistory property of the standard implementation of the spheroid component using a deferred function.

<void> starFormationHistoryRateFunction() Set the function to be used for the rate method of the starFormationHistory property of the SpheroidStandard component.

<type(history)> starFormationHistoryRateGet() Get the rate of change of the starFormationHistory property of an standard implementation of the spheroid component class.

<void> starFormationHistoryRateIntrinsic(<type(history)> setValue→, <logical> [interrupt]↔,
<*procedure(interruptTask)> [interruptProcedure]↔) Accumulate directly (i.e. circumventing any deferred function binding) to the rate of change of the starFormationHistory property of an standard implementation of the spheroid component class.

<logical> starFormationHistoryRateIsAttached() Return true if the deferred function used to rate the starFormationHistory property of the SpheroidStandard component class has been attached.

<void> starFormationHistoryScale(<type(history)> setValue→) Set the absolute scale of the starFormationHistory property of an standard implementation of the spheroid component class.

<void> starFormationHistorySet(<type(history)> setValue→) Set the starFormationHistory property of an standard implementation of the spheroid component class.

<double precision> starFormationRate() Get the value of the starFormationRate property of the standard implementation of the spheroid component using a deferred function.

<type(varying_string), allocatable, dimension(:) => matches> starFormationRateAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spheroid class that have the desired attributes for the starFormationRate property

<void> starFormationRateFunction() Set the function to be used for the get method of the starFormationRate property of the SpheroidStandard component.

<logical> starFormationRateIsAttached() Return true if the deferred function used to get the starFormationRate property of the SpheroidStandard component class has been attached.

<logical> starFormationRateIsGettable() Returns true if the starFormationRate property is gettable for the spheroid component class.

<logical> starFormationRateIsSettable() Specify whether the starFormationRate property of the spheroid component is settable.

<double precision> starFormationRateRateGet() Returns a zero rate for the starFormationRate property for the spheroid component class.

<type(history)> stellarPropertiesHistory() Get the stellarPropertiesHistory property of an standard implementation of the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> stellarPropertiesHistoryAttributeMatch(<l [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spheroid class that have the desired attributes for the stellarPropertiesHistory property

<integer> stellarPropertiesHistoryCount() Return a count of the number of scalar properties in the stellarPropertiesHistory property of an standard implementation of the spheroid component class.

<void> stellarPropertiesHistoryInactive() Indicate that the stellarPropertiesHistory property of an standard implementation of the spheroid component class is inactive for differential equation solving.

<logical> stellarPropertiesHistoryIsGettable() Returns true if the stellarPropertiesHistory property is gettable for the spheroid component class.

<logical> stellarPropertiesHistoryIsSettable() Specify whether the stellarPropertiesHistory property of the spheroid component is settable.

<void> stellarPropertiesHistoryRate(<type(history)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the stellarPropertiesHistory property of the standard implementation of the spheroid component using a deferred function.

<void> stellarPropertiesHistoryRateFunction() Set the function to be used for the rate method of the stellarPropertiesHistory property of the SpheroidStandard component.

<type(history)> stellarPropertiesHistoryRateGet() Get the rate of change of the stellarPropertiesHistory property of an standard implementation of the spheroid component class.

<void> stellarPropertiesHistoryRateIntrinsic(<type(history)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate directly (i.e. circumventing any deferred function binding) to the rate of change of the stellarPropertiesHistory property of an standard implementation of the spheroid component class.

<logical> stellarPropertiesHistoryRateIsAttached() Return true if the deferred function used to rate the stellarPropertiesHistory property of the SpheroidStandard component class has been attached.

<void> stellarPropertiesHistoryScale(<type(history)> setValue→) Set the absolute scale of the stellarPropertiesHistory property of an standard implementation of the spheroid component class.

<void> stellarPropertiesHistorySet(<type(history)> setValue→) Set the stellarPropertiesHistory property of an standard implementation of the spheroid component class.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<type(varying_string)> type() Returns the type name for the standard implementation of the spheroid component class.

<double precision> velocity() Get the velocity property of an standard implementation of the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> velocityAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spheroid class that have the desired attributes for the velocity property

<logical> velocityIsGettable() Returns true if the velocity property is gettable for the spheroid component class.

<logical> velocityIsSettable() Specify whether the velocity property of the spheroid component is settable.

<double precision> velocityRateGet() Returns a zero rate for the velocity property for the spheroid component class.

<void> velocitySet(<double precision> setValue→) Set the velocity property of an standard implementation of the spheroid component class.

<logical> verySimpleIsActive() Return true if the verySimple implementation of the spheroid component is the active choice.

nodeComponentSpheroidVerySimple

<type(abundances)> abundancesGas() Get the abundancesGas property of an verySimple implementation of the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> abundancesGasAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spheroid class that have the desired attributes for the abundancesGas property

<integer> abundancesGasCount() Return a count of the number of scalar properties in the abundancesGas property of an verySimple implementation of the spheroid component class.

<void> abundancesGasInactive() Indicate that the abundancesGas property of an verySimple implementation of the spheroid component class is inactive for differential equation solving.

<logical> abundancesGasIsGettable() Returns true if the abundancesGas property is gettable for the spheroid component class.

<logical> abundancesGasIsSettable() Specify whether the abundancesGas property of the spheroid component is settable.

<void> abundancesGasRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptT [interruptProcedure]↔) Accumulate to the rate of change of the abundancesGas property of an verySimple implementation of the spheroid component class.

<type(abundances)> abundancesGasRateGet() Get the rate of change of the abundancesGas property of an verySimple implementation of the spheroid component class.

<void> abundancesGasScale(<type(abundances)> setValue→) Set the absolute scale of the abundancesGas property of an verySimple implementation of the spheroid component class.

<void> abundancesGasSet(<type(abundances)> setValue→) Set the abundancesGas property of an verySimple implementation of the spheroid component class.

<type(abundances)> abundancesStellar() Get the abundancesStellar property of an verySimple implementation of the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> abundancesStellarAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spheroid class that have the desired attributes for the abundancesStellar property

<integer> abundancesStellarCount() Return a count of the number of scalar properties in the abundancesStellar property of an verySimple implementation of the spheroid component class.

<void> abundancesStellarInactive() Indicate that the abundancesStellar property of an verySimple implementation of the spheroid component class is inactive for differential equation solving.

<logical> abundancesStellarIsGettable() Returns true if the abundancesStellar property is gettable for the spheroid component class.

<logical> abundancesStellarIsSettable() Specify whether the abundancesStellar property of the spheroid component is settable.

<void> abundancesStellarRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interr
[interruptProcedure]↔) Accumulate to the rate of change of the abundancesStellar property of an verySimple implementation of the spheroid component class.

<type(abundances)> abundancesStellarRateGet() Get the rate of change of the abundancesStellar property of an verySimple implementation of the spheroid component class.

<void> abundancesStellarScale(<type(abundances)> setValue→) Set the absolute scale of the abundancesStellar property of an verySimple implementation of the spheroid component class.

<void> abundancesStellarSet(<type(abundances)> setValue→) Set the abundancesStellar property of an verySimple implementation of the spheroid component class.

<double precision> angularMomentum() Returns the default value for the angularMomentum property for the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> angularMomentumAttributeMatch(<logical>
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the spheroid class that have the desired attributes for the angularMomentum property

<integer> angularMomentumCount() Compute the count of evolvable quantities in the angularMomentum property of the SpheroidStandard component.

<logical> angularMomentumIsGettable() Returns true if the angularMomentum property is gettable for the spheroid component class.

<logical> angularMomentumIsSettable() Specify whether the angularMomentum property of the spheroid component is settable.

<void> angularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interrup
[interruptProcedure]↔) Accept a rate set for the angularMomentum property of the spheroid component class. Trigger an interrupt to create the component.

<double precision> angularMomentumRateGet() Returns a zero rate for the angularMomentum property for the spheroid component class.

<void> angularMomentumScale(<double precision> value) Set the scale of the angularMomentum property of the SpheroidStandard component.

<void> angularMomentumSet(<double precision> value) Set the angularMomentum property of the spheroid component.

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a verySimple implementation of the spheroid component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType>
[massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a verySimple implementation of the spheroid component from raw (binary) file.

<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→) Deserialize evolvable properties of a verySimple implementation of the spheroid component from array.

<void> destroy() Finalize a verySimple implementation of the spheroid component.

<void> dumpASCII() Dump the content of a spheroid component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<double precision> energyGasInput() Returns the default value for the energyGasInput property for the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> energyGasInputAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spheroid class that have the desired attributes for the energyGasInput property

<integer> energyGasInputCount() Compute the count of evolvable quantities in the energyGasInput property of the SpheroidStandard component.

<logical> energyGasInputIsGettable() Returns true if the energyGasInput property is gettable for the spheroid component class.

<logical> energyGasInputIsSettable() Specify whether the energyGasInput property of the spheroid component is settable.

<void> energyGasInputRate(<double precision> value) Cumulate to the rate of the energyGasInput property of the SpheroidStandard component.

<double precision> energyGasInputRateGet() Returns a zero rate for the energyGasInput property for the spheroid component class.

<double precision> halfMassRadius() Returns the default value for the halfMassRadius property for the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> halfMassRadiusAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spheroid class that have the desired attributes for the halfMassRadius property

<logical> halfMassRadiusIsGettable() Returns true if the halfMassRadius property is gettable for the spheroid component class.

<logical> halfMassRadiusIsSettable() Specify whether the halfMassRadius property of the spheroid component is settable.

<double precision> halfMassRadiusRateGet() Returns a zero rate for the halfMassRadius property for the spheroid component class.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a verySimple member of the spheroid component.

<logical> isInitialized() Get the isInitialized property of an verySimple implementation of the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> isInitializedAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spheroid class that have the desired attributes for the isInitialized property

<logical> isInitializedIsGettable() Returns true if the isInitialized property is gettable for the spheroid component class.

<logical> isInitializedIsSettable() Specify whether the isInitialized property of the spheroid component is settable.

<logical> isInitializedRateGet() Returns a zero rate for the isInitialized property for the spheroid component class.

<void> isInitializedSet(<logical> setValue→) Set the isInitialized property of an verySimple implementation of the spheroid component class.

<type(stellarLuminosities)> luminositiesStellar() Get the luminositiesStellar property of an verySimple implementation of the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> luminositiesStellarAttributeMatch(<logica [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spheroid class that have the desired attributes for the luminositiesStellar property

<integer> luminositiesStellarCount() Return a count of the number of scalar properties in the luminositiesStellar property of an verySimple implementation of the spheroid component class.

<void> luminositiesStellarInactive() Indicate that the luminositiesStellar property of an verySimple implementation of the spheroid component class is inactive for differential equation solving.

<logical> luminositiesStellarIsGettable() Returns true if the luminositiesStellar property is gettable for the spheroid component class.

<logical> luminositiesStellarIsSettable() Specify whether the luminositiesStellar property of the spheroid component is settable.

<void> luminositiesStellarRate(<type(stellarLuminosities)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate to the rate of change of the luminositiesStellar property of an verySimple implementation of the spheroid component class.

<type(stellarLuminosities)> luminositiesStellarRateGet() Get the rate of change of the luminositiesStellar property of an verySimple implementation of the spheroid component class.

<void> luminositiesStellarScale(<type(stellarLuminosities)> setValue→) Set the absolute scale of the luminositiesStellar property of an verySimple implementation of the spheroid component class.

<void> luminositiesStellarSet(<type(stellarLuminosities)> setValue→) Set the luminositiesStellar property of an verySimple implementation of the spheroid component class.

<double precision> massGas() Get the massGas property of an verySimple implementation of the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> massGasAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spheroid class that have the desired attributes for the massGas property

<integer> massGasCount() Return a count of the number of scalar properties in the massGas property of an verySimple implementation of the spheroid component class.

<void> massGasInactive() Indicate that the massGas property of an verySimple implementation of the spheroid component class is inactive for differential equation solving.

<logical> massGasIsGettable() Returns true if the massGas property is gettable for the spheroid component class.

<logical> massGasIsSettable() Specify whether the massGas property of the spheroid component is settable.

<void> massGasRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate to the rate of change of the massGas property of an verySimple implementation of the spheroid component class.

<double precision> massGasRateGet() Get the rate of change of the massGas property of an verySimple implementation of the spheroid component class.

<void> massGasScale(<double precision> setValue→) Set the absolute scale of the massGas property of an verySimple implementation of the spheroid component class.

<void> massGasSet(<double precision> setValue→) Set the massGas property of an verySimple implementation of the spheroid component class.

<double precision> massGasSink() Returns the default value for the massGasSink property for the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> massGasSinkAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spheroid class that have the desired attributes for the massGasSink property

<integer> massGasSinkCount() Compute the count of evolvable quantities in the massGasSink property of the SpheroidStandard component.

<logical> massGasSinkIsGettable() Returns true if the massGasSink property is gettable for the spheroid component class.

<logical> massGasSinkIsSettable() Specify whether the massGasSink property of the spheroid component is settable.

<void> massGasSinkRate(<double precision> value) Cumulate to the rate of the massGasSink property of the SpheroidStandard component.

<double precision> massGasSinkRateGet() Returns a zero rate for the massGasSink property for the spheroid component class.

<double precision> massStellar() Get the massStellar property of an verySimple implementation of the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> massStellarAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spheroid class that have the desired attributes for the massStellar property

<integer> massStellarCount() Return a count of the number of scalar properties in the massStellar property of an verySimple implementation of the spheroid component class.

<double precision> massStellarFormed() Returns the default value for the massStellarFormed property for the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> massStellarFormedAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spheroid class that have the desired attributes for the massStellarFormed property

<integer> massStellarFormedCount() Compute the count of evolvable quantities in the massStellarFormed property of the SpheroidStandard component.

<logical> massStellarFormedIsGettable() Returns true if the massStellarFormed property is gettable for the spheroid component class.

<logical> massStellarFormedIsSettable() Specify whether the massStellarFormed property of the spheroid component is settable.

<void> massStellarFormedRate(<double precision> value) Cumulate to the rate of the massStellarFormed property of the SpheroidStandard component.

<double precision> massStellarFormedRateGet() Returns a zero rate for the massStellarFormed property for the spheroid component class.

<void> massStellarFormedScale(<double precision> value) Set the scale of the massStellarFormed property of the SpheroidStandard component.

<void> massStellarFormedSet(<double precision> value) Set the massStellarFormed property of the spheroid component.

<void> massStellarInactive() Indicate that the massStellar property of an verySimple implementation of the spheroid component class is inactive for differential equation solving.

<logical> massStellarIsGettable() Returns true if the massStellar property is gettable for the spheroid component class.

<logical> massStellarIsSettable() Specify whether the massStellar property of the spheroid component is settable.

<void> massStellarRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTas [interruptProcedure]↔) Accumulate to the rate of change of the massStellar property of an verySimple implementation of the spheroid component class.

<double precision> massStellarRateGet() Get the rate of change of the massStellar property of an verySimple implementation of the spheroid component class.

<void> massStellarScale(<double precision> setValue→) Set the absolute scale of the massStellar property of an verySimple implementation of the spheroid component class.

<void> massStellarSet(<double precision> setValue→) Set the massStellar property of an verySimple implementation of the spheroid component class.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a verySimple implementation of the spheroid component class.

<logical> nullIsActive() Return true if the null implementation of the spheroid component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_- int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a spheroid component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a verySimple implementation of the spheroid component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Return the names of properties to output for a verySimple implementation of the spheroid component.

