The task should check whether `propertyComponent` matches its stored `componentIndex` value. If it does, it should set `propertyName` to a suitable name (e.g. `hernquistSpheroid::stellarMass`) and set `matchedProperty=true`. The value of `propertyObject` will be either `objectTypeProperty` indicating that the object in question is a standard property, or `objectTypeHistory` indicating that it is a history. The value of `propertyIndex` then gives the position of the object in question in the array of properties or histories.

Evolution Timestep Tasks

Merger tree nodes are evolved over some fixed timestep before evolution is stopped and other processing is allowed. The timestep is always sufficiently small such that the node does not evolve past the time of its parent node, nor does it evolve past the time of any of its satellite nodes. An arbitrary number of other criteria can be used to adjust the timestep. Such a criterion can be added using the `timeStepsTask` directive. For example, the `simple` timestep task adds itself using

```
!# <timeStepsTask>
!#  <unitName>Merger_Tree_Timestep_Simple</unitName>
!# </timeStepsTask>
```

Here, `unitName` gives the name of the subroutine to be called to (possibly) adjust the timestep. It should have the following form:

```
subroutine My_Timestep(thisNode,timeStep,End_Of_Timestep_Task,report,lockNode,lockType)
  implicit none
  type     (treeNode      ), intent(inout), pointer           :: thisNode
  procedure(              ), intent(inout), pointer           :: End_Of_Timestep_Task
  double precision         , intent(inout)                    :: timeStep
  logical                  , intent(in   )                    :: report
  type     (treeNode      ), intent(inout), pointer, optional :: lockNode
  type     (varying_string), intent(inout),          optional :: lockType
  .
  .
  .
  return
end subroutine My_Timestep
```

This subroutine should compute a suitable timestep for `thisNode` and, if it is less than the currently defined value of `timeStep` should set `timeStep` to that value. Optionally, the procedure pointer `End_Of_Timestep_Task` can be set to point to a subroutine which will be called after the node is evolved to the end of the timestep. It is acceptable for this pointer to be null. Note that the `End_Of_Timestep_Task` will only be called for the task which provided the shortest timestep—other tasks can always request to be called again when the next timestep is determined. The subroutine to be called at the end of the timestep must have the form:

```
subroutine My_End_Of_Timestep_Task(thisTree,thisNode,deadlockStatus)
  implicit none
  type(mergerTree), intent(in)             :: thisTree
  type(treeNode),   intent(inout), pointer :: thisNode
  integer,          intent(inout)          :: deadlockStatus
  .
  .
  .
  return
end subroutine My_End_Of_Timestep_Task
```

The `deadlockStatus` argument should be set to `isNotDeadlocked` (provided by the Merger_Trees_Evolve_Deadlock_Status module) if, and only if, the end of timestep task makes some change to the state of the tree (e.g. merging a node), to indicate that the tree was not deadlocked in this pass (i.e. something actually changed in the tree).

If the `report` argument is `true` then the function should report the value of `timestep` prior to exiting. (This is used in reporting on timestepping criteri in deadlocked trees.) It is recommended that the report be made using the Evolve_To_Time_Report() function. Additionally, if the optional `lockNode` and `lockType` arguments are present then additional information can be supplied to aid in diagnosing deadlock conditions. If the current task is limiting the timestep then the `lockNode` pointer should be set to point to whichever node is causing the limit (which may be `thisNode` or some other node, e.g. a satellite of `thisNode`, etc.), and `lockType` should be set to a short description label identifying the type of limit.

Galactic Component Density

The function `Galactic_Structure_Density()` computes the density of material at a given position within a node. To have their density counted, each component must register a task using:

```
!# <densityTask>
!#  <unitName>Density_Procedure</unitName>
!# </densityTask>
```

where `Density_Procedure` is the name of a function with the following template

```
double precision function Density_Procedure(thisNode,position,coordinateSystem,componentType,massType,w
   type(treeNode),   intent(inout), pointer  :: thisNode
   integer,          intent(in)              :: massType,coordinateSystem,componentType,weightBy,weight
   double precision, intent(in)              :: radius
   logical         , intent(in),    optional :: haloLoaded
   .
   .
   .
   return
end function Density_Procedure
```

If `componentType` is a match to the component then the function should return the density of the component matching type `massType` at `position` for `thisNode`. `componentType` and `massType` can take one of the values described in §16.2. In the above "density" can actually refer to different quantities depending on the values of `weightBy` (and `weightIndex`):

`weightByMass` The actual mass should be returned (the value of `weightIndex` is irrelevant);

`weightByLuminosity` The `weightIndex`$^{\text{th}}$ luminosity should be returned.

If `haloLoaded=true` (which should be the default if this option is not present), then the effects of baryonic loading on the halo profile should be taken into account where necessary. Otherwise, the effects of baryonic loading should be ignored.

Galactic Component Enclosed Mass

The function `Galactic_Structure_Enclosed_Mass()` computes the mass within a specified radius in a node. To have their mass counted, each component must register a task using:

```
!# <enclosedMassTask>
!#  <unitName>Enclosed_Mass_Procedure</unitName>
!# </enclosedMassTask>
```

where `Enclosed_Mass_Procedure` is the name of a function with the following template

```
double precision function Enclosed_Mass_Procedure(thisNode,radius,componentType,massType,weightBy,weigh
   type(treeNode),   intent(inout), pointer  :: thisNode
   integer,          intent(in)              :: massType,componentType,weightBy,weightIndex
   double precision, intent(in)              :: radius
   logical         , intent(in),    optional :: haloLoaded
   .
   .
   .
   return
end function Enclosed_Mass_Procedure
```

If `componentType` is a match to the component then the function should return the "mass" of the component matching type `massType` within `radius` for `thisNode`. `componentType` and `massType` can take one of the values described in §16.2. If `radius` is equal to or greater than `radiusLarge` the routine should the total "mass" (i.e. "mass" within infinite radius). In the above "mass" can actually refer to different quantities depending on the values of `weightBy` (and `weightIndex`):

`weightByMass` The actual mass should be returned (the value of `weightIndex` is irrelevant);

`weightByLuminosity` The `weightIndex`$^{\text{th}}$ luminosity should be returned.

If `haloLoaded=true` (which should be the default if this option is not present), then the effects of baryonic loading on the halo profile should be taken into account where necessary. Otherwise, the effects of baryonic loading should be ignored.

Galactic Component Rotation Curve

The function `Galactic_Structure_Rotation_Curve()` computes the rotation curve at a specified radius in a node. To have their contribution counted, each component must register a task using:

```
!# <rotationCurveTask>
!#  <unitName>Rotation_Curve_Procedure</unitName>
!# </rotationCurveTask>
```

where `Rotation_Curve_Procedure` is the name of a function with the following template

```
 double precision function Rotation_Curve_Procedure(thisNode,radius,componentType,massType,haloLoaded)
    type(treeNode),   intent(inout), pointer  :: thisNode
    integer,          intent(in)              :: massType,componentType
    double precision, intent(in)              :: radius
    logical         , intent(in),    optional :: haloLoaded
    .
    .
    .
    return
 end function Rotation_Curve_Procedure
```

If `componentType` is a match to the component then the procedure should return the contribution to the rotation curve due to the component matching type `massType` within `radius` for `thisNode`. `componentType` and `massType` can take one of the values described in §16.2. If `haloLoaded=true` (which should be the default if this option is not present), then the effects of baryonic loading on the halo profile should be taken into account where necessary. Otherwise, the effects of baryonic loading should be ignored.

Galactic Component Rotation Curve Gradient

The function `Galactic_Structure_Rotation_Curve_Gradient()` computes the gradient of the rotation curve at a specified radius in a node. To have their contribution counted, each component must register a task using:

```
!# <rotationCurveGradientTask>
!#  <unitName>Rotation_Curve_Gradient_Procedure</unitName>
!# </rotationCurveGradientTask>
```

where `Rotation_Curve_Gradient_Procedure` is the name of a function with the following template

```
 double precision function Rotation_Curve_Gradient_Procedure(thisNode,radius,componentType,massType,halo
    type(treeNode),   intent(inout), pointer  :: thisNode
    integer,          intent(in)              :: massType,componentType
    double precision, intent(in)              :: radius
    logical         , intent(in),    optional :: haloLoaded
    .
    .
    .
    return
 end function Rotation_Curve_Gradient_Procedure
```

If `componentType` is a match to the component then the function should return the contribution to the gradient of $V_c^2(r)$ due to the component matching type `massType` within `radius` for `thisNode`. *Note that this is the gradient of the square of the rotation curve to permit gradients to be directly summed.* `componentType` and `massType` can take one of the values described in §16.2. If `haloLoaded=true` (which should be the default if this option is not present), then the effects of baryonic loading on the halo profile should be taken into account where necessary. Otherwise, the effects of baryonic loading should be ignored.

Galactic Component Potential

The function `Galactic_Structure_Potential()` computes the potential at a specified radius in a node. To have their contribution counted, each component must register a task using:

```
 !# <potentialTask>
 !#  <unitName>Potential_Task</unitName>
 !# </potentialTask>
```

where `Potential_Task` is the name of a function with the following template

```
 double precision function Potential_Procedure(thisNode,radius,componentType,massType,haloLoaded)
    type(treeNode),   intent(inout), pointer   :: thisNode
    integer,          intent(in),    optional  :: componentType
    double precision, intent(in)                :: radius
    logical         , intent(in),    optional :: haloLoaded
    .
    .
    return
 end function Potential_Procedure
```

If `componentType` is a match to the component then the procedure should return the contribution to the rotation curve due to the component matching type `massType` within `radius` for `thisNode`. `componentType` and `massType` can take one of the values described in §16.2. If `haloLoaded=true` (which should be the default if this option is not present), then the effects of baryonic loading on the halo profile should be taken into account where necessary. Otherwise, the effects of baryonic loading should be ignored.

Galactic Component Surface Density

The function `Galactic_Structure_Surface_Density()` computes the surface density of material at a given position within a node. Note that while a 3-D position is specified the routine should return the surface density corresponding to integrating the component density through the minor axis (typically the z-axis). To have their surface density counted, each component must register a task using:

```
!# <surfaceDensityTask>
!#  <unitName>Surface_Density_Procedure</unitName>
!# </surfaceDensityTask>
```

where `Surface_Density_Procedure` is the name of a function with the following template

```
double precision function Surface_Density_Procedure(thisNode,position,coordinateSystem,componentType,ma
   type(treeNode),   intent(inout), pointer     :: thisNode
   integer,          intent(in)                 :: massType,coordinateSystem,componentType
   double precision, intent(in),    dimension(3):: position
   logical         , intent(in),    optional    :: haloLoaded
   .
   .
   .
   return
end function Surface_Density_Procedure
```

If `componentType` is a match to the component then the function should return the surface density of the component matching type `massType` at `position` for `thisNode`. `componentType` and `massType` can take one of the values described in §16.2. The coordinate system in which `position` is specified is given by `coordinateSystem` which can take on the following values:

`coordinateSystemCartesian` Cartesian (x, y, z);

`coordinateSystemSpherical` Spherical (r, θ, ϕ);

`coordinateSystemCylindrical` Cylindrical (R, ϕ, z).

If `haloLoaded`=`true` (which should be the default if this option is not present), then the effects of baryonic loading on the halo profile should be taken into account where necessary. Otherwise, the effects of baryonic loading should be ignored.

Halo Formation Events

Tasks to be performed when a halo is deemed to have "formed" (or reformed) can be registered using the `haloFormationTask` directive. For example, the `Tree_Node_Methods_Hot_Halo` module registers a task using

```
!# <haloFormationTask>
!#  <unitName>Hot_Halo_Formation_Task</unitName>
!# </haloFormationTask>
```

The contents of `<unitName>` should give the name of the subroutine to be called on halo formation. The subroutine should have a single argument, `thisNode`, which is the node that has (re)formed.

HDF5 File Close

Tasks to be performed just prior to closing the Galacticus output HDF5 file (typically involving writing accumulated data to that file) can be registered using the `hdfPreCloseTask` directive. For example, the `Merger_Tree_Timesteps_History` module registers a task using

```
!# <hdfPreCloseTask>
!#  <unitName>Merger_Tree_History_Write</unitName>
!# </hdfPreCloseTask>
```

The contents of `<unitName>` should give the name of the subroutine to be called prior to HDF5 file closure. The subroutine should have no arguments.

Merger Tree Extra Output Tasks

Extra outputs for merger trees (i.e. those which do not involve output of a fixed number of properties for every node—examples might be star formation histories for a subset of galaxies) can be added using the directive: `mergerTreeExtraOutputTask`. The directive should give the name of the subroutine to be called to perform the task. A template for this task is:

```
!# <mergerTreeExtraOutputTask>
!#  <unitName>Galacticus_Extra_Output_Example</unitName>
!# </mergerTreeExtraOutputTask>
subroutine Galacticus_Extra_Output_Example(thisNode,iOutput,treeIndex,nodePassesFilter)
  implicit none
  type(treeNode),          intent(inout), pointer :: thisNode
  integer,                 intent(in)             :: iOutput
  integer(kind=kind_int8), intent(in)             :: treeIndex
  logical,                 intent(in)             :: nodePassesFilter
  .
  .
  .
  return
end subroutine Galacticus_Extra_Output_Example
```

The subroutine will be called for each node in each merger tree at each output, and should perform whatever extra output related to `thisNode`. The index of the output and tree are provided as `iOutput` and `treeIndex` for reference, and may be used in organizing output. The `nodePassesFilter` flag will be set to `true` if `thisNode` passed all active output filters (see §16.4.1). If it is `false` then typically no output should occur (although other tasks may still be undertaken).

Merger Tree Output Tasks

Additional outputs for merger trees can be added using three directives: `mergerTreeOutputPropertyCount`, `mergerTreeOutputNames` and `mergerTreeOutputTask`. Each directive should give the name of the subroutine to be called to perform the task and, additionally, a name for sorting (this should be the same for all three directives and ensures that output tasks are always called in the correct order). Templates for these tasks are:

```
!# <mergerTreeOutputNames>
!#  <unitName>Galacticus_Output_Tree_Example_Names</unitName>
!#  <sortName>Galacticus_Output_Tree_Example</sortName>
!# </mergerTreeOutputNames>
subroutine Galacticus_Output_Tree_Example_Names(integerProperty,integerPropertyNames,integerPropertyCo
     &,doubleProperty,doublePropertyNames,doublePropertyComments,doublePropertyUnitsSI,time)
  implicit none
  double precision, intent(in)                  :: time
  integer,          intent(inout)               :: integerProperty,doubleProperty
  character(len=*), intent(inout), dimension(:) :: integerPropertyNames,integerPropertyComments,double
       &,doublePropertyComments
  double precision, intent(inout), dimension(:) :: integerPropertyUnitsSI,doublePropertyUnitsSI
  .
  .
  .
  return
```

```
  end subroutine Galacticus_Output_Tree_Example_Names

  !# <mergerTreeOutputPropertyCount>
  !#  <unitName>Galacticus_Output_Tree_Example_Property_Count</unitName>
  !#  <sortName>Galacticus_Output_Tree_Example</sortName>
  !# </mergerTreeOutputPropertyCount>
  subroutine Galacticus_Output_Tree_Example_Property_Count(integerPropertyCount,doublePropertyCount)
    implicit none
    integer, intent(inout) :: integerPropertyCount,doublePropertyCount
    .
    .
    .
    return
  end subroutine Galacticus_Output_Tree_Example_Property_Count

  !# <mergerTreeOutputTask>
  !#  <unitName>Galacticus_Output_Tree_Example</unitName>
  !#  <sortName>Galacticus_Output_Tree_Example</sortName>
  !# </mergerTreeOutputTask>
  subroutine Galacticus_Output_Tree_Example(thisNode,integerProperty,integerBufferCount,integerBuffer,do
       &,doubleBufferCount,doubleBuffer)
    implicit none
    type(treeNode),          intent(inout), pointer :: thisNode
    integer,                 intent(inout)          :: integerProperty,integerBufferCount,doubleProperty
    integer(kind=kind_int8), intent(inout)          :: integerBuffer(:,:)
    double precision,        intent(inout)          :: doubleBuffer(:,:)
    .
    .
    .
    return
  end subroutine Galacticus_Output_Tree_Example
```

The `mergerTreeOutputPropertyCount` subroutine must simply increment `integerPropertyCount` and `doublePropertyCount` by the number of integer and double precision properties that will be output respectively. The `mergerTreeOutputNames` subroutine must store the dataset names, comments and units in the SI system[8] for each integer and double precision property in the supplied arrays. The value of `integerProperty` and `doubleProperty` should be incremented by 1 before each property name/comment is set—these then supply the position within the input arrays in which to store the name. The `mergerTreeOutputTask` subroutine must similarly place the desired property values for `thisNode` into the supplied arrays. The value of `integerProperty` and `doubleProperty` should be incremented by 1 before each property value is set. The value can then be stored in, for example, `integerBuffer(integerBufferCount,integerPrope`

Merger Tree Pre-Construction Tasks

Additional tasks to be performed prior to the construction of each merger tree can be added using the `mergerTreePreTreeConstructionTask` directive. For example, the tree timing task uses this directive as follows:

```
  !# <mergerTreePreTreeConstructionTask>
```

[8] For dimensionless quantities, the units may be set to zero. In such cases, the `unitsInSI` attribute for the dataset will not be written to the Galacticus output file.

```
!#   <unitName>Meta_Tree_Timing_Pre_Construction</unitName>
!# </mergerTreePreTreeConstructionTask>
```

Here, `Meta_Tree_Timing_Pre_Construction` is the name of a subroutine which will be called to perform whatever tasks are required. The subroutine must have the following form:

```
 subroutine Merger_Tree_PreConstruction_Task()
  implicit none
  .
  .
  .
  return
end subroutine Merger_Tree_PreConstruction_Task
```

The subroutine will be called once for each tree, before the tree has been constructed.

Merger Tree Post-Evolution Tasks

Additional tasks to be performed after the evolution (and subsequent destruction) of each merger tree can be added using the `mergerTreePostEvolveTasker` directive. For example, the tree timing task uses this directive as follows:

```
!# <mergerTreePostEvolveTask>
!#   <unitName>Meta_Tree_Timing_Post_Evolve</unitName>
!# </mergerTreePostEvolveTask>
```

Here, `Meta_Tree_Timing_Post_Evolve` is the name of a subroutine which will be called to perform whatever tasks are required. The subroutine must have the following form:

```
 subroutine Merger_Tree_PostEvolution_Task()
  implicit none
  .
  .
  .
  return
end subroutine Merger_Tree_PostEvolution_Task
```

The subroutine will be called once for each tree, after the tree has been evolved and destroyed.

Merger Tree Pre-Evolution Tasks

Additional tasks to be performed on merger trees prior to their evolution can be added using the `mergerTreePreEvolveTask` directive. For example, the mass accretion history task uses this directive as follows:

```
!# <mergerTreePreEvolveTask>
!#   <unitName>Merger_Tree_Mass_Accretion_History_Output</unitName>
!# </mergerTreePreEvolveTask>
```

Here, `Merger_Tree_Mass_Accretion_History_Output` is the name of a subroutine which will be called to perform whatever tasks are required. The subroutine must have the following form:

```
 subroutine Merger_Tree_PreEvolution_Task(thisTree)
  implicit none
  type(mergerTree), intent(in) :: thisTree
  .
  .
  .
  return
end subroutine Merger_Tree_PreEvolution_Task
```

where `thisTree` is the tree to be processed. The function will be called once for each tree, prior to the tree being evolved. Note that `thisTree` may link to other trees via its `nextTree` pointer. The function may want to process each tree in this linked list.

Merger Tree Initialization Tasks

Additional tasks to be performed during merger tree initialization can be added using the `mergerTreeInitializeTask` directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the `standard` basic component method uses this directive as follows:

```
!# <satelliteMergerTask>
!#  <unitName>Halo_Mass_Accretion_Rate</unitName>
!# </satelliteMergerTask>
```

Here, `Halo_Mass_Accretion_Rate` is the name of a subroutine which will be called to perform whatever tasks are required as a result of the merger. The subroutine must have the following form:

```
 subroutine Merger_Tree_Initialize_Task(thisNode)
  implicit none
  type(treeNode), pointer, intent(inout) :: thisNode
  .
  .
  .
  return
end subroutine Merger_Tree_Initialize_Task
```

where `thisNode` is the node to be initialized. The subroutine will be called once for each node in the tree.

Merger Tree Structure Output Tasks

Additional outputs for merger tree structure output can be added using the `mergerTreeStructureOutputTask`. The directive should give the name of the subroutine to be called to perform the task. The templates for this tasks is:

```
!# <mergerTreeStructureOutputTask>
!#  <unitName>Structure_Output_Task</unitName>
!# </mergerTreeStructureOutputTask>
subroutine Structure_Output_Task(baseNode,nodeProperty,treeGroup)
  implicit none
  type(treeNode),   intent(in),    pointer      :: baseNode
  double precision, intent(inout), dimension(:) :: nodeProperty
  type(hdf5Object), intent(inout)               :: treeGroup
  .
```

```
    .
    .
    return
  end subroutine Structure_Output_Task
```

The subroutine must walk the merger tree beginning from the given `baseNode` and store each property to output in the given `nodeProperty` array. Once populated, this array can be written to the appropriate HDF5 group, given by `treeGroup`, in the GALACTICUS output file.

Node Dump

The function `Node_Dump(thisNode)` writes out all properties of a node to the display. To have their properties listed, each component must register a task using:

```
!# <nodeDumpTask>
!#  <unitName>Node_Dump_Procedure</unitName>
!# </nodeDumpTask>
```

where `Node_Dump_Procedure` is the name of a subroutine with the following template

```
 subroutine Node_Dump_Procedure(thisNode)
    type(treeNode),   intent(inout), pointer :: thisNode
    .
    .
    .
    return
 end subroutine Node_Dump_Procedure
```

If the node contains an active component, this subroutine should display all relevant properties of the component. If not, it can display a short message indicating that fact.

Output Group Output Tasks

Extra outputs for output groups (i.e. the groups which hold all merger tree data for a given output time) can be added using the directive: `outputGroupOutputTask`. The directive should give the name of the subroutine to be called to perform the task. A template for this task is:

```
  !# <outputGroupOutputTask>
  !#  <unitName>Galacticus_Output_Group_Output_Example</unitName>
  !# </outputGroupOutputTask>
  subroutine Galacticus_Output_Group_Output_Example(outputGroup,time)
    implicit none
    type(hdf5Object), intent(inout) :: outputGroup
    double precision, intent(in)    :: time
    .
    .
    .
    return
  end subroutine Galacticus_Output_Group_Output_Example
```

The subroutine will be called for each output group created, and should perform whatever extra output it requires. The `outputGroup` object and the corresponding output `time` are provided as input parameters.

Post-evolve Tasks

Additional methods for post-evolve tasks (i.e. things that should be done after each node is evolved differentially to the next output time, interrupt, or event) can be added using the `postEvolveTask` directive. The directive should contain a single argument, giving the name of a subroutine to be called to perform the task. For example, the standard hot halo component adds a task as follows:

```
!# <postEvolveTask>
!#  <unitName>Tree_Node_Hot_Halo_Postevolve_Standard</unitName>
!# </postEvolveTask>
```

Here, `Tree_Node_Hot_Halo_Postevolve_Standard` is the name of a subroutine which will be called to perform whatever tasks are required. The subroutine must have the following form:

```
 subroutine Post_Evolve_Task(node)
  implicit none
  type(treeNode), intent(inout) :: node
  .
  .
  .
  return
end subroutine Post_Evolve_Task
```

where `node` is the node for which tasks will be performed. Tasks typically involve cleaning up after differential evolution.

Post-step Tasks

Additional methods for post-step tasks (i.e. things that should be done after each ODE solver step when evoling a node differentially) can be added using the `postStepTask` directive. The directive should contain a single argument, giving the name of a subroutine to be called to perform the task. For example, the standard hot halo component adds a task as follows:

```
!# <postStepTask>
!#  <unitName>Tree_Node_Hot_Halo_Poststep_Standard</unitName>
!# </postStepTask>
```

Here, `Tree_Node_Hot_Halo_Poststep_Standard` is the name of a subroutine which will be called to perform whatever tasks are required. The subroutine must have the following form:

```
 subroutine Post_Step_Task(node,status)
  implicit none
  type   (treeNode), intent(inout) :: node
  integer          , intent(inout) :: status
  .
  .
  .
  return
end subroutine Post_Step_Task
```

where `node` is the node for which tasks should be performed. If any change is made to the state of the node then `status` should be set equal to `FGSL_Failure`. Tasks typically involve cleaning up after differential evolution.

Pre-derivative Tasks

Additional methods for pre-derivative tasks (i.e. things that should be done just prior to the computation of derivatives or properties for a node) can be added using the `preDerivativeTask` directive. The directive should contain a single argument, giving the name of a subroutine to be called to perform the task. For example, the standard hot halo component adds a task as follows:

```
!# <preDerivativeTask>
!#  <unitName>Tree_Node_Hot_Halo_Prederivative_Standard</unitName>
!# </preDerivativeTask>
```

Here, `Tree_Node_Hot_Halo_Prederivative_Standard` is the name of a subroutine which will be called to perform whatever tasks are required. The subroutine must have the following form:

```
 subroutine Prederivative_Task(thisNode)
  implicit none
  type(treeNode), pointer, intent(inout) :: thisNode
  .
  .
  .
  return
end subroutine Prederivative_Task
```

where `thisNode` is the node for which derivatives will be computed. Tasks typically involve precomputing quantities that will be used in finding the derivatives.

Radius Solver Tasks

Galactic radii solver functions (see §16.4.1) need to be able to interact with the components of a tree node to

1. Determine which components want a radius to be solved for;
2. Get and set the properties of those components.

The `radiusSolverPlausibility` and `radiusSolverTask` directives facilitate this. A component which has a radius to be solved for should include directives of the form:

```
!# <radiusSolverTask>
!#  <unitName>Component_Radius_Solver_Plausibility</unitName>
!# </radiusSolverTask>
```

and

```
!# <radiusSolverTask>
!#  <unitName>Component_Radius_Solver</unitName>
!# </radiusSolverTask>
```

where `Component_Radius_Solver_Plausibility` is the name of a subroutine which will specify whether or not the component is physically plausible for radius solving (e.g. has non-negative mass) and should have the following form:

```
subroutine Component_Radius_Solver_Plausibility(thisNode,galaxyIsPhysicallyPlausible)
   implicit none
   type(treeNode), pointer, intent(inout) :: thisNode
```

```
   logical,                intent(inout) :: galaxyIsPhysicallyPlausible
   .
   .
   .
   return
end subroutine Component_Radius_Solver_Plausibility
```

which should set `galaxyIsPhysicallyPlausible` to false if the component is not physically plausible, but should otherwise leave `galaxyIsPhysicallyPlausible` unchanged. Additionally, `Component_Radius_Solver` is the name of a subroutine which will supply the necessary information about the node, and which should have the following form:

```
subroutine Component_Radius_Solver(thisNode,componentActive,specificAngularMomentum,Radius_Get,Radius_S
   implicit none
   type(treeNode),   pointer, intent(inout) :: thisNode
   logical,                   intent(out)   :: componentActive
   double precision,          intent(out)   :: specificAngularMomentum
   procedure(),      pointer, intent(out)   :: Radius_Get,Velocity_Get
   procedure(),      pointer, intent(out)   :: Radius_Set,Velocity_Set
   .
   .
   .
   return
end subroutine Component_Radius_Solver
```

When called, the subroutine should set `componentActive` to indicate whether or not this nod contains an active component of the type. If it does, it should also set `specificAngularMomentum` to reflect the specific angular momentum (in km s^{-1} Mpc) of the component (at whatever point in its profile the radius is required) and should point the four procedure pointers to routines which get and set the radius and circular velocity properties of the component (which should have the standard form for component get and set methods). It is acceptable for the set procedures to point to dummy routines.

The galactic structure radii solver routines will use this information to determine (and set) the radius and circular velocity of the component. An advantage of this approach is that different radii solver methods can all use this same system, ensuring that just a single interface is needed in each component.

Satellite Host Change Tasks

Additional methods for satellite host change events (i.e. when a satellite node moves to a new host) can be added using the `satelliteHostChangeTask` directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the `simple` satellite orbits components uses this directive as follows:

```
!# <satelliteHostChangeTask>
!#  <unitName>Satellite_Orbit_New_Host</unitName>
!# </satelliteHostChangeTask>
```

Here, `Satellite_Orbit_New_Host` is the name of a subroutine which will be called to perform whatever tasks are required as a result of the host change. The subroutine must have the following form:

```
subroutine New_Host_Task(thisNode)
 implicit none
 type(treeNode), pointer, intent(inout) :: thisNode
```

```
    .
    .
    .
    return
  end subroutine New_Host_Task
```

where `thisNode` is the node which has changed host (the new host halo is `thisNode%parentNode`).

Satellite Merger Tasks

Additional methods for satellite merger tasks can be added using the `satelliteMergerTask` directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the `simple` satellite orbits components uses this directive as follows:

```
!# <satelliteMergerTask>
!#  <unitName>Satellite_Merger_Task</unitName>
!# </satelliteMergerTask>
```

Here, `Satellite_Merger_Task` is the name of a subroutine which will be called to perform whatever tasks are required as a result of the merger. The subroutine must have the following form:

```
  subroutine Satellite_Merger_Task(thisNode)
   implicit none
   type(treeNode), pointer, intent(inout) :: thisNode
   .
   .
   .
   return
  end subroutine Satellite_Merger_Task
```

where `thisNode` is the node about to merge with `thisNode%parentNode`.

Star Formation History Tasks

Additional methods for star formation history tracking can be added using the `starFormationHistoriesMethod` directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the `metallicitySplit` method uses this directive as follows:

```
!# <starFormationHistoriesMethod>
!#  <unitName>Star_Formation_Histories_Metallicity_Split_Initialize</unitName>
!# </starFormationHistoriesMethod>
```

Here, `Star_Formation_Histories_Metallicity_Split_Initialize` is the name of a subroutine which will be called to initialize the method. The subroutine must have the following form:

```
  subroutine Method_Initialize( starFormationHistoriesMethod     &
       &                       ,Star_Formation_History_Create_Do &
       &                       ,Star_Formation_History_Scales_Do &
       &                       ,Star_Formation_History_Record_Do &
       &                       ,Star_Formation_History_Output_Do &
       &                      )
    implicit none
    type(varying_string),          intent(in)    ::  starFormationHistoriesMethod
```

```
   procedure(),          pointer, intent(inout) ::  Star_Formation_History_Create_Do &
      &                                            ,Star_Formation_History_Scales_Do &
      &                                            ,Star_Formation_History_Record_Do &
      &                                            ,Star_Formation_History_Output_Do

   if (starFormationHistoriesMethod == 'myMethod') then
      Star_Formation_History_Create_Do => My_Create
      Star_Formation_History_Scales_Do => My_Scales
      Star_Formation_History_Record_Do => My_Record
      Star_Formation_History_Output_Do => My_Output
   end if
   return
 end subroutine Method_Initialize
```

where `myMethod` is the name of this method as will be specified by the `starFormationHistoriesMethod` input parameter. The procedure pointers must be set to point to subroutines which perform the functions described below. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The `Star_Formation_History_Create_Do` subroutine must have the form:

```
 subroutine My_Create(thisNode,thisHistory)
   implicit none
   type(treeNode), intent(inout), pointer :: thisNode
   type(history),   ntent(inout)          :: thisHistory
   return
 end subroutine My_Create
```

and should return a history object in `thisHistory` suitable for holding a star formation history for `thisNode`.

The `Star_Formation_History_Scales_Do` subroutine must have the form:

```
 subroutine My_Scales(thisHistory,stellarMass,stellarAbundances)
   implicit none
   double precision,          intent(in)    :: stellarMass
   type(abundancesStructure), intent(in)    :: stellarAbundances
   type(history),             intent(inout) :: thisHistory
   return
 end subroutine My_Scales
```

and should set the ODE solver error tolerance scales in `thisHistory`, using the provided information on `stellarMass` and `stellarAbundances` if required.

The `Star_Formation_History_Record_Do` subroutine must have the form:

```
 subroutine My_Record(thisNode,thisHistory,fuelAbundances,starFormationRate)
   implicit none
   type(treeNode),            intent(inout), pointer :: thisNode
   type(history),             intent(inout)          :: thisHistory
   type(abundancesStructure), intent(in)             :: fuelAbundances
   double precision,          intent(in)             :: starFormationRate
   return
 end subroutine My_Record
```

and should record the contribution to the star formation history in `thisHistory` for `thisNode` given the current `starFormationRate` and star formation `fuelAbundances`. That is, the subroutine should adjust the rates in `thisHistory` appropriately.

The `Star_Formation_History_Output_Do` subroutine must have the form:

```
subroutine My_Output(thisNode,thisHistory,iOutput,treeIndex,componentLabel)
  implicit none
  type(treeNode),          intent(inout), pointer :: thisNode
  type(history),           intent(inout)          :: thisHistory
  integer,                 intent(in)             :: iOutput
  integer(kind=kind_int8), intent(in)             :: treeIndex
  character(len=*),        intent(in)             :: componentLabel
  return
end subroutine My_Output
```

and should write the star formation history, `thisHistory`, for `thisNode` to the output file. The output number and tree index are provided as `iOutput` and `treeIndex` for reference, and `componentLabel` provides a suitable label for the component to which the history belongs (and so should be used in the name of the datasets to which the history is written for example).

Conventionally, star formation histories are output as follows:

```
HDF5 "galacticus.hdf5" {
GROUP "starFormationHistories" {
   COMMENT "Star formation history data."
   GROUP "Output1" {
      COMMENT "Star formation histories for all trees at each out"
      GROUP "mergerTree1" {
         COMMENT "Star formation histories for each tree."
         DATASET "diskSFH<nodeID>" {
         COMMENT "Star formation history stellar masses of the disk "
            DATATYPE  H5T_IEEE_F64LE
            DATASPACE  SIMPLE { }
         }
         DATASET "diskTime<nodeID>" {
         COMMENT "Star formation history times of the disk component"
            DATATYPE  H5T_IEEE_F64LE
            DATASPACE  SIMPLE { }
         }
         DATASET "spheroidSFH<nodeID>" {
         COMMENT "Star formation history stellar masses of the spher"
            DATATYPE  H5T_IEEE_F64LE
            DATASPACE  SIMPLE { }
         }
         DATASET "spheroidTime<nodeID>" {
         COMMENT "Star formation history times of the spheroid compo"
            DATATYPE  H5T_IEEE_F64LE
            DATASPACE  SIMPLE { }
         }
      }
      GROUP "mergerTree2" {
      .
```

```
      .
      .
      }
   }
   GROUP "Output1" {
   .
   .
   .
   }
}
}
```

where `nodeID` is the index of the relevant node. The specifics of each dataset will depend on the selected star formation history method.

Currently defined star formation history methods are:

`metallicitySplit` The star formation history is tabulated on a grid of time and metallicity. The binning in time is chosen such that bins are at most of size `[starFormationHistoryTimeStep]` between the time at which each galaxy formed and the final output time, and at most of size `[starFormationHistoryFineTimeStep]` in the period `[starFormationHistoryFineTime]` prior to each output time (all times specified in Gyr). The allows fine binning of recent star formation just prior to each output. Usually, the metallicity binning is arranged logarithmically in metallicity with `[starFormationHistoryMetallicityCount]` bins between `[starFormationHistoryMetallicityMinimum]` and `[starFormationHistoryMetallicityMaximum]` (specified in Solar units). Note that the metallicity associated with each bin is the minimum metallicity for that bin (the maximum being the metallicity value associated with the next bin, except for the final bin which extends to infinite metallicity). If `[starFormationHistoryMetallicityCount]`$= 0$ is set, then the star formation history is not split by metallicity (i.e. a single metallicity bin encompassing all metallicities from zero to infinity is used). Alternatively, specific metallicity bin boundaries can be set via the `[starFormationHistoryMetallicityBoundaries]` parameter—a final boundary corresponding to infinity is always added automatically. Output follows the conventional format, with 2D star formation history datasets to represent the history as a function of time and metallicity. An additional `metallicities` dataset is added to the `starFormationHistories` output group to record the metallicity binning as follows:

```
DATASET "metallicities" {
 COMMENT "Metallicities at which star formation histories are tabulated"
   DATATYPE  H5T_IEEE_F64LE
   DATASPACE  SIMPLE { ( [starFormationHistoryMetallicityCount] ) / ( [starFormationHistoryMetallic
}
```

`inSitu` The star formation history is tabulated on a grid of time and is split between in-situ and accreted star formation. The time grid is the same as (and controlled by the same parameters) are for the `metallicitySplit` method. Output follows the conventional format, with 2D star formation history datasets to represent the history as a function of time and origin. The first element in the origin dimension records in-situ star formation, while the second element records total star formation.

16.5. Subsystems

This section describes some of the subsystems within Galacticus that support various physical entities or processes.

16.5.1. Kepler Orbits

The `keplerOrbit` object (provided by the `Kepler_Orbits_Structure` module) stores the parameters of a single Keplerian orbit. It internally handles computation of additional/alternate orbital parameters once an orbit has been fully defined. Currently, the orientation of orbits (i.e. the unit vector normal to the orbital plane and the argument of periapsis) is not tracked. As such, orbits are fully defined by three parameters (in addition to the masses of the orbitting bodies). The following limitations presently apply to the `keplerOrbit` object:

- If an orbit is overdefined (i.e. if more than three parameters are set manually) no checking is performed to ensure that the parameters are consistent with a Keplerian orbit;
- Not all interconversions between parameters are supported[9]. If a conversion cannot be performed, an error message will be given.

A `keplerOrbit` object can be reset by calling the `reset()` method, and its defined/undefined status can be tested with the `isDefined()` method or asserted with the `assertIsDefined()` method. The following orbital parameters are supported, each method returning the value of the parameter and a corresponding method suffixed with `Set` can be used to set the parameter: `radius`, `velocityRadial`, `velocityTengentail`, `energy`, `angularMomentum`, `eccentricity`, `semiMajorAxis`, `radiusPericenter`, `radiusApocenter`. Additionally, the masses of the orbitting bodies are provided by the `hostMass()` and `reducedMassSpecific()`$= M_{\rm host}/(M_{\rm host}+M_{\rm satellite})$ methods. Finally, the `velocityScale()` method returns $GM_{\rm host}/r$ where r is the radius of the orbit.

16.5.2. Chemicals

The chemicals subsystem provides both a interface to a database of known chemicals (allowing their physical properties to be queried) and a structure to store abundances/masses/etc. of the set of chemicals being tracked in Galacticus. The name "chemicals" is used to denote any chemical species that might be involved in reactions, including molecules, atoms, atomic and molecular ions and electrons.

Chemical Database

The file `data/Chemical_Database.cml` contains a database of chemicals that can currently be used by Galacticus. It uses a simplified version of the Chemical Markup Language to describe chemicals. An excerpt from the database is shown below:

```
<list>
 <chemical>
  <id>MolecularHydrogenAnion</id>
  <formalCharge>-1</formalCharge>
  <atomArray>
    <atom>
     <id>1</id>
     <elementType>H</elementType>
    </atom>
    <atom>
     <id>2</id>
     <elementType>H</elementType>
```

[9] The `keplerOrbit` object works by trying to convert to the combination radius, radial and tengential velocities. Once these are defined, all other parameters can be computed. However, for orbits defined in terms of other parameters, the `keplerOrbit` object does not know how to convert from every such combination of parameters.

```
    </atom>
   </atomArray>
   <bondArray>
    <bond>
     <atomRefs2>1 2</atomRefs2>
     <order>1</order>
    </bond>
   </bondArray>
  </chemical>
  .
  .
  .
 </list>
```

The database contains a `list` of chemicals, each contained within a `chemical` element. The `id` element provides a label for the chemical (usually a descriptive name with no white space). The `formalCharge` element gives the charge of the chemical in units of the elementary charge. The chemical is then describe by a list of atoms and bonds inside `atomArray` and `bondArray` elements respectively. The `atomArray` can contain any number of `atom` elements, which should describe each atom in the chemical giving it a unique `id` number and an `elementType`, which is the short one or two letter label for the element (e.g. H, Ni, etc.). The `bondArray` should contain a `bond` entry for each atomic bond, which itself contains a `atomRefs2` element giving the IDs of the two atoms participating in the bond and an `order` element which gives the order of the bond (e.g. "1" for a single bond).

Chemical Structure

Within Galacticus a chemical is represeted using the `chemicalStructure` type which is provided by the `Chemical_Structures` module. A `chemicalStructure` object can be assigned a particular chemical by retrieving that chemical from the database using:

```
call myChemical%retrieve("chemicalID")
```

where `chemicalID` is the ID of the chemical in the databse. Any chemical can be exported to a CML file using

```
call myChemical%export(fileName)
```

where `fileName` gives the name of the file to which to export.

Once assigned a chemical, basic properties such as mass and charge (in atomic units) can be accessed using `myChemical%mass` and `myChemical%charge` respectively. The mass is computed from the known atomic masses of the constituent atoms of the chemical.

Chemical Abundances

Within Galacticus a set of abundances (or masses, or densities...) for all chemicals being tracked, as specified by the `[chemicalsToTrack]` input parameter, is stored within a `chemicalAbundancesStructure` type, as provided by the `Chemical_Abundances_Structure` module. The structure provides interfaces for setting and retrieving the abundance of a given chemical species, to pack/unpack all chemicals to/from an array, to convert from mass-weighted to number-weigted quantities and to multiplty and divide the chemicals abundances by a given amount. Additionally, the `Chemical_Abundances_Structure` module provides functions which provide a count of the number of chemicals tracked, to look up the index of a chemical array represetation from its name, and to retrieve the name of a given chemical.

16.5.3. Radiation

This subsystem handles radiation fields, providing convenient means to communicate radiation fields from one part of the Galacticus code to another. A radiation object can hold multiple different types of radiation field (e.g. it could contain both the cosmic microwave background and an interstellar radiation field localized to a specific galaxy).

Radiation Structure

Within Galacticus radiation fields are represented by the `radiationStructure` type which is provided by the `Radiation_Structures` module. A `radiationStructure` object must first be defined using:

```
call myRadiation%define([radiationType1,radiationType2])
```

where the list of `radiationTypes` specifies what radiation components will be present in this radiation object. Currently defined radiation types are:

`CMB` The cosmic microwave background;

`Null` A null (zero radiation) component.

For example,

```
call myRadiation%define([radiationTypeCMB])
```

will define the `myRadiation` object to contain just the cosmic microwave background.

Once defined, the specific radiation field can be set using:

```
call myRadiation%set(thisNode)
```

This will cause all components to set their radiation fields using (if necessary) the properties of `thisNode`. Radiation objects can be queried using the following methods:

`temperature(radiationTypes)` Returns the temperature (in Kelvin) of the radiation object. The optional `radiationTypes` array specifies which radiation types are to be queried.

`flux(wavelength,radiationTypes)` Returns the flux (in ergs cm^2 s^{-1} Hz^{-1} ster^{-1}) of the radiation object at the given `wavelength` (specified in units of Å). The optional `radiationTypes` array specifies which radiation types are to be queried.

16.5.4. Coordinates

The `coordinate` class, provided by the `Coordinates` module provides an object describing a position in three-dimensional space. Each extension of this class (currently, `coordinateCartesian`, `coordinateCylindrical`, and `coordinateSpherical`) supply methods to convert to and from Cartesian coordinates. The assignment operator (`=`) is overloaded such that coordinate objects of any class can be assigned to any other class and conversion to the appropriate coordinate system will happen automatically. A function accepting a `class(coordinate)` object can therefore convert it to, for example, spherical coordinates simply using

```
class(coordinate         ), intent(in) :: coordinates
type (coordinateSpherical)             :: coordinatesSpherical
coordinatesSpherical=coordinates
```

and thereby allow a position to be passed to it in any coordinate system.

Each extension of the base class also provides methods to get and set the values of each component of the relevant coordinate system (see §15.8.2 for complete details).

17. Auxilliary Methods

17.1. Conditional Stellar Mass Function

Empirical conditional stellar mass functions are used by GALACTICUS in calculations of halo mass function sampling. GALACTICUS implements the following calculations of tree processing times, which can be selected via the `[conditionalStellarMassFunctionMethod]` input parameter.

17.1.1. Behroozi (2010) Method

Currently the only option, and selected using `[conditionalStellarMassFunctionMethod]`=`Behroozi2010`, this method adopts the fitting function of Behroozi et al. [2010]:

$$\langle N_\mathrm{c}(M_\star|M)\rangle \equiv \int_{M_\star}^\infty \phi_\mathrm{c}(M'_\star)\mathrm{d}\ln M'_\star = \frac{1}{2}\left[1-\mathrm{erf}\left(\frac{\log_{10} M_\star - \log_{10} f_\mathrm{SHMR}(M)}{\sqrt{2}\sigma_{\log M_\star}}\right)\right]. \tag{17.1}$$

Here, the function $f_\mathrm{SHMR}(M)$ is the solution of

$$\log_{10} M = \log_{10} M_1 + \beta \log_{10}\left(\frac{M_\star}{M_{\star,0}}\right) + \frac{(M_\star/M_{\star,0})^\delta}{1+(M_\star/M_{\star,0})^{-\gamma}} - 1/2. \tag{17.2}$$

For satellites,

$$\langle N_\mathrm{s}(M_\star|M)\rangle \equiv \int_{M_\star}^\infty \phi_\mathrm{s}(M'_\star)\mathrm{d}\ln M'_\star = \langle N_\mathrm{c}(M_\star|M)\rangle \left(\frac{f^{-1}_\mathrm{SHMR}(M_\star)}{M_\mathrm{sat}}\right)^{\alpha_\mathrm{sat}} \exp\left(-\frac{M_\mathrm{cut}}{f^{-1}_\mathrm{SHMR}(M_\star)}\right), \tag{17.3}$$

where

$$\frac{M_\mathrm{sat}}{10^{12}M_\odot} = B_\mathrm{sat}\left(\frac{f^{-1}_\mathrm{SHMR}(M_\star)}{10^{12}M_\odot}\right)^{\beta_\mathrm{sat}}, \tag{17.4}$$

and

$$\frac{M_\mathrm{cut}}{10^{12}M_\odot} = B_\mathrm{cut}\left(\frac{f^{-1}_\mathrm{SHMR}(M_\star)}{10^{12}M_\odot}\right)^{\beta_\mathrm{cut}}. \tag{17.5}$$

By default, parameter values are taken from the fit of Leauthaud et al. [2011], specifically their `SIG_MOD1` method for their z_1 sample. These default values, and the GALACTICUS input parameters which can be used to adjust them are shown in Table 17.1. This method assumes that $P_\mathrm{s}(N|M_\star,M;\delta\ln M_\star)$ is a Poisson distribution while $P_\mathrm{c}(N|M_\star,M;\delta\ln M_\star)$ has a Bernoulli distribution, with each distribution's free parameter fixed by requiring

$$\phi(M_\star;M)\delta\ln M_\star = \sum_{N=0}^\infty N P(N|M_\star,M;\delta\ln M_\star) \tag{17.6}$$

Table 17.1.: Parameters of the Behroozi et al. [2010] conditional stellar mass function model, along with their default values and the corresponding Galacticus input parameters.

Parameter	Default	Galacticus name
$\alpha_{\rm sat}$	1.0	[conditionalStellarMassFunctionBehrooziAlphaSatellite]
$\log_{10} M_1$	12.520	[conditionalStellarMassFunctionBehrooziLog10M1]
$\log_{10} M_{\star,0}$	10.916	[conditionalStellarMassFunctionBehrooziLog10Mstar0]
β	0.457	[conditionalStellarMassFunctionBehrooziBeta]
δ	0.5666	[conditionalStellarMassFunctionBehrooziDelta]
γ	1.53	[conditionalStellarMassFunctionBehrooziGamma]
$\sigma_{\log M_\star}$	0.206	[conditionalStellarMassFunctionBehrooziSigmaLogMstar]
$B_{\rm cut}$	1.47	[conditionalStellarMassFunctionBehrooziBCut]
$B_{\rm sat}$	10.62	[conditionalStellarMassFunctionBehrooziBSatellite]
$\beta_{\rm cut}$	-0.13	[conditionalStellarMassFunctionBehrooziBetaCut]
$\beta_{\rm sat}$	0.859	[conditionalStellarMassFunctionBehrooziBetaCut]

17.2. Tree Timing

Estimates of the time taken to process a merger tree are used in some halo sampling rate functions and may in future be used in load balancing algorithms. Galacticus implements the following calculations of tree processing times, which can be selected via the `[timePerTreeMethod]` input parameter.

17.2.1. File Method

Currently the only option, and selected using `[timePerTreeMethod]=file`, this method assumes that the time taken to process a tree is given by

$$\log_{10}[\tau_{\rm tree}(M)] = \sum_{i=0}^{2} C_i (\log_{10} M)^i, \tag{17.7}$$

where M is the root mass of the tree and the coefficients C_i are read from a file, the name of which is specified via the `[timePerTreeFitFileName]` parameter. This file should be an XML document with the structure:

```
<timing>
 <fit>
   <coefficient>-0.73</coefficient>
   <coefficient>-0.20</coefficient>
   <coefficient>0.03</coefficient>
 </fit>
</timing>
```

where the array of coefficients give the values C_0, C_1 and C_2.

Note that, if Galacticus is run with `[metaCollectTimingData]=true`, then it will output measures of tree processing time to the output file (see §4.3.1). The analysis script `scripts/analysis/treeTiming.pl` can be used to extract tree timing data from such an output file and output fitting coefficients in the above format. It is used as follows:

```
treeTiming.pl <modelFile> [options.....]
```

where `<modelFile>` is the name of the GALACTICUS output file to analyze. The following options can be specified:

`accumulate` If present, this argument will cause new timing data from the `<modelFile>` is be accumulated with any timing data already present in the output file (which must be specified in this case). The fit is recomputed from the totallity of the accumulated data;

`outputFile` If present, the timing data for individual trees together with the fitting coefficiencts will be output to the specified file;

`maxPoints` When accumulating trees to the output file, this paramter, if present, will limit the number of trees stored in the file to the given value. The oldest trees added to the file will be dropped first;

`plotFile` If present, a plot of the tree timing as a function of halo mass, together with the fitting function, will be output to the specified file.

Note that the output file will contain both the fitting coefficients in the format described above and, additionally, a list of tree root masses and processing times (necessary if you later want to append trees from another run to this file).

18. Source Code Documentation

file: work/build/objects.nodes.components.Inc
Description: Auto-generated file describing the hierarchy of node and component objects.
Code lines: N/A
Contained by: file accretion.Bondi_Hoyle_Lyttleton.F90

file: XRay_Absorption_ISM_Wilms2000.F90
Description: Contains a program which wraps the dotbvabs function (which implements the model of Wilms et al. 2000) from XSpec to produce a table of X-ray absorption cross-sections in the ISM. This program assumes that various files from XSpec have been downloaded into the aux/XSpec folder—usually this program will be run automatically as needed by the Galacticus::ISMCrossSections module.
Code lines: 167

function: fgabnd
Description: Function to return the abundance (relative to hydrogen) of elements. Required by dotbvabs.
Code lines: 28
Contained by: file XRay_Absorption_ISM_Wilms2000.F90

Modules used: galacticus_error

subroutine: xermsg
Description: Error message function required by dotbvabs.
Code lines: 12

file: accretion.halo.Naoz_Barkana_2007.F90
Description: An implementation of accretion from the IGM onto halos using filtering mass of the IGM calculated from an equation from Naoz and Barkana [2007].
Code lines: 390
Modules used: intergalactic_medium_filtering_masses

interface: accretionhalonaozbarkana2007
Description: Constructors for the naozBarkana2007 halo accretion class.
Code lines: 4
Contained by: file accretion.halo.Naoz_Barkana_2007.F90

function: naozbarkana2007accretedmass
Description: Computes the mass of baryons accreted into node.
Code lines: 20
Contained by: file accretion.halo.Naoz_Barkana_2007.F90
Modules used: galacticus_nodes

function: naozbarkana2007accretionrate
Description: Computes the baryonic accretion rate onto node.
Code lines: 36
Contained by: file accretion.halo.Naoz_Barkana_2007.F90
Modules used: galacticus_nodes

subroutine: naozbarkana2007autohook
Description: Attach to the calculation reset event.
Code lines: 8
Contained by: file accretion.halo.Naoz_Barkana_2007.F90
Modules used: events_hooks

function: naozbarkana2007branchhasbaryons
Description: Returns true if this branch can accrete any baryons.
Code lines: 24
Contained by: file accretion.halo.Naoz_Barkana_2007.F90
Modules used: galacticus_nodes merger_tree_walkers

subroutine: naozbarkana2007calculationreset
Description: Reset the accretion rate calculation.
Code lines: 10
Contained by: file accretion.halo.Naoz_Barkana_2007.F90

function: naozbarkana2007constructorinternal
Description: Internal constructor for the naozBarkana2007 halo accretion class.
Code lines: 19
Contained by: file accretion.halo.Naoz_Barkana_2007.F90
Modules used: atomic_data galacticus_error

function: naozbarkana2007constructorparameters
Description: Constructor for the naozBarkana2007 halo accretion class which takes a parameter set as input.
Code lines: 29
Contained by: file accretion.halo.Naoz_Barkana_2007.F90
Modules used: input_parameters

subroutine: naozbarkana2007destructor
Description: Destructor for the naozBarkana2007 halo accretion class.
Code lines: 9
Contained by: file accretion.halo.Naoz_Barkana_2007.F90
Modules used: events_hooks

function: naozbarkana2007failedaccretedmass
Description: Computes the mass of baryons accreted into node.
Code lines: 20
Contained by: file accretion.halo.Naoz_Barkana_2007.F90
Modules used: galacticus_nodes

function: naozbarkana2007failedaccretionrate
Description: Computes the baryonic accretion rate onto node.
Code lines: 36
Contained by: file accretion.halo.Naoz_Barkana_2007.F90
Modules used: accretion_halo_totals galacticus_nodes

function: naozbarkana2007filteredfraction
Description: Returns the baryonic mass fraction in a halo after the effects of the filtering mass.
Code lines: 25
Contained by: file accretion.halo.Naoz_Barkana_2007.F90
Modules used: dark_matter_profile_mass_definitions galacticus_nodes

function: naozbarkana2007filteredfractioncompute
Description: Compute the filtered fraction.
Code lines: 9
Contained by: file accretion.halo.Naoz_Barkana_2007.F90

function: naozbarkana2007filteredfractionrate
Description: Returns the baryonic mass accretion rate fraction in a halo after the effects of the filtering mass.

Modules used: dark_matter_profile_mass_definitions galacticus_nodes math_exponentiation

file: `accretion.halo.cold_mode.F90`
Description: An implementation of accretion from the IGM onto halos using simple truncation to mimic the effects of reionization and accounting for cold mode accretion.
Code lines: 406
Modules used: `cooling_functions` `kind_numbers`

interface: `accretionhalocoldmode`
Description: Constructors for the `coldMode` halo accretion class.
Code lines: 4
Contained by: file `accretion.halo.cold_mode.F90`

function: `coldmodeaccretedmass`
Description: Computes the mass of baryons accreted into `node`.
Code lines: 9
Contained by: file `accretion.halo.cold_mode.F90`

function: `coldmodeaccretedmasschemicals`
Description: Computes the mass of chemicals accreted (in $M_\odot$) onto `node` from the intergalactic medium.
Code lines: 19
Contained by: file `accretion.halo.cold_mode.F90`
Modules used: `chemical_abundances_structure`

function: `coldmodeaccretedmassmetals`
Description: Computes the mass of abundances accreted (in $M_\odot$) onto `node` from the intergalactic medium.
Code lines: 10
Contained by: file `accretion.halo.cold_mode.F90`

function: `coldmodeaccretionrate`
Description: Computes the baryonic accretion rate onto `node`.
Code lines: 9
Contained by: file `accretion.halo.cold_mode.F90`

function: `coldmodeaccretionratechemicals`
Description: Computes the rate of mass of chemicals accretion (in $M_\odot$/Gyr) onto `node` from the intergalactic medium. Assumes a primordial mixture of hydrogen and helium and that accreted material is in collisional ionization equilibrium at the virial temperature.
Code lines: 21
Contained by: file `accretion.halo.cold_mode.F90`
Modules used: `chemical_abundances_structure`

function: `coldmodeaccretionratemetals`
Description: Computes the rate of mass of abundance accretion (in $M_\odot$/Gyr) onto `node` from the intergalactic medium.
Code lines: 10
Contained by: file `accretion.halo.cold_mode.F90`

subroutine: `coldmodeautohook`
Description: Attach to the calculation reset event.
Code lines: 8

Contained by: file accretion.halo.cold_mode.F90
Modules used: events_hooks

subroutine: coldmodecalculationreset
Description: Reset the accretion rate calculation.
Code lines: 9
Contained by: file accretion.halo.cold_mode.F90

function: coldmodechemicalmasses
Description: Compute the masses of chemicals accreted (in $M_\odot$) onto node from the intergalactic medium.
Code lines: 47
Contained by: file accretion.halo.cold_mode.F90
Modules used: abundances_structure, chemical_abundances_structure, chemical_reaction_rates_utilities, galacticus_nodes, numerical_constants_astronomical

function: coldmodecoldmodefraction
Description: Computes the fraction of accretion occuring in the specified mode.
Code lines: 75
Contained by: file accretion.halo.cold_mode.F90
Modules used: abundances_structure, chemical_abundances_structure, chemical_reaction_rates_utilities, galacticus_error, galacticus_nodes, numerical_constants_astronomical, numerical_constants_atomic, numerical_constants_math, numerical_constants_physical, numerical_constants_prefixes, shocks_1d

function: coldmodeconstructorinternal
Description: Internal constructor for the coldMode halo accretion class.
Code lines: 19
Contained by: file accretion.halo.cold_mode.F90

function: coldmodeconstructorparameters
Description: Default constructor for the coldMode halo accretion class.
Code lines: 33
Contained by: file accretion.halo.cold_mode.F90
Modules used: input_parameters

subroutine: coldmodedestructor
Description: Destructor for the coldMode halo accretion class.
Code lines: 9
Contained by: file accretion.halo.cold_mode.F90
Modules used: events_hooks

function: coldmodefailedaccretedmass
Description: Computes the mass of baryons accreted into node.
Code lines: 9
Contained by: file accretion.halo.cold_mode.F90

function: `coldmodefailedaccretionrate`
Description: Computes the baryonic accretion rate onto `node`.
Code lines: 9
Contained by: file `accretion.halo.cold_mode.F90`

file: `accretion.halo.simple.F90`
Description: An implementation of accretion from the IGM onto halos using simple truncation to mimic the effects of reionization.
Code lines: 475
Modules used: `accretion_halo_totals` `chemical_states` `cosmology_functions` `cosmology_parameters` `dark_matter_halo_scales` `intergalactic_medium_state` `radiation_fields`

interface: `accretionhalosimple`
Description: Constructors for the `simple` halo accretion class.
Code lines: 4
Contained by: file `accretion.halo.simple.F90`

function: `simpleaccretedmass`
Description: Computes the mass of baryons accreted into `node`.
Code lines: 18
Contained by: file `accretion.halo.simple.F90`
Modules used: `galacticus_nodes`

function: `simpleaccretedmasschemicals`
Description: Computes the mass of chemicals accreted (in $M_\odot$) onto `node` from the intergalactic medium.
Code lines: 20
Contained by: file `accretion.halo.simple.F90`
Modules used: `chemical_abundances_structure`

function: `simpleaccretedmassmetals`
Description: Computes the mass of abundances accreted (in $M_\odot$) onto `node` from the intergalactic medium.
Code lines: 13
Contained by: file `accretion.halo.simple.F90`
Modules used: `abundances_structure`

function: `simpleaccretionrate`
Description: Computes the baryonic accretion rate onto `node`.
Code lines: 35
Contained by: file `accretion.halo.simple.F90`
Modules used: `galacticus_nodes`

function: `simpleaccretionratechemicals`
Description: Computes the rate of mass of chemicals accretion (in $M_\odot$/Gyr) onto `node` from the intergalactic medium. Assumes a primordial mixture of hydrogen and helium and that accreted material is in collisional ionization equilibrium at the virial temperature.
Code lines: 21
Contained by: file `accretion.halo.simple.F90`

Modules used: chemical_abundances_structure

function: simpleaccretionratemetals
Description: Computes the rate of mass of abundance accretion (in $M_\odot$/Gyr) onto node from the intergalactic medium.
Code lines: 13
Contained by: file accretion.halo.simple.F90
Modules used: abundances_structure

function: simplebranchhasbaryons
Description: Returns true if this branch can accrete any baryons.
Code lines: 18
Contained by: file accretion.halo.simple.F90
Modules used: merger_tree_walkers

function: simplechemicalmasses
Description: Compute the masses of chemicals accreted (in $M_\odot$) onto node from the intergalactic medium.
Code lines: 32
Contained by: file accretion.halo.simple.F90
Modules used: abundances_structure, chemical_abundances_structure, chemical_reaction_rates_utilities, galacticus_nodes, numerical_constants_astronomical

function: simpleconstructorinternal
Description: Internal constructor for the simple halo accretion class.
Code lines: 23
Contained by: file accretion.halo.simple.F90
Modules used: chemical_abundances_structure, galacticus_error, galacticus_nodes

function: simpleconstructorparameters
Description: Default constructor for the simple halo accretion class.
Code lines: 77
Contained by: file accretion.halo.simple.F90
Modules used: galacticus_error, input_parameters

subroutine: simpledestructor
Description: Destructor for the simple halo accretion class.
Code lines: 13
Contained by: file accretion.halo.simple.F90

function: simplefailedaccretedmass
Description: Computes the mass of baryons accreted into node.
Code lines: 18
Contained by: file accretion.halo.simple.F90
Modules used: galacticus_nodes

function: simplefailedaccretionrate
Description: Computes the baryonic accretion rate onto node.