<void> postOutput(<double precision> time→) Perform post-output processing for a verySimple implementation of the spheroid component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<double precision> radius() Get the radius property of an verySimple implementation of the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> radiusAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spheroid class that have the desired attributes for the radius property

<logical> radiusIsGettable() Returns true if the radius property is gettable for the spheroid component class.

<logical> radiusIsSettable() Specify whether the radius property of the spheroid component is settable.

<double precision> radiusRateGet() Returns a zero rate for the radius property for the spheroid component class.

<void> radiusSet(<double precision> setValue→) Set the radius property of an verySimple implementation of the spheroid component class.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→) Compute offsets into serialization arrays for a verySimple implementation of the spheroid component.

<void> serializeASCII() Serialize the contents of a verySimple implementation of the spheroid component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the serialization of a verySimple implementation of the spheroid component.

<void> serializeRaw(<integer> fileHandle→) Serialize the contents of a verySimple implementation of the spheroid component to raw (binary) file.

<void> serializeValues(<double precision[:]> array←, <integer> propertyType→) Serialize evolvable properties of a verySimple implementation of the spheroid component to array.

<void> serializeXML(<integer> fileHandle→) Serialize the contents of a verySimple implementation of the spheroid component to XML.

<integer(c_size_t)> sizeOf() Return the size in bytes of a verySimple implementation of the spheroid component.

<logical> standardIsActive() Return true if the standard implementation of the spheroid component is the active choice.

<type(history)> starFormationHistory() Returns the default value for the starFormationHistory property for the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> starFormationHistoryAttributeMatch(<logic
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the spheroid class that have the desired attributes for the starFormationHistory property

<integer> starFormationHistoryCount() Compute the count of evolvable quantities in the starFormationHistory property of the SpheroidStandard component.

<logical> starFormationHistoryIsGettable() Returns true if the starFormationHistory property is gettable for the spheroid component class.

<logical> starFormationHistoryIsSettable() Specify whether the starFormationHistory property of the spheroid component is settable.

<void> starFormationHistoryRate(<type(history)> setValue→, <logical> [interrupt]↔, <*procedure(interr
[interruptProcedure]↔) Accept a rate set for the starFormationHistory property of the spheroid component class. Trigger an interrupt to create the component.

<type(history)> starFormationHistoryRateGet() Returns a zero rate for the starFormationHistory property for the spheroid component class.

<void> starFormationHistoryScale(<type(history)> value) Set the scale of the starFormationHistory property of the SpheroidStandard component.

<void> starFormationHistorySet(<type(history)> value) Set the starFormationHistory property of the spheroid component.

<double precision> starFormationRate() Get the value of the starFormationRate property of the verySimple implementation of the spheroid component using a deferred function.

<type(varying_string), allocatable, dimension(:) => matches> starFormationRateAttributeMatch(<logical>
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the spheroid class that have the desired attributes for the starFormationRate property

<void> starFormationRateFunction() Set the function to be used for the get method of the starFormationRate property of the SpheroidVerySimple component.

<logical> starFormationRateIsAttached() Return true if the deferred function used to get the starFormationRate property of the SpheroidVerySimple component class has been attached.

<logical> starFormationRateIsGettable() Returns true if the starFormationRate property is gettable for the spheroid component class.

<logical> starFormationRateIsSettable() Specify whether the starFormationRate property of the spheroid component is settable.

<double precision> starFormationRateRateGet() Returns a zero rate for the starFormationRate property for the spheroid component class.

<type(history)> stellarPropertiesHistory() Get the stellarPropertiesHistory property of an verySimple implementation of the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> stellarPropertiesHistoryAttributeMatch(<l
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the spheroid class that have the desired attributes for the stellarPropertiesHistory property

<integer> stellarPropertiesHistoryCount() Return a count of the number of scalar properties in the stellarPropertiesHistory property of an verySimple implementation of the spheroid component class.

<void> stellarPropertiesHistoryInactive() Indicate that the stellarPropertiesHistory property of an verySimple implementation of the spheroid component class is inactive for differential equation solving.

<logical> stellarPropertiesHistoryIsGettable() Returns true if the stellarPropertiesHistory property is gettable for the spheroid component class.

<logical> stellarPropertiesHistoryIsSettable() Specify whether the stellarPropertiesHistory property of the spheroid component is settable.

<void> stellarPropertiesHistoryRate(<type(history)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate to the rate of change of the stellarPropertiesHistory property of an verySimple implementation of the spheroid component class.

<type(history)> stellarPropertiesHistoryRateGet() Get the rate of change of the stellarPropertiesHistory property of an verySimple implementation of the spheroid component class.

<void> stellarPropertiesHistoryScale(<type(history)> setValue→) Set the absolute scale of the stellarPropertiesHistory property of an verySimple implementation of the spheroid component class.

<void> stellarPropertiesHistorySet(<type(history)> setValue→) Set the stellarPropertiesHistory property of an verySimple implementation of the spheroid component class.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<type(varying_string)> type() Returns the type name for the verySimple implementation of the spheroid component class.

<double precision> velocity() Get the velocity property of an verySimple implementation of the spheroid component class.

<type(varying_string), allocatable, dimension(:) => matches> velocityAttributeMatch(<logical>
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the spheroid class that have the desired attributes for the velocity property

<logical> velocityIsGettable() Returns true if the velocity property is gettable for the spheroid component class.

<logical> velocityIsSettable() Specify whether the velocity property of the spheroid component is settable.

<double precision> velocityRateGet() Returns a zero rate for the velocity property for the spheroid component class.

<void> velocitySet(<double precision> setValue→) Set the velocity property of an verySimple implementation of the spheroid component class.

<logical> verySimpleIsActive() Return true if the verySimple implementation of the spheroid component is the active choice.

nodeComponentSpin

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a generic spin component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Read properties from raw file.

<void> deserializeValues(<double(:)> array→, <integer> propertyType→) Deserialize the evolvable quantities from an array.

<void> destroy() Finalize a generic spin component.

<void> dumpASCII() Dump the content of a spin component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a generic spin component.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a nodeComponent object.

<logical> nullIsActive() Return true if the null implementation of the spin component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a spin component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a generic spin component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Establish the names of properties to output for a generic spin component.

<void> postOutput(<double precision> time→) Perform post-output processing of a spin component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<logical> preset3DIsActive() Return true if the preset3D implementation of the spin component is the active choice.

<logical> presetIsActive() Return true if the preset implementation of the spin component is the active choice.

<logical> randomIsActive() Return true if the random implementation of the spin component is the active choice.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets() Set offsets into serialization arrays.

<void> serializeASCII() Serialize the content of a spin component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the number of evolvable quantities to be evolved.

<void> serializeRaw(<integer> fileHandle→) Generate a binary dump of all properties.

<void> serializeValues(<double(:)> array←, <integer> propertyType→) Serialize the evolvable quantities to an array.

<void> serializeXML() Generate an XML dump of all properties.

<integer(c_size_t)> sizeOf() Return the size in bytes of a nodeComponentSpin component.

<double precision> spin() Returns the default value for the spin property for the spin component class.

<type(varying_string), allocatable, dimension(:) => matches> spinAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spin class that have the desired attributes for the spin property

<integer> spinCount() Compute the count of evolvable quantities in the spin property of the SpinPreset component.

<double precision> spinGrowthRate() Returns the default value for the spinGrowthRate property for the spin component class.

<type(varying_string), allocatable, dimension(:) => matches> spinGrowthRateAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spin class that have the desired attributes for the spinGrowthRate property

<logical> spinGrowthRateIsGettable() Returns true if the spinGrowthRate property is gettable for the spin component class.

<logical> spinGrowthRateIsSettable() Specify whether the spinGrowthRate property of the spin component is settable.

<double precision> spinGrowthRateRateGet() Returns a zero rate for the spinGrowthRate property for the spin component class.

<void> spinGrowthRateSet(<double precision> value) Set the spinGrowthRate property of the spin component.

<logical> spinIsGettable() Returns true if the spin property is gettable for the spin component class.

<logical> spinIsSettable() Specify whether the spin property of the spin component is settable.

<void> spinRate(<double precision> value) Cumulate to the rate of the spin property of the SpinPreset component.

<double precision> spinRateGet() Returns a zero rate for the spin property for the spin component class.

<void> spinScale(<double precision> value) Set the scale of the spin property of the SpinPreset component.

<void> spinSet(<double precision> value) Set the spin property of the spin component.

<double precision, dimension(:), allocatable => classDefault> spinVector() Returns the default value for the spinVector property for the spin component class.

<type(varying_string), allocatable, dimension(:) => matches> spinVectorAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spin class that have the desired attributes for the spinVector property

<integer> spinVectorCount() Compute the count of evolvable quantities in the spinVector property of the SpinVitvitska component.

<double precision, dimension(:), allocatable => classDefault> spinVectorGrowthRate() Returns the default value for the spinVectorGrowthRate property for the spin component class.

<type(varying_string), allocatable, dimension(:) => matches> spinVectorGrowthRateAttributeMatch(<logic [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spin class that have the desired attributes for the spinVectorGrowthRate property

<logical> spinVectorGrowthRateIsGettable() Returns true if the spinVectorGrowthRate property is gettable for the spin component class.

<logical> spinVectorGrowthRateIsSettable() Specify whether the spinVectorGrowthRate property of the spin component is settable.

<double precision, dimension(:), allocatable => classDefault> spinVectorGrowthRateRateGet() Returns a zero rate for the spinVectorGrowthRate property for the spin component class.

<void> spinVectorGrowthRateSet(<double precision[:]> value) Set the spinVectorGrowthRate property of the spin component.

<logical> spinVectorIsGettable() Returns true if the spinVector property is gettable for the spin component class.

<logical> spinVectorIsSettable() Specify whether the spinVector property of the spin component is settable.

<void> spinVectorRate(<double precision[:]> value) Cumulate to the rate of the spinVector property of the SpinVitvitska component.

<double precision, dimension(:), allocatable => classDefault> spinVectorRateGet() Returns a zero rate for the spinVector property for the spin component class.

<void> spinVectorScale(<double precision[:]> value) Set the scale of the spinVector property of the SpinVitvitska component.

<void> spinVectorSet(<double precision[:]> value) Set the spinVector property of the spin component.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<type(varying_string)> type() Returns the type name for the spin component class.

<logical> vitvitskaIsActive() Return true if the vitvitska implementation of the spin component is the active choice.

nodeComponentSpinNull

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a null implementation of the spin component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a null implementation of the spin component from raw (binary) file.

<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→) Deserialize evolvable properties of a null implementation of the spin component from array.

<void> destroy() Finalize a null implementation of the spin component.

<void> dumpASCII() Dump the content of a spin component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a null member of the spin component.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a null implementation of the spin component class.

<logical> nullIsActive() Return true if the null implementation of the spin component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a spin component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a null implementation of the spin component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Return the names of properties to output for a null implementation of the spin component.

<void> postOutput(<double precision> time→) Perform post-output processing of a spin component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<logical> preset3DIsActive() Return true if the preset3D implementation of the spin component is the active choice.

<logical> presetIsActive() Return true if the preset implementation of the spin component is the active choice.

<logical> randomIsActive() Return true if the random implementation of the spin component is the active choice.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→) Compute offsets into serialization arrays for a null implementation of the spin component.

<void> serializeASCII() Serialize the contents of a null implementation of the spin component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the serialization of a null implementation of the spin component.

<void> serializeRaw(<integer> fileHandle→) Serialize the contents of a null implementation of the spin component to raw (binary) file.

<void> serializeValues(<double precision[:]> array←, <integer> propertyType→) Serialize evolvable properties of a null implementation of the spin component to array.

<void> serializeXML(<integer> fileHandle→) Serialize the contents of a null implementation of the spin component to XML.

<integer(c_size_t)> sizeOf() Return the size in bytes of a null implementation of the spin component.

<double precision> spin() Returns the default value for the spin property for the spin component class.

<type(varying_string), allocatable, dimension(:) => matches> spinAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spin class that have the desired attributes for the spin property

<integer> spinCount() Compute the count of evolvable quantities in the spin property of the SpinPreset component.

<double precision> spinGrowthRate() Returns the default value for the spinGrowthRate property for the spin component class.

<type(varying_string), allocatable, dimension(:) => matches> spinGrowthRateAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spin class that have the desired attributes for the spinGrowthRate property

<logical> spinGrowthRateIsGettable() Returns true if the spinGrowthRate property is gettable for the spin component class.

<logical> spinGrowthRateIsSettable() Specify whether the spinGrowthRate property of the spin component is settable.

<double precision> spinGrowthRateRateGet() Returns a zero rate for the spinGrowthRate property for the spin component class.

<void> spinGrowthRateSet(<double precision> value) Set the spinGrowthRate property of the spin component.

<logical> spinIsGettable() Returns true if the spin property is gettable for the spin component class.

<logical> spinIsSettable() Specify whether the spin property of the spin component is settable.

<void> spinRate(<double precision> value) Cumulate to the rate of the spin property of the SpinPreset component.

<double precision> spinRateGet() Returns a zero rate for the spin property for the spin component class.

<void> spinScale(<double precision> value) Set the scale of the spin property of the SpinPreset component.

<void> spinSet(<double precision> value) Set the spin property of the spin component.

<double precision, dimension(:), allocatable => classDefault> spinVector() Returns the default value for the spinVector property for the spin component class.

<type(varying_string), allocatable, dimension(:) => matches> spinVectorAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spin class that have the desired attributes for the spinVector property

<integer> spinVectorCount() Compute the count of evolvable quantities in the spinVector property of the SpinVitvitska component.

<double precision, dimension(:), allocatable => classDefault> spinVectorGrowthRate() Returns the default value for the spinVectorGrowthRate property for the spin component class.

<type(varying_string), allocatable, dimension(:) => matches> spinVectorGrowthRateAttributeMatch(<logic
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the spin class that have the desired attributes for the spinVectorGrowthRate property

<logical> spinVectorGrowthRateIsGettable() Returns true if the spinVectorGrowthRate property is gettable for the spin component class.

<logical> spinVectorGrowthRateIsSettable() Specify whether the spinVectorGrowthRate property of the spin component is settable.

<double precision, dimension(:), allocatable => classDefault> spinVectorGrowthRateRateGet()
Returns a zero rate for the spinVectorGrowthRate property for the spin component class.

<void> spinVectorGrowthRateSet(<double precision[:]> value) Set the spinVectorGrowthRate property of the spin component.

<logical> spinVectorIsGettable() Returns true if the spinVector property is gettable for the spin component class.

<logical> spinVectorIsSettable() Specify whether the spinVector property of the spin component is settable.

<void> spinVectorRate(<double precision[:]> value) Cumulate to the rate of the spinVector property of the SpinVitvitska component.

<double precision, dimension(:), allocatable => classDefault> spinVectorRateGet() Returns a zero rate for the spinVector property for the spin component class.

<void> spinVectorScale(<double precision[:]> value) Set the scale of the spinVector property of the SpinVitvitska component.

<void> spinVectorSet(<double precision[:]> value) Set the spinVector property of the spin component.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→,
<massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<type(varying_string)> type() Returns the type name for the null implementation of the spin component class.

<logical> vitvitskaIsActive() Return true if the vitvitska implementation of the spin component is the active choice.

nodeComponentSpinPreset

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a preset implementation of the spin component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a preset implementation of the spin component from raw (binary) file.