Code lines: 32
Contained by: file accretion.halo.simple.F90
Modules used: galacticus_nodes

function: simplefailedfraction
Description: Returns the fraction of potential accretion onto a halo from the IGM which fails.
Code lines: 15
Contained by: file accretion.halo.simple.F90
Modules used: galacticus_nodes

function: simplevelocityscale
Description: Returns the velocity scale to use for node. Use the virial velocity.
Code lines: 8
Contained by: file accretion.halo.simple.F90

file: accretion.halo.total.Bertschinger.F90
Description: An implementation of the intergalactic medium state class for a simplistic model of instantaneous and full reionization.
Code lines: 78

interface: accretionhalototalbertschinger
Description: Constructors for the bertschinger total halo accretion class.
Code lines: 3
Contained by: file accretion.halo.total.Bertschinger.F90

function: bertschingeraccretedmass
Description: Return the mass accreted onto a halo.
Code lines: 12
Contained by: file accretion.halo.total.Bertschinger.F90
Modules used: galacticus_nodes

function: bertschingeraccretionrate
Description: Return the accretion rate onto a halo.
Code lines: 12
Contained by: file accretion.halo.total.Bertschinger.F90
Modules used: galacticus_nodes

function: bertschingerconstructorparameters
Description: Constructor for the bertschinger total halo accretion state class which takes a parameter set as input.
Code lines: 10
Contained by: file accretion.halo.total.Bertschinger.F90
Modules used: input_parameters

file: accretion.halo.total.F90
Description: Contains a module which provides a class for calculations of the intergalactic medium thermal and ionization state.
Code lines: 47

module: accretion_halo_totals

Description: Provides a class for calculations of the total accretion rate onto halos for use by the halo accretion classes which compute the accretion rates of baryonic material.
Code lines: 25
Contained by: file accretion.halo.total.F90
Modules used: galacticus_nodes
Used by: function naozbarkana2007failedaccretionrate; file accretion.halo.simple.F90; subroutine galacticus_function_classes_destroy; subroutine galacticus_state_retrieve; subroutine galacticus_state_store

file: accretion.halo.total.simple.F90
Description: An implementation of the intergalactic medium state class for a simplistic model of instantaneous and full reionization.
Code lines: 78

interface: accretionhalototalsimple
Description: Constructors for the simple total halo accretion class.
Code lines: 3
Contained by: file accretion.halo.total.simple.F90

function: simpleaccretedmass
Description: Return the mass accreted onto a halo.
Code lines: 12
Contained by: file accretion.halo.total.simple.F90
Modules used: galacticus_nodes

function: simpleaccretionrate
Description: Return the accretion rate onto a halo.
Code lines: 12
Contained by: file accretion.halo.total.simple.F90
Modules used: galacticus_nodes

function: simpleconstructorparameters
Description: Constructor for the simple total halo accretion state class which takes a parameter set as input.
Code lines: 10
Contained by: file accretion.halo.total.simple.F90
Modules used: input_parameters

file: accretion.halo.zero.F90
Description: An implementation of zero accretion from the IGM onto halos.
Code lines: 172

interface: accretionhalozero
Description: Constructors for the zero halo accretion class.
Code lines: 3
Contained by: file accretion.halo.zero.F90

function: `zeroaccretedmass`
Description: Computes the mass of baryons accreted into `node`.
Code lines: 10
Contained by: file `accretion.halo.zero.F90`

function: `zeroaccretedmasschemicals`
Description: Computes the mass of chemicals accreted (in $M_\odot$) onto `node` from the intergalactic medium.
Code lines: 12
Contained by: file `accretion.halo.zero.F90`
Modules used: `chemical_abundances_structure`

function: `zeroaccretedmassmetals`
Description: Computes the mass of abundances accreted (in $M_\odot$) onto `node` from the intergalactic medium.
Code lines: 12
Contained by: file `accretion.halo.zero.F90`
Modules used: `abundances_structure`

function: `zeroaccretionrate`
Description: Computes the baryonic accretion rate onto `node`.
Code lines: 10
Contained by: file `accretion.halo.zero.F90`

function: `zeroaccretionratechemicals`
Description: Computes the rate of mass of chemicals accretion (in $M_\odot$/Gyr) onto `node` from the intergalactic medium.
Code lines: 12
Contained by: file `accretion.halo.zero.F90`
Modules used: `chemical_abundances_structure`

function: `zeroaccretionratemetals`
Description: Computes the rate of mass of abundance accretion (in $M_\odot$/Gyr) onto `node` from the intergalactic medium.
Code lines: 12
Contained by: file `accretion.halo.zero.F90`
Modules used: `abundances_structure`

function: `zerobranchhasbaryons`
Description: Returns true if this branch can accrete any baryons.
Code lines: 9
Contained by: file `accretion.halo.zero.F90`

function: `zeroconstructorparameters`
Description: Constructor for the `zero` halo accretion class which takes a parameter set as input.
Code lines: 10
Contained by: file `accretion.halo.zero.F90`
Modules used: `input_parameters`

function: `zerofailedaccretedmass`

Description: Computes the mass of baryons accreted into `node`.
Code lines: 10
Contained by: file accretion.halo.zero.F90

function: `zerofailedaccretionrate`
Description: Computes the baryonic accretion rate onto `node`.
Code lines: 10
Contained by: file accretion.halo.zero.F90

file: `accretion_disks.ADAF.F90`
Description: Implementation of an ADAF accretion disk.
Code lines: 833
Modules used: tables

interface: `accretiondisksadaf`
Description: Constructors for the ADAF accretion disk class.
Code lines: 4
Contained by: file accretion_disks.ADAF.F90

function: `adafadiabaticindexdefault`
Description: Returns the default adiabatic index in an ADAF give the field enhancement option.
Code lines: 16
Contained by: file accretion_disks.ADAF.F90
Modules used: galacticus_error

function: `adafangularmomentum`
Description: Returns the specific angular momentum of accreted material in the ADAF.
Code lines: 14
Contained by: file accretion_disks.ADAF.F90

function: `adafconstructorinternal`
Description: Internal constructor for the ADAF accretion disk class.
Code lines: 98
Contained by: file accretion_disks.ADAF.F90
Modules used: black_hole_fundamentals, galacticus_error, numerical_constants_physical, table_labels

function: `adafconstructorparameters`
Description: Constructor for the ADAF accretion disk class which takes a parameter set as input.
Code lines: 84
Contained by: file accretion_disks.ADAF.F90
Modules used: input_parameters

subroutine: `adafdestructor`
Description: Destructor for the ADAF accretion disk class.
Code lines: 7
Contained by: file accretion_disks.ADAF.F90

function: `adafefficiencyradiative`
Description: Computes the radiative efficiency for an ADAF.

Code lines: 18
Contained by: file accretion_disks.ADAF.F90
Modules used: galacticus_error

function: adafenthalpy
Description: Returns the relativistic enthalpy of the ADAF.
Code lines: 14
Contained by: file accretion_disks.ADAF.F90

function: adafenthalpyangularmomentumproduct
Description: Return the product of enthalpy and angular momentum for the ADAF.
Code lines: 25
Contained by: file accretion_disks.ADAF.F90
Modules used: black_hole_fundamentals

function: adaffieldenhancement
Description: Returns the field enhancement factor, g, in the ADAF.
Code lines: 24
Contained by: file accretion_disks.ADAF.F90
Modules used: black_hole_fundamentals

function: adaffluidangularvelocity
Description: Returns the angular velocity of the rotating fluid with respect to the local inertial observer (ZAMO).
Code lines: 15
Contained by: file accretion_disks.ADAF.F90
Modules used: black_hole_fundamentals

function: adafgamma
Description: Returns the net relativistic boost factor from the fluid frame of an ADAF to an observer at rest at infinity. The input quantities are in natural units.
Code lines: 15
Contained by: file accretion_disks.ADAF.F90

function: adafgammaazimuthal
Description: Returns the ϕ component relativistic boost factor from the fluid frame of an ADAF to an observer at rest at infinity. The input quantities are in natural units.
Code lines: 16
Contained by: file accretion_disks.ADAF.F90
Modules used: black_hole_fundamentals

function: adafgammaradial
Description: Returns the r component relativistic boost factor from the fluid frame of an ADAF to an observer at rest at infinity. The input quantities are in natural units.
Code lines: 15
Contained by: file accretion_disks.ADAF.F90

function: adafheight
Description: Return the (dimensionless) height in an ADAF at given `radius`, for a black hole of given `spinBlackHole`.

Code lines: 17
Contained by: file accretion_disks.ADAF.F90
Modules used: black_hole_fundamentals

function: adafjetpowerblackhole
Description: Returns the power of the black hole-launched jet from an ADAF.
Code lines: 23
Contained by: file accretion_disks.ADAF.F90
Modules used: black_hole_fundamentals

function: adafjetpowerdisk
Description: Returns the power of the disk-launched jet from an ADAF.
Code lines: 18
Contained by: file accretion_disks.ADAF.F90
Modules used: black_hole_fundamentals

function: adafjetpowerdiskfromblackhole
Description: Returns the power extracted from the black hole by the disk-launched jet from an ADAF.
Code lines: 14
Contained by: file accretion_disks.ADAF.F90

function: adafpowerjet
Description: Computes the jet power of the given black hole in due to accretion from an ADAF disk.
Code lines: 19
Contained by: file accretion_disks.ADAF.F90
Modules used: black_hole_fundamentals numerical_constants_physical

function: adafratespinup
Description: Computes the spin up rate of the black hole in `thisBlackHole` due to accretion from an ADAF. disk.
Code lines: 20
Contained by: file accretion_disks.ADAF.F90

function: adaftemperature
Description: Return the dimensionless temperature of the ADAF
Code lines: 23
Contained by: file accretion_disks.ADAF.F90
Modules used: black_hole_fundamentals

function: adafvelocity
Description: Return the (dimensionless) velocity in an ADAF at given `radius`, for a black hole of given `spinBlackHole`.
Code lines: 29
Contained by: file accretion_disks.ADAF.F90
Modules used: black_hole_fundamentals

function: adafviscosityparameter
Description: Returns the effective value of the α viscosity parameter for an ADAF.
Code lines: 28

Contained by: file accretion_disks.ADAF.F90

file: accretion_disks.Eddington_limited.F90
Description: Implementation of an Eddington-limited accretion disk.
Code lines: 128

interface: accretiondiskseddingtonlimited
Description: Constructors for the Eddington-limited accretion disk class.
Code lines: 4
Contained by: file accretion_disks.Eddington_limited.F90

function: eddingtonlimitedconstructorinternal
Description: Internal constructor for the Eddington-limited accretion disk class.
Code lines: 8
Contained by: file accretion_disks.Eddington_limited.F90

function: eddingtonlimitedconstructorparameters
Description: Constructor for the Eddington-limited accretion disk class which takes a parameter set as input.
Code lines: 28
Contained by: file accretion_disks.Eddington_limited.F90
Modules used: galacticus_error input_parameters

function: eddingtonlimitedefficiencyradiative
Description: Return the radiative efficiency of an Eddington-limited accretion disk.
Code lines: 10
Contained by: file accretion_disks.Eddington_limited.F90

function: eddingtonlimitedpowerjet
Description: Return the jet power of an Eddington-limited accretion disk.
Code lines: 20
Contained by: file accretion_disks.Eddington_limited.F90
Modules used: black_hole_fundamentals numerical_constants_physical

function: eddingtonlimitedratespinup
Description: Computes the spin up rate of the black hole in `thisNode` due to accretion from an Eddington-limited accretion disk. disk. This is always zero, as no physical model is specified for this accretion disk method.
Code lines: 11
Contained by: file accretion_disks.Eddington_limited.F90

file: accretion_disks.F90
Description: Contains a module which provides a class that implements accretion disks.
Code lines: 55

module: accretion_disks
Description: Provides a class that implements accretion disks.
Code lines: 33
Contained by: file accretion_disks.F90

Modules used: galacticus_nodes
Used by: subroutine galacticus_function_classes_destroy; subroutine galacticus_state_retrieve; subroutine galacticus_state_store; module node_component_black_hole_standard; program test_accretion_disks

file: accretion_disks.Shakura_Sunyaev.F90
Description: Implementation of a Shakura and Sunyaev [1973] accretion disk.
Code lines: 122

interface: accretiondiskssshakurasunyaev
Description: Constructors for the Eddington-limited accretion disk class.
Code lines: 3
Contained by: file accretion_disks.Shakura_Sunyaev.F90

function: shakurasunyaevconstructorparameters
Description: Constructor for the Shakura and Sunyaev [1973] accretion disk class which takes a parameter set as input.
Code lines: 10
Contained by: file accretion_disks.Shakura_Sunyaev.F90
Modules used: input_parameters

function: shakurasunyaevefficiencyradiative
Description: Return the radiative efficiency of a Shakura and Sunyaev [1973] accretion disk.
Code lines: 11
Contained by: file accretion_disks.Shakura_Sunyaev.F90
Modules used: black_hole_fundamentals

function: shakurasunyaevpowerjet
Description: Computes the jet power for a Shakura and Sunyaev [1973] (thin) accretion disk, using the expressions from Meier (2001; his equations 4 and 5).
Code lines: 41
Contained by: file accretion_disks.Shakura_Sunyaev.F90
Modules used: black_hole_fundamentals; numerical_constants_astronomical; numerical_constants_physical

function: shakurasunyaevratespinup
Description: Compute the rate of spin up of a black hole by a Shakura and Sunyaev [1973] accretion disk.
Code lines: 13
Contained by: file accretion_disks.Shakura_Sunyaev.F90
Modules used: black_hole_fundamentals

file: accretion_disks.spectra.F90
Description: Contains a module that implements calculations of accretion disk spectra.
Code lines: 41

module: accretion_disk_spectra
Description: Implements calculations of accretion disk spectra.

Code lines: 19
Contained by: file accretion_disks.spectra.F90
Modules used: galacticus_nodes
Used by: subroutine galacticus_function_-classes_destroy; subroutine galacticus_state_retrieve; subroutine galacticus_state_store; file radiation.intergalactic_-background.internal.F90; subroutine agnspectrahopkins2008buildfileperform

file: accretion_disks.spectra.Hopkins2007.F90
Description: An implementation of the accretion disk spectra class using the model of Hopkins et al. [2007].
Code lines: 203
Modules used: file_utilities

interface: accretiondiskspectrahopkins2007
Description: Constructors for the hopkins2007 accretion disk spectra class.
Code lines: 4
Contained by: file accretion_disks.spectra.Hopkins2007.F90

subroutine: hopkins2007buildfile
Description: Build a file containing a tabulation of the Hopkins et al. [2007] model AGN spectra.
Code lines: 117
Contained by: file accretion_disks.spectra.Hopkins2007.F90
Modules used: dates_and_times; galacticus_display; galacticus_error; galacticus_paths; io_hdf5; iso_fortran_env; numerical_constants_astronomical; numerical_constants_units; numerical_ranges; string_handling; system_command

function: hopkins2007constructorinternal
Description: Constructor for the hopkins2007 accretion disk spectra class.
Code lines: 20
Contained by: file accretion_disks.spectra.Hopkins2007.F90
Modules used: galacticus_paths

function: hopkins2007constructorparameters
Description: Constructor for the hopkins2007 accretion disk spectra class.
Code lines: 10
Contained by: file accretion_disks.spectra.Hopkins2007.F90
Modules used: input_parameters

file: accretion_disks.spectra.file.F90
Description: An implementation of the accretion disk spectra class for tabulated spectra read from file.
Code lines: 188
Modules used: fgsl

interface: `accretiondiskspectrafile`
Description: Constructors for the `file` accretion disk spectra class.
Code lines: 4
Contained by: file accretion_disks.spectra.file.F90

function: `fileconstructorinternal`
Description: Internal constructor for the `file` accretion disk spectra class.
Code lines: 18
Contained by: file accretion_disks.spectra.file.F90
Modules used: array_utilities galacticus_error galacticus_nodes

function: `fileconstructorparameters`
Description: Constructor for the `file` accretion disk spectra class which takes a parameter set as input.
Code lines: 17
Contained by: file accretion_disks.spectra.file.F90

subroutine: `filedestructor`
Description: Default destructor for the `file` accretion disk spectra class.
Code lines: 17
Contained by: file accretion_disks.spectra.file.F90
Modules used: memory_management numerical_interpolation

subroutine: `fileloadfile`
Description: Load a file of AGN spectra.
Code lines: 26
Contained by: file accretion_disks.spectra.file.F90
Modules used: galacticus_error io_hdf5

function: `filespectrum`
Description: Return the accretion disk spectrum for tabulated spectra.
Code lines: 39
Contained by: file accretion_disks.spectra.file.F90
Modules used: galacticus_nodes iso_c_binding numerical_constants_astronomical numerical_constants_physical numerical_interpolation

file: `accretion_disks.switched.F90`
Description: Implementation of a switched (ADAF/thin) accretion disk.
Code lines: 267

interface: `accretiondisksswitched`
Description: Constructors for the switched accretion disk class.
Code lines: 4
Contained by: file accretion_disks.switched.F90

function: `switchedconstructorinternal`
Description: Internal constructor for the switched accretion disk class.

Code lines: 14
Contained by: file accretion_disks.switched.F90

function: switchedconstructorparameters
Description: Constructor for the switched accretion disk class which takes a parameter set as input.
Code lines: 67
Contained by: file accretion_disks.switched.F90
Modules used: galacticus_error input_parameters

subroutine: switcheddestructor
Description: Destructor for the switched accretion disk class.
Code lines: 8
Contained by: file accretion_disks.switched.F90

function: switchedefficiencyradiative
Description: Return the radiative efficiency of a switched (ADAF/thin) accretion disk.
Code lines: 14
Contained by: file accretion_disks.switched.F90

function: switchedefficiencyradiativescalingadaf
Description: Determine the scaling of radiative efficiency of the ADAF component in a switched accretion disk.
Code lines: 27
Contained by: file accretion_disks.switched.F90
Modules used: black_hole_fundamentals

function: switchedfractionadaf
Description: Decide which type of accretion disk to use.
Code lines: 33
Contained by: file accretion_disks.switched.F90
Modules used: black_hole_fundamentals

function: switchedpowerjet
Description: Return the jet power of a switched (ADAF/thin) accretion disk.
Code lines: 11
Contained by: file accretion_disks.switched.F90

function: switchedratespinup
Description: Computes the spin up rate of the black hole in thisNode due to accretion from a switched (ADAF/thin) accretion disk.
Code lines: 12
Contained by: file accretion_disks.switched.F90

file: ann_config.cpp

file: atomic.cross_sections.Compton.F90
Description: Contains a module which implements calculation of the Compton cross-section.
Code lines: 45

module: `atomic_cross_sections_compton`
Description: Implements calculation of the Compton cross-section.
Code lines: 23
Contained by: file `atomic.cross_sections.Compton.F90`
Used by: program `xray_absorption_ism_wilms2000`

function: `atomic_cross_section_compton`
Description: Returns the Compton cross section (in cm^2) for the specified `photonEnergy` (in keV) from Klein and Nishina [1929].
Code lines: 13
Contained by: module `atomic_cross_sections_compton`
Modules used: `numerical_constants_physical` `numerical_constants_prefixes` `numerical_constants_units`

file: `atomic.cross_sections.ionization.photo.F90`
Description: Contains a module that implements the atomic photo-ionization cross-section class.
Code lines: 40

module: `atomic_cross_sections_ionization_photo`
Description: Implements the atomic photo-ionization cross-section class.
Code lines: 18
Contained by: file `atomic.cross_sections.ionization.photo.F90`
Used by: file `chemical.reaction_-rates.hydrogen.F90` subroutine `galacticus_function_-classes_destroy` subroutine `galacticus_state_retrieve` subroutine `galacticus_state_store` file `radiation.intergalactic_-background.internal.F90` file `universe.operators.intergalactic_-medium_state_evolve.F90`

file: `atomic.cross_sections.ionization.photo.Verner.F90`
Description: Implementation of an atomic photoionization cross section class based on (`phfit2.f`) written by D. A. Verner (Version 2. March 25, 1996).
Code lines: 2024

interface: `atomiccrosssectionionizationphotoverner`
Description: Constructors for the `verner` atomic photoionization cross-section class.
Code lines: 3
Contained by: file `atomic.cross_sections.ionization.photo.Verner.F90`

function: `vernerconstructorparameters`
Description: Constructor for the `verner` atomic photoionization cross-section class which builds the object from a parameter set.
Code lines: 10
Contained by: file `atomic.cross_sections.ionization.photo.Verner.F90`
Modules used: `input_parameters`

function: `vernercrosssection`

Description: Computes the cross section for photo-ionization (in units of cm^2) at the specified `wavelength` for all ionization stages of all atoms from H to Zn ($Z = 30$) by use of the following fit parameters:

- Outer shells of the Opacity Project (OP) elements: Verner et al. [1996]
- Inner shells of all elements, and outer shells of the non-OP elements: Verner and Yakovlev [1995]

Original version (`phfit2.f`) written by D. A. Verner (Version 2. March 25, 1996). Inner-shell ionization energies of some low-ionized species are slightly improved to fit smoothly the experimental inner-shell ionization energies of neutral atoms.

Code lines: 73

Contained by: file atomic.cross_sections.ionization.photo.Verner.F90
Modules used: numerical_constants_physical numerical_constants_units

file: atomic.data.F90
Description: Contains a module which provides various atomic data.
Code lines: 351

module: atomic_data
Description: Provides various atomic data.
Code lines: 329
Contained by: file atomic.data.F90
Used by:

function bertschingerconstructorinternal	function naozbarkana2007constructorinternal

subroutine abundances_initialize	subroutine abundances_set_metallicity
function fileconstructorinternal	subroutine fileread
function nagashima2005constructorinternal	function instantaneousconstructorinternal

function: abundance_pattern_lookup
Description: Returns the position in the atoms() array of an element specified by atomic number, name or short label.
Code lines: 34
Contained by: module atomic_data
Modules used: galacticus_error string_handling

function: atom_lookup
Description: Returns the position in the atoms() array of an element specified by atomic number, name or short label.
Code lines: 44
Contained by: module atomic_data
Modules used: galacticus_error string_handling

function: atomic_abundance
Description: Returns the abundance by mass of a given atom in a given abundance pattern.
Code lines: 32
Contained by: module atomic_data

function: atomic_data_atoms_count
Description: Return the number of atomic species known in this module.
Code lines: 10
Contained by: module atomic_data

subroutine: atomic_data_initialize
Description: Ensure that the module is initialized by reading in data.
Code lines: 117
Contained by: module atomic_data
Modules used: fox_dom galacticus_error

galacticus_paths
iso_varying_string
string_handling
io_xml
memory_management

function: `atomic_mass`
Description: Returns the atomic mass of an element specified by atomic number, name or short label.
Code lines: 21
Contained by: module atomic_data

function: `atomic_short_label`
Description: Return the short label for an atom.
Code lines: 19
Contained by: module atomic_data

type: `atomicdata`
Description: Data type for storing atomic data.
Code lines: 7
Contained by: module atomic_data

file: `atomic.ionization_potentials.F90`
Description: Contains a module that implements an atomic ionization potential class.
Code lines: 41

module: `atomic_ionization_potentials`
Description: Implements an atomic ionization potential class.
Code lines: 17
Contained by: file atomic.ionization_potentials.F90
Used by: file atomic.radiation.gaunt_-factors.Sutherland1998.F90
subroutine galacticus_function_-classes_destroy
subroutine galacticus_state_store

program test_gaunt_factors

file: `atomic.ionization_potentials.Verner.F90`
Description: Implements an atomic ionization potential class, which provides potentials for all ionization stages of all atoms from H to Zn using data taken from Dima Verner's code.
Code lines: 542

interface: `atomicionizationpotentialverner`
Description: Constructors for the `verner` atomic ionization potential class.
Code lines: 3
Contained by: file atomic.ionization_potentials.Verner.F90

function: `vernerconstructorparameters`
Description: Constructor for the `verner` atomic ionization potentail class which builds the object from a parameter set.
Code lines: 10
Contained by: file atomic.ionization_potentials.Verner.F90

Modules used: input_parameters

function: vernerpotential
Description: Return the ionization potential (in units of electon volts) for the ion with given atomicNumber and electronNumber using data taken from Dima Verner's code.
Code lines: 11
Contained by: file atomic.ionization_potentials.Verner.F90

file: atomic.radiation.gaunt_factors.F90
Description: Contains a module which provides a class implenting Gaunt factors.
Code lines: 40

module: atomic_radiation_gaunt_factors
Description: Provides a class implenting Gaunt factors.
Code lines: 18
Contained by: file atomic.radiation.gaunt_factors.F90
Used by: subroutine galacticus_function_classes_destroy; subroutine galacticus_state_retrieve; subroutine galacticus_state_store; program test_gaunt_factors; file universe.operators.intergalactic_medium_state_evolve.F90

file: atomic.radiation.gaunt_factors.Sutherland1998.F90
Description: An implementation of Gaunt factors using the Sutherland [1998] fitting function.
Code lines: 117
Modules used: atomic_ionization_potentials

interface: gauntfactorsutherland1998
Description: Constructors for the sutherland1998 gaunt factor class.
Code lines: 4
Contained by: file atomic.radiation.gaunt_factors.Sutherland1998.F90

function: sutherland1998constructorinternal
Description: Internal constructor for the sutherland1998 gaunt factor class.
Code lines: 8
Contained by: file atomic.radiation.gaunt_factors.Sutherland1998.F90

function: sutherland1998constructorparameters
Description: Constructor for the sutherland1998 gaunt factor class which takes a parameter set as input.
Code lines: 13
Contained by: file atomic.radiation.gaunt_factors.Sutherland1998.F90
Modules used: input_parameters

subroutine: sutherland1998destructor
Description: Destructor for the sutherland1998 gaunt factor class.
Code lines: 7
Contained by: file atomic.radiation.gaunt_factors.Sutherland1998.F90

function: sutherland1998total

Description: Compute thermally averaged Gaunt factors for thermal electron distributions using the tabulations and fits of Sutherland [1998].
Code lines: 35
Contained by: file atomic.radiation.gaunt_factors.Sutherland1998.F90
Modules used: arrays_search, galacticus_error, iso_c_binding, numerical_constants_physical, numerical_constants_units

file: atomic.radiation.gaunt_factors.vanHoof2014.F90
Description: An implementation of Gaunt factors using the van Hoof et al. [2014] fitting function.
Code lines: 120
Modules used: atomic_ionization_potentials

interface: gauntfactorvanhoof2014
Description: Constructors for the vanHoof2014 gaunt factor class.
Code lines: 4
Contained by: file atomic.radiation.gaunt_factors.vanHoof2014.F90

function: vanhoof2014constructorinternal
Description: Internal constructor for the vanHoof2014 gaunt factor class.
Code lines: 8
Contained by: file atomic.radiation.gaunt_factors.vanHoof2014.F90

function: vanhoof2014constructorparameters
Description: Constructor for the vanHoof2014 gaunt factor class which takes a parameter set as input.
Code lines: 13
Contained by: file atomic.radiation.gaunt_factors.vanHoof2014.F90
Modules used: input_parameters

subroutine: vanhoof2014destructor
Description: Destructor for the vanHoof2014 gaunt factor class.
Code lines: 7
Contained by: file atomic.radiation.gaunt_factors.vanHoof2014.F90

function: vanhoof2014total
Description: Compute thermally averaged Gaunt factors for thermal electron distributions using the tabulations and fits of van Hoof et al. [2014].
Code lines: 38
Contained by: file atomic.radiation.gaunt_factors.vanHoof2014.F90
Modules used: arrays_search, galacticus_error, iso_c_binding, numerical_constants_physical, numerical_constants_units

file: atomic.rates.excitation.collisional.F90
Description: Contains a module which provides a class implenting atomic collisional excitation rates.
Code lines: 42

module: atomic_rates_excitation_collisional
Description: Provides a class implenting atomic collisional excitation rates.
Code lines: 18

Contained by: file atomic.rates.excitation.collisional.F90
Used by: subroutine galacticus_function_classes_destroy; subroutine galacticus_state_retrieve; subroutine galacticus_state_store; file universe.operators.intergalactic_medium_state_evolve.F90

file: atomic.rates.excitation.collisional.ScholzWalters91.F90
Description: An implementation of atomic collisional excitation using the fitting functions of Scholz and Walters [1991].
Code lines: 98

interface: atomicexcitationratecollisionalscholzwalters1991
Description: Constructors for the scholzWalters1991 atomic collisional excitation class.
Code lines: 3
Contained by: file atomic.rates.excitation.collisional.ScholzWalters91.F90

function: scholzwalters1991constructorparameters
Description: Constructor for the scholzWalters1991 atomic collisional excitation class which takes a parameter set as input.
Code lines: 11
Contained by: file atomic.rates.excitation.collisional.ScholzWalters91.F90
Modules used: input_parameters

function: scholzwalters1991coolingrate
Description: Return collisional excitation cooling rates, in units of J/m^3/s, for ion Ion at temperature T (in Kelvin) using the fitting functions of Scholz and Walters [1991].
Code lines: 44
Contained by: file atomic.rates.excitation.collisional.ScholzWalters91.F90
Modules used: galacticus_error

file: atomic.rates.ionization.collisional.F90
Description: Contains a module which provides a class implenting atomic collisional ionization rates.
Code lines: 40

module: atomic_rates_ionization_collisional
Description: Provides a class implenting radiative recombiantion rates.
Code lines: 18
Contained by: file atomic.rates.ionization.collisional.F90
Used by: file chemical.reaction_rates.hydrogen.F90; subroutine galacticus_function_classes_destroy; subroutine galacticus_state_retrieve; subroutine galacticus_state_store; file universe.operators.intergalactic_medium_state_evolve.F90

file: atomic.rates.ionization.collisional.Verner.F90
Description: An implementation of atomic collisional ionization rates based on the code originally written by Dima Verner.
Code lines: 497

interface: atomicionizationratecollisionalverner1996

Description: Constructors for the `verner1996` atomic collisional ionization class.
Code lines: 3
Contained by: file `atomic.rates.ionization.collisional.Verner.F90`

function: `verner1996constructorparameters`
Description: Constructor for the `verner1996` atomic collisional ionization class which takes a parameter set as input.
Code lines: 11
Contained by: file `atomic.rates.ionization.collisional.Verner.F90`
Modules used: `input_parameters`

function: `verner1996rate`
Description: Computes the rate coefficient of direct collisional ionization (in units of $\mathrm{cm}^3\ \mathrm{s}^{-1}$) at the specified `temperature` for all ions of atoms with $Z < 28$ by use of the fits from Voronov (1997; Version 2, March 24, 1997). Based on the code originally written by Dima Verner. The ionization state passed to this function should be that of the atom/ion prior to ionization.
Code lines: 32
Contained by: file `atomic.rates.ionization.collisional.Verner.F90`
Modules used: `numerical_constants_physical` `numerical_constants_units`

file: `atomic.rates.recombination.dielectronic.Arnaud85.F90`
Description: Implements an atomic dielectronic recombination class which uses the fits from Aldrovandi and Pequignot [1973], Shull and van Steenberg [1982] and Arnaud and Rothenflug [1985].
Code lines: 251

function: `arnaud1985constructorparameters`
Description: Constructor for the `arnaud1985` atomic ionization potentail class which builds the object from a parameter set.
Code lines: 11
Contained by: file `atomic.rates.recombination.dielectronic.Arnaud85.F90`
Modules used: `input_parameters`

function: `arnaud1985rate`
Description: Calculates rates of dielectric recombination for all ionization stages of all elements from H to Ni ($Z = 28$) by use of the fits from Aldrovandi and Pequignot [1973], Shull and van Steenberg [1982] and Arnaud and Rothenflug [1985]. Input parameters: `atomicNumber`: atomic number; `electronNumber`: number of electrons; `temperature`: temperature [K]. Output parameter: rate coefficient [$\mathrm{cm}^3\ \mathrm{s}^{-1}$].
Code lines: 22
Contained by: file `atomic.rates.recombination.dielectronic.Arnaud85.F90`
Modules used: `galacticus_error`

interface: `atomicrecombinationratedielectronicarnaud1985`
Description: Constructors for the `arnaud1985` atomic dielectronic recombination rate class.

file: `atomic.rates.recombination.radiative.Verner.F90`

Description: An implementation of atomic radiative recombination rates based on the code originally written by Dima Verner.
Code lines: 655

interface: `atomicrecombinationrateradiativeverner1996`

Description: Constructors for the `verner1996` atomic radiative recombination class.
Code lines: 3
Contained by: file atomic.rates.recombination.radiative.Verner.F90

function: `verner1996constructorparameters`

Description: Constructor for the `verner1996` atomic radiative recombination class which takes a parameter set as input.
Code lines: 10
Contained by: file atomic.rates.recombination.radiative.Verner.F90
Modules used: input_parameters

function: `verner1996rate`

Description: Computes the rate coefficient of radiative recombination (in units of $\mathrm{cm}^3\ \mathrm{s}^{-1}$) at the specified `temperature` for all ions of all elements from H through Zn (selected by the `atomicNumber` and the `ionizationState` *of the recombined ion*) use of the following fits:

- H-like, He-like, Li-like, Na-like: [Verner and Ferland, 1996];
- Other ions of C, N, O, Ne: [Pequignot et al., 1991], refitted by Verner & Ferland formula to ensure correct asymptotes;
- Fe XVII-XXIII: [Arnaud and Raymond, 1992];
- Fe I-XV: refitted by Verner & Ferland formula to ensure correct asymptotes;
- Other ions of Mg, Si, S, Ar, Ca, Fe, Ni: [Shull and van Steenberg, 1982];
- Other ions of Na, Al: [Landini and Fossi, 1990];
- Other ions of F, P, Cl, K, Ti, Cr, Mn, Co (excluding Ti I-II, Cr I-IV, Mn I-V, Co I): [Landini and Fossi, 1991];
- All other species: interpolations of the power-law fits.

Based on the code originally written by Dima Verner. The ionization state passed to this function should be that of the atom/ion post recombination.

Code lines: 20
Contained by: file `black_holes.binaries.initial_separation.spheroid_size_fraction.F90`
Modules used: `input_parameters`

function: `spheroidradiusfractionseparationinitial`
Description: Returns an initial separation for a binary black holes that is a fixed fraction of the scale radius of the larger of the host and satellite spheroids.
Code lines: 13
Contained by: file `black_holes.binaries.initial_separation.spheroid_size_fraction.F90`
Modules used: `galacticus_nodes`

file: `black_holes.binaries.initial_separation.tidal_radius.F90`
Description: Implements a class for black hole binary initial separation based on tidal disruption of the satellite galaxy.
Code lines: 107

interface: `blackholebinaryinitialseparationtidalradius`

Description: Constructors for the `tidalRadius` black hole binary initial radius class.
Code lines: 3
Contained by: file `black_holes.binaries.initial_separation.tidal_radius.F90`

function: `tidalradiusconstructorparameters`
Description: Constructor for the `tidalRadius` black hole bianry recoild class which takes a parameter list as input.
Code lines: 11
Contained by: file `black_holes.binaries.initial_separation.tidal_radius.F90`
Modules used: `input_parameters`

function: `tidalradiusroot`
Description: Root function used in solving for the radius of tidal disruption of a satellite galaxy.
Code lines: 10
Contained by: file `black_holes.binaries.initial_separation.tidal_radius.F90`
Modules used: `galactic_structure_enclosed_masses` `galactic_structure_options`

function: `tidalradiusseparationinitial`
Description: Returns an initial separation for a binary black holes through tidal disruption.
Code lines: 36
Contained by: file `black_holes.binaries.initial_separation.tidal_radius.F90`
Modules used: `galactic_structure_enclosed_masses` `galactic_structure_options` `galacticus_nodes` `root_finder`

file: `black_holes.binaries.recoil_velocity.Campanelli2007.F90`
Description: Implements a black hole binary recoil velocity class which follows the formulae in Campanelli et al. [2007], derived from post-Newtonian evaluations.
Code lines: 95

interface: `blackholebinaryrecoilcampanelli2007`
Description: Constructors for the `campanelli2007` black hole binary recoil class.
Code lines: 3
Contained by: file `black_holes.binaries.recoil_velocity.Campanelli2007.F90`

function: `campanelli2007constructorparameters`
Description: Constructor for the `campanelli2007` black hole bianry recoild class which takes a parameter list as input.
Code lines: 11
Contained by: file `black_holes.binaries.recoil_velocity.Campanelli2007.F90`
Modules used: `input_parameters`

function: `campanelli2007velocity`

Description:	Returns the recoil velocity of a black hole binary, accounting for the parallel and perpendicular velocities, plus that of the binary's center of mass. Constants used are retrieved from the articles by: Koppitz et al. [2007] for $H = (7.3 \pm 0.3)10^3$ km/s, González et al. [2007b] for $A = 1.2 \times 10^4$ km/s $B = -0.93$, González et al. [2007a] for $K \cos(\delta\theta) = (6, -5.3)10^4$ km/s and $K = (6.0 \pm 0.1)10^4$ km/s.

Modules used: galacticus_nodes numerical_constants_physical

interface: black_hole_horizon_radius
Code lines: 3
Contained by: module black_hole_fundamentals

function: black_hole_horizon_radius_node
Description: Return the radius of the horizon for a Kerr metric with dimensionless angular momentum j. The radius is in units of the gravitational radius.
Code lines: 32
Contained by: module black_hole_fundamentals
Modules used: galacticus_error galacticus_nodes

function: black_hole_horizon_radius_spin
Description: Return the radius of the horizon for a Kerr metric with dimensionless angular momentum j. The radius is in units of the gravitational radius.
Code lines: 8
Contained by: module black_hole_fundamentals

interface: black_hole_isco_radius
Code lines: 3
Contained by: module black_hole_fundamentals

function: black_hole_isco_radius_node
Description: Returns the radius (in physical or gravitational units and for a prograde or retorgrade orbit) of the innermost stable circular orbit for the black hole in thisBlackHole.
Code lines: 33

Contained by: module black_hole_fundamentals
Modules used: galacticus_nodes

function: black_hole_isco_radius_spin
Description: Returns the radius (in gravitational units and for a prograde or retorgrade orbit) of the innermost stable circular orbit for a black hole with spin blackHoleSpin.
Code lines: 42
Contained by: module black_hole_fundamentals
Modules used: galacticus_error

function: black_hole_isco_specific_angular_momentum
Description: Returns the specific angular momentum (in physical or gravitational units and for a prograde or retorgrade orbit) of the innermost stable circular orbit for the black hole in thisBlackHole.
Code lines: 43
Contained by: module black_hole_fundamentals
Modules used: galacticus_nodes numerical_constants_physical

interface: black_hole_isco_specific_energy
Code lines: 3
Contained by: module black_hole_fundamentals

function: black_hole_isco_specific_energy_node
Description: Returns the specific energy (in physical or gravitational units and for a prograde or retorgrade orbit) of the innermost stable circular orbit for the black hole in thisNode.
Code lines: 27
Contained by: module black_hole_fundamentals
Modules used: galacticus_nodes numerical_constants_physical

function: black_hole_isco_specific_energy_spin
Description: Returns the specific energy (in physical or gravitational units and for a prograde or retorgrade orbit) of the innermost stable circular orbit for a black hole of given blackHoleSpin.
Code lines: 23
Contained by: module black_hole_fundamentals

interface: black_hole_metric_a_factor
Code lines: 3
Contained by: module black_hole_fundamentals

function: black_hole_metric_a_factor_node
Description: Returns the $\mathcal{A}$ factor appearing in the Kerr metric for thisBlackHole.
Code lines: 34
Contained by: module black_hole_fundamentals
Modules used: galacticus_error galacticus_nodes

function: black_hole_metric_a_factor_spin
Description: Returns the $\mathcal{A}$ factor appearing in the Kerr metric for spin blackHoleSpin.
Code lines: 7
Contained by: module black_hole_fundamentals

interface: `black_hole_metric_d_factor`
Code lines: 3
Contained by: module black_hole_fundamentals

function: `black_hole_metric_d_factor_node`
Description: Returns the $\mathcal{D}$ factor appearing in the Kerr metric for `thisBlackHole`.
Code lines: 34
Contained by: module black_hole_fundamentals
Modules used: galacticus_error galacticus_nodes

function: `black_hole_metric_d_factor_spin`
Description: Returns the $\mathcal{D}$ factor appearing in the Kerr metric for spin `blackHoleSpin`.
Code lines: 7
Contained by: module black_hole_fundamentals

interface: `black_hole_rotational_energy_spin_down`
Code lines: 3
Contained by: module black_hole_fundamentals

function: `black_hole_rotational_energy_spin_down_node`
Description: Wrapper function for Black_Hole_Rotational_Energy_Spin_Down_Node which takes a tree node as input.
Code lines: 14
Contained by: module black_hole_fundamentals
Modules used: galacticus_nodes

function: `black_hole_rotational_energy_spin_down_spin`
Description: Computes the spin down rate of a black hole due to extraction of rotational energy. Specifically, it returns the factor S in the relation:

$$s = -S \frac{P_{\rm rotation}}{\dot{M}_{\bullet,0} {\rm c}^2}, \tag{18.1}$$

where $P_{\rm rotation}$ is the power of rotational energy extraction and

$$S = [(1+\sqrt{1-j^2})^2 + j^2] \frac{\sqrt{1-j^2}}{j}, \tag{18.2}$$

for black hole spin j.
Code lines: 30
Contained by: module black_hole_fundamentals

interface: `black_hole_static_radius`
Code lines: 3
Contained by: module black_hole_fundamentals

function: `black_hole_static_radius_node`
Description: Return the radius of the static limit for a Kerr metric for the black hole in `thisBlackHole` and angle `theta`.
Code lines: 35

Contained by: module black_hole_fundamentals
Modules used: galacticus_error galacticus_nodes

function: black_hole_static_radius_spin
Description: Return the radius of the static limit for a Kerr metric for a black hole of given blackHoleSpin and angle theta.
Code lines: 18
Contained by: module black_hole_fundamentals
Modules used: numerical_constants_math

file: chemical.reaction_rates.F90
Description: Contains a module that implements a class providing calculations of chemical reaction rates.
Code lines: 46

module: chemical_reaction_rates
Description: Provides a class implementing chemical reaction rates.
Code lines: 24
Contained by: file chemical.reaction_rates.F90

Modules used: numerical_constants_physical numerical_constants_units

function: `hydrogennetworkhminus_hplus_to_2h_ratecoefficient`
Description: Compute the rate coefficient (in units of $\mathrm{c}^3\ \mathrm{s}^{-1}$) for the reaction $\mathrm{H}_2^+ + \mathrm{H} \rightarrow \mathrm{H}_2 + \mathrm{H}^+$.
Code lines: 7
Contained by: file chemical.reaction_rates.hydrogen.F90

subroutine: `hydrogennetworkrateh2_electron_to_2h_electron`
Description: Computes the rate (in units of $\mathrm{c}^{-3}\ \mathrm{s}^{-1}$) for the reaction $\mathrm{H}_2 + \mathrm{e}^- \rightarrow 2\mathrm{H} + \mathrm{e}^-$.
Code lines: 44
Contained by: file chemical.reaction_rates.hydrogen.F90
Modules used: radiation_fields

subroutine: `hydrogennetworkrateh2_gamma_to_2h`
Description: Computes the rate (in units of $\mathrm{cm}^{-3}\ \mathrm{s}^{-1}$) for the reaction $\mathrm{H}_2^+ + \gamma \rightarrow 2\mathrm{H}^+ + \mathrm{e}^-$.
Code lines: 49
Contained by: file chemical.reaction_rates.hydrogen.F90
Modules used: numerical_constants_physical numerical_constants_units radiation_fields

subroutine: `hydrogennetworkrateh2_gamma_to_h2plus_electron`
Description: Computes the rate (in units of $\mathrm{cm}^{-3}\ \mathrm{s}^{-1}$) for the reaction $\mathrm{H}_2 + \gamma \rightarrow \mathrm{H}_2^+ + \mathrm{e}^-$.
Code lines: 49
Contained by: file chemical.reaction_rates.hydrogen.F90
Modules used: numerical_constants_physical numerical_constants_units radiation_fields

subroutine: `hydrogennetworkrateh2_gamma_to_h2star_to_2h`
Description: Computes the rate (in units of $\mathrm{cm}^{-3}\ \mathrm{s}^{-1}$) for the reaction $\mathrm{H}_2 + \gamma \rightarrow H_2^* \rightarrow 2\mathrm{H}$.
Code lines: 47

Contained by: file chemical.reaction_rates.hydrogen.F90
Modules used: numerical_constants_physical numerical_constants_units radiation_fields

subroutine: hydrogennetworkrateh2_h_to_3h
Description: Computes the rate (in units of c^{-3} s^{-1}) for the reaction $H_2 + H \rightarrow 3H$.
Code lines: 51
Contained by: file chemical.reaction_rates.hydrogen.F90
Modules used: numerical_constants_physical numerical_constants_units radiation_fields

subroutine: hydrogennetworkrateh2_hplus_to_h2plus_h
Description: Computes the rate (in units of c^{-3} s^{-1}) for the reaction $H_2 + H^+ \rightarrow H_2^+ + H$.
Code lines: 52
Contained by: file chemical.reaction_rates.hydrogen.F90
Modules used: numerical_constants_physical numerical_constants_units radiation_fields

subroutine: hydrogennetworkrateh2plus_electron_to_2h
Description: Computes the rate (in units of c^{-3} s^{-1}) for the reaction $H_2^+ + e^- \rightarrow 2H$.
Code lines: 46
Contained by: file chemical.reaction_rates.hydrogen.F90
Modules used: radiation_fields

subroutine: hydrogennetworkrateh2plus_gamma_to_2hplus_electron
Description: Computes the rate (in units of cm^{-3} s^{-1}) for the reaction $H_2^+ + \gamma \rightarrow 2H^+ + e^-$.
Code lines: 51
Contained by: file chemical.reaction_rates.hydrogen.F90
Modules used: numerical_constants_physical numerical_constants_units radiation_fields

subroutine: hydrogennetworkrateh2plus_gamma_to_h_hplus
Description: Computes the rate (in units of c^{-3} s^{-1}) for the reaction $H_2^+ + \gamma \rightarrow H + H^+$.
Code lines: 55
Contained by: file chemical.reaction_rates.hydrogen.F90
Modules used: numerical_constants_physical numerical_constants_units radiation_fields

subroutine: hydrogennetworkrateh2plus_h_to_h2_hplus
Description: Computes the rate (in units of c^{-3} s^{-1}) for the reaction $H_2^+ + H \rightarrow H_2 + H^+$.
Code lines: 44
Contained by: file chemical.reaction_rates.hydrogen.F90
Modules used: radiation_fields

subroutine: hydrogennetworkrateh2plus_hminus_to_h2_h
Description: Computes the rate (in units of c^{-3} s^{-1}) for the reaction $H_2^+ + H^- \rightarrow H_2 + H$.
Code lines: 45
Contained by: file chemical.reaction_rates.hydrogen.F90

Modules used: radiation_fields

subroutine: hydrogennetworkrateh_electron_to_hminus_photon
Description: Computes the rate (in units of cm^{-3} s^{-1}) for the reaction $H + e^- \rightarrow H^- + \gamma$.
Code lines: 43
Contained by: file chemical.reaction_rates.hydrogen.F90
Modules used: radiation_fields

subroutine: hydrogennetworkrateh_electron_to_hplus_2electron
Description: Computes the rate (in units of c^{-3} s^{-1}) for the reaction $H + e^- \rightarrow H^+ + 2e^-$.
Code lines: 41
Contained by: file chemical.reaction_rates.hydrogen.F90
Modules used: radiation_fields

subroutine: hydrogennetworkrateh_gamma_to_hplus_electron
Description: Computes the rate (in units of cm^{-3} s^{-1}) for the reaction $H + \gamma \rightarrow H^+ + e^-$.
Code lines: 50
Contained by: file chemical.reaction_rates.hydrogen.F90
Modules used: numerical_constants_physical numerical_constants_units radiation_fields

subroutine: hydrogennetworkrateh_hminus_to_h2_electron
Description: Computes the rate (in units of cm^{-3} s^{-1}) for the reaction $H + H^- \rightarrow H_2 + e^-$.
Code lines: 43
Contained by: file chemical.reaction_rates.hydrogen.F90
Modules used: radiation_fields

subroutine: hydrogennetworkrateh_hplus_to_h2plus_photon
Description: Computes the rate (in units of c^{-3} s^{-1}) for the reaction $H + H^+ \rightarrow H_2^+ + \gamma$.
Code lines: 51
Contained by: file chemical.reaction_rates.hydrogen.F90

subroutine: hydrogennetworkratehminus_gamma_to_h_electron
Description: Computes the rate (in units of c^{-3} s^{-1}) for the reaction $H^- + \gamma \rightarrow H + e^-$.
Code lines: 54
Contained by: file chemical.reaction_rates.hydrogen.F90
Modules used: numerical_constants_physical numerical_constants_units radiation_fields

subroutine: hydrogennetworkratehminus_h_to_2h_electron

Description: Computes the rate (in units of c^{-3} s^{-1}) for the reaction $H^- + H \rightarrow 2H + e^-$.
Code lines: 52
Contained by: file chemical.reaction_rates.hydrogen.F90
Modules used: numerical_constants_physical, numerical_constants_units, radiation_fields

subroutine: hydrogennetworkratehminus_hplus_to_2h
Description: Computes the rate (in units of c^{-3} s^{-1}) for the reaction $H_2^+ + H \rightarrow H_2 + H^+$.
Code lines: 43
Contained by: file chemical.reaction_rates.hydrogen.F90
Modules used: radiation_fields

subroutine: hydrogennetworkratehminus_hplus_to_h2plus_electron
Description: Computes the rate (in units of cm^{-3} s^{-1}) for the reaction $H^- + H^+ \rightarrow H_2^+ + e^-$.
Code lines: 53
Contained by: file chemical.reaction_rates.hydrogen.F90
Modules used: numerical_constants_physical, numerical_constants_units, radiation_fields

subroutine: hydrogennetworkratehplus_electron_to_h_photon
Description: Computes the rate (in units of c^{-3} s^{-1}) for the reaction $H^+ + e^- \rightarrow H + \gamma$.
Code lines: 41
Contained by: file chemical.reaction_rates.hydrogen.F90
Modules used: radiation_fields

subroutine: hydrogennetworkrates
Description: Compute rates of change of chemical abundances due to reactions involving chemical hydrogen species.
Code lines: 58
Contained by: file chemical.reaction_rates.hydrogen.F90
Modules used: galacticus_error, radiation_fields

file: chemical.reaction_rates.utilities.F90
Description: Contains a module that implements various useful utility functions for calculations of chemical abundances and rates.
Code lines: 41

module: chemical_reaction_rates_utilities
Description: Implements various useful utility functions for calculations of chemical abundances and rates.
Code lines: 19
Contained by: file chemical.reaction_rates.utilities.F90
Used by: function coldmodechemicalmasses, function coldmodecoldmodefraction, function simplechemicalmasses, function betaprofileradius, function betaprofileradiusgrowthrate, function isothermalradius, function simpleradius, function integrandluminosityxray, subroutine node_component_hot_halo_standard_formation, subroutine node_component_hot_halo_standard_outflow_return, subroutine node_component_hot_halo_standard_rate_compute

function: `chemicals_mass_to_density_conversion`

Description: Returns the conversion factor from mass of chemicals in ($M_\odot/M_{\rm atomic}$) to number density in cm^{-3} assuming that the mass is distributed uniformly in a sphere of the given `radius` (in Mpc).
Code lines: 9
Contained by: module `chemical_reaction_rates_utilities`
Modules used: `numerical_constants_astronomical`

file: `chemical.reaction_rates.zero.F90`

Description: An implementation of calculations of chemical reaction rates which assumes zero rates.
Code lines: 65

interface: `chemicalreactionratezero`

Description: Constructors for the `zero` chemical reaction rates class.
Code lines: 3
Contained by: file `chemical.reaction_rates.zero.F90`

function: `zeroconstructorparameters`

Description: Constructor for the `zero` chemical reaction rates class which takes a parameter set as input.
Code lines: 11
Contained by: file `chemical.reaction_rates.zero.F90`
Modules used: `input_parameters`

subroutine: `zerorates`

Description: Return zero rates of chemical reactions.
Code lines: 13
Contained by: file `chemical.reaction_rates.zero.F90`

file: `chemical.state.CIE_file.F90`

Description: Implements a chemical state class which reads and interpolates a collisional ionization equilibrium chemical state from a file.
Code lines: 635
Modules used: `fgsl`

interface: `chemicalstateciefile`

Description: Constructors for the "CIE file" chemical state class.
Code lines: 4
Contained by: file `chemical.state.CIE_file.F90`

subroutine: `ciefilechemicaldensities`

Description: Return the densities of chemical species at the given temperature and hydrogen density for the specified set of abundances and radiation field. Units of the returned electron density are cm$^-$3.
Code lines: 75
Contained by: file `chemical.state.CIE_file.F90`
Modules used: `abundances_structure` `chemical_abundances_structure` `iso_c_binding` `radiation_fields` `table_labels`

function: `ciefileconstructorinternal`

Description: Internal constructor for the "CIE file" chemical state class.
Code lines: 22
Contained by: file chemical.state.CIE_file.F90

function: ciefileconstructorparameters
Description: Constructor for the "CIE file" chemical state class which takes a parameter set as input.
Code lines: 19
Contained by: file chemical.state.CIE_file.F90
Modules used: galacticus_paths

subroutine: ciefiledestructor
Description: Destructor for the "CIE file" chemical state class.
Code lines: 10
Contained by: file chemical.state.CIE_file.F90
Modules used: numerical_interpolation

function: ciefileelectrondensity
Description: Return the electron density by interpolating in tabulated CIE data read from a file.
Code lines: 68
Contained by: file chemical.state.CIE_file.F90
Modules used: abundances_structure iso_c_binding radiation_fields table_labels

function: ciefileelectrondensitydensitylogslope
Description: Return the logarithmic slope of the electron density with respect to density assuming atomic CIE.
Code lines: 14
Contained by: file chemical.state.CIE_file.F90
Modules used: abundances_structure radiation_fields

function: ciefileelectrondensitytemperaturelogslope
Description: Return the logarithmic slope of the electron density with respect to temperature by interpolating in tabulated CIE data read from a file.
Code lines: 71
Contained by: file chemical.state.CIE_file.F90
Modules used: abundances_structure iso_c_binding radiation_fields table_labels

function: ciefileinterpolate
Description: Perform the interpolation.
Code lines: 14
Contained by: file chemical.state.CIE_file.F90
Modules used: iso_c_binding

subroutine: ciefileinterpolatingfactors
Description: Determine the interpolating paramters.
Code lines: 28
Contained by: file chemical.state.CIE_file.F90
Modules used: iso_c_binding numerical_interpolation

subroutine: `ciefilereadfile`
Description: Read in data from an chemical state file.
Code lines: 100
Contained by: file chemical.state.CIE_file.F90
Modules used: file_utilities, galacticus_display, galacticus_error, io_hdf5, iso_varying_string, table_labels

file: `chemical.state.F90`
Description: Contains a module that provides a class implementing the chemical state.
Code lines: 69

module: `chemical_states`
Description: Provides a class implementing the chemical state.
Code lines: 47
Contained by: file chemical.state.F90
Modules used: abundances_structure, chemical_abundances_structure, radiation_fields
Used by: file accretion.halo.simple.F90; file cooling.cooling_function.CMB_Compton.F90; function summationcoolingfunction; function summationcoolingfunctiondensitylogslope; file cooling.cooling_time.simple.F90; subroutine galacticus_function_classes_destroy; subroutine galacticus_state_retrieve; subroutine galacticus_state_store; file nodes.property_extractor.ICM_SZ.F90; module node_component_hot_halo_standard; program test_cooling_functions

file: `chemical.state.atomic_CIE_cloudy.F90`
Description: Implements a chemical state class which utilizes the Cloudy code to compute state in collisional ionization equilibrium.
Code lines: 222

subroutine: `atomiccieclоudychemicaldensities`
Description: Return the densities of chemical species at the given temperature and hydrogen density for the specified set of abundances and radiation field. Units of the returned electron density are cm^{-}3.
Code lines: 13
Contained by: file chemical.state.atomic_CIE_cloudy.F90

function: `atomiccieclоudyconstructorinternal`
Description: Internal constructor for the "atomic CIE Cloudy" chemical state class.
Code lines: 19
Contained by: file chemical.state.atomic_CIE_cloudy.F90

function: `atomiccieclоudyconstructorparameters`
Description: Constructor for the "atomic CIE Cloudy" chemical state class which takes a parameter set as input.