<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→) Deserialize evolvable properties of a preset implementation of the spin component from array.

<void> destroy() Finalize a preset implementation of the spin component.

<void> dumpASCII() Dump the content of a spin component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a preset member of the spin component.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a preset implementation of the spin component class.

<logical> nullIsActive() Return true if the null implementation of the spin component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a spin component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a preset implementation of the spin component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Return the names of properties to output for a preset implementation of the spin component.

<void> postOutput(<double precision> time→) Perform post-output processing of a spin component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<logical> preset3DIsActive() Return true if the preset3D implementation of the spin component is the active choice.

<logical> presetIsActive() Return true if the preset implementation of the spin component is the active choice.

<logical> randomIsActive() Return true if the random implementation of the spin component is the active choice.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→) Compute offsets into serialization arrays for a preset implementation of the spin component.

<void> serializeASCII() Serialize the contents of a preset implementation of the spin component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the serialization of a preset implementation of the spin component.

<void> serializeRaw(<integer> fileHandle→) Serialize the contents of a preset implementation of the spin component to raw (binary) file.

<void> serializeValues(<double precision[:]> array←, <integer> propertyType→) Serialize evolvable properties of a preset implementation of the spin component to array.

<void> serializeXML(<integer> fileHandle→) Serialize the contents of a preset implementation of the spin component to XML.

<integer(c_size_t)> sizeOf() Return the size in bytes of a preset implementation of the spin component.

<double precision> spin() Get the spin property of an preset implementation of the spin component class.

<type(varying_string), allocatable, dimension(:) => matches> spinAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spin class that have the desired attributes for the spin property

<integer> spinCount() Return a count of the number of scalar properties in the spin property of an preset implementation of the spin component class.

<double precision> spinGrowthRate() Get the spinGrowthRate property of an preset implementation of the spin component class.

<type(varying_string), allocatable, dimension(:) => matches> spinGrowthRateAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spin class that have the desired attributes for the spinGrowthRate property

<logical> spinGrowthRateIsGettable() Returns true if the spinGrowthRate property is gettable for the spin component class.

<logical> spinGrowthRateIsSettable() Specify whether the spinGrowthRate property of the spin component is settable.

<double precision> spinGrowthRateRateGet() Returns a zero rate for the spinGrowthRate property for the spin component class.

<void> spinGrowthRateSet(<double precision> setValue→) Set the spinGrowthRate property of an preset implementation of the spin component class.

<void> spinInactive() Indicate that the spin property of an preset implementation of the spin component class is inactive for differential equation solving.

<logical> spinIsGettable() Returns true if the spin property is gettable for the spin component class.

<logical> spinIsSettable() Specify whether the spin property of the spin component is settable.

<void> spinRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate to the rate of change of the spin property of an preset implementation of the spin component class.

<double precision> spinRateGet() Get the rate of change of the spin property of an preset implementation of the spin component class.

<void> spinScale(<double precision> setValue→) Set the absolute scale of the spin property of an preset implementation of the spin component class.

<void> spinSet(<double precision> setValue→) Set the spin property of an preset implementation of the spin component class.

<double precision, dimension(:), allocatable => classDefault> spinVector() Returns the default value for the spinVector property for the spin component class.

<type(varying_string), allocatable, dimension(:) => matches> spinVectorAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spin class that have the desired attributes for the spinVector property

<integer> spinVectorCount() Compute the count of evolvable quantities in the spinVector property of the SpinVitvitska component.

<double precision, dimension(:), allocatable => classDefault> spinVectorGrowthRate() Returns the default value for the spinVectorGrowthRate property for the spin component class.

<type(varying_string), allocatable, dimension(:) => matches> spinVectorGrowthRateAttributeMatch(<logic
[requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→)
Return a text list of component implementations in the spin class that have the desired attributes for the spinVectorGrowthRate property

<logical> spinVectorGrowthRateIsGettable() Returns true if the spinVectorGrowthRate property is gettable for the spin component class.

<logical> spinVectorGrowthRateIsSettable() Specify whether the spinVectorGrowthRate property of the spin component is settable.

<double precision, dimension(:), allocatable => classDefault> spinVectorGrowthRateRateGet()
Returns a zero rate for the spinVectorGrowthRate property for the spin component class.

<void> spinVectorGrowthRateSet(<double precision[:]> value) Set the spinVectorGrowthRate property of the spin component.

<logical> spinVectorIsGettable() Returns true if the spinVector property is gettable for the spin component class.

<logical> spinVectorIsSettable() Specify whether the spinVector property of the spin component is settable.

<void> spinVectorRate(<double precision[:]> value) Cumulate to the rate of the spinVector property of the SpinVitvitska component.

<double precision, dimension(:), allocatable => classDefault> spinVectorRateGet() Returns a zero rate for the spinVector property for the spin component class.

<void> spinVectorScale(<double precision[:]> value) Set the scale of the spinVector property of the SpinVitvitska component.

<void> spinVectorSet(<double precision[:]> value) Set the spinVector property of the spin component.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→,
<massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<type(varying_string)> type() Returns the type name for the preset implementation of the spin component class.

<logical> vitvitskaIsActive() Return true if the vitvitska implementation of the spin component is the active choice.

nodeComponentSpinPreset3D

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a preset3D implementation of the spin component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a preset3D implementation of the spin component from raw (binary) file.

<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→) Deserialize evolvable properties of a preset3D implementation of the spin component from array.

<void> destroy() Finalize a preset3D implementation of the spin component.

<void> dumpASCII() Dump the content of a spin component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a preset3D member of the spin component.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a preset3D implementation of the spin component class.

<logical> nullIsActive() Return true if the null implementation of the spin component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a spin component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a preset3D implementation of the spin component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Return the names of properties to output for a preset3D implementation of the spin component.

<void> postOutput(<double precision> time→) Perform post-output processing for a preset3D implementation of the spin component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<logical> preset3DIsActive() Return true if the preset3D implementation of the spin component is the active choice.

<logical> presetIsActive() Return true if the preset implementation of the spin component is the active choice.

<logical> randomIsActive() Return true if the random implementation of the spin component is the active choice.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→) Compute offsets into serialization arrays for a preset3D implementation of the spin component.

<void> serializeASCII() Serialize the contents of a preset3D implementation of the spin component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the serialization of a preset3D implementation of the spin component.

<void> serializeRaw(<integer> fileHandle→) Serialize the contents of a preset3D implementation of the spin component to raw (binary) file.

<void> serializeValues(<double precision[:]> array←, <integer> propertyType→) Serialize evolvable properties of a preset3D implementation of the spin component to array.

<void> serializeXML(<integer> fileHandle→) Serialize the contents of a preset3D implementation of the spin component to XML.

<integer(c_size_t)> sizeOf() Return the size in bytes of a preset3D implementation of the spin component.

<double precision> spin() Get the spin property of an preset implementation of the spin component class.

<type(varying_string), allocatable, dimension(:) => matches> spinAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spin class that have the desired attributes for the spin property

<integer> spinCount() Return a count of the number of scalar properties in the spin property of an preset implementation of the spin component class.

<double precision> spinGrowthRate() Get the spinGrowthRate property of an preset implementation of the spin component class.

<type(varying_string), allocatable, dimension(:) => matches> spinGrowthRateAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spin class that have the desired attributes for the spinGrowthRate property

<logical> spinGrowthRateIsGettable() Returns true if the spinGrowthRate property is gettable for the spin component class.

<logical> spinGrowthRateIsSettable() Specify whether the spinGrowthRate property of the spin component is settable.

<double precision> spinGrowthRateRateGet() Returns a zero rate for the spinGrowthRate property for the spin component class.

<void> spinGrowthRateSet(<double precision> setValue→) Set the spinGrowthRate property of an preset implementation of the spin component class.

<void> spinInactive() Indicate that the spin property of an preset implementation of the spin component class is inactive for differential equation solving.

<logical> spinIsGettable() Returns true if the spin property is gettable for the spin component class.

<logical> spinIsSettable() Specify whether the spin property of the spin component is settable.

<void> spinRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate to the rate of change of the spin property of an preset implementation of the spin component class.

<double precision> spinRateGet() Get the rate of change of the spin property of an preset implementation of the spin component class.

<void> spinScale(<double precision> setValue→) Set the absolute scale of the spin property of an preset implementation of the spin component class.

<void> spinSet(<double precision> setValue→) Set the spin property of an preset implementation of the spin component class.

<double precision, dimension(:), allocatable => propertyValue> spinVector() Get the spinVector property of an preset3D implementation of the spin component class.

<type(varying_string), allocatable, dimension(:) => matches> spinVectorAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spin class that have the desired attributes for the spinVector property

<integer> spinVectorCount() Return a count of the number of scalar properties in the spinVector property of an preset3D implementation of the spin component class.

<double precision, dimension(:), allocatable => propertyValue> spinVectorGrowthRate() Get the spinVectorGrowthRate property of an preset3D implementation of the spin component class.

<type(varying_string), allocatable, dimension(:) => matches> spinVectorGrowthRateAttributeMatch(<logic [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spin class that have the desired attributes for the spinVectorGrowthRate property

<logical> spinVectorGrowthRateIsGettable() Returns true if the spinVectorGrowthRate property is gettable for the spin component class.

<logical> spinVectorGrowthRateIsSettable() Specify whether the spinVectorGrowthRate property of the spin component is settable.

<double precision, dimension(:), allocatable => classDefault> spinVectorGrowthRateRateGet() Returns a zero rate for the spinVectorGrowthRate property for the spin component class.

<void> spinVectorGrowthRateSet(<double precision[:]> setValue→) Set the spinVectorGrowthRate property of an preset3D implementation of the spin component class.

<void> spinVectorInactive() Indicate that the spinVector property of an preset3D implementation of the spin component class is inactive for differential equation solving.

<logical> spinVectorIsGettable() Returns true if the spinVector property is gettable for the spin component class.

<logical> spinVectorIsSettable() Specify whether the spinVector property of the spin component is settable.

<void> spinVectorRate(<double precision[:]> setValue→, <logical> [interrupt]↔, <*procedure(interruptT [interruptProcedure]↔) Accumulate to the rate of change of the spinVector property of an preset3D implementation of the spin component class.

<double precision, dimension(:), allocatable => propertyRate> spinVectorRateGet() Get the rate of change of the spinVector property of an preset3D implementation of the spin component class.

<void> spinVectorScale(<double precision[:]> setValue→) Set the absolute scale of the spinVector property of an preset3D implementation of the spin component class.

<void> spinVectorSet(<double precision[:]> setValue→) Set the spinVector property of an preset3D implementation of the spin component class.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<type(varying_string)> type() Returns the type name for the preset3D implementation of the spin component class.

<logical> vitvitskaIsActive() Return true if the vitvitska implementation of the spin component is the active choice.

nodeComponentSpinRandom

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a random implementation of the spin component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a random implementation of the spin component from raw (binary) file.

<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→) Deserialize evolvable properties of a random implementation of the spin component from array.

<void> destroy() Finalize a random implementation of the spin component.

<void> dumpASCII() Dump the content of a spin component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a random member of the spin component.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a random implementation of the spin component class.

<logical> nullIsActive() Return true if the null implementation of the spin component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a spin component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a random implementation of the spin component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Return the names of properties to output for a random implementation of the spin component.

<void> postOutput(<double precision> time→) Perform post-output processing of a spin component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<logical> preset3DIsActive() Return true if the preset3D implementation of the spin component is the active choice.

<logical> presetIsActive() Return true if the preset implementation of the spin component is the active choice.

<logical> randomIsActive() Return true if the random implementation of the spin component is the active choice.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→) Compute offsets into serialization arrays for a random implementation of the spin component.

<void> serializeASCII() Serialize the contents of a random implementation of the spin component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the serialization of a random implementation of the spin component.

<void> serializeRaw(<integer> fileHandle→) Serialize the contents of a random implementation of the spin component to raw (binary) file.

<void> serializeValues(<double precision[:]> array←, <integer> propertyType→) Serialize evolvable properties of a random implementation of the spin component to array.

<void> serializeXML(<integer> fileHandle→) Serialize the contents of a random implementation of the spin component to XML.

<integer(c_size_t)> sizeOf() Return the size in bytes of a random implementation of the spin component.

<double precision> spin() Get the spin property of an random implementation of the spin component class.

<type(varying_string), allocatable, dimension(:) => matches> spinAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spin class that have the desired attributes for the spin property

<integer> spinCount() Return a count of the number of scalar properties in the spin property of an random implementation of the spin component class.

<double precision> spinGrowthRate() Returns the default value for the spinGrowthRate property for the spin component class.

<type(varying_string), allocatable, dimension(:) => matches> spinGrowthRateAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spin class that have the desired attributes for the spinGrowthRate property

<logical> spinGrowthRateIsGettable() Returns true if the spinGrowthRate property is gettable for the spin component class.

<logical> spinGrowthRateIsSettable() Specify whether the spinGrowthRate property of the spin component is settable.

<double precision> spinGrowthRateRateGet() Returns a zero rate for the spinGrowthRate property for the spin component class.

<void> spinGrowthRateSet(<double precision> value) Set the spinGrowthRate property of the spin component.

<void> spinInactive() Indicate that the spin property of an random implementation of the spin component class is inactive for differential equation solving.

<logical> spinIsGettable() Returns true if the spin property is gettable for the spin component class.

<logical> spinIsSettable() Specify whether the spin property of the spin component is settable.

<void> spinRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate to the rate of change of the spin property of an random implementation of the spin component class.

<double precision> spinRateGet() Get the rate of change of the spin property of an random implementation of the spin component class.

<void> spinScale(<double precision> setValue→) Set the absolute scale of the spin property of an random implementation of the spin component class.

<void> spinSet(<double precision> setValue→) Set the spin property of an random implementation of the spin component class.

<double precision, dimension(:), allocatable => classDefault> spinVector() Returns the default value for the spinVector property for the spin component class.

<type(varying_string), allocatable, dimension(:) => matches> spinVectorAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spin class that have the desired attributes for the spinVector property

<integer> spinVectorCount() Compute the count of evolvable quantities in the spinVector property of the SpinVitvitska component.

<double precision, dimension(:), allocatable => classDefault> spinVectorGrowthRate() Returns the default value for the spinVectorGrowthRate property for the spin component class.

<type(varying_string), allocatable, dimension(:) => matches> spinVectorGrowthRateAttributeMatch(<logic [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spin class that have the desired attributes for the spinVectorGrowthRate property

<logical> spinVectorGrowthRateIsGettable() Returns true if the spinVectorGrowthRate property is gettable for the spin component class.

<logical> spinVectorGrowthRateIsSettable() Specify whether the spinVectorGrowthRate property of the spin component is settable.

<double precision, dimension(:), allocatable => classDefault> spinVectorGrowthRateRateGet() Returns a zero rate for the spinVectorGrowthRate property for the spin component class.

<void> spinVectorGrowthRateSet(<double precision[:]> value) Set the spinVectorGrowthRate property of the spin component.

<logical> spinVectorIsGettable() Returns true if the spinVector property is gettable for the spin component class.

<logical> spinVectorIsSettable() Specify whether the spinVector property of the spin component is settable.

<void> spinVectorRate(<double precision[:]> value) Cumulate to the rate of the spinVector property of the SpinVitvitska component.