Code lines: 10
Contained by: file chemical.state.atomic_CIE_cloudy.F90
Modules used: input_parameters

subroutine: atomiccieclоudydestructor
Description: Destructor for the "atomic CIE Cloudy" chemical state class.
Code lines: 9
Contained by: file chemical.state.atomic_CIE_cloudy.F90
Modules used: numerical_interpolation

function: atomiccieclоudyelectrondensity
Description: Return the electron density for collisional ionization equilibrium as computed by Cloudy.
Code lines: 12
Contained by: file chemical.state.atomic_CIE_cloudy.F90

function: atomiccieclоudyelectrondensitydensitylogslope
Description: Return the logarithmic slope of the electron density with respect to density for collisional ionization equilibrium as computed by Cloudy.
Code lines: 12
Contained by: file chemical.state.atomic_CIE_cloudy.F90

function: atomiccieclоudyelectrondensitytemperaturelogslope
Description: Return the logarithmic slope of the electron density with respect to temperature for collisional ionization equilibrium as computed by Cloudy. read from a file.
Code lines: 13
Contained by: file chemical.state.atomic_CIE_cloudy.F90

subroutine: atomiccieclоudytabulate
Description: Create the chemical state.
Code lines: 44
Contained by: file chemical.state.atomic_CIE_cloudy.F90
Modules used: galacticus_display, galacticus_paths, interfaces_cloudy_cie, string_handling, system_command

interface: chemicalstateatomiccieclоudy
Description: Constructors for the "atomic CIE Cloudy" chemical state class.
Code lines: 4
Contained by: file chemical.state.atomic_CIE_cloudy.F90

file: constant.F90
Code lines: 269

file: cooling.cold_mode.infall_rate.F90
Description: Contains a module that implements calculations of the infall rate from the cold mode.
Code lines: 41

module: cooling_cold_mode_infall_rates
Description: Implements calculations of the infall rate from the cold mode.
Code lines: 19
Contained by: file cooling.cold_mode.infall_rate.F90
Modules used: galacticus_nodes
Used by: subroutine galacticus_function_classes_destroy; subroutine galacticus_state_retrieve; subroutine galacticus_state_store; file nodes.property_extractor.cold_mode_infall_rate.F90; module node_component_hot_halo_cold_mode

file: cooling.cold_mode.infall_rate.dynamical_time.F90
Description: Implementation of a calculation of cold mode infall rates assuming infall on a dynamical timescale.
Code lines: 104
Modules used: dark_matter_halo_scales

interface: coldmodeinfallratedynamicaltime

Description: Constructors for the dynamicalTime cooling time class.
Code lines: 4
Contained by: file cooling.cold_mode.infall_rate.dynamical_time.F90

function: dynamicaltimeconstructorinternal
Description: Internal constructor for the dynamical time cooling time class.
Code lines: 13
Contained by: file cooling.cold_mode.infall_rate.dynamical_time.F90
Modules used: galacticus_error galacticus_nodes

function: dynamicaltimeconstructorparameters
Description: Constructor for the dynamical time cooling time class which builds the object from a parameter set.
Code lines: 22
Contained by: file cooling.cold_mode.infall_rate.dynamical_time.F90
Modules used: input_parameters

subroutine: dynamicaltimedestructor
Description: Destructor for the dynamical time cold mode infall rate class.
Code lines: 7
Contained by: file cooling.cold_mode.infall_rate.dynamical_time.F90

function: dynamicaltimeinfallrate
Description: Computes the cold mode infall rate as a fraction of the halo dynamical time.
Code lines: 11
Contained by: file cooling.cold_mode.infall_rate.dynamical_time.F90
Modules used: galacticus_nodes

file: cooling.cooling_function.CIE_file.F90
Description: Implements a cooling function class which interpolates in a tabulated cooling function read from file.
Code lines: 542
Modules used: fgsl

function: ciefileconstructorinternal
Description: Internal constructor for the "CIE file" cooling function class.
Code lines: 17
Contained by: file cooling.cooling_function.CIE_file.F90

function: ciefileconstructorparameters
Description: Constructor for the "CIE file" cooling function class which takes a parameter set as input.
Code lines: 26
Contained by: file cooling.cooling_function.CIE_file.F90
Modules used: input_parameters

function: ciefilecoolingfunction
Description: Return the cooling function by interpolating in tabulated CIE data read from a file.
Code lines: 70
Contained by: file cooling.cooling_function.CIE_file.F90

Modules used: abundances_structure, chemical_abundances_structure, iso_c_binding, radiation_fields, table_labels

function: ciefilecoolingfunctiondensitylogslope
Description: Return the logarithmic slope of the cooling function with respect to density.
Code lines: 16
Contained by: file cooling.cooling_function.CIE_file.F90
Modules used: abundances_structure, chemical_abundances_structure, radiation_fields

function: ciefilecoolingfunctiontemperaturelogslope
Description: Return the slope of the cooling function with respect to temperature by interpolating in tabulated CIE data read from a file.
Code lines: 77
Contained by: file cooling.cooling_function.CIE_file.F90
Modules used: abundances_structure, chemical_abundances_structure, iso_c_binding, radiation_fields, table_labels

subroutine: ciefiledestructor
Description: Destructor for the "CIE file" cooling function class.
Code lines: 10
Contained by: file cooling.cooling_function.CIE_file.F90
Modules used: numerical_interpolation

function: ciefileinterpolate
Description: Perform the interpolation.
Code lines: 13
Contained by: file cooling.cooling_function.CIE_file.F90
Modules used: iso_c_binding

subroutine: ciefileinterpolatingfactors
Description: Determine the interpolating paramters.
Code lines: 28
Contained by: file cooling.cooling_function.CIE_file.F90
Modules used: iso_c_binding, numerical_interpolation

subroutine: ciefilereadfile
Description: Read in data from a cooling function file.
Code lines: 82
Contained by: file cooling.cooling_function.CIE_file.F90
Modules used: file_utilities, galacticus_display, galacticus_error, io_hdf5, iso_varying_string, table_labels

interface: coolingfunctionciefile
Description: Constructors for the "CIE file" cooling function class.
Code lines: 4

Contained by: file cooling.cooling_function.CIE_file.F90

file: cooling.cooling_function.CMB_Compton.F90
Description: Implements a cooling function class which implements cooling due to Compton scattering off of CMB photons.
Code lines: 172
Modules used: chemical_states

function: cmbcomptonconstructorinternal
Description: Internal constructor for the cmbCompton cooling function class.
Code lines: 9
Contained by: file cooling.cooling_function.CMB_Compton.F90
Modules used: input_parameters

function: cmbcomptonconstructorparameters
Description: Constructor for the "CMB Compton" cooling function class which takes a parameter set as input.
Code lines: 13
Contained by: file cooling.cooling_function.CMB_Compton.F90
Modules used: input_parameters

function: cmbcomptoncoolingfunction
Description: Return the cooling function due to Compton scattering off of CMB photons.
Code lines: 22
Contained by: file cooling.cooling_function.CMB_Compton.F90
Modules used: abundances_structure chemical_abundances_structure numerical_constants_physical numerical_constants_units radiation_fields

function: cmbcomptoncoolingfunctiondensitylogslope
Description: Return the logarithmic gradient with respect to density of the cooling function due to Compton scattering off of CMB photons.
Code lines: 17
Contained by: file cooling.cooling_function.CMB_Compton.F90
Modules used: abundances_structure chemical_abundances_structure radiation_fields

function: cmbcomptoncoolingfunctiontemperaturelogslope
Description: Return the logarithmic gradient with respect to temperature of the cooling function due to Compton scattering off of CMB photons.
Code lines: 20
Contained by: file cooling.cooling_function.CMB_Compton.F90
Modules used: abundances_structure chemical_abundances_structure radiation_fields

subroutine: cmbcomptondestructor
Description: Destructor for the cmbCompton cooling function class.
Code lines: 7
Contained by: file cooling.cooling_function.CMB_Compton.F90

function: `cmbcomptontemperature`
Description: Return the temperature of the cosmic microwave background.
Code lines: 26
Contained by: file `cooling.cooling_function.CMB_Compton.F90`
Modules used: `galacticus_error` `radiation_fields`

interface: `coolingfunctioncmbcompton`
Description: Constructors for the "CMB Compton" cooling function class.
Code lines: 4
Contained by: file `cooling.cooling_function.CMB_Compton.F90`

file: `cooling.cooling_function.F90`
Description: Contains a module that provides a class implementing cooling functions.
Code lines: 63

module: `cooling_functions`
Description: Provides a class implementing cooling functions.
Code lines: 41
Contained by: file `cooling.cooling_function.F90`

Used by: file `accretion.halo.cold_mode.F90`; file `cooling.cooling_time.simple.F90`; subroutine `galacticus_function_classes_destroy`; subroutine `galacticus_state_retrieve`; subroutine `galacticus_state_store`; file `nodes.property_extractor.ICM_Xray_luminosity.F90`; program `test_cooling_functions`

file: `cooling.cooling_function.atomic_CIE_Cloudy.F90`
Description: Implements a cooling function class which utilizes the Cloudy code to compute cooling in collisional ionization equilibrium.
Code lines: 206

function: `atomiccieclоudyconstructorinternal`
Description: Internal constructor for the "atomic CIE Cloudy" cooling function class.
Code lines: 14
Contained by: file `cooling.cooling_function.atomic_CIE_Cloudy.F90`

function: `atomiccieclоudyconstructorparameters`
Description: Constructor for the "atomic CIE Cloudy" cooling function class which takes a parameter set as input.
Code lines: 10
Contained by: file `cooling.cooling_function.atomic_CIE_Cloudy.F90`
Modules used: `input_parameters`

function: `atomiccieclоudycoolingfunction`
Description: Return the cooling function for collisional ionization equilibrium as computed by Cloudy.
Code lines: 13

Contained by: file cooling.cooling_function.atomic_CIE_Cloudy.F90

function: atomiccieclоudycoolingfunctiondensitylogslope
Description: Return the logarithmic slope of the cooling function with respect to density for collisional ionization equilibrium as computed by Cloudy.
Code lines: 13
Contained by: file cooling.cooling_function.atomic_CIE_Cloudy.F90

function: atomiccieclоudycoolingfunctiontemperaturelogslope
Description: Return the logarithmic slope of the cooling function with respect to temperature for collisional ionization equilibrium as computed by Cloudy. read from a file.
Code lines: 14
Contained by: file cooling.cooling_function.atomic_CIE_Cloudy.F90

subroutine: atomiccieclоudydestructor
Description: Destructor for the "atomic CIE Cloudy" cooling function class.
Code lines: 9
Contained by: file cooling.cooling_function.atomic_CIE_Cloudy.F90
Modules used: numerical_interpolation

subroutine: atomiccieclоudytabulate
Description: Create the chemical state.
Code lines: 44
Contained by: file cooling.cooling_function.atomic_CIE_Cloudy.F90
Modules used: galacticus_display galacticus_paths interfaces_cloudy_cie string_handling system_command

interface: coolingfunctionatomiccieclоudy
Description: Constructors for the "atomic CIE Cloudy" cooling function class.
Code lines: 4
Contained by: file cooling.cooling_function.atomic_CIE_Cloudy.F90

file: cooling.cooling_function.molecular_hydrogen_Galli_Palla.F90
Description: Implements a cooling function class which implements cooling from molecular hydrogen using the cooling function of Galli and Palla [1998].
Code lines: 392

interface: coolingfunctionmolecularhydrogengallipalla
Description: Constructors for the "molecular hydrogen (Galli & Palla)" cooling function class.
Code lines: 4
Contained by: file cooling.cooling_function.molecular_hydrogen_Galli_Palla.F90

subroutine: molecularhydrogengallipallacommonfactors
Description: Compute the ratio of critical number density to the hydrogen number density for use in molecular hydrogen cooling functions.
Code lines: 32
Contained by: file cooling.cooling_function.molecular_hydrogen_Galli_Palla.F90
Modules used: numerical_constants_prefixes

function: `molecularhydrogengallipallaconstructorinternal`
Description: Internal constructor for the "molecular hydrogen (Galli & Palla)" cooling function class.
Code lines: 19
Contained by: file `cooling.cooling_function.molecular_hydrogen_Galli_Palla.F90`

function: `molecularhydrogengallipallaconstructorparameters`
Description: Constructor for the "molecular hydrogen (Galli & Palla)" cooling function class which takes a parameter set as input.
Code lines: 10
Contained by: file `cooling.cooling_function.molecular_hydrogen_Galli_Palla.F90`
Modules used: `input_parameters`

function: `molecularhydrogengallipallacoolingfunction`
Description: Return the cooling function due to molecular hydrogen using the cooling function of Galli and Palla [1998] (which refers to the local thermodynamic equilibrium cooling function of Hollenbach and McKee [1979]). Cooling functions involving H_2^+ are computed using polynomial fits to the results of Suchkov and Shchekinov [1978] found by Andrew Benson by measuring curves from the original paper.
Code lines: 24
Contained by: file `cooling.cooling_function.molecular_hydrogen_Galli_Palla.F90`
Modules used: `abundances_structure` `chemical_abundances_structure` `radiation_fields`

function: `molecularhydrogengallipallacoolingfunctiondensitylogslope`
Description: Return the gradient with respect to density of the cooling function due to molecular hydrogen using the cooling function of Galli and Palla [1998].
Code lines: 43
Contained by: file `cooling.cooling_function.molecular_hydrogen_Galli_Palla.F90`
Modules used: `abundances_structure` `chemical_abundances_structure` `radiation_fields`

function: `molecularhydrogengallipallacoolingfunctionh2plus_electron`
Description: Compute the cooling function due to H_2^+–e^- interactions.
Code lines: 26
Contained by: file `cooling.cooling_function.molecular_hydrogen_Galli_Palla.F90`
Modules used: `chemical_abundances_structure`

function: `molecularhydrogengallipallacoolingfunctionh_h2`
Description: Compute the cooling function due to H–H_2 interactions.
Code lines: 22
Contained by: file `cooling.cooling_function.molecular_hydrogen_Galli_Palla.F90`
Modules used: `chemical_abundances_structure`

function: `molecularhydrogengallipallacoolingfunctionh_h2plus`
Description: Compute the cooling function due to H–H_2^+ interactions.
Code lines: 25
Contained by: file `cooling.cooling_function.molecular_hydrogen_Galli_Palla.F90`
Modules used: `chemical_abundances_structure`

function: `molecularhydrogengallipallacoolingfunctiontemperaturelogslope`
Description: Return the gradient with respect to temperature of the cooling function due to molecular hydrogen using the cooling function of Galli and Palla [1998].
Code lines: 75
Contained by: file `cooling.cooling_function.molecular_hydrogen_Galli_Palla.F90`
Modules used: `abundances_structure` `chemical_abundances_structure` `numerical_constants_prefixes` `radiation_fields`

file: `cooling.cooling_function.summation.F90`
Description: Implements a cooling function class which sums over other cooling functions.
Code lines: 253

type: `coolantlist`
Code lines: 3
Contained by: file `cooling.cooling_function.summation.F90`

interface: `coolingfunctionsummation`
Description: Constructors for the "summation" cooling function class.
Code lines: 4
Contained by: file `cooling.cooling_function.summation.F90`

function: `summationconstructorinternal`
Description: Internal constructor for the "summation" cooling function class.
Code lines: 14
Contained by: file `cooling.cooling_function.summation.F90`

function: `summationconstructorparameters`
Description: Constructor for the "summation" cooling function class which takes a parameter set as input.
Code lines: 21
Contained by: file `cooling.cooling_function.summation.F90`
Modules used: `input_parameters`

function: `summationcoolingfunction`
Description: Return the cooling function summed over other cooling functions.
Code lines: 21
Contained by: file `cooling.cooling_function.summation.F90`
Modules used: `abundances_structure` `chemical_abundances_structure` `chemical_states` `radiation_fields`

function: `summationcoolingfunctiondensitylogslope`
Description: Return the logarithmic gradient with respect to density of the cooling function due to Compton scattering off of CMB photons.
Code lines: 33
Contained by: file `cooling.cooling_function.summation.F90`
Modules used: `abundances_structure` `chemical_abundances_structure` `chemical_states` `galacticus_error` `radiation_fields`

function: summationcoolingfunctiontemperaturelogslope

Description: Return the logarithmic gradient with respect to temperature of the cooling function due to Compton scattering off of CMB photons.
Code lines: 32
Contained by: file cooling.cooling_function.summation.F90
Modules used: abundances_structure, chemical_abundances_structure, galacticus_error, radiation_fields

subroutine: summationdeepcopy

Description: Perform a deep copy for the summation cooling function class.
Code lines: 31
Contained by: file cooling.cooling_function.summation.F90
Modules used: galacticus_error

subroutine: summationdescriptor

Description: Add parameters to an input parameter list descriptor which could be used to recreate this object.
Code lines: 19
Contained by: file cooling.cooling_function.summation.F90
Modules used: fox_dom, input_parameters

subroutine: summationdestructor

Description: Destructor for the "summation" cooling function class.
Code lines: 16
Contained by: file cooling.cooling_function.summation.F90

file: cooling.cooling_radius.F90

Description: Contains a module that implements calculations of the cooling radius.
Code lines: 49

module: cooling_radii

Description: Provides a class that implements calculations of the cooling radius.
Code lines: 27
Contained by: file cooling.cooling_radius.F90
Modules used: galacticus_nodes
Used by: file cooling.infall_radius.cooling_and_freefall.F90; file cooling.infall_radius.cooling_radius.F90; subroutine galacticus_function_classes_destroy; subroutine galacticus_state_retrieve; subroutine galacticus_state_store; file nodes.property_extractor.cooling_radius.F90; module node_component_black_hole_simple; module node_component_black_hole_standard

file: cooling.cooling_radius.beta_profile.F90

Description: Implementation of a cooling radius class for β-profile halos, assuming collisional ionization equilibrium such that cooling time scales as inverse density.
Code lines: 343
Modules used: cooling_times, cooling_times_available

cosmology_functions dark_matter_halo_scales
hot_halo_mass_distributions hot_halo_temperature_profiles

subroutine: betaprofileautohook
Description: Attach to the calculation reset event.
Code lines: 8
Contained by: file cooling.cooling_radius.beta_profile.F90
Modules used: events_hooks

subroutine: betaprofilecalculationreset
Description: Reset the cooling radius calculation.
Code lines: 10
Contained by: file cooling.cooling_radius.beta_profile.F90

function: betaprofileconstructorinternal
Description: Internal constructor for the β-profile cooling radius class.
Code lines: 49
Contained by: file cooling.cooling_radius.beta_profile.F90
Modules used: abundances_structure array_utilities
chemical_abundances_structure galacticus_error
galacticus_nodes iso_varying_string
string_handling

function: betaprofileconstructorparameters
Description: Constructor for the β-profile cooling radius class which builds the object from a parameter set.
Code lines: 28
Contained by: file cooling.cooling_radius.beta_profile.F90
Modules used: input_parameters

subroutine: betaprofiledestructor
Description: Destructor for the β-profile cooling radius class.
Code lines: 15
Contained by: file cooling.cooling_radius.beta_profile.F90
Modules used: events_hooks

function: betaprofileradius
Description: Return the cooling radius in the β-profile model.
Code lines: 66
Contained by: file cooling.cooling_radius.beta_profile.F90
Modules used: abundances_structure chemical_abundances_structure
chemical_reaction_rates_utilities galacticus_nodes
hot_halo_mass_distributions

function: betaprofileradiusgrowthrate
Description: Returns the cooling radius growth rate (in Mpc/Gyr) in the hot atmosphere.
Code lines: 65
Contained by: file cooling.cooling_radius.beta_profile.F90

Modules used: abundances_structure, chemical_abundances_structure, chemical_reaction_rates_utilities, galacticus_nodes, hot_halo_mass_distributions

interface: `coolingradiusbetaprofile`
Description: Constructors for the betaProfile cooling radius class.
Code lines: 4
Contained by: file cooling.cooling_radius.beta_profile.F90

file: `cooling.cooling_radius.isothermal_profile.F90`
Description: Implementation of a cooling radius class for isothermal halos, assuming collisional ionization equilibrium such that cooling time scales as inverse density.
Code lines: 277
Modules used: cooling_times, cooling_times_available, cosmology_functions, dark_matter_halo_scales, hot_halo_mass_distributions, hot_halo_temperature_profiles, kind_numbers

interface: `coolingradiusisothermal`
Description: Constructors for the isothermal cooling radius class.
Code lines: 4
Contained by: file cooling.cooling_radius.isothermal_profile.F90

subroutine: `isothermalautohook`
Description: Attach to the calculation reset event.
Code lines: 8
Contained by: file cooling.cooling_radius.isothermal_profile.F90
Modules used: events_hooks

subroutine: `isothermalcalculationreset`
Description: Reset the cooling radius calculation.
Code lines: 10
Contained by: file cooling.cooling_radius.isothermal_profile.F90

function: `isothermalconstructorinternal`
Description: Internal constructor for the isothermal cooling radius class.
Code lines: 31
Contained by: file cooling.cooling_radius.isothermal_profile.F90
Modules used: abundances_structure, array_utilities, chemical_abundances_structure, galacticus_error, galacticus_nodes, iso_varying_string, string_handling

function: `isothermalconstructorparameters`
Description: Constructor for the isothermal cooling radius class which builds the object from a parameter set.
Code lines: 28
Contained by: file cooling.cooling_radius.isothermal_profile.F90
Modules used: input_parameters

subroutine: `isothermaldestructor`
Description: Destructor for the isothermal cooling radius class.
Code lines: 15
Contained by: file `cooling.cooling_radius.isothermal_profile.F90`
Modules used: `events_hooks`

function: `isothermalradius`
Description: Return the cooling radius in the isothermal model.
Code lines: 57
Contained by: file `cooling.cooling_radius.isothermal_profile.F90`
Modules used: `abundances_structure` `chemical_abundances_structure` `chemical_reaction_rates_utilities` `galacticus_nodes`

function: `isothermalradiusgrowthrate`
Description: Returns the cooling radius growth rate (in Mpc/Gyr) in the hot atmosphere.
Code lines: 30
Contained by: file `cooling.cooling_radius.isothermal_profile.F90`
Modules used: `dark_matter_halo_scales`

file: `cooling.cooling_radius.simple.F90`
Description: Implementation of a simple cooling radius class.
Code lines: 338
Modules used: `abundances_structure` `chemical_abundances_structure` `cooling_times` `cooling_times_available` `cosmology_functions` `hot_halo_mass_distributions` `hot_halo_temperature_profiles` `kind_numbers` `radiation_fields`

function: `coolingradiusroot`
Description: Root function which evaluates the difference between the cooling time at `radius` and the time available for cooling.
Code lines: 14
Contained by: file `cooling.cooling_radius.simple.F90`

interface: `coolingradiussimple`
Description: Constructors for the simple cooling radius class.
Code lines: 4
Contained by: file `cooling.cooling_radius.simple.F90`

subroutine: `simpleautohook`
Description: Attach to the calculation reset event.
Code lines: 8
Contained by: file `cooling.cooling_radius.simple.F90`
Modules used: `events_hooks`

subroutine: `simplecalculationreset`
Description: Reset the cooling radius calculation.
Code lines: 10

Contained by: file cooling.cooling_radius.simple.F90

function: simpleconstructorinternal
Description: Internal constructor for the simple cooling radius class.
Code lines: 30
Contained by: file cooling.cooling_radius.simple.F90
Modules used: abundances_structure, array_utilities, chemical_abundances_structure, galacticus_error, galacticus_nodes, iso_varying_string, string_handling

function: simpleconstructorparameters
Description: Constructor for the simple cooling radius class which builds the object from a parameter set.
Code lines: 25
Contained by: file cooling.cooling_radius.simple.F90
Modules used: input_parameters

subroutine: simpledestructor
Description: Destructor for the simple cooling radius class.
Code lines: 14
Contained by: file cooling.cooling_radius.simple.F90
Modules used: events_hooks

function: simpleradius
Description: Return the cooling radius in the simple model.
Code lines: 76
Contained by: file cooling.cooling_radius.simple.F90
Modules used: chemical_reaction_rates_utilities, galacticus_nodes, root_finder

function: simpleradiusgrowthrate
Description: Returns the cooling radius growth rate (in Mpc/Gyr) in the hot atmosphere.
Code lines: 53
Contained by: file cooling.cooling_radius.simple.F90
Modules used: abundances_structure, chemical_abundances_structure, galacticus_nodes

file: cooling.cooling_rate.Cole2000.F90
Description: Implementation of a cooling rate class for the Cole et al. [2000] cooling rate calculation.
Code lines: 123
Modules used: cooling_infall_radii, hot_halo_mass_distributions

function: cole2000constructorinternal
Description: Internal constructor for the Cole et al. [2000] cooling rate class.
Code lines: 9
Contained by: file cooling.cooling_rate.Cole2000.F90

function: cole2000constructorparameters

Description: Constructor for the Cole et al. [2000] cooling rate class which builds the object from a parameter set.
Code lines: 16
Contained by: file cooling.cooling_rate.Cole2000.F90
Modules used: input_parameters

subroutine: cole2000destructor
Description: Destructor for the Cole et al. [2000] cooling rate class.
Code lines: 8
Contained by: file cooling.cooling_rate.Cole2000.F90

function: cole2000rate
Description: Returns the cooling rate (in $M_\odot$ Gyr^{-1}) in the hot atmosphere for the White and Frenk [1991] cooling rate model.
Code lines: 37
Contained by: file cooling.cooling_rate.Cole2000.F90
Modules used: galacticus_nodes numerical_constants_math

interface: coolingratecole2000
Description: Constructors for the Cole et al. [2000] cooling rate class.
Code lines: 4
Contained by: file cooling.cooling_rate.Cole2000.F90

file: cooling.cooling_rate.F90
Description: Contains a module that implements calculations of the cooling rate.
Code lines: 40

module: cooling_rates
Description: Provides a class that implements calculations of the cooling rate.
Code lines: 18
Contained by: file cooling.cooling_rate.F90
Modules used: galacticus_nodes
Used by: subroutine galacticus_function_classes_destroy; subroutine galacticus_state_retrieve; subroutine galacticus_state_store; file nodes.property_extractor.cooling_rate.F90; module node_component_hot_halo_standard; module node_component_hot_halo_very_simple; module node_component_mass_flow_statistics_standard

file: cooling.cooling_rate.White-Frenk.F90
Description: Implementation of a cooling rate class for the White and Frenk [1991] cooling rate calculation.
Code lines: 143
Modules used: cooling_infall_radii dark_matter_halo_scales hot_halo_mass_distributions

interface: coolingratewhitefrenk1991

Description: Constructors for the White and Frenk [1991] cooling rate class.
Code lines: 4
Contained by: file cooling.cooling_rate.White-Frenk.F90

function: whitefrenk1991constructorinternal
Description: Internal constructor for the White and Frenk [1991] cooling rate class.
Code lines: 16
Contained by: file cooling.cooling_rate.White-Frenk.F90
Modules used: array_utilities galacticus_error galacticus_nodes

function: whitefrenk1991constructorparameters
Description: Constructor for the White and Frenk [1991] cooling rate class which builds the object from a parameter set.
Code lines: 28
Contained by: file cooling.cooling_rate.White-Frenk.F90
Modules used: input_parameters

subroutine: whitefrenk1991destructor
Description: Destructor for the White and Frenk [1991] cooling rate class.
Code lines: 9
Contained by: file cooling.cooling_rate.White-Frenk.F90

function: whitefrenk1991rate
Description: Returns the cooling rate (in $M_\odot$ Gyr^{-1}) in the hot atmosphere for the White and Frenk [1991] cooling rate model.
Code lines: 35
Contained by: file cooling.cooling_rate.White-Frenk.F90
Modules used: galacticus_nodes numerical_constants_math

file: cooling.cooling_rate.cut_off.F90
Description: Implementation of a cooling rate class which modifies another cooling rate by cutting off cooling above some virial velocity.
Code lines: 168
Modules used: cosmology_functions dark_matter_halo_scales

interface: coolingratecutoff
Description: Constructors for the cut off cooling rate class.
Code lines: 4
Contained by: file cooling.cooling_rate.cut_off.F90

function: cutoffconstructorinternal
Description: Internal constructor for the cut off cooling rate class.
Code lines: 15
Contained by: file cooling.cooling_rate.cut_off.F90
Modules used: galacticus_error

function: cutoffconstructorparameters
Description: Constructor for the cut off cooling rate class which builds the object from a parameter set.
Code lines: 54

Contained by: file cooling.cooling_rate.cut_off.F90
Modules used: input_parameters

subroutine: cutoffdestructor
Description: Destructor for the cut off cooling rate class.
Code lines: 8
Contained by: file cooling.cooling_rate.cut_off.F90

function: cutoffrate
Description: Returns the cooling rate (in $M_\odot$ Gyr^{-1}) in the hot atmosphere for a model in which this rate is cut off before/after a given epoch and below a given virial velocity.
Code lines: 24
Contained by: file cooling.cooling_rate.cut_off.F90
Modules used: galacticus_nodes

file: cooling.cooling_rate.multiplier.F90
Description: Implementation of a cooling rate class which modifies another cooling rate by cutting off cooling in satellites.
Code lines: 97

interface: coolingratemultiplier
Description: Constructors for the cut off cooling rate class.
Code lines: 4
Contained by: file cooling.cooling_rate.multiplier.F90

function: multiplierconstructorinternal
Description: Internal constructor for the cut off cooling rate class.
Code lines: 8
Contained by: file cooling.cooling_rate.multiplier.F90

function: multiplierconstructorparameters
Description: Constructor for the cut off cooling rate class which builds the object from a parameter set.
Code lines: 22
Contained by: file cooling.cooling_rate.multiplier.F90
Modules used: input_parameters

subroutine: multiplierdestructor
Description: Destructor for the cut off cooling rate class.
Code lines: 7
Contained by: file cooling.cooling_rate.multiplier.F90

function: multiplierrate
Description: Returns the cooling rate (in $M_\odot$ Gyr^{-1}) in the hot atmosphere for a model in which this rate is multiplied by some fixed value.
Code lines: 9
Contained by: file cooling.cooling_rate.multiplier.F90

file: cooling.cooling_rate.no_cooling_satellites.F90
Description: Implementation of a cooling rate class which modifies another cooling rate by cutting off cooling in satellites.

Code lines: 91

interface: `coolingratenocoolingsatellites`
Description: Constructors for the cut off cooling rate class.
Code lines: 4
Contained by: file `cooling.cooling_rate.no_cooling_satellites.F90`

function: `nocoolingsatellitesconstructorinternal`
Description: Internal constructor for the cut off cooling rate class.
Code lines: 8
Contained by: file `cooling.cooling_rate.no_cooling_satellites.F90`
Modules used: `array_utilities`

function: `nocoolingsatellitesconstructorparameters`
Description: Constructor for the cut off cooling rate class which builds the object from a parameter set.
Code lines: 13
Contained by: file `cooling.cooling_rate.no_cooling_satellites.F90`
Modules used: `input_parameters`

subroutine: `nocoolingsatellitesdestructor`
Description: Destructor for the cut off cooling rate class.
Code lines: 7
Contained by: file `cooling.cooling_rate.no_cooling_satellites.F90`

function: `nocoolingsatellitesrate`
Description: Returns the cooling rate (in $M_\odot$ Gyr^{-1}) in the hot atmosphere for a model in which this rate is cut off in satellites.
Code lines: 13
Contained by: file `cooling.cooling_rate.no_cooling_satellites.F90`

file: `cooling.cooling_rate.simple.F90`
Description: Implementation of a simple cooling rate class.
Code lines: 85

interface: `coolingratesimple`
Description: Constructors for the simple cooling rate class.
Code lines: 4
Contained by: file `cooling.cooling_rate.simple.F90`

function: `simpleconstructorinternal`
Description: Internal constructor for the simple cooling rate class.
Code lines: 8
Contained by: file `cooling.cooling_rate.simple.F90`

function: `simpleconstructorparameters`
Description: Constructor for the simple cooling rate class which builds the object from a parameter set.
Code lines: 20
Contained by: file `cooling.cooling_rate.simple.F90`
Modules used: `input_parameters`

function: `simplerate`
Description: Returns the cooling rate (in $M_\odot$ Gyr^{-1}) in the hot atmosphere for a model in which this rate is always simple.
Code lines: 11
Contained by: file `cooling.cooling_rate.simple.F90`
Modules used: `galacticus_nodes`

file: `cooling.cooling_rate.simple_scaling.F90`
Description: Implementation of a cooling rate class in which the cooling rate scales with the mass of the halo.
Code lines: 162
Modules used: `cosmology_functions`

interface: `coolingratesimplescaling`
Description: Constructors for the simple caling cooling rate class.
Code lines: 4
Contained by: file `cooling.cooling_rate.simple_scaling.F90`

function: `simplescalingconstructorinternal`
Description: Internal constructor for the simple caling cooling rate class.
Code lines: 19
Contained by: file `cooling.cooling_rate.simple_scaling.F90`
Modules used: `array_utilities` `galacticus_error` `galacticus_nodes`

function: `simplescalingconstructorparameters`
Description: Constructor for the simple caling cooling rate class which builds the object from a parameter set.
Code lines: 54
Contained by: file `cooling.cooling_rate.simple_scaling.F90`
Modules used: `input_parameters`

subroutine: `simplescalingdestructor`
Description: Destructor for the simple caling cooling rate class.
Code lines: 7
Contained by: file `cooling.cooling_rate.simple_scaling.F90`

function: `simplescalingrate`
Description: Returns the cooling rate (in $M_\odot$ Gyr^{-1}) in the hot atmosphere for a model in which this rate scales with the mass of the halo.
Code lines: 28
Contained by: file `cooling.cooling_rate.simple_scaling.F90`
Modules used: `galacticus_nodes`

file: `cooling.cooling_rate.velocity_maximum_scaling.F90`
Description: Implementation of a cooling rate class in which the cooling rate scales with the peak circular velocity in the halo.
Code lines: 206
Modules used: `cosmology_functions` `dark_matter_profiles_dmo`

math_exponentiation

interface: `coolingratevelocitymaximumscaling`
Description: Constructors for the velocity maximum scaling cooling rate class.
Code lines: 4
Contained by: file cooling.cooling_rate.velocity_maximum_scaling.F90

function: `velocitymaximumscalingconstructorinternal`
Description: Internal constructor for the velocity maximum scaling cooling rate class.
Code lines: 27
Contained by: file cooling.cooling_rate.velocity_maximum_scaling.F90
Modules used: array_utilities galacticus_error galacticus_nodes

function: `velocitymaximumscalingconstructorparameters`
Description: Constructor for the velocity maximum scaling cooling rate class which builds the object from a parameter set.
Code lines: 81
Contained by: file cooling.cooling_rate.velocity_maximum_scaling.F90
Modules used: input_parameters

subroutine: `velocitymaximumscalingdestructor`
Description: Destructor for the velocity maximum scaling cooling rate class.
Code lines: 8
Contained by: file cooling.cooling_rate.velocity_maximum_scaling.F90

function: `velocitymaximumscalingrate`
Description: Returns the cooling rate (in $M_\odot$ Gyr^{-1}) in the hot atmosphere for a model in which this rate scales with the maximum circular velocity of the halo.
Code lines: 30
Contained by: file cooling.cooling_rate.velocity_maximum_scaling.F90
Modules used: galacticus_nodes

file: `cooling.cooling_rate.zero.F90`
Description: Implementation of a zero cooling rate class.
Code lines: 60

interface: `coolingratezero`
Description: Constructors for the zero cooling rate class.
Code lines: 3
Contained by: file cooling.cooling_rate.zero.F90

function: `zeroconstructorparameters`
Description: Constructor for the zero cooling rate class which builds the object from a parameter set.
Code lines: 10
Contained by: file cooling.cooling_rate.zero.F90
Modules used: input_parameters

function: `zerorate`

Description: Returns the cooling rate (in $M_\odot$ Gyr^{-1}) in the hot atmosphere for a model in which this rate is always zero.
Code lines: 9
Contained by: file cooling.cooling_rate.zero.F90

file: cooling.cooling_time.F90
Description: Contains a module that implements calculations of the cooling time.
Code lines: 64

module: cooling_times
Description: Implements calculations of the cooling time.
Code lines: 42
Contained by: file cooling.cooling_time.F90
Modules used: abundances_structure, chemical_abundances_structure, radiation_fields
Used by: file cooling.cooling_radius.beta_profile.F90; file cooling.cooling_radius.isothermal_profile.F90; file cooling.cooling_radius.simple.F90; subroutine galacticus_function_classes_destroy; subroutine galacticus_state_retrieve; subroutine galacticus_state_store

file: cooling.cooling_time.simple.F90
Description: Implementation of a simple cooling time class.
Code lines: 156
Modules used: chemical_states, cooling_functions

interface: coolingtimesimple
Description: Constructors for the simple cooling time class.
Code lines: 4
Contained by: file cooling.cooling_time.simple.F90

function: simpleconstructorinternal
Description: Internal constructor for the simple cooling time class.
Code lines: 10
Contained by: file cooling.cooling_time.simple.F90

function: simpleconstructorparameters
Description: Constructor for the simple cooling time class which builds the object from a parameter set.
Code lines: 25
Contained by: file cooling.cooling_time.simple.F90
Modules used: input_parameters

subroutine: simpledestructor
Description: Destructor for the simple cooling time class.
Code lines: 8
Contained by: file cooling.cooling_time.simple.F90

function: simplegradientdensitylogarithmic
Description: Return $\mathrm{d}\ln t_{\rm cool}/\mathrm{d}\ln\rho$ for gas at the given `temperature` (in Kelvin), `density` (in $M_\odot$ Mpc^{-3}), composition specified by `gasAbundances` and experiencing a radiation field as described by `radiation`.

Code lines: 12
Contained by: file cooling.cooling_time.simple.F90

function: simplegradienttemperaturelogarithmic
Description: Return $\mathrm{d}\ln t_{\rm cool}/\mathrm{d}\ln T$ for gas at the given temperature (in Kelvin), density (in $M_\odot$ Mpc^{-3}), composition specified by gasAbundances and experiencing a radiation field as described by radiation.
Code lines: 12
Contained by: file cooling.cooling_time.simple.F90

function: simpletime
Description: Compute the cooling time (in Gyr) for gas at the given temperature (in Kelvin), density (in $M_\odot$ Mpc^{-3}), composition specified by gasAbundances and experiencing a radiation field as described by radiation.
Code lines: 30
Contained by: file cooling.cooling_time.simple.F90
Modules used: numerical_constants_astronomical numerical_constants_physical

file: cooling.freefall_radii.F90
Description: Contains a module that implements calculations of the freefall radius.
Code lines: 48

module: freefall_radii
Description: Provides a class that implements calculations of the freefall radius.
Code lines: 26
Contained by: file cooling.freefall_radii.F90
Modules used: galacticus_nodes
Used by: file cooling.infall_radius.cooling_-and_freefall.F90 subroutine galacticus_function_-classes_destroy
subroutine galacticus_state_retrieve subroutine galacticus_state_store

file: cooling.freefall_radii.dark_matter_halo.F90
Description: Implementation of a simple freefall radius class.
Code lines: 116
Modules used: cooling_freefall_times_available dark_matter_profiles_dmo

function: darkmatterhaloconstructorinternal
Description: Internal constructor for the darkMatterHalo freefall radius class.
Code lines: 9
Contained by: file cooling.freefall_radii.dark_matter_halo.F90

function: darkmatterhaloconstructorparameters
Description: Constructor for the darkMatterHalo freefall radius class which builds the object from a parameter set.
Code lines: 16
Contained by: file cooling.freefall_radii.dark_matter_halo.F90
Modules used: input_parameters

subroutine: darkmatterhalodestructor

Description: Destructor for the darkMatterHalo freefall radius class.
Code lines: 8
Contained by: file cooling.freefall_radii.dark_matter_halo.F90

function: darkmatterhaloradius
Description: Return the freefall radius in the darkMatterHalo model.
Code lines: 12
Contained by: file cooling.freefall_radii.dark_matter_halo.F90

function: darkmatterhaloradiusgrowthrate
Description: Returns the freefall radius growth rate (in Mpc/Gyr) in the hot atmosphere.
Code lines: 14
Contained by: file cooling.freefall_radii.dark_matter_halo.F90

interface: freefallradiusdarkmatterhalo
Description: Constructors for the darkMatterHalo freefall radius class.
Code lines: 4
Contained by: file cooling.freefall_radii.dark_matter_halo.F90

file: cooling.freefall_time_available.F90
Description: Contains a module that implements calculations of the time available for freefall in cooling calculations.
Code lines: 48

module: cooling_freefall_times_available
Description: Provides a class that implements calculations of the freefall radius.
Code lines: 26
Contained by: file cooling.freefall_time_available.F90
Modules used: galacticus_nodes
Used by: file cooling.freefall_radii.dark_matter_halo.F90; subroutine galacticus_function_classes_destroy; subroutine galacticus_state_retrieve; subroutine galacticus_state_store

file: cooling.freefall_time_available.halo_formation.F90
Description: Implementation of the Cole et al. [2000] method for computing the time available for freefall in cooling calculations in hot halos.
Code lines: 88

interface: freefalltimeavailablehaloformation
Description: Constructors for the haloFormation freefall time available class.
Code lines: 3
Contained by: file cooling.freefall_time_available.halo_formation.F90

function: haloformationconstructorparameters
Description: Constructor for the haloFormation freefall time available class which builds the object from a parameter set.
Code lines: 15
Contained by: file cooling.freefall_time_available.halo_formation.F90
Modules used: galacticus_error; galacticus_nodes; input_parameters

function: `haloformationtimeavailable`
Description: Compute the time available for freefall using the Cole et al. [2000] method. Specifically, the time available is assumed to be the time since the halo formation event.
Code lines: 15
Contained by: file `cooling.freefall_time_available.halo_formation.F90`
Modules used: `galacticus_nodes`

function: `haloformationtimeavailableincreaserate`
Description: Compute the rate of increase of the time available for freefall using the Cole et al. [2000] method. We return a rate of 1.
Code lines: 11
Contained by: file `cooling.freefall_time_available.halo_formation.F90`

file: `cooling.infall_radius.F90`
Description: Contains a module that implements calculations of the infall radius for cooling calculations.
Code lines: 47

module: `cooling_infall_radii`
Description: Provides a class that implements calculations of the infall radius for cooling calculations.
Code lines: 25
Contained by: file `cooling.infall_radius.F90`
Modules used: `galacticus_nodes`
Used by: file `cooling.cooling_rate.Cole2000.F90`; file `cooling.cooling_rate.White-Frenk.F90`; subroutine `galacticus_function_classes_destroy`; subroutine `galacticus_state_retrieve`; subroutine `galacticus_state_store`; module `node_component_hot_halo_standard`

file: `cooling.infall_radius.cooling_and_freefall.F90`
Description: Implementation of an infall radius calculation in which the infall radius is the smaller of the cooling and freefall radii.
Code lines: 115
Modules used: `cooling_radii`; `freefall_radii`

function: `coolingfreefallconstructorinternal`
Description: Internal constructor for the cooling radius infall radii class.
Code lines: 10
Contained by: file `cooling.infall_radius.cooling_and_freefall.F90`
Modules used: `galacticus_error`

function: `coolingfreefallconstructorparameters`
Description: Constructor for the cooling radius infall radii class which builds the object from a parameter set.
Code lines: 16
Contained by: file `cooling.infall_radius.cooling_and_freefall.F90`
Modules used: `input_parameters`

subroutine: `coolingfreefalldestructor`

Description: Destructor for the cooling radius infall radii class.
Code lines: 8
Contained by: file cooling.infall_radius.cooling_and_freefall.F90

function: coolingfreefallradius
Description: Return the infall radius in the "cooling radius" model in Mpc/Gyr.
Code lines: 11
Contained by: file cooling.infall_radius.cooling_and_freefall.F90

function: coolingfreefallradiusincreaserate
Description: Return the growth rate of the infall radius in the "cooling radius" model in Mpc/Gyr.
Code lines: 15
Contained by: file cooling.infall_radius.cooling_and_freefall.F90

interface: coolinginfallradiuscoolingfreefall
Description: Constructors for the cooling radius infall radii class.
Code lines: 4
Contained by: file cooling.infall_radius.cooling_and_freefall.F90

file: cooling.infall_radius.cooling_radius.F90
Description: Implementation of a simple infall radius calculation, simply assuming that the infall radius equals the cooling radius.
Code lines: 98
Modules used: cooling_radii

interface: coolinginfallradiuscoolingradius
Description: Constructors for the cooling radius infall radii class.
Code lines: 4
Contained by: file cooling.infall_radius.cooling_radius.F90

function: coolingradiusconstructorinternal
Description: Internal constructor for the cooling radius infall radii class.
Code lines: 9
Contained by: file cooling.infall_radius.cooling_radius.F90
Modules used: galacticus_error

function: coolingradiusconstructorparameters
Description: Constructor for the cooling radius infall radii class which builds the object from a parameter set.
Code lines: 13
Contained by: file cooling.infall_radius.cooling_radius.F90
Modules used: input_parameters

subroutine: coolingradiusdestructor
Description: Destructor for the cooling radius infall radii class.
Code lines: 7
Contained by: file cooling.infall_radius.cooling_radius.F90

function: coolingradiusradius

Description: Return the infall radius in the "cooling radius" model in Mpc/Gyr.
Code lines: 8
Contained by: file cooling.infall_radius.cooling_radius.F90

function: coolingradiusradiusincreaserate
Description: Return the growth rate of the infall radius in the "cooling radius" model in Mpc/Gyr.
Code lines: 8
Contained by: file cooling.infall_radius.cooling_radius.F90

file: cooling.specific_angular_momentum.F90
Description: Contains a module that implements calculations of the specific angular momentum of cooling gas.
Code lines: 43

module: cooling_specific_angular_momenta
Description: Provides a class that implements calculations of the specific angular momentum of cooling gas.
Code lines: 21
Contained by: file cooling.specific_angular_momentum.F90
Modules used: galacticus_nodes
Used by: subroutine galacticus_function_-classes_destroy; subroutine galacticus_state_retrieve; subroutine galacticus_state_store; module node_component_hot_halo_-standard

file: cooling.specific_angular_momentum.constant_rotation.F90
Description: Implementation of a specific angular momentum of cooling gas class assuming a constant rotation velocity as a function of radius.
Code lines: 236
Modules used: dark_matter_profiles_dmo; hot_halo_mass_distributions; kind_numbers

function: constantrotationangularmomentumspecific
Description: Return the specific angular momentum of cooling gas in the constantRotation model.
Code lines: 63
Contained by: file cooling.specific_angular_momentum.constant_rotation.F90
Modules used: galacticus_error; galacticus_nodes; numerical_constants_physical

subroutine: constantrotationautohook
Description: Attach to the calculation reset event.
Code lines: 8
Contained by: file cooling.specific_angular_momentum.constant_rotation.F90
Modules used: events_hooks

subroutine: constantrotationcalculationreset
Description: Reset the specific angular momentum of cooling gas calculation.
Code lines: 9
Contained by: file cooling.specific_angular_momentum.constant_rotation.F90

function: `constantrotationconstructorinternal`
Description: Internal constructor for the darkMatterHalo freefall radius class.
Code lines: 13
Contained by: file `cooling.specific_angular_momentum.constant_rotation.F90`

function: `constantrotationconstructorparameters`
Description: Constructor for the constantRotation freefall radius class which builds the object from a parameter set.
Code lines: 48
Contained by: file `cooling.specific_angular_momentum.constant_rotation.F90`
Modules used: `input_parameters`

subroutine: `constantrotationdestructor`
Description: Destructor for the constant rotation specific angular momentum of cooling gas class.
Code lines: 10
Contained by: file `cooling.specific_angular_momentum.constant_rotation.F90`
Modules used: `events_hooks`

interface: `coolingspecificangularmomentumconstantrotation`
Description: Constructors for the constantRotation specific angular momentum of cooling gas class.
Code lines: 4
Contained by: file `cooling.specific_angular_momentum.constant_rotation.F90`

file: `cooling.specific_angular_momentum.mean.F90`
Description: Implementation of a specific angular momentum of cooling gas class in which all gas has the mean specific angular momentum of the hot gas halo.
Code lines: 68

interface: `coolingspecificangularmomentummean`
Description: Constructors for the mean specific angular momentum of cooling gas class.
Code lines: 3
Contained by: file `cooling.specific_angular_momentum.mean.F90`

function: `meanangularmomentumspecific`
Description: Return the specific angular momentum of cooling gas in the mean model.
Code lines: 14
Contained by: file `cooling.specific_angular_momentum.mean.F90`
Modules used: `galacticus_nodes`

function: `meanconstructorparameters`
Description: Constructor for the mean freefall radius class which builds the object from a parameter set.
Code lines: 10
Contained by: file `cooling.specific_angular_momentum.mean.F90`
Modules used: `input_parameters`

file: `cooling.time_available.F90`
Description: Contains a module that implements calculations of the time available for cooling.
Code lines: 46

module: `cooling_times_available`
Description: Provides a class that implements calculations of the time available for cooling.
Code lines: 24
Contained by: file `cooling.time_available.F90`
Modules used: `galacticus_nodes`
Used by: file `cooling.cooling_radius.beta_profile.F90`; file `cooling.cooling_radius.isothermal_profile.F90`; file `cooling.cooling_radius.simple.F90`; subroutine `galacticus_function_classes_destroy`; subroutine `galacticus_state_retrieve`; subroutine `galacticus_state_store`

file: `cooling.time_available.White-Frenk.F90`
Description: Implementation of the White and Frenk [1991] time available for cooling class.
Code lines: 127
Modules used: `dark_matter_halo_scales`

interface: `coolingtimeavailablewhitefrenk1991`
Description: Constructors for the White and Frenk [1991] time available for cooling class.
Code lines: 4
Contained by: file `cooling.time_available.White-Frenk.F90`

function: `whitefrenk1991constructorinternal`
Description: Internal constructor for the White and Frenk [1991] cooling rate class.
Code lines: 11
Contained by: file `cooling.time_available.White-Frenk.F90`
Modules used: `galacticus_error`

function: `whitefrenk1991constructorparameters`
Description: Constructor for the White and Frenk [1991] time available for cooling class which builds the object from a parameter set.
Code lines: 22
Contained by: file `cooling.time_available.White-Frenk.F90`
Modules used: `input_parameters`

subroutine: `whitefrenk1991destructor`
Description: Destructor for the White and Frenk [1991] cooling rate class.
Code lines: 7
Contained by: file `cooling.time_available.White-Frenk.F90`

function: `whitefrenk1991timeavailable`
Description: Returns the time available for cooling (in units of Gyr) in the hot atmosphere for the White and Frenk [1991] model.
Code lines: 22
Contained by: file `cooling.time_available.White-Frenk.F90`
Modules used: `galacticus_nodes`

function: `whitefrenk1991timeavailableincreaserate`
Description: Compute the rate of increase of the time available for cooling using the White and Frenk [1991] method. We return a rate of 1, even though technically it can depend on halo properties.

Code lines: 11
Contained by: file cooling.time_available.White-Frenk.F90

file: cooling.time_available.halo_formation.F90
Description: Implementation of the Cole et al. [2000] time available for cooling class.
Code lines: 84

interface: coolingtimeavailableformationtime
Description: Constructors for the Cole et al. [2000] time available for cooling class.
Code lines: 3
Contained by: file cooling.time_available.halo_formation.F90

function: formationtimeconstructorparameters
Description: Constructor for the Cole et al. [2000] time available for cooling class which builds the object from a parameter set.
Code lines: 14
Contained by: file cooling.time_available.halo_formation.F90
Modules used: galacticus_error galacticus_nodes input_parameters

function: formationtimetimeavailable
Description: Returns the time available for cooling (in units of Gyr) in the hot atmosphere for the Cole et al. [2000] model.
Code lines: 14
Contained by: file cooling.time_available.halo_formation.F90
Modules used: galacticus_nodes

function: formationtimetimeavailableincreaserate
Description: Compute the rate of increase of the time available for cooling using the Cole et al. [2000] method. We return a rate of 1, even though technically it can depend on halo properties.
Code lines: 11
Contained by: file cooling.time_available.halo_formation.F90

file: cosmology.functions.F90
Description: Contains a module which provides an object that implements cosmological functions.
Code lines: 249

module: cosmology_functions
Description: Provides an object that implements cosmological functions.
Code lines: 227
Contained by: file cosmology.functions.F90

module io_irate

file: cosmology.functions.matter_dark_energy.F90

Description: An implementation of the cosmological functions class for cosmologies consisting of collisionless matter and dark energy with an equation of state of the form: $P = \rho^w$ with $w(a) = w_0 + w_1 a(1-a)$.
Code lines: 682
Modules used: cosmology_parameters fgsl

interface: cosmologyfunctionsmatterdarkenergy

Description: Constructors for the matter plus dark energy cosmological functions class.
Code lines: 4
Contained by: file cosmology.functions.matter_dark_energy.F90

function: matterdarkenergyagetableodes

Description: System of differential equations to solve for expansion factor vs. age.
Code lines: 13
Contained by: file cosmology.functions.matter_dark_energy.F90

function: matterdarkenergyconstructorinternal

Description: Constructor for the matter plus dark energy cosmological functions class.
Code lines: 15
Contained by: file cosmology.functions.matter_dark_energy.F90
Modules used: cosmology_parameters

function: matterdarkenergyconstructorparameters

Description: Default constructor for the matter plus dark energy cosmological functions class.
Code lines: 31
Contained by: file cosmology.functions.matter_dark_energy.F90
Modules used: input_parameters

function: matterdarkenergycosmictime

Description: Return the cosmological matter density in units of the critical density at the present day.
Code lines: 36
Contained by: file cosmology.functions.matter_dark_energy.F90
Modules used: galacticus_error numerical_interpolation

function: `matterdarkenergydistancecomoving`
Description: Returns the comoving distance to cosmological time `time`.
Code lines: 11
Contained by: file `cosmology.functions.matter_dark_energy.F90`
Modules used: `galacticus_error`

function: `matterdarkenergydistancecomovingconvert`
Description: Convert bewteen different measures of distance.
Code lines: 12
Contained by: file `cosmology.functions.matter_dark_energy.F90`
Modules used: `galacticus_error`

function: `matterdarkenergydomination`
Description: Function used in root finding when seeking epoch at which matter dominates over dark energy.
Code lines: 7
Contained by: file `cosmology.functions.matter_dark_energy.F90`

function: `matterdarkenergydominationepochmatter`
Code lines: 59
Contained by: file `cosmology.functions.matter_dark_energy.F90`
Modules used: `cosmology_functions_parameters` `root_finder`

function: `matterdarkenergyequalityepochmatterdarkenergy`
Description: Return the epoch of matter-dark energy magnitude equality (either expansion factor or cosmic time).
Code lines: 54
Contained by: file `cosmology.functions.matter_dark_energy.F90`
Modules used: `cosmology_functions_parameters` `cosmology_parameters` `root_finder`

function: `matterdarkenergyequationofstatedarkenergy`
Description: Return the dark energy equation of state.
Code lines: 21
Contained by: file `cosmology.functions.matter_dark_energy.F90`
Modules used: `galacticus_error`

function: `matterdarkenergyexpansionfactorchange`
Description: Compute the expansion factor at time `timeEnd` given an initial value `expansionFactorStart` at time `timeStart`.
Code lines: 21
Contained by: file `cosmology.functions.matter_dark_energy.F90`
Modules used: `ode_solver`

function: `matterdarkenergyexponentdarkenergy`
Description: Return the dark energy exponent.
Code lines: 21
Contained by: file `cosmology.functions.matter_dark_energy.F90`

Modules used: galacticus_error

function: matterdarkenergyexponentdarkenergyderivative
Description: Return the derivative of the dark energy exponent with respect to expansion factor.
Code lines: 22
Contained by: file cosmology.functions.matter_dark_energy.F90
Modules used: galacticus_error

function: matterdarkenergyhubbleparameterepochal
Description: Returns the Hubble parameter at the request cosmological time, time, or expansion factor, expansionFactor.
Code lines: 37
Contained by: file cosmology.functions.matter_dark_energy.F90
Modules used: galacticus_error

function: matterdarkenergyhubbleparameterrateofchange
Description: Returns the rate of change of the Hubble parameter at the requested cosmological time, time, or expansion factor, expansionFactor.
Code lines: 26
Contained by: file cosmology.functions.matter_dark_energy.F90
Modules used: galacticus_error

subroutine: matterdarkenergymakeexpansionfactortable
Description: Builds a table of expansion factor vs. time for dark energy universes.
Code lines: 127
Contained by: file cosmology.functions.matter_dark_energy.F90
Modules used: cosmology_parameters memory_management numerical_interpolation numerical_ranges

function: matterdarkenergyomegadarkenergyepochal
Description: Return the dark energy density parameter at expansion factor expansionFactor.
Code lines: 26
Contained by: file cosmology.functions.matter_dark_energy.F90
Modules used: galacticus_error

subroutine: matterdarkenergytargetself
Description: Set a module-scope pointer to the current dark energy cosmology functions object.
Code lines: 7
Contained by: file cosmology.functions.matter_dark_energy.F90

function: matterdarkenergytimeatdistancecomoving
Description: Returns the cosmological time corresponding to given comovingDistance.
Code lines: 11
Contained by: file cosmology.functions.matter_dark_energy.F90
Modules used: galacticus_error

file: cosmology.functions.matter_lambda.F90
Description: An implementation of the cosmological functions class for cosmologies consisting of collisionless matter plus a cosmological constant.
Code lines: 1061

Modules used: cosmology_parameters fgsl

interface: cosmologyfunctionsmatterlambda
Description: Constructors for the matter plus cosmological constant cosmological functions class.
Code lines: 4
Contained by: file cosmology.functions.matter_lambda.F90

function: matterlambdaagetableodes
Description: System of differential equations to solve for expansion factor vs. age.
Code lines: 11
Contained by: file cosmology.functions.matter_lambda.F90

function: matterlambdacollapseodes
Description: System of differential equations to solve for age vs. expansion factor.
Code lines: 14
Contained by: file cosmology.functions.matter_lambda.F90

function: matterlambdacomovingdistanceintegrand
Description: Integrand function used in computing the comoving distance.
Code lines: 9
Contained by: file cosmology.functions.matter_lambda.F90
Modules used: numerical_constants_astronomical numerical_constants_physical

function: matterlambdaconstructorinternal
Description: Constructor for the matter plus cosmological constant cosmological functions class.
Code lines: 96
Contained by: file cosmology.functions.matter_lambda.F90
Modules used: iso_varying_string numerical_comparison ode_solver

function: matterlambdaconstructorparameters
Description: Parameter-based constructor for the matter plus cosmological constant cosmological functions class.
Code lines: 13
Contained by: file cosmology.functions.matter_lambda.F90
Modules used: input_parameters

function: matterlambdacosmictime
Description: Return the cosmological matter density in units of the critical density at the present day.
Code lines: 41
Contained by: file cosmology.functions.matter_lambda.F90
Modules used: galacticus_error numerical_interpolation

subroutine: matterlambdadensityscalingearlytime
Code lines: 14
Contained by: file cosmology.functions.matter_lambda.F90

subroutine: matterlambdadestructor
Description: Default constructor for the matter plus cosmological constant cosmological functions class.

Code lines: 20
Contained by: file cosmology.functions.matter_lambda.F90
Modules used: numerical_interpolation

function: matterlambdadistanceangular
Description: Returns the angular diameter distance to cosmological time time.
Code lines: 11
Contained by: file cosmology.functions.matter_lambda.F90
Modules used: galacticus_error numerical_interpolation

function: matterlambdadistancecomoving
Description: Returns the comoving distance to cosmological time time.
Code lines: 34
Contained by: file cosmology.functions.matter_lambda.F90
Modules used: galacticus_error numerical_interpolation

function: matterlambdadistancecomovingconvert
Description: Convert between different measures of distance.
Code lines: 54
Contained by: file cosmology.functions.matter_lambda.F90
Modules used: cosmology_functions_options galacticus_error numerical_interpolation

function: matterlambdadistanceluminosity
Description: Returns the luminosity distance to cosmological time time.
Code lines: 11
Contained by: file cosmology.functions.matter_lambda.F90
Modules used: galacticus_error numerical_interpolation

function: matterlambdadominationepochmatter
Code lines: 28
Contained by: file cosmology.functions.matter_lambda.F90
Modules used: cosmology_functions_parameters

subroutine: matterlambdaepochvalidate
Description: Validate a cosmic epoch, specified either by time or expansion factor, and optionally return time, expansion factor, and collapsing status.
Code lines: 42
Contained by: file cosmology.functions.matter_lambda.F90
Modules used: galacticus_error

function: matterlambdaequalityepochmattercurvature
Description: Return the epoch of matter-curvature magnitude equality (either expansion factor or cosmic time).
Code lines: 16
Contained by: file cosmology.functions.matter_lambda.F90
Modules used: cosmology_functions_parameters

function: matterlambdaequalityepochmatterdarkenergy

Description: Return the epoch of matter-dark energy magnitude equality (either expansion factor or cosmic time).
Code lines: 16
Contained by: file cosmology.functions.matter_lambda.F90
Modules used: cosmology_functions_parameters

function: matterlambdaequalityepochmatterradiation
Description: Return the epoch of matter-radiation magnitude equality (either expansion factor or cosmic time).
Code lines: 16
Contained by: file cosmology.functions.matter_lambda.F90
Modules used: cosmology_functions_parameters

function: matterlambdaequationofstatedarkenergy
Description: Return the dark energy equation of state.
Code lines: 9
Contained by: file cosmology.functions.matter_lambda.F90

function: matterlambdaexpansionfactor
Description: Returns the expansion factor at cosmological time time.
Code lines: 70
Contained by: file cosmology.functions.matter_lambda.F90
Modules used: galacticus_error iso_varying_string numerical_interpolation

function: matterlambdaexpansionrate
Description: Returns the cosmological expansion rate, $\dot{a}/a$ at expansion factor expansionFactor.
Code lines: 9
Contained by: file cosmology.functions.matter_lambda.F90

function: matterlambdaexponentdarkenergy
Description: Return the dark energy equation of state.
Code lines: 9
Contained by: file cosmology.functions.matter_lambda.F90

function: matterlambdahubbleparameterepochal
Description: Returns the Hubble parameter at the request cosmological time, time, or expansion factor, expansionFactor.
Code lines: 33
Contained by: file cosmology.functions.matter_lambda.F90
Modules used: galacticus_error

function: matterlambdahubbleparameterrateofchange
Description: Returns the rate of change of the Hubble parameter at the request cosmological time, time, or expansion factor, expansionFactor.
Code lines: 13
Contained by: file cosmology.functions.matter_lambda.F90
Modules used: galacticus_error

subroutine: matterlambdamakedistancetable

Description: Builds a table of distance vs. time.
Code lines: 59
Contained by: file cosmology.functions.matter_lambda.F90
Modules used: memory_management numerical_integration numerical_interpolation numerical_ranges

subroutine: matterlambdamakeexpansionfactortable
Description: Builds a table of expansion factor vs. time.
Code lines: 106
Contained by: file cosmology.functions.matter_lambda.F90
Modules used: memory_management numerical_interpolation numerical_ranges ode_solver

function: matterlambdamatterdensityepochal
Description: Return the matter density at expansion factor expansionFactor.
Code lines: 28
Contained by: file cosmology.functions.matter_lambda.F90
Modules used: galacticus_error

function: matterlambdaomegadarkenergyepochal
Description: Return the dark energy density parameter at expansion factor expansionFactor.
Code lines: 13
Contained by: file cosmology.functions.matter_lambda.F90
Modules used: galacticus_error

function: matterlambdaomegamatterepochal
Description: Return the matter density parameter at expansion factor expansionFactor.
Code lines: 13
Contained by: file cosmology.functions.matter_lambda.F90
Modules used: galacticus_error

function: matterlambdaomegamatterrateofchange
Description: Return the rate of change of the matter density parameter at expansion factor expansionFactor.
Code lines: 13
Contained by: file cosmology.functions.matter_lambda.F90
Modules used: galacticus_error

function: matterlambdatemperaturecmbepochal
Description: Return the temperature of the CMB at expansion factor expansionFactor.
Code lines: 13
Contained by: file cosmology.functions.matter_lambda.F90
Modules used: galacticus_error

function: matterlambdatimeatdistancecomoving
Description: Returns the cosmological time corresponding to given comovingDistance.
Code lines: 32
Contained by: file cosmology.functions.matter_lambda.F90
Modules used: galacticus_error numerical_interpolation

function: `matterlambdatimebigcrunch`
Description: Return the time of the Big Crunch (or a negative value if no Big Crunch occurs).
Code lines: 11
Contained by: file cosmology.functions.matter_lambda.F90

file: `cosmology.functions.options.F90`
Description: Contains a module which provides options for cosmological functions.
Code lines: 29

module: `cosmology_functions_options`
Description: Provides options for cosmological functions.
Code lines: 7
Contained by: file cosmology.functions.options.F90

file: `dark_matter.particle.cold_dark_matter.F90`
Description: Contains a module which implements a cold dark matter particle class.
Code lines: 50
Modules used: cosmology_parameters

function: `cdmconstructorparameters`
Description: Constructor for the "`CDM`" dark matter particle class which takes a parameter set as input.