<double precision, dimension(:), allocatable => classDefault> spinVectorRateGet() Returns a zero rate for the spinVector property for the spin component class.

<void> spinVectorScale(<double precision[:]> value) Set the scale of the spinVector property of the SpinVitvitska component.

<void> spinVectorSet(<double precision[:]> value) Set the spinVector property of the spin component.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<type(varying_string)> type() Returns the type name for the random implementation of the spin component class.

<logical> vitvitskaIsActive() Return true if the vitvitska implementation of the spin component is the active choice.

nodeComponentSpinVitvitska

<void> assign(<class(nodeComponent)> to←, <class(nodeComponent)> from→) Assign a node component to another node component.

<void> builder(<*type(node)> componentDefinition→) Build a vitvitska implementation of the spin component from a supplied XML definition.

<double> density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the density.

<void> deserializeRaw(<integer> fileHandle→) Deserialize the contents of a vitvitska implementation of the spin component from raw (binary) file.

<void> deserializeValues(<double precision[:]> array→, <integer> propertyType→) Deserialize evolvable properties of a vitvitska implementation of the spin component from array.

<void> destroy() Finalize a vitvitska implementation of the spin component.

<void> dumpASCII() Dump the content of a spin component.

<double> enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the mass enclosed within a radius.

<*type(treeNode)> host() Return a pointer to the host treeNode object.

<void> hotHaloCoolingAbundancesRate(<type(abundances)> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingAngularMomentumRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.

<void> hotHaloCoolingMassRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(inter [interruptProcedure]↔) Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.

<void> initialize() Initialize a vitvitska member of the spin component.

<type(varying_string)> nameFromIndex(<integer> count↔, <integer> propertyType→) Return the name of the property of given index for a vitvitska implementation of the spin component class.

<logical> nullIsActive() Return true if the null implementation of the spin component is the active choice.

<void> odeStepRatesInitialize() Initialize rates for evolvable properties.

<void> odeStepScalesInitialize() Initialize scales for evolvable properties.

<void> output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(kind=kind_int8)[:,:]> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double precision[:,:]> doubleBuffer↔, <double precision> time→, <type(multiCounter)> outputInstance→, <integer> instance→) Populate output buffers with properties to output for a spin component.

<void> outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double precision> time→, <integer> instance→) Increment the count of properties to output for a vitvitska implementation of the spin component.

<void> outputNames(<integer> integerProperty↔, <character(len=*)[:]> integerPropertyNames↔, <character(len=*)[:]> integerPropertyComments↔, <double precision[:]> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <character(len=*)[:]> doublePropertyNames↔, <character(len=*)[:]> doublePropertyComments↔, <double precision[:]> doublePropertyUnitsSI↔, <double precision> time→, <integer> instance→) Return the names of properties to output for a vitvitska implementation of the spin component.

<void> postOutput(<double precision> time→) Perform post-output processing of a spin component.

<double> potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the gravitational potential.

<logical> preset3DIsActive() Return true if the preset3D implementation of the spin component is the active choice.

<logical> presetIsActive() Return true if the preset implementation of the spin component is the active choice.

<logical> randomIsActive() Return true if the random implementation of the spin component is the active choice.

<double> rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve.

<double> rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→) Compute the rotation curve gradient.

<void> serializationOffsets(<integer> count↔, <integer> countSubset↔, <integer> propertyType→) Compute offsets into serialization arrays for a vitvitska implementation of the spin component.

<void> serializeASCII() Serialize the contents of a vitvitska implementation of the spin component to ASCII.

<integer> serializeCount(<integer> propertyType→) Return a count of the serialization of a vitvitska implementation of the spin component.

<void> serializeRaw(<integer> fileHandle→) Serialize the contents of a vitvitska implementation of the spin component to raw (binary) file.

<void> serializeValues(<double precision[:]> array←, <integer> propertyType→) Serialize evolvable properties of a vitvitska implementation of the spin component to array.

<void> serializeXML(<integer> fileHandle→) Serialize the contents of a vitvitska implementation of the spin component to XML.

<integer(c_size_t)> sizeOf() Return the size in bytes of a vitvitska implementation of the spin component.

<double precision> spin() Get the value of the spin property of the vitvitska implementation of the spin component using a deferred function.

<type(varying_string), allocatable, dimension(:) => matches> spinAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spin class that have the desired attributes for the spin property

<integer> spinCount() Return a count of the number of scalar properties in the spin property of an vitvitska implementation of the spin component class.

<void> spinFunction() Set the function to be used for the get method of the spin property of the SpinVitvitska component.

<double precision> spinGrowthRate() Get the value of the spinGrowthRate property of the vitvitska implementation of the spin component using a deferred function.

<type(varying_string), allocatable, dimension(:) => matches> spinGrowthRateAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spin class that have the desired attributes for the spinGrowthRate property

<void> spinGrowthRateFunction() Set the function to be used for the get method of the spinGrowthRate property of the SpinVitvitska component.

<logical> spinGrowthRateIsAttached() Return true if the deferred function used to get the spinGrowthRate property of the SpinVitvitska component class has been attached.

<logical> spinGrowthRateIsGettable() Returns true if the spinGrowthRate property is gettable for the spin component class.

<logical> spinGrowthRateIsSettable() Specify whether the spinGrowthRate property of the spin component is settable.

<double precision> spinGrowthRateRateGet() Returns a zero rate for the spinGrowthRate property for the spin component class.

<void> spinGrowthRateSet(<double precision> value) Set the spinGrowthRate property of the spin component.

<void> spinInactive() Indicate that the spin property of an vitvitska implementation of the spin component class is inactive for differential equation solving.

<logical> spinIsAttached() Return true if the deferred function used to get the spin property of the SpinVitvitska component class has been attached.

<logical> spinIsGettable() Returns true if the spin property is gettable for the spin component class.

<logical> spinIsSettable() Specify whether the spin property of the spin component is settable.

<void> spinRate(<double precision> setValue→, <logical> [interrupt]↔, <*procedure(interruptTask)> [interruptProcedure]↔) Accumulate to the rate of change of the spin property of an vitvitska implementation of the spin component class.

<double precision> spinRateGet() Get the rate of change of the spin property of an vitvitska implementation of the spin component class.

<void> spinScale(<double precision> setValue→) Set the absolute scale of the spin property of an vitvitska implementation of the spin component class.

<void> spinSet(<double precision> setValue→) Set the spin property of an vitvitska implementation of the spin component class.

<double precision> spinValue() Get the spin property of an vitvitska implementation of the spin component class.

<double precision, dimension(:), allocatable => propertyValue> spinVector() Get the value of the spinVector property of the vitvitska implementation of the spin component using a deferred function.

<type(varying_string), allocatable, dimension(:) => matches> spinVectorAttributeMatch(<logical> [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spin class that have the desired attributes for the spinVector property

<integer> spinVectorCount() Return a count of the number of scalar properties in the spinVector property of an vitvitska implementation of the spin component class.

<void> spinVectorFunction() Set the function to be used for the get method of the spinVector property of the SpinVitvitska component.

<double precision, dimension(:), allocatable => classDefault> spinVectorGrowthRate() Returns the default value for the spinVectorGrowthRate property for the spin component class.

<type(varying_string), allocatable, dimension(:) => matches> spinVectorGrowthRateAttributeMatch(<logic [requireSettable]→, <logical> [requireGettable]→, <logical> [requireEvolvable]→) Return a text list of component implementations in the spin class that have the desired attributes for the spinVectorGrowthRate property

<logical> spinVectorGrowthRateIsGettable() Returns true if the spinVectorGrowthRate property is gettable for the spin component class.

<logical> spinVectorGrowthRateIsSettable() Specify whether the spinVectorGrowthRate property of the spin component is settable.

<double precision, dimension(:), allocatable => classDefault> spinVectorGrowthRateRateGet() Returns a zero rate for the spinVectorGrowthRate property for the spin component class.

<void> spinVectorGrowthRateSet(<double precision[:]> value) Set the spinVectorGrowthRate property of the spin component.

<void> spinVectorInactive() Indicate that the spinVector property of an vitvitska implementation of the spin component class is inactive for differential equation solving.

<logical> spinVectorIsAttached() Return true if the deferred function used to get the spinVector property of the SpinVitvitska component class has been attached.

<logical> spinVectorIsGettable() Returns true if the spinVector property is gettable for the spin component class.

<logical> spinVectorIsSettable() Specify whether the spinVector property of the spin component is settable.

<void> spinVectorRate(<double precision[:]> setValue→, <logical> [interrupt]↔, <*procedure(interruptT [interruptProcedure]↔) Accumulate to the rate of change of the spinVector property of an vitvitska implementation of the spin component class.

<double precision, dimension(:), allocatable => propertyRate> spinVectorRateGet() Get the rate of change of the spinVector property of an vitvitska implementation of the spin component class.

<void> spinVectorScale(<double precision[:]> setValue→) Set the absolute scale of the spinVector property of an vitvitska implementation of the spin component class.

<void> spinVectorSet(<double precision[:]> setValue→) Set the spinVector property of an vitvitska implementation of the spin component class.

<double precision, dimension(:), allocatable => propertyValue> spinVectorValue() Get the spinVector property of an vitvitska implementation of the spin component class.

<double> surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→) Compute the surface density.

<type(varying_string)> type() Returns the type name for the vitvitska implementation of the spin component class.

<logical> vitvitskaIsActive() Return true if the vitvitska implementation of the spin component is the active choice.

nodeEvent

<void> deserializeRaw(<integer> fileUnit→) Deserialize a nodeEvent object from raw file.

<integer(c_size_t)> nonStaticSizeOf() Compute the size of the non-static parts of a spin object.

<void> serializeRaw(<integer> fileUnit→, <logical> includeType→) Serialize a nodeEvent object to raw file.

nodeEventBranchJump

<void> deserializeRaw(<integer> fileUnit→) Deserialize a nodeEventBranchJump object from raw file.

<integer(c_size_t)> nonStaticSizeOf() Compute the size of the non-static parts of a spin object.

<void> serializeRaw(<integer> fileUnit→, <logical> includeType→) Serialize a nodeEventBranchJump object to raw file.

nodeEventBranchJumpInterTree

<void> deserializeRaw(<integer> fileUnit→) Deserialize a nodeEventBranchJumpInterTree object from raw file.

<integer(c_size_t)> nonStaticSizeOf() Compute the size of the non-static parts of a spin object.

<void> serializeRaw(<integer> fileUnit→, <logical> includeType→) Serialize a nodeEventBranchJumpInterTree object to raw file.

nodeEventSubhaloPromotion

<void> deserializeRaw(<integer> fileUnit→) Deserialize a nodeEventSubhaloPromotion object from raw file.

<integer(c_size_t)> nonStaticSizeOf() Compute the size of the non-static parts of a spin object.

<void> serializeRaw(<integer> fileUnit→, <logical> includeType→) Serialize a nodeEventSubhaloPromotion object to raw file.

nodeEventSubhaloPromotionInterTree

<void> deserializeRaw(<integer> fileUnit→) Deserialize a nodeEventSubhaloPromotionInterTree object from raw file.

<integer(c_size_t)> nonStaticSizeOf() Compute the size of the non-static parts of a spin object.

<void> serializeRaw(<integer> fileUnit→, <logical> includeType→) Serialize a nodeEventSubhaloPromotionInt object to raw file.

nodePropertyExtractorClass

void addInstances(\textcolor{red}{\textless type((treeNode))\textgreater} node\arginout,\textcolor{red type((multiCounter))\textgreater} instance\arginout) Add multiple instances of this property to a multiCounter object.

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((nodePropertyExtractorClass))\textgreater} destination\arginout) Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

integer quantity() Return the class of the extracted property.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

integer type() Return the type of the extracted property.

nodePropertyExtractorConcentration

void addInstances(\textcolor{red}{\textless type((treeNode))\textgreater} node\arginout,\textcolor{red type((multiCounter))\textgreater} instance\arginout) Add multiple instances of this property to a multiCounter object.

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((nodePropertyExtractorClass))\textgreater} destination\arginout) Perform a deep copy of the object.

<type(varying_string)> description() Return a description of the property extracted.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

<double> extract(<type(treeNode)> node→) Extract the property from the given node.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

<type(varying_string)> name() Return the name of the property extracted.

type(varying_string) objectType() Return the type of the object.

integer quantity() Return the class of the extracted property.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

integer type() Return the type of the extracted property.

<double> unitsInSI() Return the units of the property extracted in the SI system.

nodePropertyExtractorDensityContrasts

void addInstances(\textcolor{red}{\textless type((treeNode))\textgreater} node\arginout,\textcolor{red type((multiCounter))\textgreater} instance\arginout) Add multiple instances of this property to a multiCounter object.

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((nodePropertyExtractorClass))\textgreater} destination\arginout) Perform a deep copy of the object.

<type(varying_string)>(:) descriptions(<double> time→) Return descriptions of the properties extracted.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

<integer> elementCount(<double> time→) Return the number of properties in the tuple.

<double(:)> extract(<type(treeNode)> node→, <double> time→, <type(multiCounter)> [instance]→) Extract the properties from the given node.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

<type(varying_string)>(:) names(<double> time→) Return the names of the properties extracted.

type(varying_string) objectType() Return the type of the object.

integer quantity() Return the class of the extracted property.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

integer type() Return the type of the extracted property.

<double(:)> unitsInSI(<double> time→) Return the units of the properties extracted in the SI system.

nodePropertyExtractorDensityProfile

void addInstances(\textcolor{red}{\textless type((treeNode))\textgreater} node\arginout,\textcolor{red type((multiCounter))\textgreater} instance\arginout) Add multiple instances of this property to a multiCounter object.

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((nodePropertyExtractorClass))\textgreater} destination\arginout) Perform a deep copy of the object.

<type(varying_string)>(:) descriptions(<double> time→) Return descriptions of the properties extracted.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

<integer> elementCount(<double> time→) Return the number of properties in the tuple.

<double(:)> extract(<type(treeNode)> node→, <double> time→, <type(multiCounter)> [instance]→) Extract the properties from the given node.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

<type(varying_string)>(:) names(<double> time→) Return the names of the properties extracted.

type(varying_string) objectType() Return the type of the object.

integer quantity() Return the class of the extracted property.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

integer type() Return the type of the extracted property.

<double(:)> unitsInSI(<double> time→) Return the units of the properties extracted in the SI system.

nodePropertyExtractorDescendents

void addInstances(\textcolor{red}{\textless type((treeNode))\textgreater} node\arginout,\textcolor{red type((multiCounter))\textgreater} instance\arginout) Add multiple instances of this property to a multiCounter object.

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((nodePropertyExtractorClass))\textgreater} destination\arginout) Perform a deep copy of the object.

<type(varying_string)> description() Return a description of the property extracted.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

<integer> extract(<type(treeNode)> node→) Extract the property from the given node.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

<type(varying_string)> name() Return the name of the property extracted.

type(varying_string) objectType() Return the type of the object.

integer quantity() Return the class of the extracted property.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

integer type() Return the type of the extracted property.

<double> unitsInSI() Return the units of the property extracted in the SI system.

nodePropertyExtractorFinalDescendent

void addInstances(\textcolor{red}{\textless type((treeNode))\textgreater} node\arginout,\textcolor{red}{\textless type((multiCounter))\textgreater} instance\arginout) Add multiple instances of this property to a multiCounter object.