Code lines: 10
Contained by: file dark_matter.particle.cold_dark_matter.F90
Modules used: input_parameters

interface: darkmatterparticlecdm
Description: Constructors for the "CDM" dark matter particle class.
Code lines: 3
Contained by: file dark_matter.particle.cold_dark_matter.F90

file: dark_matter.particle.warm_dark_matter.thermal.F90
Description: Contains a module which implements a thermal warm dark matter particle class.
Code lines: 154
Modules used: cosmology_parameters

interface: darkmatterparticlewdmthermal
Description: Constructors for the "WDMThermal" dark matter particle class.
Code lines: 4
Contained by: file dark_matter.particle.warm_dark_matter.thermal.F90

function: wdmthermalconstructorinternal
Description: Internal constructor for the "WDMThermal" dark matter particle class.
Code lines: 12
Contained by: file dark_matter.particle.warm_dark_matter.thermal.F90
Modules used: input_parameters

function: wdmthermalconstructorparameters
Description: Constructor for the "WDMThermal" dark matter particle class which takes a parameter set as input.
Code lines: 32
Contained by: file dark_matter.particle.warm_dark_matter.thermal.F90
Modules used: input_parameters

function: wdmthermaldegreesoffreedomeffective
Description: Return the effective number of degrees of freedom of a thermal warm dark matter particle.
Code lines: 7
Contained by: file dark_matter.particle.warm_dark_matter.thermal.F90

function: wdmthermaldegreesoffreedomeffectivedecoupling
Description: Return the effective number of relativistic degrees of freedom at the time of decoupling of a thermal warm dark matter particle. The effective number of relativistic degrees of freedom at the time of decoupling is determined from the requirement that the warm dark matter particle have the correct relic density to provide the entire mass of dark matter [Hogan, 1999, eqn. 17].
Code lines: 10
Contained by: file dark_matter.particle.warm_dark_matter.thermal.F90

subroutine: wdmthermaldestructor
Description: Destructor for the cut off cooling rate class.
Code lines: 7

Contained by: file dark_matter.particle.warm_dark_matter.thermal.F90

function: wdmthermalmass
Description: Return the mass, in units of keV, of a thermal warm dark matter particle.
Code lines: 7
Contained by: file dark_matter.particle.warm_dark_matter.thermal.F90

file: dark_matter_halos.Correa2015.utilities.F90
Description: Contains a module which implements utility functions for the Correa et al. [2015] dark matter halo models.
Code lines: 53

module: dark_matter_halos_correa2015
Description: Implements utility functions for the Correa et al. [2015] dark matter halo models.
Code lines: 31
Contained by: file dark_matter_halos.Correa2015.utilities.F90
Used by: function correa2015time function correa2015concentration

subroutine: dark_matter_halo_correa2015_fit_parameters
Description: Computes fitting function parameters for the Correa et al. [2015] dark matter halo models.
Code lines: 21
Contained by: module dark_matter_halos_correa2015
Modules used: cosmological_density_field linear_growth numerical_constants_math

file: dark_matter_halos.formation_times.F90
Description: Contains a module which implements calculations of dark matter halo formation times.
Code lines: 64

module: dark_matter_halo_formation_times
Description: Implements calculations of dark matter halo formation times.
Code lines: 42
Contained by: file dark_matter_halos.formation_times.F90
Used by: function zhao2009concentration subroutine node_component_merging_statistics_standard_merger_tree_init

function: dark_matter_halo_formation_time
Description: Returns the time at which the main branch progenitor of node first had a mass equal to formationMassFraction of the current mass.
Code lines: 32
Contained by: module dark_matter_halo_formation_times
Modules used: dark_matter_halo_mass_accretion_histories galacticus_nodes

file: dark_matter_halos.mass_accretion_history.Correa2015.F90
Description: An implementation of dark matter halo mass accretion histories using the Correa et al. [2015] algorithm.
Code lines: 143
Modules used: cosmological_density_field cosmology_functions linear_growth

function: `correa2015constructorinternal`
Description: Generic constructor for the `correa2015` dark matter halo mass accretion history class.
Code lines: 10
Contained by: file `dark_matter_halos.mass_accretion_history.Correa2015.F90`

function: `correa2015constructorparameters`
Description: Constructor for the `correa2015` dark matter halo mass accretion history class which takes a parameter set as input.
Code lines: 20
Contained by: file `dark_matter_halos.mass_accretion_history.Correa2015.F90`
Modules used: `input_parameters`

subroutine: `correa2015destructor`
Description: Destructor for the `correa2015` dark matter halo mass accretion history class.
Code lines: 9
Contained by: file `dark_matter_halos.mass_accretion_history.Correa2015.F90`

function: `correa2015time`
Description: Compute the time corresponding to `mass` in the mass accretion history of `thisNode` using the algorithm of Correa et al. [2015].
Code lines: 50
Contained by: file `dark_matter_halos.mass_accretion_history.Correa2015.F90`
Modules used: `dark_matter_halos_correa2015` `galacticus_nodes` `root_finder`

function: `redshiftmasssolver`
Description: Root solver function used in finding the redshift corresponding to a given mass in the Correa et al. [2015] mass accretion history algorithm.
Code lines: 8
Contained by: function `correa2015time`

interface: `darkmatterhalomassaccretionhistorycorrea2015`
Description: Constructors for the `correa2015` dark matter halo mass accretion history class.
Code lines: 4
Contained by: file `dark_matter_halos.mass_accretion_history.Correa2015.F90`

file: `dark_matter_halos.mass_accretion_history.F90`
Description: Contains a module which provides a class for calculations of dark matter halo mass accretion histories.
Code lines: 41

module: `dark_matter_halo_mass_accretion_histories`
Description: Provides a class for calculations of dark matter halo mass accretion histories.
Code lines: 19
Contained by: file `dark_matter_halos.mass_accretion_history.F90`
Modules used: `galacticus_nodes`
Used by: function `dark_matter_halo_formation_time` file `dark_matter_profiles.structure.concentration.Zhao2009.F90`

file: dark_matter_halos.mass_accretion_history.Wechsler2002.F90
Description: An implementation of dark matter halo mass accretion histories using the Wechsler et al. [2002] algorithm.
Code lines: 168
Modules used: cosmological_density_field cosmology_functions

interface: darkmatterhalomassaccretionhistorywechsler2002
Description: Constructors for the wechsler2002 dark matter halo mass accretion history class.
Code lines: 4
Contained by: file dark_matter_halos.mass_accretion_history.Wechsler2002.F90

function: wechsler2002constructorinternal
Description: Generic constructor for the wechsler2002 dark matter halo mass accretion history class.
Code lines: 14
Contained by: file dark_matter_halos.mass_accretion_history.Wechsler2002.F90
Modules used: galacticus_error

function: wechsler2002constructorparameters
Description: Default constructor for the wechsler2002 dark matter halo mass accretion history class.
Code lines: 42
Contained by: file dark_matter_halos.mass_accretion_history.Wechsler2002.F90
Modules used: input_parameters

subroutine: wechsler2002destructor
Description: Destructor for the wechsler2002 dark matter halo mass accretion history class.
Code lines: 9
Contained by: file dark_matter_halos.mass_accretion_history.Wechsler2002.F90

function: wechsler2002time
Description: Compute the time corresponding to mass in the mass accretion history of thisNode using the algorithm of Wechsler et al. [2002].
Code lines: 48
Contained by: file dark_matter_halos.mass_accretion_history.Wechsler2002.F90
Modules used: galacticus_nodes

function: expansionfactoratformation
Description: Computes the expansion factor at formation using the simple model of Bullock et al. [2001].
Code lines: 16
Contained by: function wechsler2002time

file: dark_matter_halos.mass_accretion_history.Zhao2009.F90
Description: An implementation of dark matter halo mass accretion histories using the Zhao et al. [2009] algorithm.
Code lines: 167
Modules used: cosmological_density_field

interface: darkmatterhalomassaccretionhistoryzhao2009
Description: Constructors for the zhao2009 dark matter halo mass accretion history class.
Code lines: 4
Contained by: file dark_matter_halos.mass_accretion_history.Zhao2009.F90

function: zhao2009constructorinternal
Description: Generic constructor for the zhao2009 dark matter halo mass accretion history class.
Code lines: 9
Contained by: file dark_matter_halos.mass_accretion_history.Zhao2009.F90

function: zhao2009constructorparameters
Description: Constructor for the zhao2009 dark matter halo mass accretion history class which takes a parameter set as input.
Code lines: 17
Contained by: file dark_matter_halos.mass_accretion_history.Zhao2009.F90
Modules used: input_parameters

subroutine: zhao2009destructor
Description: Destructor for the zhao2009 dark matter halo mass accretion history class.
Code lines: 8
Contained by: file dark_matter_halos.mass_accretion_history.Zhao2009.F90

function: zhao2009time
Description: Compute the time corresponding to mass in the mass accretion history of thisNode using the algorithm of Zhao et al. [2009].
Code lines: 82
Contained by: file dark_matter_halos.mass_accretion_history.Zhao2009.F90
Modules used: fgsl, galacticus_error, galacticus_nodes, ode_solver

function: growthrateodes
Description: System of differential equations to solve for the growth rate.
Code lines: 31
Contained by: function zhao2009time

file: dark_matter_halos.mass_loss_rates.F90
Description: Contains a module which implements calculations of mass loss rates from dark matter halos.
Code lines: 41

module: dark_matter_halos_mass_loss_rates
Description: Implements calculations of mass loss rates from dark matter halos.
Code lines: 19
Contained by: file dark_matter_halos.mass_loss_rates.F90

Modules used: galacticus_nodes
Used by: subroutine galacticus_function_classes_destroy; subroutine galacticus_state_retrieve; subroutine galacticus_state_store; module node_component_satellite_standard

file: dark_matter_halos.mass_loss_rates.vanDenBosch.F90
Description: Implementation of mass loss rates from dark matter halos using the prescription of van den Bosch et al. [2005].
Code lines: 130
Modules used: cosmology_functions; virial_density_contrast

interface: darkmatterhalomasslossratevandenbosch
Description: Constructors for the vanDenBosch dark matter halo mass loss rate class.
Code lines: 4
Contained by: file dark_matter_halos.mass_loss_rates.vanDenBosch.F90

function: vandenboschconstructorinternal
Description: Internal constructor for the vanDenBosch dark matter halo mass loss rate class.
Code lines: 10
Contained by: file dark_matter_halos.mass_loss_rates.vanDenBosch.F90

function: vandenboschconstructorparameters
Description: Constructor for the vanDenBosch dark matter halo mass loss rate class which builds the object from a parameter set.
Code lines: 33
Contained by: file dark_matter_halos.mass_loss_rates.vanDenBosch.F90
Modules used: input_parameters

subroutine: vandenboschdestructor
Description: Destructor for the vanDenBosch dark matter halo mass loss rate class.
Code lines: 8
Contained by: file dark_matter_halos.mass_loss_rates.vanDenBosch.F90

function: vandenboschrate
Description: Returns the mass loss rate from the dark matter halo of the given node in units of $M_\odot$/Gyr.
Code lines: 23
Contained by: file dark_matter_halos.mass_loss_rates.vanDenBosch.F90
Modules used: galacticus_nodes

file: dark_matter_halos.mass_loss_rates.zero.F90
Description: Implementation of zero mass loss rate from dark matter halos.
Code lines: 62

interface: darkmatterhalomasslossratezero
Description: Constructors for the zero dark matter halo mass loss rate class.
Code lines: 3
Contained by: file dark_matter_halos.mass_loss_rates.zero.F90

function: zeroconstructorparameters

Description: Constructor for the zero dark matter halo mass loss rate class which builds the object from a parameter set.
Code lines: 10
Contained by: file dark_matter_halos.mass_loss_rates.zero.F90
Modules used: input_parameters

function: zerorate
Description: Returns the mass loss rate from the dark matter halo of the given node in units of $M_\odot$/Gyr.
Code lines: 9
Contained by: file dark_matter_halos.mass_loss_rates.zero.F90

file: dark_matter_halos.scales.F90

Contained by: module dark_matter_halo_spins
Modules used: dark_matter_profiles_dmo galacticus_nodes numerical_constants_physical

file: dark_matter_halos.spins.distributions.Bett2007.F90
Description: An implementation of the dark matter halo spin distribution which uses the fitting function proposed by Bett et al. [2007].
Code lines: 163
Modules used: table_labels tables

function: bett2007constructorinternal
Description: Internal constructor for the bett2007 dark matter halo spin distribution class.
Code lines: 31
Contained by: file dark_matter_halos.spins.distributions.Bett2007.F90
Modules used: array_utilities gamma_functions iso_c_binding

function: bett2007constructorparameters
Description: Constructor for the bett2007 dark matter halo spin distribution class which takes a parameter list as input.
Code lines: 31
Contained by: file dark_matter_halos.spins.distributions.Bett2007.F90
Modules used: input_parameters

subroutine: bett2007destructor
Description: Destructor for the bett2007 dark matter halo spin distribution class.
Code lines: 9
Contained by: file dark_matter_halos.spins.distributions.Bett2007.F90

function: bett2007distribution
Description: Compute the spin parameter distribution for the given node assuming the fitting function of Bett et al. [2007].
Code lines: 12
Contained by: file dark_matter_halos.spins.distributions.Bett2007.F90
Modules used: galacticus_nodes

function: `bett2007sample`
Description: Sample from a Bett et al. [2007] spin parameter distribution for the given `node`.
Code lines: 16
Contained by: file `dark_matter_halos.spins.distributions.Bett2007.F90`
Modules used: `galacticus_error` `pseudo_random`

interface: `halospindistributionbett2007`
Description: Constructors for the `bett2007` dark matter halo spin distribution class.
Code lines: 5
Contained by: file `dark_matter_halos.spins.distributions.Bett2007.F90`

file: `dark_matter_halos.spins.distributions.F90`
Description: Contains a module that provides a class for dark matter halo spin distributions.
Code lines: 46

module: `halo_spin_distributions`
Description: Provides a class for dark matter halo spin distributions.
Code lines: 24
Contained by: file `dark_matter_halos.spins.distributions.F90`
Modules used: `galacticus_nodes`
Used by:
- subroutine `galacticus_function_classes_destroy`
- file `galacticus.output.analyses.distribution_operator.spin_N-body_errors.F90`
- function `spindistributionbett2007constructorinternal`
- subroutine `galacticus_state_retrieve`
- subroutine `galacticus_state_store`
- file `merger_trees.construct.read.F90`
- function `spindistributionevaluate`
- module `node_component_spin_vitvitska`
- module `node_component_spin_random`
- file `tasks.halo_spin_distribution.F90`
- subroutine `halospindistributionperform`

file: `dark_matter_halos.spins.distributions.N-body_errors.F90`
Description: An implementation of the dark matter halo spin distribution which modifies another spin distribution to account for the effects of particle noise errors in spins measured in N-body simulations.
Code lines: 684
Modules used: `cosmology_functions` `dark_matter_halo_scales` `dark_matter_profile_scales` `dark_matter_profiles_dmo` `halo_mass_functions` `statistics_nbody_halo_mass_errors`

interface: `halospindistributionnbodyerrors`
Description: Constructors for the `nbodyErrors` dark matter halo spin distribution class.
Code lines: 5
Contained by: file `dark_matter_halos.spins.distributions.N-body_errors.F90`

function: `nbodyerrorsconstructorinternal`
Description: Internal constructor for the `nbodyErrors` dark matter halo spin distribution class.
Code lines: 22
Contained by: file `dark_matter_halos.spins.distributions.N-body_errors.F90`

function: `nbodyerrorsconstructorparameters`
Description: Constructor for the `nbodyErrors` dark matter halo spin distribution class which takes a parameter list as input.
Code lines: 70
Contained by: file `dark_matter_halos.spins.distributions.N-body_errors.F90`
Modules used: `input_parameters`

subroutine: `nbodyerrorsdestructor`
Description: Destructor for the `nbodyErrors` dark matter halo spin distribution class.
Code lines: 12
Contained by: file `dark_matter_halos.spins.distributions.N-body_errors.F90`

function: `nbodyerrorsdistribution`
Description: Compute the spin distribution.
Code lines: 30
Contained by: file `dark_matter_halos.spins.distributions.N-body_errors.F90`
Modules used: `galacticus_nodes`

function: `nbodyerrorsdistributionaveraged`
Description: Compute the spin distribution averaged over all halos more massive than the given `massLimit`.
Code lines: 34
Contained by: file `dark_matter_halos.spins.distributions.N-body_errors.F90`
Modules used: `galacticus_calculations_resets` `galacticus_nodes`

function: `nbodyerrorsdistributionfixedpoint`
Description: Compute the spin distribution for a fixed point in intrinsic mass and spin.
Code lines: 27
Contained by: file `dark_matter_halos.spins.distributions.N-body_errors.F90`
Modules used: `galacticus_nodes`

function: `nbodyerrorsnoncentralchisquaremode`
Description: Computes the mode of the degree-3 non-central chi-squared distribution function for given χ.
Code lines: 13
Contained by: file `dark_matter_halos.spins.distributions.N-body_errors.F90`
Modules used: `root_finder`

function: `nbodyerrorsnoncentralchisquaremoderoot`
Description: Root function used in finding the mode of the degree-3 non-central chi-squared distribution function.
Code lines: 7
Contained by: file `dark_matter_halos.spins.distributions.N-body_errors.F90`

function: `nbodyerrorssample`
Description: Sample from the halo spin distribution.
Code lines: 11
Contained by: file `dark_matter_halos.spins.distributions.N-body_errors.F90`

Modules used: galacticus_error

subroutine: nbodyerrorstabulate
Description: Tabulate the halo spin distribution.
Code lines: 339
Contained by: file dark_matter_halos.spins.distributions.N-body_errors.F90
Modules used: fgsl, galacticus_calculations_resets, galacticus_error, galacticus_nodes, iso_c_binding, memory_management, numerical_constants_math, numerical_integration

function: errorsspindependent
Description: Compute the spin-dependent error term.
Code lines: 8
Contained by: subroutine nbodyerrorstabulate

function: massintegral
Description: Integral over the halo mass function and halo mass error distribution.
Code lines: 14
Contained by: subroutine nbodyerrorstabulate

function: massspinintegral
Description: Integral over the halo mass function, spin distribution, halo mass error distribution, and spin error distribution.
Code lines: 66
Contained by: subroutine nbodyerrorstabulate
Modules used: galacticus_error, input_parameters

function: productdistributionintegral
Description: Product distribution integrand.
Code lines: 39
Contained by: subroutine nbodyerrorstabulate

function: spinerrorintegral
Description: Integral over the spin error distribution.
Code lines: 35
Contained by: subroutine nbodyerrorstabulate

function: spinintegral
Description: Integral over the intrinsic spin distribution, and spin error distribution.
Code lines: 14
Contained by: subroutine nbodyerrorstabulate

file: dark_matter_halos.spins.distributions.delta_function.F90
Description: An implementation of the dark matter halo spin distribution which assumes a δ-function distribution.
Code lines: 114

function: deltafunctionconstructorinternal

Description: Internal constructor for the `deltaFunction` dark matter halo spin distribution class.
Code lines: 9
Contained by: file dark_matter_halos.spins.distributions.delta_function.F90

function: `deltafunctionconstructorparameters`
Description: Constructor for the `deltaFunction` dark matter halo spin distribution class which takes a parameter list as input.
Code lines: 21
Contained by: file dark_matter_halos.spins.distributions.delta_function.F90
Modules used: input_parameters

subroutine: `deltafunctiondestructor`
Description: Destructor for the `deltaFunction` dark matter halo spin distribution class.
Code lines: 9
Contained by: file dark_matter_halos.spins.distributions.delta_function.F90

function: `deltafunctiondistribution`
Description: Return the spin parameter distribution for the given `node`.
Code lines: 11
Contained by: file dark_matter_halos.spins.distributions.delta_function.F90
Modules used: galacticus_error

function: `deltafunctionsample`
Description: Sample from a δ-function spin parameter distribution for the given `node`.
Code lines: 10
Contained by: file dark_matter_halos.spins.distributions.delta_function.F90

interface: `halospindistributiondeltafunction`
Description: Constructors for the `deltaFunction` dark matter halo spin distribution class.
Code lines: 5
Contained by: file dark_matter_halos.spins.distributions.delta_function.F90

file: `dark_matter_halos.spins.distributions.lognormal.F90`
Description: An implementation of the dark matter halo spin distribution which assumes a log-normal distribution.
Code lines: 117

interface: `halospindistributionlognormal`
Description: Constructors for the `logNormal` dark matter halo spin distribution class.
Code lines: 5
Contained by: file dark_matter_halos.spins.distributions.lognormal.F90

function: `lognormalconstructorinternal`
Description: Internal constructor for the `logNormal` dark matter halo spin distribution class.
Code lines: 10
Contained by: file dark_matter_halos.spins.distributions.lognormal.F90

function: `lognormalconstructorparameters`
Description: Constructor for the `logNormal` dark matter halo spin distribution class which takes a parameter list as input.
Code lines: 32

Contained by: file dark_matter_halos.spins.distributions.lognormal.F90
Modules used: input_parameters

function: lognormaldistribution
Description: Return the spin parameter distribution for the given node assuming a log-normal distribution.
Code lines: 14
Contained by: file dark_matter_halos.spins.distributions.lognormal.F90
Modules used: galacticus_nodes numerical_constants_math

function: lognormalsample
Description: Sample from a log-normal spin parameter distribution for the given node.
Code lines: 10
Contained by: file dark_matter_halos.spins.distributions.lognormal.F90

file: dark_matter_profiles.F90
Description: Contains a module which provides an object that implements non-dark-matter-only dark matter halo profiles.
Code lines: 200

module: dark_matter_profiles
Description: Provides an object that implements non-dark-matter-only dark matter halo profiles.
Code lines: 178
Contained by: file dark_matter_profiles.F90
Modules used: dark_matter_profiles_generic galacticus_nodes kind_numbers
Used by: module dark_matter_profile_structure_tasks; function galactic_structure_radius_enclosing_mass; file galactic_structure.radius_solver.equilibrium.F90; subroutine galacticus_function_classes_destroy; subroutine galacticus_state_retrieve; subroutine galacticus_state_store; program test_dark_matter_profiles_generic

file: dark_matter_profiles.adiabatic_Gnedin2004.F90
Description: An implementation of adiabaticGnedin2004 dark matter halo profiles.
Code lines: 924
Modules used: cosmology_parameters dark_matter_halo_scales dark_matter_profiles_dmo dark_matter_profiles_generic galactic_structure_options math_exponentiation

subroutine: adiabaticgnedin2004autohook
Description: Attach to the calculation reset event.
Code lines: 8
Contained by: file dark_matter_profiles.adiabatic_Gnedin2004.F90
Modules used: events_hooks

subroutine: adiabaticgnedin2004calculationreset
Description: Reset the dark matter profile calculation.

Code lines: 13
Contained by: file dark_matter_profiles.adiabatic_Gnedin2004.F90

function: adiabaticgnedin2004circularvelocity
Description: Returns the circular velocity (in km/s) in the dark matter profile of node at the given radius (given in units of Mpc).
Code lines: 14
Contained by: file dark_matter_profiles.adiabatic_Gnedin2004.F90

function: adiabaticgnedin2004circularvelocitymaximum
Description: Returns the maximum circular velocity (in km/s) in the dark matter profile of node.
Code lines: 12
Contained by: file dark_matter_profiles.adiabatic_Gnedin2004.F90

subroutine: adiabaticgnedin2004computefactors
Description: Compute various factors needed when solving for the initial radius in the dark matter halo using the adiabatic contraction algorithm of Gnedin et al. [2004].
Code lines: 183
Contained by: file dark_matter_profiles.adiabatic_Gnedin2004.F90
Modules used: galacticus_nodes, hot_halo_mass_distributions, node_component_black_hole_simple_structure, node_component_black_hole_standard_structure_tasks, node_component_hot_halo_cold_mode_structure_tasks, numerical_constants_physical

function: adiabaticgnedin2004constructorinternal
Description: Generic constructor for the adiabaticGnedin2004 dark matter profile class.
Code lines: 21
Contained by: file dark_matter_profiles.adiabatic_Gnedin2004.F90
Modules used: galacticus_error

function: adiabaticgnedin2004constructorparameters
Description: Default constructor for the adiabaticGnedin2004 dark matter halo profile class.
Code lines: 47
Contained by: file dark_matter_profiles.adiabatic_Gnedin2004.F90
Modules used: input_parameters

function: adiabaticgnedin2004density
Description: Returns the density (in $M_\odot$ Mpc^{-3}) in the dark matter profile of node at the given radius (given in units of Mpc).
Code lines: 18
Contained by: file dark_matter_profiles.adiabatic_Gnedin2004.F90

function: adiabaticgnedin2004densitylogslope
Description: Returns the logarithmic slope of the density in the dark matter profile of node at the given radius (given in units of Mpc).
Code lines: 16
Contained by: file dark_matter_profiles.adiabatic_Gnedin2004.F90

function: adiabaticgnedin2004derivativesolver

Description: Root function used in finding the derivative of the initial radius in the dark matter halo when solving for adiabatic contraction.
Code lines: 17
Contained by: file dark_matter_profiles.adiabatic_Gnedin2004.F90
Modules used: numerical_constants_math

subroutine: adiabaticgnedin2004destructor
Description: Destructor for the adiabaticGnedin2004 dark matter halo profile class.
Code lines: 11
Contained by: file dark_matter_profiles.adiabatic_Gnedin2004.F90
Modules used: events_hooks

function: adiabaticgnedin2004enclosedmass
Description: Returns the enclosed mass (in $M_\odot$) in the dark matter profile of node at the given radius (given in units of Mpc).
Code lines: 10
Contained by: file dark_matter_profiles.adiabatic_Gnedin2004.F90

function: adiabaticgnedin2004energy
Description: Return the energy of a adiabaticGnedin2004 halo density profile.
Code lines: 12
Contained by: file dark_matter_profiles.adiabatic_Gnedin2004.F90

function: adiabaticgnedin2004energygrowthrate
Description: Return the rate of change of the energy of a adiabaticGnedin2004 halo density profile.
Code lines: 12
Contained by: file dark_matter_profiles.adiabatic_Gnedin2004.F90

function: adiabaticgnedin2004freefallradius
Description: Returns the freefall radius in the adiabaticGnedin2004 density profile at the specified time (given in Gyr).
Code lines: 14
Contained by: file dark_matter_profiles.adiabatic_Gnedin2004.F90

function: adiabaticgnedin2004freefallradiusincreaserate
Description: Returns the rate of increase of the freefall radius in the adiabaticGnedin2004 density profile at the specified time (given in Gyr).
Code lines: 14
Contained by: file dark_matter_profiles.adiabatic_Gnedin2004.F90

function: adiabaticgnedin2004kspace
Description: Returns the Fourier transform of the adiabaticGnedin2004 density profile at the specified waveNumber (given in Mpc^{-1}), using the expression given in Cooray and Sheth (2002; eqn. 81).
Code lines: 14
Contained by: file dark_matter_profiles.adiabatic_Gnedin2004.F90

function: adiabaticgnedin2004massenclosed
Description: Unary function returning the enclosed mass in a component. Suitable for mapping over components. Ignores the dark matter profile.