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\arginout,\textcolor{red}{\textless character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((nodePropertyExtractorClass))\textgreater} destination\arginout) Perform a deep copy of the object.

<type(varying_string)> description() Return a description of the property extracted.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\textcolor{red}{\textless logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

<integer> extract(<type(treeNode)> node→) Extract the property from the given node.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDigest\argin) Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

<type(varying_string)> name() Return the name of the property extracted.

type(varying_string) objectType() Return the type of the object.

integer quantity() Return the class of the extracted property.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

`integer type()` Return the type of the extracted property.

`<double> unitsInSI()` Return the units of the property extracted in the SI system.

nodePropertyExtractorFractionAccretionHotMode

`void addInstances(\textcolor{red}{\textless type((treeNode ))\textgreater} node\arginout,\textcolor{red type((multiCounter))\textgreater} instance\arginout)` Add multiple instances of this property to a `multiCounter` object.

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void autoHook()` Insert any event hooks required by this object.

`void deepCopy(\textcolor{red}{\textless class((nodePropertyExtractorClass))\textgreater} destination\arginout)` Perform a deep copy of the object.

`<type(varying_string)> description()` Return a description of the property extracted.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`<double> extract(<type(treeNode)> node→)` Extract the property from the given `node`.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

`<type(varying_string)> name()` Return the name of the property extracted.

`type(varying_string) objectType()` Return the type of the object.

`integer quantity()` Return the class of the extracted property.

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

`<void> referenceCountIncrement()` Increment the reference count to this object.

`<void> referenceCountReset()` Reset the reference count to this object to 0.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

`integer type()` Return the type of the extracted property.

`<double> unitsInSI()` Return the units of the property extracted in the SI system.

nodePropertyExtractorHalfMassRadius

void addInstances(\textcolor{red}{\textless type((treeNode))\textgreater} node\arginout,\textcolor{red}{\textless type((multiCounter))\textgreater} instance\arginout) Add multiple instances of this property to a multiCounter object.

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\arginout,\textcolor{red}{\textless character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((nodePropertyExtractorClass))\textgreater} destination\arginout) Perform a deep copy of the object.

<type(varying_string)> description() Return a description of the property extracted.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\textcolor{red}{\textless logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

<double> extract(<type(treeNode)> node→) Extract the property from the given node.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDigest\argin) Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

<type(varying_string)> name() Return the name of the property extracted.

type(varying_string) objectType() Return the type of the object.

integer quantity() Return the class of the extracted property.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

integer type() Return the type of the extracted property.

<double> unitsInSI() Return the units of the property extracted in the SI system.

nodePropertyExtractorHaloBias

`void addInstances(\textcolor{red}{\textless type((treeNode ))\textgreater} node\arginout,\textcolor{red}{\textless type((multiCounter))\textgreater} instance\arginout)` Add multiple instances of this property to a `multiCounter` object.

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\arginout,\textcolor{red}{\textless character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void autoHook()` Insert any event hooks required by this object.

`void deepCopy(\textcolor{red}{\textless class((nodePropertyExtractorClass))\textgreater} destination\arginout)` Perform a deep copy of the object.

`<type(varying_string)> description()` Return a description of the property extracted.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\textcolor{red}{\textless logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`<double> extract(<type(treeNode)> node→)` Extract the property from the given `node`.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDigest\argin)` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

`<type(varying_string)> name()` Return the name of the property extracted.

`type(varying_string) objectType()` Return the type of the object.

`integer quantity()` Return the class of the extracted property.

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

`<void> referenceCountIncrement()` Increment the reference count to this object.

`<void> referenceCountReset()` Reset the reference count to this object to 0.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

`integer type()` Return the type of the extracted property.

`<double> unitsInSI()` Return the units of the property extracted in the SI system.

nodePropertyExtractorHaloEnvironment

void addInstances(\textcolor{red}{\textless type((treeNode))\textgreater} node\arginout,\textcolor{red} type((multiCounter))\textgreater} instance\arginout) Add multiple instances of this property to a multiCounter object.

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((nodePropertyExtractorClass))\textgreater} destination\arginout) Perform a deep copy of the object.

<type(varying_string)>(:) descriptions(<double> time→) Return descriptions of the properties extracted.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

<integer> elementCount(<double> time→) Return the number of properties in the tuple.

<double(:)> extract(<type(treeNode)> node→, <double> time→, <type(multiCounter)> [instance]→) Extract the properties from the given node.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

<type(varying_string)>(:) names(<double> time→) Return the names of the properties extracted.

type(varying_string) objectType() Return the type of the object.

integer quantity() Return the class of the extracted property.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

integer type() Return the type of the extracted property.

<double(:)> unitsInSI(<double> time→) Return the units of the properties extracted in the SI system.

nodePropertyExtractorICMSZ

`void addInstances(\textcolor{red}{\textless type((treeNode ))\textgreater} node\arginout,\textcolor{red}{\textless type((multiCounter))\textgreater} instance\arginout)` Add multiple instances of this property to a `multiCounter` object.

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\arginout,\textcolor{red}{\textless character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void autoHook()` Insert any event hooks required by this object.

`void deepCopy(\textcolor{red}{\textless class((nodePropertyExtractorClass))\textgreater} destination\arginout)` Perform a deep copy of the object.

`<type(varying_string)> description()` Return a description of the property extracted.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\textcolor{red}{\textless logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`<double> extract(<type(treeNode)> node→)` Extract the property from the given `node`.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDigest\argin)` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

`<type(varying_string)> name()` Return the name of the property extracted.

`type(varying_string) objectType()` Return the type of the object.

`integer quantity()` Return the class of the extracted property.

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

`<void> referenceCountIncrement()` Increment the reference count to this object.

`<void> referenceCountReset()` Reset the reference count to this object to 0.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

`integer type()` Return the type of the extracted property.

`<double> unitsInSI()` Return the units of the property extracted in the SI system.

nodePropertyExtractorICMXRayLuminosity

`void addInstances(\textcolor{red}{\textless type((treeNode ))\textgreater} node\arginout,\textcolor{red}{\textless type((multiCounter))\textgreater} instance\arginout)` Add multiple instances of this property to a `multiCounter` object.

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\arginout,\textcolor{red}{\textless character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void autoHook()` Insert any event hooks required by this object.

`void deepCopy(\textcolor{red}{\textless class((nodePropertyExtractorClass))\textgreater} destination\arginout)` Perform a deep copy of the object.

`<type(varying_string)>(:) descriptions(<double> time→)` Return descriptions of the properties extracted.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\textcolor{red}{\textless logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`<integer> elementCount(<double> time→)` Return the number of properties in the tuple.

`<double(:)> extract(<type(treeNode)> node→, <double> time→, <type(multiCounter)> [instance]→)` Extract the properties from the given `node`.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDigest\argin)` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

`<type(varying_string)>(:) names(<double> time→)` Return the names of the properties extracted.

`type(varying_string) objectType()` Return the type of the object.

`integer quantity()` Return the class of the extracted property.

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

`<void> referenceCountIncrement()` Increment the reference count to this object.

`<void> referenceCountReset()` Reset the reference count to this object to 0.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

`integer type()` Return the type of the extracted property.

`<double(:)> unitsInSI(<double> time→)` Return the units of the properties extracted in the SI system.

nodePropertyExtractorIndicesHost

`void addInstances(\textcolor{red}{\textless type((treeNode ))\textgreater} node\arginout,\textcolor{red}{\textless type((multiCounter))\textgreater} instance\arginout)` Add multiple instances of this property to a `multiCounter` object.

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\arginout,\textcolor{red}{\textless character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void autoHook()` Insert any event hooks required by this object.

`void deepCopy(\textcolor{red}{\textless class((nodePropertyExtractorClass))\textgreater} destination\arginout)` Perform a deep copy of the object.

`<type(varying_string)> description()` Return a description of the property extracted.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\textcolor{red}{\textless logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`<integer> extract(<type(treeNode)> node→)` Extract the property from the given `node`.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDigest\argin)` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

`<type(varying_string)> name()` Return the name of the property extracted.

`type(varying_string) objectType()` Return the type of the object.

`integer quantity()` Return the class of the extracted property.

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

`<void> referenceCountIncrement()` Increment the reference count to this object.

`<void> referenceCountReset()` Reset the reference count to this object to 0.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

`integer type()` Return the type of the extracted property.

`<double> unitsInSI()` Return the units of the property extracted in the SI system.

nodePropertyExtractorIndicesTree

void addInstances(\textcolor{red}{\textless type((treeNode))\textgreater} node\arginout,\textcolor{red} type((multiCounter))\textgreater} instance\arginout) Add multiple instances of this property to a multiCounter object.

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((nodePropertyExtractorClass))\textgreater} destination\arginout) Perform a deep copy of the object.

<type(varying_string)> description() Return a description of the property extracted.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

<integer> extract(<type(treeNode)> node→) Extract the property from the given node.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

<type(varying_string)> name() Return the name of the property extracted.

type(varying_string) objectType() Return the type of the object.

integer quantity() Return the class of the extracted property.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

integer type() Return the type of the extracted property.

<double> unitsInSI() Return the units of the property extracted in the SI system.

nodePropertyExtractorIntegerScalar

`void addInstances(\textcolor{red}{\textless type((treeNode ))\textgreater} node\arginout,\textcolor{red}{\textless type((multiCounter))\textgreater} instance\arginout)` Add multiple instances of this property to a `multiCounter` object.

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\arginout,\textcolor{red}{\textless character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void autoHook()` Insert any event hooks required by this object.

`void deepCopy(\textcolor{red}{\textless class((nodePropertyExtractorClass))\textgreater} destination\arginout)` Perform a deep copy of the object.

`<type(varying_string)> description()` Return a description of the property extracted.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\textcolor{red}{\textless logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`<integer> extract(<type(treeNode)> node→)` Extract the property from the given `node`.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDigest\argin)` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

`<type(varying_string)> name()` Return the name of the property extracted.

`type(varying_string) objectType()` Return the type of the object.

`integer quantity()` Return the class of the extracted property.

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

`<void> referenceCountIncrement()` Increment the reference count to this object.

`<void> referenceCountReset()` Reset the reference count to this object to 0.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

`integer type()` Return the type of the extracted property.

`<double> unitsInSI()` Return the units of the property extracted in the SI system.

nodePropertyExtractorIntegerTuple

void addInstances(\textcolor{red}{\textless type((treeNode))\textgreater} node\arginout,\textcolor{red} type((multiCounter))\textgreater} instance\arginout) Add multiple instances of this property to a multiCounter object.

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((nodePropertyExtractorClass))\textgreater} destination\arginout) Perform a deep copy of the object.

<type(varying_string)>(:) descriptions(<double> time→) Return descriptions of the properties extracted.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

<integer> elementCount(<double> time→) Return the number of properties in the tuple.

<integer(:)> extract(<type(treeNode)> node→, <double> time→, <type(multiCounter)> [instance]→) Extract the properties from the given node.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

<type(varying_string)>(:) names(<double> time→) Return the names of the properties extracted.

type(varying_string) objectType() Return the type of the object.

integer quantity() Return the class of the extracted property.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

integer type() Return the type of the extracted property.

<double(:)> unitsInSI(<double> time→) Return the units of the properties extracted in the SI system.

nodePropertyExtractorLightcone

`void addInstances(\textcolor{red}{\textless type((treeNode ))\textgreater} node\arginout,\textcolor{red}{\textless type((multiCounter))\textgreater} instance\arginout)` Add multiple instances of this property to a `multiCounter` object.

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\arginout,\textcolor{red}{\textless character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void autoHook()` Insert any event hooks required by this object.

`void deepCopy(\textcolor{red}{\textless class((nodePropertyExtractorClass))\textgreater} destination\arginout)` Perform a deep copy of the object.

`<type(varying_string)>(:) descriptions(<double> time→)` Return descriptions of the properties extracted.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\textcolor{red}{\textless logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`<integer> elementCount(<double> time→)` Return the number of properties in the tuple.

`<double(:)> extract(<type(treeNode)> node→, <double> time→, <type(multiCounter)> [instance]→)` Extract the properties from the given `node`.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDigest\argin)` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

`<type(varying_string)>(:) names(<double> time→)` Return the names of the properties extracted.

`type(varying_string) objectType()` Return the type of the object.

`integer quantity()` Return the class of the extracted property.

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

`<void> referenceCountIncrement()` Increment the reference count to this object.

`<void> referenceCountReset()` Reset the reference count to this object to 0.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

`integer type()` Return the type of the extracted property.

`<double(:)> unitsInSI(<double> time→)` Return the units of the properties extracted in the SI system.

nodePropertyExtractorLmnstyEmssnLine

void addInstances(\textcolor{red}{\textless type((treeNode))\textgreater} node\arginout,\textcolor{red} type((multiCounter))\textgreater} instance\arginout) Add multiple instances of this property to a multiCounter object.

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((nodePropertyExtractorClass))\textgreater} destination\arginout) Perform a deep copy of the object.

<type(varying_string)> description() Return a description of the property extracted.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

<double> extract(<type(treeNode)> node→) Extract the property from the given node.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

<type(varying_string)> name() Return the name of the property extracted.

type(varying_string) objectType() Return the type of the object.

integer quantity() Return the class of the extracted property.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

type(varying_string) objectType() Return the type of the object.

integer quantity() Return the class of the extracted property.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

integer type() Return the type of the extracted property.

<double> unitsInSI() Return the units of the property extracted in the SI system.

nodePropertyExtractorMainBranchStatus

`void addInstances(\textcolor{red}{\textless type((treeNode ))\textgreater} node\arginout,\textcolor{red}{\textless type((multiCounter))\textgreater} instance\arginout)` Add multiple instances of this property to a `multiCounter` object.

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\arginout,\textcolor{red}{\textless character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void autoHook()` Insert any event hooks required by this object.

`void deepCopy(\textcolor{red}{\textless class((nodePropertyExtractorClass))\textgreater} destination\arginout)` Perform a deep copy of the object.

`<type(varying_string)> description()` Return a description of the property extracted.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\textcolor{red}{\textless logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`<integer> extract(<type(treeNode)> node→)` Extract the property from the given `node`.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDigest\argin)` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

`<type(varying_string)> name()` Return the name of the property extracted.

`type(varying_string) objectType()` Return the type of the object.

`integer quantity()` Return the class of the extracted property.

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

`<void> referenceCountIncrement()` Increment the reference count to this object.

`<void> referenceCountReset()` Reset the reference count to this object to 0.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

`integer type()` Return the type of the extracted property.

`<double> unitsInSI()` Return the units of the property extracted in the SI system.

nodePropertyExtractorMassBlackHole

void addInstances(\textcolor{red}{\textless type((treeNode))\textgreater} node\arginout,\textcolor{red} type((multiCounter))\textgreater} instance\arginout) Add multiple instances of this property to a multiCounter object.

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((nodePropertyExtractorClass))\textgreater} destination\arginout) Perform a deep copy of the object.

<type(varying_string)> description() Return a description of the property extracted.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

<double> extract(<type(treeNode)> node→) Extract the property from the given node.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

<type(varying_string)> name() Return the name of the property extracted.

type(varying_string) objectType() Return the type of the object.

integer quantity() Return the class of the extracted property.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

integer type() Return the type of the extracted property.

<double> unitsInSI() Return the units of the property extracted in the SI system.

nodePropertyExtractorMassHalo

`void addInstances(\textcolor{red}{\textless type((treeNode ))\textgreater} node\arginout,\textcolor{red}{\textless type((multiCounter))\textgreater} instance\arginout)` Add multiple instances of this property to a `multiCounter` object.

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\arginout,\textcolor{red}{\textless character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void autoHook()` Insert any event hooks required by this object.

`void deepCopy(\textcolor{red}{\textless class((nodePropertyExtractorClass))\textgreater} destination\arginout)` Perform a deep copy of the object.

`<type(varying_string)> description()` Return a description of the property extracted.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\textcolor{red}{\textless logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`<double> extract(<type(treeNode)> node→)` Extract the property from the given `node`.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDigest\argin)` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

`<type(varying_string)> name()` Return the name of the property extracted.

`type(varying_string) objectType()` Return the type of the object.

`integer quantity()` Return the class of the extracted property.

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

`<void> referenceCountIncrement()` Increment the reference count to this object.

`<void> referenceCountReset()` Reset the reference count to this object to 0.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

`integer type()` Return the type of the extracted property.

`<double> unitsInSI()` Return the units of the property extracted in the SI system.

nodePropertyExtractorMassHost

void addInstances(\textcolor{red}{\textless type((treeNode))\textgreater} node\arginout,\textcolor{red} type((multiCounter))\textgreater} instance\arginout) Add multiple instances of this property to a multiCounter object.

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((nodePropertyExtractorClass))\textgreater} destination\arginout) Perform a deep copy of the object.

<type(varying_string)> description() Return a description of the property extracted.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

<double> extract(<type(treeNode)> node→) Extract the property from the given node.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

<type(varying_string)> name() Return the name of the property extracted.

type(varying_string) objectType() Return the type of the object.

integer quantity() Return the class of the extracted property.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

integer type() Return the type of the extracted property.

<double> unitsInSI() Return the units of the property extracted in the SI system.

nodePropertyExtractorMassISM

`void addInstances(\textcolor{red}{\textless type((treeNode ))\textgreater} node\arginout,\textcolor{red}{\textless type((multiCounter))\textgreater} instance\arginout)` Add multiple instances of this property to a `multiCounter` object.

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\arginout,\textcolor{red}{\textless character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void autoHook()` Insert any event hooks required by this object.

`void deepCopy(\textcolor{red}{\textless class((nodePropertyExtractorClass))\textgreater} destination\arginout)` Perform a deep copy of the object.

`<type(varying_string)> description()` Return a description of the property extracted.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\textcolor{red}{\textless logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`<double> extract(<type(treeNode)> node→)` Extract the property from the given `node`.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDigest\argin)` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

`<type(varying_string)> name()` Return the name of the property extracted.

`type(varying_string) objectType()` Return the type of the object.

`integer quantity()` Return the class of the extracted property.

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

`<void> referenceCountIncrement()` Increment the reference count to this object.

`<void> referenceCountReset()` Reset the reference count to this object to 0.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

`integer type()` Return the type of the extracted property.

`<double> unitsInSI()` Return the units of the property extracted in the SI system.

nodePropertyExtractorMassProfile

void addInstances(\textcolor{red}{\textless type((treeNode))\textgreater} node\arginout,\textcolor{red} type((multiCounter))\textgreater} instance\arginout) Add multiple instances of this property to a multiCounter object.

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((nodePropertyExtractorClass))\textgreater} destination\arginout) Perform a deep copy of the object.

<type(varying_string)>(:) descriptions(<double> time→) Return descriptions of the properties extracted.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

<integer> elementCount(<double> time→) Return the number of properties in the tuple.

<double(:)> extract(<type(treeNode)> node→, <double> time→, <type(multiCounter)> [instance]→) Extract the properties from the given node.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

<type(varying_string)>(:) names(<double> time→) Return the names of the properties extracted.

type(varying_string) objectType() Return the type of the object.

integer quantity() Return the class of the extracted property.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

integer type() Return the type of the extracted property.

<double(:)> unitsInSI(<double> time→) Return the units of the properties extracted in the SI system.

nodePropertyExtractorMassStellar

`void addInstances(\textcolor{red}{\textless type((treeNode ))\textgreater} node\arginout,\textcolor{red}{\textless type((multiCounter))\textgreater} instance\arginout)` Add multiple instances of this property to a `multiCounter` object.

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\arginout,\textcolor{red}{\textless character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void autoHook()` Insert any event hooks required by this object.

`void deepCopy(\textcolor{red}{\textless class((nodePropertyExtractorClass))\textgreater} destination\arginout)` Perform a deep copy of the object.

`<type(varying_string)> description()` Return a description of the property extracted.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\textcolor{red}{\textless logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`<double> extract(<type(treeNode)> node→)` Extract the property from the given `node`.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDigest\argin)` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

`<type(varying_string)> name()` Return the name of the property extracted.

`type(varying_string) objectType()` Return the type of the object.

`integer quantity()` Return the class of the extracted property.

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

`<void> referenceCountIncrement()` Increment the reference count to this object.

`<void> referenceCountReset()` Reset the reference count to this object to 0.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

`integer type()` Return the type of the extracted property.

`<double> unitsInSI()` Return the units of the property extracted in the SI system.

nodePropertyExtractorMassStellarMorphology

void addInstances(\textcolor{red}{\textless type((treeNode))\textgreater} node\arginout,\textcolor{red}{\textless type((multiCounter))\textgreater} instance\arginout) Add multiple instances of this property to a multiCounter object.

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\arginout,\textcolor{red}{\textless character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((nodePropertyExtractorClass))\textgreater} destination\arginout) Perform a deep copy of the object.

<type(varying_string)> description() Return a description of the property extracted.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\textcolor{red}{\textless logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

<double> extract(<type(treeNode)> node→) Extract the property from the given node.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDigest\argin) Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

<type(varying_string)> name() Return the name of the property extracted.

type(varying_string) objectType() Return the type of the object.

integer quantity() Return the class of the extracted property.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

integer type() Return the type of the extracted property.

<double> unitsInSI() Return the units of the property extracted in the SI system.

nodePropertyExtractorMassStellarSpheroid

`void addInstances(\textcolor{red}{\textless type((treeNode ))\textgreater} node\arginout,\textcolor{red}{\textless type((multiCounter))\textgreater} instance\arginout)` Add multiple instances of this property to a `multiCounter` object.

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\arginout,\textcolor{red}{\textless character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void autoHook()` Insert any event hooks required by this object.

`void deepCopy(\textcolor{red}{\textless class((nodePropertyExtractorClass))\textgreater} destination\arginout)` Perform a deep copy of the object.

`<type(varying_string)> description()` Return a description of the property extracted.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\textcolor{red}{\textless logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`<double> extract(<type(treeNode)> node→)` Extract the property from the given `node`.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDigest\argin)` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

`<type(varying_string)> name()` Return the name of the property extracted.

`type(varying_string) objectType()` Return the type of the object.

`integer quantity()` Return the class of the extracted property.

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

`<void> referenceCountIncrement()` Increment the reference count to this object.

`<void> referenceCountReset()` Reset the reference count to this object to 0.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

`integer type()` Return the type of the extracted property.

`<double> unitsInSI()` Return the units of the property extracted in the SI system.

nodePropertyExtractorMetallicityISM

void addInstances(\textcolor{red}{\textless type((treeNode))\textgreater} node\arginout,\textcolor{red} type((multiCounter))\textgreater} instance\arginout) Add multiple instances of this property to a multiCounter object.

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((nodePropertyExtractorClass))\textgreater} destination\arginout) Perform a deep copy of the object.

<type(varying_string)> description() Return a description of the property extracted.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

<double> extract(<type(treeNode)> node→) Extract the property from the given node.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

<type(varying_string)> name() Return the name of the property extracted.

type(varying_string) objectType() Return the type of the object.

integer quantity() Return the class of the extracted property.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

integer type() Return the type of the extracted property.

<double> unitsInSI() Return the units of the property extracted in the SI system.

nodePropertyExtractorMostMassiveProgenitor

`void addInstances(\textcolor{red}{\textless type((treeNode ))\textgreater} node\arginout,\textcolor{red}{\textless type((multiCounter))\textgreater} instance\arginout)` Add multiple instances of this property to a `multiCounter` object.

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\arginout,\textcolor{red}{\textless character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void autoHook()` Insert any event hooks required by this object.

`void deepCopy(\textcolor{red}{\textless class((nodePropertyExtractorClass))\textgreater} destination\arginout)` Perform a deep copy of the object.

`<type(varying_string)> description()` Return a description of the property extracted.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\textcolor{red}{\textless logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`<integer> extract(<type(treeNode)> node→)` Extract the property from the given `node`.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDigest\argin)` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

`<type(varying_string)> name()` Return the name of the property extracted.

`type(varying_string) objectType()` Return the type of the object.

`integer quantity()` Return the class of the extracted property.

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

`<void> referenceCountIncrement()` Increment the reference count to this object.

`<void> referenceCountReset()` Reset the reference count to this object to 0.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

`integer type()` Return the type of the extracted property.

`<double> unitsInSI()` Return the units of the property extracted in the SI system.

nodePropertyExtractorMulti

`void addInstances(\textcolor{red}{\textless type((treeNode ))\textgreater} node\arginout,\textcolor{red}{\textless type((multiCounter))\textgreater} instance\arginout)` Add multiple instances of this property to a `multiCounter` object.

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\arginout,\textcolor{red}{\textless character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void autoHook()` Insert any event hooks required by this object.

`void deepCopy(\textcolor{red}{\textless class((nodePropertyExtractorClass))\textgreater} destination\arginout)` Perform a deep copy of the object.

`<type(varying_string)>(:) descriptions(<integer> elementType→,<double> time→)` Return descriptions of the properties extracted.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\textcolor{red}{\textless logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`<integer> elementCount(<integer> elementType→,<double> time→)` Return the number of properties in the tuple.

`<double(:)> extractDouble(<type(treeNode)> node→, <double> time→, <type(multiCounter)> [instance]→)` Extract the double properties from the given `node`.

`<integer(:)> extractInteger(<type(treeNode)> node→, <double> time→, <type(multiCounter)> [instance]→)` Extract the integer properties from the given `node`.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDigest)` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<void> initialize()` Initialize the multi property extractor.

`<logical> isDefault()` Return true if this is the default object of this class.

`<type(varying_string)>(:) names(<integer> elementType→,<double> time→)` Return the names of the properties extracted.

`type(varying_string) objectType()` Return the type of the object.

`integer quantity()` Return the class of the extracted property.

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

`<void> referenceCountIncrement()` Increment the reference count to this object.

`<void> referenceCountReset()` Reset the reference count to this object to 0.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

`integer type()` Return the type of the extracted property.

`<double(:)> unitsInSI(<integer> elementType→,<double> time→)` Return the units of the properties extracted in the SI system.

nodePropertyExtractorNodeIndices

`void addInstances(\textcolor{red}{\textless type((treeNode ))\textgreater} node\arginout,\textcolor{red type((multiCounter))\textgreater} instance\arginout)` Add multiple instances of this property to a `multiCounter` object.

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void autoHook()` Insert any event hooks required by this object.

`void deepCopy(\textcolor{red}{\textless class((nodePropertyExtractorClass))\textgreater} destination\arginout)` Perform a deep copy of the object.

`<type(varying_string)>(:) descriptions(<double> time→)` Return descriptions of the properties extracted.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`<integer> elementCount(<double> time→)` Return the number of properties in the tuple.

`<integer(:)> extract(<type(treeNode)> node→, <double> time→, <type(multiCounter)> [instance]→)` Extract the properties from the given `node`.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

`<type(varying_string)>(:) names(<double> time→)` Return the names of the properties extracted.

`type(varying_string) objectType()` Return the type of the object.

`integer quantity()` Return the class of the extracted property.

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

`<void> referenceCountIncrement()` Increment the reference count to this object.

`<void> referenceCountReset()` Reset the reference count to this object to 0.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

integer type() Return the type of the extracted property.

<double(:)> unitsInSI(<double> time→) Return the units of the properties extracted in the SI system.

nodePropertyExtractorNull

void addInstances(\textcolor{red}{\textless type((treeNode))\textgreater} node\arginout,\textcolor{red type((multiCounter))\textgreater} instance\arginout) Add multiple instances of this property to a multiCounter object.

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((nodePropertyExtractorClass))\textgreater} destination\arginout) Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

integer quantity() Return the class of the extracted property.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

integer type() Return the type of the extracted property.

nodePropertyExtractorProjectedDensity

`void addInstances(\textcolor{red}{\textless type((treeNode ))\textgreater} node\arginout,\textcolor{red}{\textless type((multiCounter))\textgreater} instance\arginout)` Add multiple instances of this property to a `multiCounter` object.

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\arginout,\textcolor{red}{\textless character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void autoHook()` Insert any event hooks required by this object.

`void deepCopy(\textcolor{red}{\textless class((nodePropertyExtractorClass))\textgreater} destination\arginout)` Perform a deep copy of the object.

`<type(varying_string)>(:) descriptions(<double> time→)` Return descriptions of the properties extracted.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\textcolor{red}{\textless logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`<integer> elementCount(<double> time→)` Return the number of properties in the tuple.

`<double(:)> extract(<type(treeNode)> node→, <double> time→, <type(multiCounter)> [instance]→)` Extract the properties from the given `node`.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDigest\argin)` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

`<type(varying_string)>(:) names(<double> time→)` Return the names of the properties extracted.

`type(varying_string) objectType()` Return the type of the object.

`integer quantity()` Return the class of the extracted property.

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

`<void> referenceCountIncrement()` Increment the reference count to this object.

`<void> referenceCountReset()` Reset the reference count to this object to 0.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

`integer type()` Return the type of the extracted property.

`<double(:)> unitsInSI(<double> time→)` Return the units of the properties extracted in the SI system.

nodePropertyExtractorRadiiHalfLightProperties

void addInstances(\textcolor{red}{\textless type((treeNode))\textgreater} node\arginout,\textcolor{red} type((multiCounter))\textgreater} instance\arginout) Add multiple instances of this property to a multiCounter object.

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((nodePropertyExtractorClass))\textgreater} destination\arginout) Perform a deep copy of the object.

<type(varying_string)>(:) descriptions(<double> time→) Return descriptions of the properties extracted.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

<integer> elementCount(<double> time→) Return the number of properties in the tuple.

<double(:)> extract(<type(treeNode)> node→, <double> time→, <type(multiCounter)> [instance]→) Extract the properties from the given node.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

<type(varying_string)>(:) names(<double> time→) Return the names of the properties extracted.

type(varying_string) objectType() Return the type of the object.

integer quantity() Return the class of the extracted property.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

integer type() Return the type of the extracted property.

<double(:)> unitsInSI(<double> time→) Return the units of the properties extracted in the SI system.

nodePropertyExtractorRadiusCooling

`void addInstances(\textcolor{red}{\textless type((treeNode ))\textgreater} node\arginout,\textcolor{red}{\textless type((multiCounter))\textgreater} instance\arginout)` Add multiple instances of this property to a `multiCounter` object.

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\arginout,\textcolor{red}{\textless character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void autoHook()` Insert any event hooks required by this object.

`void deepCopy(\textcolor{red}{\textless class((nodePropertyExtractorClass))\textgreater} destination\arginout)` Perform a deep copy of the object.

`<type(varying_string)> description()` Return a description of the property extracted.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\textcolor{red}{\textless logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`<double> extract(<type(treeNode)> node→)` Extract the property from the given `node`.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDigest\argin)` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

`<type(varying_string)> name()` Return the name of the property extracted.

`type(varying_string) objectType()` Return the type of the object.

`integer quantity()` Return the class of the extracted property.

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

`<void> referenceCountIncrement()` Increment the reference count to this object.

`<void> referenceCountReset()` Reset the reference count to this object to 0.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

`integer type()` Return the type of the extracted property.

`<double> unitsInSI()` Return the units of the property extracted in the SI system.

nodePropertyExtractorRadiusHalfMass

void addInstances(\textcolor{red}{\textless type((treeNode))\textgreater} node\arginout,\textcolor{red}{\textless type((multiCounter))\textgreater} instance\arginout) Add multiple instances of this property to a multiCounter object.

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\arginout,\textcolor{red}{\textless character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((nodePropertyExtractorClass))\textgreater} destination\arginout) Perform a deep copy of the object.

<type(varying_string)> description() Return a description of the property extracted.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\textcolor{red}{\textless logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

<double> extract(<type(treeNode)> node→) Extract the property from the given node.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDigest\argin) Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

<type(varying_string)> name() Return the name of the property extracted.

type(varying_string) objectType() Return the type of the object.

integer quantity() Return the class of the extracted property.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

integer type() Return the type of the extracted property.

<double> unitsInSI() Return the units of the property extracted in the SI system.

nodePropertyExtractorRateCooling

`void addInstances(\textcolor{red}{\textless type((treeNode ))\textgreater} node\arginout,\textcolor{red}{\textless type((multiCounter))\textgreater} instance\arginout)` Add multiple instances of this property to a `multiCounter` object.

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\arginout,\textcolor{red}{\textless character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void autoHook()` Insert any event hooks required by this object.

`void deepCopy(\textcolor{red}{\textless class((nodePropertyExtractorClass))\textgreater} destination\arginout)` Perform a deep copy of the object.

`<type(varying_string)> description()` Return a description of the property extracted.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\textcolor{red}{\textless logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`<double> extract(<type(treeNode)> node→)` Extract the property from the given `node`.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDigest\argin)` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

`<type(varying_string)> name()` Return the name of the property extracted.

`type(varying_string) objectType()` Return the type of the object.

`integer quantity()` Return the class of the extracted property.

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

`<void> referenceCountIncrement()` Increment the reference count to this object.

`<void> referenceCountReset()` Reset the reference count to this object to 0.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

`integer type()` Return the type of the extracted property.

`<double> unitsInSI()` Return the units of the property extracted in the SI system.

nodePropertyExtractorRateInfallColdMode

void addInstances(\textcolor{red}{\textless type((treeNode))\textgreater} node\arginout,\textcolor{red}{\textless type((multiCounter))\textgreater} instance\arginout) Add multiple instances of this property to a multiCounter object.

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\arginout,\textcolor{red}{\textless character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((nodePropertyExtractorClass))\textgreater} destination\arginout) Perform a deep copy of the object.

<type(varying_string)> description() Return a description of the property extracted.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\textcolor{red}{\textless logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

<double> extract(<type(treeNode)> node→) Extract the property from the given node.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDigest\argin) Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

<type(varying_string)> name() Return the name of the property extracted.

type(varying_string) objectType() Return the type of the object.

integer quantity() Return the class of the extracted property.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

integer type() Return the type of the extracted property.

<double> unitsInSI() Return the units of the property extracted in the SI system.

nodePropertyExtractorRatio

`void addInstances(\textcolor{red}{\textless type((treeNode ))\textgreater} node\arginout,\textcolor{red}{\textless type((multiCounter))\textgreater} instance\arginout)` Add multiple instances of this property to a `multiCounter` object.

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\arginout,\textcolor{red}{\textless character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void autoHook()` Insert any event hooks required by this object.

`void deepCopy(\textcolor{red}{\textless class((nodePropertyExtractorClass))\textgreater} destination\arginout)` Perform a deep copy of the object.

`<type(varying_string)> description()` Return a description of the property extracted.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\textcolor{red}{\textless logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`<double> extract(<type(treeNode)> node→)` Extract the property from the given `node`.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDigest\argin)` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

`<type(varying_string)> name()` Return the name of the property extracted.

`type(varying_string) objectType()` Return the type of the object.

`integer quantity()` Return the class of the extracted property.

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

`<void> referenceCountIncrement()` Increment the reference count to this object.

`<void> referenceCountReset()` Reset the reference count to this object to 0.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

`integer type()` Return the type of the extracted property.

`<double> unitsInSI()` Return the units of the property extracted in the SI system.

nodePropertyExtractorRedshiftLastIsolated

void addInstances(\textcolor{red}{\textless type((treeNode))\textgreater} node\arginout,\textcolor{red} type((multiCounter))\textgreater} instance\arginout) Add multiple instances of this property to a multiCounter object.

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((nodePropertyExtractorClass))\textgreater} destination\arginout) Perform a deep copy of the object.

<type(varying_string)> description() Return a description of the property extracted.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

<double> extract(<type(treeNode)> node→) Extract the property from the given node.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

<type(varying_string)> name() Return the name of the property extracted.

type(varying_string) objectType() Return the type of the object.

integer quantity() Return the class of the extracted property.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

integer type() Return the type of the extracted property.

<double> unitsInSI() Return the units of the property extracted in the SI system.

nodePropertyExtractorRotationCurve

void addInstances(\textcolor{red}{\textless type((treeNode))\textgreater} node\arginout,\textcolor{red} type((multiCounter))\textgreater} instance\arginout) Add multiple instances of this property to a multiCounter object.

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((nodePropertyExtractorClass))\textgreater} destination\arginout) Perform a deep copy of the object.

<type(varying_string)>(:) descriptions(<double> time→) Return descriptions of the properties extracted.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

<integer> elementCount(<double> time→) Return the number of properties in the tuple.

<double(:)> extract(<type(treeNode)> node→, <double> time→, <type(multiCounter)> [instance]→) Extract the properties from the given node.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

<type(varying_string)>(:) names(<double> time→) Return the names of the properties extracted.

type(varying_string) objectType() Return the type of the object.

integer quantity() Return the class of the extracted property.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

integer type() Return the type of the extracted property.

<double(:)> unitsInSI(<double> time→) Return the units of the properties extracted in the SI system.

nodePropertyExtractorSatelliteOrbitalExtrema

void addInstances(\textcolor{red}{\textless type((treeNode))\textgreater} node\arginout,\textcolor{red} type((multiCounter))\textgreater} instance\arginout) Add multiple instances of this property to a multiCounter object.

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((nodePropertyExtractorClass))\textgreater} destination\arginout) Perform a deep copy of the object.

<type(varying_string)>(:) descriptions(<double> time→) Return descriptions of the properties extracted.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

<integer> elementCount(<double> time→) Return the number of properties in the tuple.

<double(:)> extract(<type(treeNode)> node→, <double> time→, <type(multiCounter)> [instance]→) Extract the properties from the given node.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

<type(varying_string)>(:) names(<double> time→) Return the names of the properties extracted.

type(varying_string) objectType() Return the type of the object.

integer quantity() Return the class of the extracted property.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

integer type() Return the type of the extracted property.

<double(:)> unitsInSI(<double> time→) Return the units of the properties extracted in the SI system.

nodePropertyExtractorSatelliteStatus

`void addInstances(\textcolor{red}{\textless type((treeNode ))\textgreater} node\arginout,\textcolor{red}{\textless type((multiCounter))\textgreater} instance\arginout)` Add multiple instances of this property to a `multiCounter` object.

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\arginout,\textcolor{red}{\textless character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void autoHook()` Insert any event hooks required by this object.

`void deepCopy(\textcolor{red}{\textless class((nodePropertyExtractorClass))\textgreater} destination\arginout)` Perform a deep copy of the object.

`<type(varying_string)> description()` Return a description of the property extracted.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\textcolor{red}{\textless logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`<integer> extract(<type(treeNode)> node→)` Extract the property from the given `node`.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDigest\argin)` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

`<type(varying_string)> name()` Return the name of the property extracted.

`type(varying_string) objectType()` Return the type of the object.

`integer quantity()` Return the class of the extracted property.

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

`<void> referenceCountIncrement()` Increment the reference count to this object.

`<void> referenceCountReset()` Reset the reference count to this object to 0.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

`integer type()` Return the type of the extracted property.

`<double> unitsInSI()` Return the units of the property extracted in the SI system.

nodePropertyExtractorScalar

void addInstances(\textcolor{red}{\textless type((treeNode))\textgreater} node\arginout,\textcolor{red} type((multiCounter))\textgreater} instance\arginout) Add multiple instances of this property to a multiCounter object.

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((nodePropertyExtractorClass))\textgreater} destination\arginout) Perform a deep copy of the object.

<type(varying_string)> description() Return a description of the property extracted.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

<double> extract(<type(treeNode)> node→) Extract the property from the given node.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

<type(varying_string)> name() Return the name of the property extracted.

type(varying_string) objectType() Return the type of the object.

integer quantity() Return the class of the extracted property.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

integer type() Return the type of the extracted property.

<double> unitsInSI() Return the units of the property extracted in the SI system.

nodePropertyExtractorSpin

`void addInstances(\textcolor{red}{\textless type((treeNode ))\textgreater} node\arginout,\textcolor{red}{\textless type((multiCounter))\textgreater} instance\arginout)` Add multiple instances of this property to a `multiCounter` object.

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\arginout,\textcolor{red}{\textless character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void autoHook()` Insert any event hooks required by this object.

`void deepCopy(\textcolor{red}{\textless class((nodePropertyExtractorClass))\textgreater} destination\arginout)` Perform a deep copy of the object.

`<type(varying_string)> description()` Return a description of the property extracted.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\textcolor{red}{\textless logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`<double> extract(<type(treeNode)> node→)` Extract the property from the given `node`.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDigest\argin)` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

`<type(varying_string)> name()` Return the name of the property extracted.

`type(varying_string) objectType()` Return the type of the object.

`integer quantity()` Return the class of the extracted property.

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

`<void> referenceCountIncrement()` Increment the reference count to this object.

`<void> referenceCountReset()` Reset the reference count to this object to 0.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

`integer type()` Return the type of the extracted property.

`<double> unitsInSI()` Return the units of the property extracted in the SI system.

nodePropertyExtractorSpinBullock

void addInstances(\textcolor{red}{\textless type((treeNode))\textgreater} node\arginout,\textcolor{red} type((multiCounter))\textgreater} instance\arginout) Add multiple instances of this property to a multiCounter object.

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((nodePropertyExtractorClass))\textgreater} destination\arginout) Perform a deep copy of the object.

<type(varying_string)>(:) descriptions(<double> time→) Return descriptions of the properties extracted.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

<integer> elementCount(<double> time→) Return the number of properties in the tuple.

<double(:)> extract(<type(treeNode)> node→, <double> time→, <type(multiCounter)> [instance]→) Extract the properties from the given node.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

<type(varying_string)>(:) names(<double> time→) Return the names of the properties extracted.

type(varying_string) objectType() Return the type of the object.

integer quantity() Return the class of the extracted property.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

integer type() Return the type of the extracted property.

<double(:)> unitsInSI(<double> time→) Return the units of the properties extracted in the SI system.

nodePropertyExtractorTreeWeight

`void addInstances(\textcolor{red}{\textless type((treeNode ))\textgreater} node\arginout,\textcolor{red}{\textless type((multiCounter))\textgreater} instance\arginout)` Add multiple instances of this property to a `multiCounter` object.

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\arginout,\textcolor{red}{\textless character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void autoHook()` Insert any event hooks required by this object.

`void deepCopy(\textcolor{red}{\textless class((nodePropertyExtractorClass))\textgreater} destination\arginout)` Perform a deep copy of the object.

`<type(varying_string)> description()` Return a description of the property extracted.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\textcolor{red}{\textless logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`<double> extract(<type(treeNode)> node→)` Extract the property from the given `node`.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDigest\argin)` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

`<type(varying_string)> name()` Return the name of the property extracted.

`type(varying_string) objectType()` Return the type of the object.

`integer quantity()` Return the class of the extracted property.

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

`<void> referenceCountIncrement()` Increment the reference count to this object.

`<void> referenceCountReset()` Reset the reference count to this object to 0.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

`integer type()` Return the type of the extracted property.

`<double> unitsInSI()` Return the units of the property extracted in the SI system.

nodePropertyExtractorTuple

`void addInstances(\textcolor{red}{\textless type((treeNode ))\textgreater} node\arginout,\textcolor{red}{\textless type((multiCounter))\textgreater} instance\arginout)` Add multiple instances of this property to a `multiCounter` object.

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\arginout,\textcolor{red}{\textless character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void autoHook()` Insert any event hooks required by this object.

`void deepCopy(\textcolor{red}{\textless class((nodePropertyExtractorClass))\textgreater} destination\arginout)` Perform a deep copy of the object.

`<type(varying_string)>(:) descriptions(<double> time→)` Return descriptions of the properties extracted.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\textcolor{red}{\textless logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`<integer> elementCount(<double> time→)` Return the number of properties in the tuple.

`<double(:)> extract(<type(treeNode)> node→, <double> time→, <type(multiCounter)> [instance]→)` Extract the properties from the given `node`.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDigest\argin)` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

`<type(varying_string)>(:) names(<double> time→)` Return the names of the properties extracted.

`type(varying_string) objectType()` Return the type of the object.

`integer quantity()` Return the class of the extracted property.

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

`<void> referenceCountIncrement()` Increment the reference count to this object.

`<void> referenceCountReset()` Reset the reference count to this object to 0.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

`integer type()` Return the type of the extracted property.

`<double(:)> unitsInSI(<double> time→)` Return the units of the properties extracted in the SI system.

nodePropertyExtractorVelocityDispersion

`void addInstances(\textcolor{red}{\textless type((treeNode ))\textgreater} node\arginout,\textcolor{red}{\textless type((multiCounter))\textgreater} instance\arginout)` Add multiple instances of this property to a `multiCounter` object.

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\arginout,\textcolor{red}{\textless character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void autoHook()` Insert any event hooks required by this object.

`void deepCopy(\textcolor{red}{\textless class((nodePropertyExtractorClass))\textgreater} destination\arginout)` Perform a deep copy of the object.

`<type(varying_string)>(:) descriptions(<double> time→)` Return descriptions of the properties extracted.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\textcolor{red}{\textless logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`<integer> elementCount(<double> time→)` Return the number of properties in the tuple.

`<double(:)> extract(<type(treeNode)> node→, <double> time→, <type(multiCounter)> [instance]→)` Extract the properties from the given `node`.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDigest\argin)` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

`<type(varying_string)>(:) names(<double> time→)` Return the names of the properties extracted.

`type(varying_string) objectType()` Return the type of the object.

`integer quantity()` Return the class of the extracted property.

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

`<void> referenceCountIncrement()` Increment the reference count to this object.

`<void> referenceCountReset()` Reset the reference count to this object to 0.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

`integer type()` Return the type of the extracted property.

`<double(:)> unitsInSI(<double> time→)` Return the units of the properties extracted in the SI system.

nodePropertyExtractorVelocityMaximum

void addInstances(\textcolor{red}{\textless type((treeNode))\textgreater} node\arginout,\textcolor{red}{\textless type((multiCounter))\textgreater} instance\arginout) Add multiple instances of this property to a multiCounter object.

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\arginout,\textcolor{red}{\textless character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((nodePropertyExtractorClass))\textgreater} destination\arginout) Perform a deep copy of the object.

<type(varying_string)> description() Return a description of the property extracted.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\textcolor{red}{\textless logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

<double> extract(<type(treeNode)> node→) Extract the property from the given node.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDigest\argin) Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

<type(varying_string)> name() Return the name of the property extracted.

type(varying_string) objectType() Return the type of the object.

integer quantity() Return the class of the extracted property.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

integer type() Return the type of the extracted property.

<double> unitsInSI() Return the units of the property extracted in the SI system.

nodePropertyExtractorVirialProperties

`void addInstances(\textcolor{red}{\textless type((treeNode ))\textgreater} node\arginout,\textcolor{red}{\textless type((multiCounter))\textgreater} instance\arginout)` Add multiple instances of this property to a `multiCounter` object.

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\arginout,\textcolor{red}{\textless character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void autoHook()` Insert any event hooks required by this object.

`void deepCopy(\textcolor{red}{\textless class((nodePropertyExtractorClass))\textgreater} destination\arginout)` Perform a deep copy of the object.

`<type(varying_string)>(:) descriptions(<double> time→)` Return descriptions of the properties extracted.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\textcolor{red}{\textless logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`<integer> elementCount(<double> time→)` Return the number of properties in the tuple.

`<double(:)> extract(<type(treeNode)> node→, <double> time→, <type(multiCounter)> [instance]→)` Extract the properties from the given `node`.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDigest\argin)` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

`<type(varying_string)>(:) names(<double> time→)` Return the names of the properties extracted.

`type(varying_string) objectType()` Return the type of the object.

`integer quantity()` Return the class of the extracted property.

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

`<void> referenceCountIncrement()` Increment the reference count to this object.

`<void> referenceCountReset()` Reset the reference count to this object to 0.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textless type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

`integer type()` Return the type of the extracted property.

`<double(:)> unitsInSI(<double> time→)` Return the units of the properties extracted in the SI system.

ompIncrementalLock

<void> initialize() (Re)initialize an OpenMP incremental lock object.

<void> set() Obtain a lock on the object.

<void> unset() Release a lock on the object.

ompLock

<void> initialize() (Re)initialize an OpenMP lock object.

<logical> ownedByThread() Return true if the current thread already owns this lock.

<void> set() Obtain a lock on the object.

<void> unset() Release a lock on the object.

ompReadWriteLock

<void> initialize() (Re)initialize an OpenMP read/write lock object

<void> setRead() Obtain a read (non-blocking) lock on the object.

<void> setWrite(<logical> [haveReadLock]→) Obtain a write (blocking) lock on the object. The lock will block until all other read/write locks on the object are released and while held will prevent any read locks from being obtained. If the thread requesting the write lock already has a read lock it should set haveReadLock=.true. when calling this function.

<void> unsetRead() Release a read (non-blocking) lock on the object.

<void> unsetWrite(<logical> [haveReadLock]→) Release a write (blocking) lock on the object. If the thread releasing the write lock already had a read lock it should set haveReadLock=.true. when calling this function to ensure that read locked is retained.

operatorUnaryClass

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\
character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((operatorUnaryClass))\textgreater} destination\arginout) Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex
logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges
Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

double precision operate(\textcolor{red}{\textless double precision\textgreater} x\argin) Operate on the given value.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

double precision unoperate(\textcolor{red}{\textless double precision\textgreater} f\argin) Reverse the operation.

operatorUnaryIdentity

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((operatorUnaryClass))\textgreater} destination\arginout) Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

double precision operate(\textcolor{red}{\textless double precision\textgreater} x\argin) Operate on the given value.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

double precision unoperate(\textcolor{red}{\textless double precision\textgreater} f\argin) Reverse the operation.

operatorUnaryInverse

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((operatorUnaryClass))\textgreater} destination\arginout) Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

double precision operate(\textcolor{red}{\textless double precision\textgreater} x\argin) Operate on the given value.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

double precision unoperate(\textcolor{red}{\textless double precision\textgreater} f\argin) Reverse the operation.

operatorUnaryLogarithm

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\
character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((operatorUnaryClass))\textgreater} destination\arginout) Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex
logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

double precision operate(\textcolor{red}{\textless double precision\textgreater} x\argin) Operate on the given value.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl
type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-
size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles
type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-
size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

double precision unoperate(\textcolor{red}{\textless double precision\textgreater} f\argin) Reverse the operation.

outputAnalysisBlackHoleBulgeRelation

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\
character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void analyze(\textcolor{red}{\textless type((treeNode))\textgreater} node\arginout,\textcolor{red}{\tex
integer((c_size_t))\textgreater} iOutput\argin) Analyze the given node.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((outputAnalysisClass))\textgreater} destination\arginout) Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

void finalize() Finalize the analysis.

<void> finalizeAnalysis() Finalize analysis of the mean function operator.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

double precision logLikelihood() Return the log-likelihood of the analysis.

type(varying_string) objectType() Return the type of the object.

void reduce(\textcolor{red}{\textless class((outputAnalysisClass))\textgreater} reduced\arginout) Reduce the object onto another object of the class.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

<void> results(<double(:)> [binCenter]↔, <double(:,:)> [functionValue]↔, <double(:,:)> [functionCovariance]↔) Return the results of the mean function operator.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

outputAnalysisClass

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void analyze(\textcolor{red}{\textless type((treeNode))\textgreater} node\arginout,\textcolor{red}{\tex integer((c_size_t))\textgreater} iOutput\argin) Analyze the given node.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((outputAnalysisClass))\textgreater} destination\arginout) Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

`void finalize()` Finalize the analysis.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

`double precision logLikelihood()` Return the log-likelihood of the analysis.

`type(varying_string) objectType()` Return the type of the object.

`void reduce(\textcolor{red}{\textless class((outputAnalysisClass))\textgreater} reduced\arginout)` Reduce the object onto another object of the class.

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

`<void> referenceCountIncrement()` Increment the reference count to this object.

`<void> referenceCountReset()` Reset the reference count to this object to 0.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

outputAnalysisColorDistributionSDSS

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void analyze(\textcolor{red}{\textless type((treeNode))\textgreater} node\arginout,\textcolor{red}{\tex integer((c_size_t))\textgreater} iOutput\argin)` Analyze the given `node`.

`void autoHook()` Insert any event hooks required by this object.

`void deepCopy(\textcolor{red}{\textless class((outputAnalysisClass))\textgreater} destination\arginout)` Perform a deep copy of the object.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`void finalize()` Finalize the analysis.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

`double precision logLikelihood()` Return the log-likelihood of the analysis.

`type(varying_string) objectType()` Return the type of the object.

void reduce(\textcolor{red}{\textless class((outputAnalysisClass))\textgreater} reduced\arginout) Reduce the object onto another object of the class.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

<void> results(<double(:)> [binCenter]↔, <double(:,:)> [functionValue]↔, <double(:,:)> [functionCovariance]↔) Return the results of the volume function operator.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

outputAnalysisConcentrationDistributionCDMCOCO

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void analyze(\textcolor{red}{\textless type((treeNode))\textgreater} node\arginout,\textcolor{red}{\tex integer((c_size_t))\textgreater} iOutput\argin)` Analyze the given `node`.

`void autoHook()` Insert any event hooks required by this object.

`void deepCopy(\textcolor{red}{\textless class((outputAnalysisClass))\textgreater} destination\arginout)` Perform a deep copy of the object.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`void finalize()` Finalize the analysis.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

`double precision logLikelihood()` Return the log-likelihood of the analysis.

`type(varying_string) objectType()` Return the type of the object.

`void reduce(\textcolor{red}{\textless class((outputAnalysisClass))\textgreater} reduced\arginout)` Reduce the object onto another object of the class.

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

`<void> referenceCountIncrement()` Increment the reference count to this object.

`<void> referenceCountReset()` Reset the reference count to this object to 0.

`<void> results(<double(:)> [binCenter]↔, <double(:,:)> [functionValue]↔, <double(:,:)> [functionCovariance]↔)` Return the results of the volume function operator.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

outputAnalysisMassFunctionStellarSDSS

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void analyze(\textcolor{red}{\textless type((treeNode))\textgreater} node\arginout,\textcolor{red}{\tex integer((c_size_t))\textgreater} iOutput\argin)` Analyze the given `node`.

`void autoHook()` Insert any event hooks required by this object.

`void deepCopy(\textcolor{red}{\textless class((outputAnalysisClass))\textgreater} destination\arginout)` Perform a deep copy of the object.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`void finalize()` Finalize the analysis.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

`double precision logLikelihood()` Return the log-likelihood of the analysis.

`type(varying_string) objectType()` Return the type of the object.

`void reduce(\textcolor{red}{\textless class((outputAnalysisClass))\textgreater} reduced\arginout)` Reduce the object onto another object of the class.

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

`<void> referenceCountIncrement()` Increment the reference count to this object.

`<void> referenceCountReset()` Reset the reference count to this object to 0.

`<void> results(<double(:)> [binCenter]↔, <double(:,:)> [functionValue]↔, <double(:,:)> [functionCovariance]↔)` Return the results of the volume function operator.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

outputAnalysisNull

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void analyze(\textcolor{red}{\textless type((treeNode))\textgreater} node\arginout,\textcolor{red}{\tex integer((c_size_t))\textgreater} iOutput\argin) Analyze the given node.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((outputAnalysisClass))\textgreater} destination\arginout) Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

void finalize() Finalize the analysis.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

double precision logLikelihood() Return the log-likelihood of the analysis.

type(varying_string) objectType() Return the type of the object.

void reduce(\textcolor{red}{\textless class((outputAnalysisClass))\textgreater} reduced\arginout) Reduce the object onto another object of the class.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

outputAnalysisPropertyOperatorAntiLog10

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((outputAnalysisPropertyOperatorClass))\textgreater} destination\arginout) Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

double precision operate(\textcolor{red}{\textless double precision\textgreater} propertyValue\argin,\t type((treeNode))\textgreater} node\arginout,\textcolor{red}{\textless integer\textgreater} propertyType\arginout,\textcolor{red}{\textless integer((c_size_t))\textgreater} outputIndex\argin) Operate on the given property.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

outputAnalysisPropertyOperatorBoolean

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((outputAnalysisPropertyOperatorClass))\textgreater} destination\arginout) Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

double precision operate(\textcolor{red}{\textless double precision\textgreater} propertyValue\argin,\t type((treeNode))\textgreater} node\arginout,\textcolor{red}{\textless integer\textgreater} propertyType\arginout,\textcolor{red}{\textless integer((c_size_t))\textgreater} outputIndex\argin) Operate on the given property.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

outputAnalysisPropertyOperatorClass

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((outputAnalysisPropertyOperatorClass))\textgreater} destination\arginout) Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges
Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

double precision operate(\textcolor{red}{\textless double precision\textgreater} propertyValue\argin,\t
type((treeNode))\textgreater} node\arginout,\textcolor{red}{\textless integer\textgreater}
propertyType\arginout,\textcolor{red}{\textless integer((c_size_t))\textgreater} outputIndex\argin)
Operate on the given property.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl
type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-
size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles
type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-
size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

outputAnalysisPropertyOperatorCsmlgyAnglrDstnc

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\
character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((outputAnalysisPropertyOperatorClass))\textgreater}
destination\arginout) Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex
logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges
Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

double precision operate(\textcolor{red}{\textless double precision\textgreater} propertyValue\argin,\t
type((treeNode))\textgreater} node\arginout,\textcolor{red}{\textless integer\textgreater}
propertyType\arginout,\textcolor{red}{\textless integer((c_size_t))\textgreater} outputIndex\argin)
Operate on the given property.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.

void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_- size_t))\textgreater} stateOperationID\argin) Store the state of this object to file.

outputAnalysisPropertyOperatorCsmlgyLmnstyDstnc

void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin) Return a list of parameter names allowed for this object.

void autoHook() Insert any event hooks required by this object.

void deepCopy(\textcolor{red}{\textless class((outputAnalysisPropertyOperatorClass))\textgreater} destination\arginout) Perform a deep copy of the object.

void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin) Return an input parameter list descriptor which could be used to recreate this object.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

double precision operate(\textcolor{red}{\textless double precision\textgreater} propertyValue\argin,\t type((treeNode))\textgreater} node\arginout,\textcolor{red}{\textless integer\textgreater} propertyType\arginout,\textcolor{red}{\textless integer((c_size_t))\textgreater} outputIndex\argin) Operate on the given property.

outputAnalysisPropertyOperatorFilterHighPass

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void autoHook()` Insert any event hooks required by this object.

`void deepCopy(\textcolor{red}{\textless class((outputAnalysisPropertyOperatorClass))\textgreater} destination\arginout)` Perform a deep copy of the object.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

`type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges` Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

`<logical> isDefault()` Return true if this is the default object of this class.

`type(varying_string) objectType()` Return the type of the object.

`double precision operate(\textcolor{red}{\textless double precision\textgreater} propertyValue\argin,\t type((treeNode))\textgreater} node\arginout,\textcolor{red}{\textless integer\textgreater} propertyType\arginout,\textcolor{red}{\textless integer((c_size_t))\textgreater} outputIndex\argin)` Operate on the given property.

`<integer> referenceCountDecrement()` Decrement the reference count to this object and return the new reference count.

`<void> referenceCountIncrement()` Increment the reference count to this object.

`<void> referenceCountReset()` Reset the reference count to this object to 0.

`void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin)` Restore the state of this object from file.

`void stateStore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textles type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_size_t))\textgreater} stateOperationID\argin)` Store the state of this object to file.

outputAnalysisPropertyOperatorHIMass

`void allowedParameters(\textcolor{red}{\textless type((varying_string))\textgreater} allowedParameters\ character((len=*))\textgreater} sourceName\argin)` Return a list of parameter names allowed for this object.

`void autoHook()` Insert any event hooks required by this object.

`void deepCopy(\textcolor{red}{\textless class((outputAnalysisPropertyOperatorClass))\textgreater} destination\arginout)` Perform a deep copy of the object.

`void descriptor(\textcolor{red}{\textless type((inputParameters))\textgreater} descriptor\arginout,\tex logical\textgreater} includeMethod\argin)` Return an input parameter list descriptor which could be used to recreate this object.

type(varying_string) hashedDescriptor(\textcolor{red}{\textless logical\textgreater} includeSourceDiges
Return a hash of the descriptor for this object, optionally include the source code digest in the hash.

<logical> isDefault() Return true if this is the default object of this class.

type(varying_string) objectType() Return the type of the object.

double precision operate(\textcolor{red}{\textless double precision\textgreater} propertyValue\argin,\t
type((treeNode))\textgreater} node\arginout,\textcolor{red}{\textless integer\textgreater}
propertyType\arginout,\textcolor{red}{\textless integer((c_size_t))\textgreater} outputIndex\argin)
Operate on the given property.

<integer> referenceCountDecrement() Decrement the reference count to this object and return the new reference count.

<void> referenceCountIncrement() Increment the reference count to this object.

<void> referenceCountReset() Reset the reference count to this object to 0.

void stateRestore(\textcolor{red}{\textless integer\textgreater} stateFile\argin,\textcolor{red}{\textl
type((fgsl_file))\textgreater} fgslStateFile\argin,\textcolor{red}{\textless integer((c_-
size_t))\textgreater} stateOperationID\argin) Restore the state of this object from file.