Code lines: 14
Contained by: file dark_matter_profiles.adiabatic_Gnedin2004.F90
Modules used: galacticus_nodes

function: adiabaticgnedin2004potential
Description: Returns the potential (in $(\mathrm{km/s})^2$) in the dark matter profile of node at the given radius (given in units of Mpc).
Code lines: 19
Contained by: file dark_matter_profiles.adiabatic_Gnedin2004.F90

function: adiabaticgnedin2004radialmoment
Description: Returns the radial moment of the density in the dark matter profile of node between the given radiusMinimum and radiusMaximum (given in units of Mpc).
Code lines: 15
Contained by: file dark_matter_profiles.adiabatic_Gnedin2004.F90

function: adiabaticgnedin2004radialvelocitydispersion
Description: Returns the radial velocity dispersion (in km/s) in the dark matter profile of node at the given radius (given in units of Mpc).
Code lines: 14
Contained by: file dark_matter_profiles.adiabatic_Gnedin2004.F90

function: adiabaticgnedin2004radiusenclosingdensity
Description: Returns the radius (in Mpc) in the dark matter profile of node which encloses the given density (given in units of $M_\odot/\mathrm{Mpc}^{-3}$).
Code lines: 14
Contained by: file dark_matter_profiles.adiabatic_Gnedin2004.F90

function: adiabaticgnedin2004radiusenclosingmass
Description: Returns the radius (in Mpc) in the dark matter profile of node which encloses the given mass (given in units of $M_\odot$).
Code lines: 14
Contained by: file dark_matter_profiles.adiabatic_Gnedin2004.F90

function: adiabaticgnedin2004radiusfromspecificangularmomentum
Description: Returns the radius (in Mpc) in node at which a circular orbit has the given specificAngularMomentum (given in units of km s^{-1} Mpc).
Code lines: 14
Contained by: file dark_matter_profiles.adiabatic_Gnedin2004.F90

function: adiabaticgnedin2004radiusinitial
Description: Compute the initial radius in the dark matter halo using the adiabatic contraction algorithm of Gnedin et al. [2004].
Code lines: 86
Contained by: file dark_matter_profiles.adiabatic_Gnedin2004.F90
Modules used: root_finder

function: adiabaticgnedin2004radiusinitialderivative
Description: Compute the derivative of the initial radius in the dark matter halo using the adiabatic contraction algorithm of Gnedin et al. [2004].

Code lines: 35
Contained by: file dark_matter_profiles.adiabatic_Gnedin2004.F90
Modules used: root_finder

function: adiabaticgnedin2004radiusorbitalmean
Description: Returns the orbit averaged radius for dark matter corresponding the given radius using the model of Gnedin et al. [2004].
Code lines: 9
Contained by: file dark_matter_profiles.adiabatic_Gnedin2004.F90

function: adiabaticgnedin2004radiusorbitalmeanderivative
Description: Returns the derivative of the orbit averaged radius for dark matter corresponding the given radius using the model of Gnedin et al. [2004].
Code lines: 9
Contained by: file dark_matter_profiles.adiabatic_Gnedin2004.F90

function: adiabaticgnedin2004rotationnormalization
Description: Return the normalization of the rotation velocity vs. specific angular momentum relation.
Code lines: 12
Contained by: file dark_matter_profiles.adiabatic_Gnedin2004.F90

function: adiabaticgnedin2004solver
Description: Root function used in finding the initial radius in the dark matter halo when solving for adiabatic contraction.
Code lines: 13
Contained by: file dark_matter_profiles.adiabatic_Gnedin2004.F90

function: adiabaticgnedin2004velocitycircularsquared
Description: Unary function returning the squared rotation curve in a component. Suitable for mapping over components.
Code lines: 13
Contained by: file dark_matter_profiles.adiabatic_Gnedin2004.F90
Modules used: galacticus_nodes

function: adiabaticgnedin2004velocitycircularsquaredgradient
Description: Unary function returning the squared rotation curve gradient in a component. Suitable for mapping over components.
Code lines: 13
Contained by: file dark_matter_profiles.adiabatic_Gnedin2004.F90
Modules used: galacticus_nodes

interface: darkmatterprofileadiabaticgnedin2004
Description: Constructors for the adiabaticGnedin2004 dark matter halo profile class.
Code lines: 4
Contained by: file dark_matter_profiles.adiabatic_Gnedin2004.F90

file: dark_matter_profiles.dark_matter_only.F90
Description: An implementation of non-dark-matter-only dark matter halo profiles which are unchanged from their dark-matter-only counterpart.
Code lines: 308

Modules used: cosmology_parameters dark_matter_profiles_dmo

function: darkmatteronlycircularvelocity
Description: Returns the circular velocity (in km/s) in the dark matter profile of node at the given radius (given in units of Mpc).
Code lines: 10
Contained by: file dark_matter_profiles.dark_matter_only.F90

function: darkmatteronlycircularvelocitymaximum
Description: Returns the maximum circular velocity (in km/s) in the dark matter profile of node.
Code lines: 8
Contained by: file dark_matter_profiles.dark_matter_only.F90

function: darkmatteronlyconstructorinternal
Description: Generic constructor for the darkMatterOnly dark matter profile class.
Code lines: 12
Contained by: file dark_matter_profiles.dark_matter_only.F90

function: darkmatteronlyconstructorparameters
Description: Constructor for the darkMatterOnly non-dark-matter-only dark matter halo profile class which takes a parameter set as input.
Code lines: 20
Contained by: file dark_matter_profiles.dark_matter_only.F90
Modules used: input_parameters

function: darkmatteronlydensity
Description: Returns the density (in $M_\odot$ Mpc^{-3}) in the dark matter profile of node at the given radius (given in units of Mpc).
Code lines: 10
Contained by: file dark_matter_profiles.dark_matter_only.F90

function: darkmatteronlydensitylogslope
Description: Returns the logarithmic slope of the density in the dark matter profile of node at the given radius (given in units of Mpc).
Code lines: 10
Contained by: file dark_matter_profiles.dark_matter_only.F90

subroutine: darkmatteronlydestructor
Description: Destructor for the darkMatterOnly dark matter halo profile class.
Code lines: 9
Contained by: file dark_matter_profiles.dark_matter_only.F90

function: darkmatteronlyenclosedmass
Description: Returns the enclosed mass (in $M_\odot$) in the dark matter profile of node at the given radius (given in units of Mpc).
Code lines: 10
Contained by: file dark_matter_profiles.dark_matter_only.F90

function: darkmatteronlyenergy

Description: Return the energy of the dark matter halo density profile.
Code lines: 8
Contained by: file dark_matter_profiles.dark_matter_only.F90

function: darkmatteronlyenergygrowthrate
Description: Return the rate of change of the energy of the dark matter halo density profile.
Code lines: 8
Contained by: file dark_matter_profiles.dark_matter_only.F90

function: darkmatteronlyfreefallradius
Description: Returns the freefall radius in the dark matter halo density profile at the specified `time` (given in Gyr).
Code lines: 10
Contained by: file dark_matter_profiles.dark_matter_only.F90

function: darkmatteronlyfreefallradiusincreaserate
Description: Returns the freefall radius in the dark matter halo density profile at the specified `time` (given in Gyr).
Code lines: 10
Contained by: file dark_matter_profiles.dark_matter_only.F90

function: darkmatteronlykspace
Description: Returns the Fourier transform of the dark matter halo density profile at the specified `waveNumber` (given in Mpc^{-1}).
Code lines: 12
Contained by: file dark_matter_profiles.dark_matter_only.F90
Modules used: galacticus_error

function: darkmatteronlypotential
Description: Returns the potential (in $(\mathrm{km/s})^2$) in the dark matter profile of `node` at the given `radius` (given in units of Mpc).
Code lines: 11
Contained by: file dark_matter_profiles.dark_matter_only.F90

function: darkmatteronlyradialmoment
Description: Returns the density (in $M_\odot$ Mpc^{-3}) in the dark matter profile of `node` at the given `radius` (given in units of Mpc).
Code lines: 11
Contained by: file dark_matter_profiles.dark_matter_only.F90

function: darkmatteronlyradialvelocitydispersion
Description: Returns the radial velocity dispersion (in km/s) in the dark matter profile of `node` at the given `radius` (given in units of Mpc).
Code lines: 10
Contained by: file dark_matter_profiles.dark_matter_only.F90

function: darkmatteronlyradiusenclosingdensity
Description: Returns the radius (in Mpc) in the dark matter profile of `node` which encloses the given `density` (given in units of $M_\odot/\mathrm{Mpc}^{-3}$).
Code lines: 10

Contained by: file dark_matter_profiles.dark_matter_only.F90

function: darkmatteronlyradiusenclosingmass

Description: Returns the radius (in Mpc) in the dark matter profile of `node` which encloses the given `mass` (given in units of $M_\odot$).
Code lines: 10
Contained by: file dark_matter_profiles.dark_matter_only.F90

function: darkmatteronlyradiusfromspecificangularmomentum

Description: Returns the radius (in Mpc) in `node` at which a circular orbit has the given `specificAngularMomentum` (given in units of km s^{-1} Mpc).
Code lines: 10
Contained by: file dark_matter_profiles.dark_matter_only.F90

function: darkmatteronlyrotationnormalization

Description: Return the normalization of the rotation velocity vs. specific angular momentum relation.
Code lines: 8
Contained by: file dark_matter_profiles.dark_matter_only.F90

interface: darkmatterprofiledarkmatteronly

Description: Constructors for the `darkMatterOnly` non-dark-matter-only dark matter halo profile class.
Code lines: 4
Contained by: file dark_matter_profiles.dark_matter_only.F90

file: dark_matter_profiles.generic.F90

Description: Contains a module which implements a base class for dark matter profiles from which both dark-matter-only and non-dark-matter-only profiles inherit.
Code lines: 819

module: dark_matter_profiles_generic

Description: A base class for dark matter profiles from which both dark-matter-only and non-dark-matter-only profiles inherit. Implements numerical calculations of certain halo properties which are to be used as a fall-back option when no analytical solution exists.
Code lines: 795
Contained by: file dark_matter_profiles.generic.F90
Modules used: dark_matter_halo_scales, function_classes, galacticus_nodes
Used by: module dark_matter_profiles; file dark_matter_profiles.adiabatic_Gnedin2004.F90; module dark_matter_profiles_dmo; file dark_matter_profiles_DMO.heated.F90; file dark_matter_profiles_DMO.truncated.F90; file dark_matter_profiles_DMO.truncated.exponential.F90; program test_dark_matter_halo_radius_enclosing_mass; program test_dark_matter_profiles_generic; program test_dark_matter_profiles_heated

type: darkmatterprofilegeneric

Description: A dark matter halo profile class implementing numerical calculations for generic dark matter halos.
Code lines: 150
Contained by: module dark_matter_profiles_generic

function: genericcircularvelocitymaximumnumerical
Description: Returns the maximum circular velocity (in km/s) in the dark matter profile of node.
Code lines: 16
Contained by: module dark_matter_profiles_generic
Modules used: root_finder

function: genericcircularvelocitynumerical
Description: Returns the circular velocity (in km/s) in the dark matter profile of node at the given radius (given in units of Mpc).
Code lines: 15
Contained by: module dark_matter_profiles_generic
Modules used: numerical_constants_physical

function: genericdensityevaluate
Description: GSL-callable function to evaluate the density of the dark matter profile.
Code lines: 7
Contained by: module dark_matter_profiles_generic

function: genericdensitylogslopenumerical
Description: Returns the logarithmic slope of the density in the dark matter profile of node at the given radius (given in units of Mpc).
Code lines: 16
Contained by: module dark_matter_profiles_generic
Modules used: numerical_differentiation

function: genericenclosedmassdifferencenumerical
Description: Returns the enclosed mass difference (in $M_\odot$) in the dark matter profile of node between the given radiusLower and radiusUpper (given in units of Mpc) using a numerical calculation.
Code lines: 33
Contained by: module dark_matter_profiles_generic
Modules used: fgsl numerical_integration

function: genericmassintegrand
Description: Integrand for mass in generic dark matter profiles.
Code lines: 12
Contained by: function genericenclosedmassdifferencenumerical
Modules used: numerical_constants_math

function: genericenclosedmassnumerical
Description: Returns the enclosed mass (in $M_\odot$) in the dark matter profile of node at the given radius (given in units of Mpc).
Code lines: 10
Contained by: module dark_matter_profiles_generic

function: genericenergyevaluate

Description: GSL-callable function to evaluate the energy of the dark matter profile.
Code lines: 16
Contained by: module dark_matter_profiles_generic
Modules used: functions_global

function: genericenergygrowthratenumerical
Description: Returns the rate of growth of the energy if the dark matter density profile.
Code lines: 32
Contained by: module dark_matter_profiles_generic
Modules used: numerical_differentiation

function: genericenergynumerical
Description: Return the energy of a generic dark matter density profile.
Code lines: 66
Contained by: module dark_matter_profiles_generic
Modules used: fgsl numerical_constants_math numerical_constants_physical numerical_integration

function: integrandenergykinetic
Description: Integrand for kinetic energy of the halo.
Code lines: 11
Contained by: function genericenergynumerical

function: integrandenergypotential
Description: Integrand for potential energy of the halo.
Code lines: 11
Contained by: function genericenergynumerical

function: integrandpseudopressure
Description: Integrand for pseudo-pressure ($\rho(r)\sigma^2(r)$) of the halo.
Code lines: 11
Contained by: function genericenergynumerical

function: genericfreefallradiusevaluate
Description: GSL-callable function to evaluate the freefall radius of the dark matter profile.
Code lines: 7
Contained by: module dark_matter_profiles_generic

function: genericfreefallradiusincreaseratenumerical
Description: Returns the rate of increase of the freefall radius in the dark matter density profile at the specified time (given in Gyr).
Code lines: 16
Contained by: module dark_matter_profiles_generic
Modules used: numerical_differentiation

function: genericfreefallradiusnumerical
Description: Returns the freefall radius in the adiabaticGnedin2004 density profile at the specified time (given in Gyr).
Code lines: 19
Contained by: module dark_matter_profiles_generic

Modules used: root_finder

function: genericspacenumerical
Description: Returns the Fourier transform of the dark matter density profile at the specified waveNumber (given in Mpc^{-1}).
Code lines: 34
Contained by: module dark_matter_profiles_generic
Modules used: fgsl numerical_integration

function: integrandfouriertransform
Description: Integrand for Fourier transform of the generic dark matter profile.
Code lines: 12
Contained by: function genericspacenumerical
Modules used: numerical_constants_math

function: genericpotentialdifferencenumerical
Description: Returns the potential difference (in $(\mathrm{km/s})^2$) in the dark matter profile of node between the given radiusLower and radiusUpper (given in units of Mpc) using a numerical calculation.
Code lines: 19
Contained by: module dark_matter_profiles_generic
Modules used: fgsl galactic_structure_options numerical_integration

function: genericpotentialnumerical
Description: Returns the potential (in $(\mathrm{km/s})^2$) in the dark matter profile of node at the given radius (given in units of Mpc) using a numerical calculation.
Code lines: 23
Contained by: module dark_matter_profiles_generic
Modules used: fgsl galactic_structure_options numerical_integration

function: genericradialmomentnumerical
Description: Returns the radial moment of the density in the dark matter profile of node between the given radiusMinimum and radiusMaximum (given in units of Mpc).
Code lines: 37
Contained by: module dark_matter_profiles_generic
Modules used: fgsl numerical_integration

function: integrandradialmoment
Description: Integrand for radial moment in a generic dark matter profile.
Code lines: 11
Contained by: function genericradialmomentnumerical

function: genericradialvelocitydispersionnumerical
Description: Returns the radial velocity dispersion (in km/s) in the dark matter profile of node at the given radius (given in units of Mpc).
Code lines: 37
Contained by: module dark_matter_profiles_generic
Modules used: fgsl numerical_constants_physical numerical_integration

function: `genericjeansequationintegrand`
Description: Integrand for generic drak matter profile Jeans equation.
Code lines: 11
Contained by: function `genericradialvelocitydispersionnumerical`

function: `genericradiusenclosingdensitynumerical`
Description: Returns the radius (in Mpc) in the dark matter profile of `node` which encloses the given `density` (given in units of $M_\odot/\mathrm{Mpc}^{-3}$).
Code lines: 19
Contained by: module `dark_matter_profiles_generic`
Modules used: `root_finder`

function: `genericradiusenclosingmassnumerical`
Description: Returns the radius (in Mpc) in the dark matter profile of `node` which encloses the given `mass` (given in units of $M_\odot$).
Code lines: 19
Contained by: module `dark_matter_profiles_generic`
Modules used: `root_finder`

function: `genericradiusfromspecificangularmomentumnumerical`
Description: Returns the radius (in Mpc) in `node` at which a circular orbit has the given `specificAngularMomentum` (given in units of km s^{-1} Mpc).
Code lines: 19
Contained by: module `dark_matter_profiles_generic`
Modules used: `root_finder`

function: `genericrotationnormalizationnumerical`
Description: Return the normalization of the rotation velocity vs. specific angular momentum relation.
Code lines: 11
Contained by: module `dark_matter_profiles_generic`
Modules used: `numerical_constants_math`

function: `integrandpotential`
Description: Integrand for gravitational potential in a generic dark matter profile.
Code lines: 12
Contained by: module `dark_matter_profiles_generic`
Modules used: `numerical_constants_physical`

function: `integrandtimefreefall`
Description: Integrand for freefall time in the halo.
Code lines: 15
Contained by: module `dark_matter_profiles_generic`
Modules used: `numerical_constants_astronomical`

function: `rootcircularvelocitymaximum`

Description: Root function used in finding the radius at which the maximum circular velocity occurs. Since for a spherical profile $V_{\rm c}^2(r) = {\rm G}M(r)/r$, then

$$\frac{{\rm d}V_{\rm c}^2}{{\rm d}r} = -\frac{{\rm G}M(r)}{r^2} + 4\pi{\rm G}\rho(r)r. \tag{18.3}$$

Therefore, the peak of the rotation curve satisfies $4\pi r^3\rho(r) - M(r) = 0$.

Code lines: 12

Contained by: module dark_matter_profiles_generic

Modules used: numerical_constants_math

function: rootdensity
Description: Root function used in finding the radius enclosing a given mean density.
Code lines: 8
Contained by: module dark_matter_profiles_generic
Modules used: numerical_constants_math

function: rootmass
Description: Root function used in finding the radius enclosing a given mass.
Code lines: 7
Contained by: module dark_matter_profiles_generic

function: rootradiusfreefall
Description: Root function used in finding the radius corresponding to a given freefall time.
Code lines: 13
Contained by: module dark_matter_profiles_generic
Modules used: fgsl numerical_integration

function: rootspecificangularmomentum
Description: Root function used in finding the radius enclosing a given specific angular momentum.
Code lines: 7
Contained by: module dark_matter_profiles_generic

file: dark_matter_profiles.heating.null.F90
Description: A null dark matter halo profile heating class.
Code lines: 90

interface: darkmatterprofileheatingnull
Description: Constructors for the null dark matter profile heating class.
Code lines: 3
Contained by: file dark_matter_profiles.heating.null.F90

function: nullconstructorparameters
Description: Constructor for the null dark matter profile heating scales class which takes a parameter set as input.
Code lines: 10
Contained by: file dark_matter_profiles.heating.null.F90
Modules used: input_parameters

function: nullspecificenergy
Description: Returns the specific energy of heating in the given node.
Code lines: 11
Contained by: file dark_matter_profiles.heating.null.F90

function: nullspecificenergygradient
Description: Returns the gradient of the specific energy of heating in the given node.
Code lines: 11
Contained by: file dark_matter_profiles.heating.null.F90

function: `nullspecificenergyiseverywherezero`
Description: Returns true if the specific energy is everywhere zero in the given `node`.
Code lines: 10
Contained by: file dark_matter_profiles.heating.null.F90

file: `dark_matter_profiles.heating.summation.F90`
Description: A dark matter halo profile heating class which sums over other heat sources.
Code lines: 193

interface: `darkmatterprofileheatingsummation`
Description: Constructors for the `summation` dark matter profile heating class.
Code lines: 4
Contained by: file dark_matter_profiles.heating.summation.F90

type: `heatsourcelist`
Code lines: 3
Contained by: file dark_matter_profiles.heating.summation.F90

function: `summationconstructorinternal`
Description: Internal constructor for the "summation" dark matter profile heating class.
Code lines: 14
Contained by: file dark_matter_profiles.heating.summation.F90

function: `summationconstructorparameters`
Description: Constructor for the `summation` dark matter profile heating class which takes a parameter set as input.
Code lines: 21
Contained by: file dark_matter_profiles.heating.summation.F90
Modules used: input_parameters

subroutine: `summationdeepcopy`
Description: Perform a deep copy for the `summation` dark matter halo profile heating class.
Code lines: 31
Contained by: file dark_matter_profiles.heating.summation.F90
Modules used: galacticus_error

subroutine: `summationdestructor`
Description: Destructor for the "summation" dark matter profile heating class.
Code lines: 14
Contained by: file dark_matter_profiles.heating.summation.F90

function: `summationspecificenergy`
Description: Returns the specific energy of heating in the given `node`.
Code lines: 16
Contained by: file dark_matter_profiles.heating.summation.F90

function: `summationspecificenergygradient`
Description: Returns the gradient of the specific energy of heating in the given `node`.

Code lines: 16
Contained by: file dark_matter_profiles.heating.summation.F90

function: summationspecificenergyiseverywherezero
Description: Returns true if the specific energy is everywhere zero in the given node.
Code lines: 18
Contained by: file dark_matter_profiles.heating.summation.F90

file: dark_matter_profiles.heating.tidal.F90
Description: A dark matter halo profile heating class which accounts for heating from tidal shocking.
Code lines: 103

interface: darkmatterprofileheatingtidal
Description: Constructors for the tidal dark matter profile heating class.
Code lines: 3
Contained by: file dark_matter_profiles.heating.tidal.F90

function: tidalconstructorparameters
Description: Constructor for the tidal dark matter profile heating scales class which takes a parameter set as input.
Code lines: 10
Contained by: file dark_matter_profiles.heating.tidal.F90
Modules used: input_parameters

function: tidalspecificenergy
Description: Returns the specific energy of heating in the given node.
Code lines: 16
Contained by: file dark_matter_profiles.heating.tidal.F90
Modules used: galacticus_nodes

function: tidalspecificenergygradient
Description: Returns the gradient of the specific energy of heating in the given node.
Code lines: 16
Contained by: file dark_matter_profiles.heating.tidal.F90
Modules used: galacticus_nodes

function: tidalspecificenergyiseverywherezero
Description: Returns true if the specific energy is everywhere zero in the given node.
Code lines: 13
Contained by: file dark_matter_profiles.heating.tidal.F90
Modules used: galacticus_nodes

file: dark_matter_profiles.heating.two_body_relaxation.F90
Description: A dark matter halo profile heating class which computes heating due to two-body relaxation.
Code lines: 170

interface: darkmatterprofileheatingtwobodyrelaxation
Description: Constructors for the twoBodyRelaxation dark matter profile heating class.
Code lines: 4

Contained by: file dark_matter_profiles.heating.two_body_relaxation.F90

function: twobodyrelaxationconstructorinternal
Description: Internal constructor for the twoBodyRelaxation dark matter profile heating scales class.
Code lines: 8
Contained by: file dark_matter_profiles.heating.two_body_relaxation.F90

function: twobodyrelaxationconstructorparameters
Description: Constructor for the twoBodyRelaxation dark matter profile heating scales class which takes a parameter set as input.
Code lines: 39
Contained by: file dark_matter_profiles.heating.two_body_relaxation.F90
Modules used: input_parameters

function: twobodyrelaxationspecificenergy
Description: Returns the specific energy of heating in the given node. The assumption here is that the mean fractional change in energy for a particle per crossing time is $8 \log \Lambda / N$ where N is the number of particles within radius $r =$radius. The crossing time is approximated by $r/V(r)$ where $V(r)$ is the circular velocity at r. The Coulomb logarithm is given by $\log \Lambda = \max(\epsilon, b_{90})$ where ϵ is the softening length, $b_{90} = 2 G m_\mathrm{p} / V^2(r)$, and m_p is the particle mass. Finally, the specific energy is assumed to be $\sigma^2(r)/2 \approx V^2(r)/4$.
Code lines: 30
Contained by: file dark_matter_profiles.heating.two_body_relaxation.F90
Modules used: galacticus_nodes numerical_constants_astronomical numerical_constants_physical numerical_constants_prefixes

function: twobodyrelaxationspecificenergygradient
Description: Returns the gradient of the specific energy of heating in the given node.
Code lines: 28
Contained by: file dark_matter_profiles.heating.two_body_relaxation.F90
Modules used: galacticus_nodes numerical_constants_physical

function: twobodyrelaxationspecificenergyiseverywherezero
Description: Returns true if the specific energy is everywhere zero in the given node.
Code lines: 13
Contained by: file dark_matter_profiles.heating.two_body_relaxation.F90
Modules used: galacticus_nodes

file: dark_matter_profiles.structure.concentration.Bullock2001.F90
Description: An implementation of dark matter halo profile concentrations using the Navarro et al. [1996] algorithm.
Code lines: 195
Modules used: cosmological_density_field cosmology_functions cosmology_parameters

function: bullock2001concentration
Description: Return the concentration of the dark matter halo profile of node using the Bullock et al. [2001] algorithm.
Code lines: 29
Contained by: file dark_matter_profiles.structure.concentration.Bullock2001.F90

Modules used: dark_matter_profile_mass_definitions galacticus_nodes virial_density_contrast

function: bullock2001constructorinternal
Description: Constructor for the bullock2001 dark matter halo profile concentration class.
Code lines: 22
Contained by: file dark_matter_profiles.structure.concentration.Bullock2001.F90
Modules used: dark_matter_halo_scales

function: bullock2001constructorparameters
Description: Default constructor for the bullock2001 dark matter halo profile concentration class.
Code lines: 43
Contained by: file dark_matter_profiles.structure.concentration.Bullock2001.F90
Modules used: input_parameters

function: bullock2001darkmatterprofiledefinition
Description: Return a dark matter density profile object defining that used in the definition of concentration in the Bullock et al. [2001] algorithm.
Code lines: 9
Contained by: file dark_matter_profiles.structure.concentration.Bullock2001.F90

function: bullock2001densitycontrastdefinition
Description: Return a virial density contrast object defining that used in the definition of concentration in the Bullock et al. [2001] algorithm.
Code lines: 9
Contained by: file dark_matter_profiles.structure.concentration.Bullock2001.F90

subroutine: bullock2001destructor
Description: Destructor for the bullock2001 dark matter halo profile concentration class.
Code lines: 12
Contained by: file dark_matter_profiles.structure.concentration.Bullock2001.F90

interface: darkmatterprofileconcentrationbullock2001
Description: Constructors for the bullock2001 dark matter halo profile concentration class.
Code lines: 4
Contained by: file dark_matter_profiles.structure.concentration.Bullock2001.F90

file: dark_matter_profiles.structure.concentration.Correa2015.F90
Description: An implementation of dark matter halo profile concentrations using the Correa et al. [2015] algorithm.
Code lines: 212
Modules used: cosmological_density_field cosmology_functions cosmology_parameters linear_growth

function: correa2015concentration
Description: Return the concentration of the dark matter halo profile of node using the Correa et al. [2015] algorithm.
Code lines: 57
Contained by: file dark_matter_profiles.structure.concentration.Correa2015.F90
Modules used: dark_matter_halos_correa2015 galacticus_nodes

root_finder

function: concentrationsolver
Description: Solver used in finding halo concentration using the Correa et al. [2015] algorithm.
Code lines: 19
Contained by: function correa2015concentration

function: correa2015constructorinternal
Description: Constructor for the correa2015 dark matter halo profile concentration class.
Code lines: 21
Contained by: file dark_matter_profiles.structure.concentration.Correa2015.F90
Modules used: dark_matter_halo_scales

function: correa2015constructorparameters
Description: Default constructor for the correa2015 dark matter halo profile concentration class.
Code lines: 32
Contained by: file dark_matter_profiles.structure.concentration.Correa2015.F90

function: correa2015darkmatterprofiledefinition
Description: Return a dark matter density profile object defining that used in the definition of concentration in the Correa et al. [2015] algorithm.
Code lines: 9
Contained by: file dark_matter_profiles.structure.concentration.Correa2015.F90

function: correa2015densitycontrastdefinition
Description: Return a virial density contrast object defining that used in the definition of concentration in the Correa et al. [2015] algorithm.
Code lines: 10
Contained by: file dark_matter_profiles.structure.concentration.Correa2015.F90

subroutine: correa2015destructor

Contained by: file `dark_matter_profiles.structure.concentration.MunozCuartas2011.F90`

file: `dark_matter_profiles.structure.concentration.NFW.F90`
Description: An implementation of dark matter halo profile concentrations using the Navarro et al. [1996] algorithm.
Code lines: 229
Modules used: `cosmological_density_field` `cosmology_functions` `cosmology_parameters` `virial_density_contrast`

interface: `darkmatterprofileconcentrationnfw1996`
Description: Constructors for the `nfw1996` dark matter halo profile concentration class.
Code lines: 4
Contained by: file `dark_matter_profiles.structure.concentration.NFW.F90`

function: `nfw1996concentration`
Description: Return the concentration of the dark matter halo profile of `node` using the Navarro et al. [1996] algorithm.
Code lines: 41
Contained by: file `dark_matter_profiles.structure.concentration.NFW.F90`
Modules used: `galacticus_nodes` `root_finder` `virial_density_contrast`

function: `nfw1996concentrationroot`
Description: Root function used in finding concentrations in the Navarro et al. [1996] method.
Code lines: 7
Contained by: file `dark_matter_profiles.structure.concentration.NFW.F90`

function: `nfw1996constructorinternal`
Description: Constructor for the `nfw1996` dark matter halo profile concentration class.

Code lines: 23
Contained by: file dark_matter_profiles.structure.concentration.NFW.F90
Modules used: dark_matter_halo_scales

function: nfw1996constructorparameters
Description: Default constructor for the nfw1996 dark matter halo profile concentration class.
Code lines: 48
Contained by: file dark_matter_profiles.structure.concentration.NFW.F90
Modules used: input_parameters

function: nfw1996darkmatterprofiledefinition
Description: Return a dark matter density profile object defining that used in the definition of concentration in the Navarro et al. [1996] algorithm.
Code lines: 9
Contained by: file dark_matter_profiles.structure.concentration.NFW.F90

function: nfw1996densitycontrastdefinition
Description: Return a virial density contrast object defining that used in the definition of concentration in the Navarro et al. [1996] algorithm.
Code lines: 9
Contained by: file dark_matter_profiles.structure.concentration.NFW.F90

subroutine: nfw1996destructor
Description: Destructor for the nfw1996 dark matter halo profile concentration class.
Code lines: 13
Contained by: file dark_matter_profiles.structure.concentration.NFW.F90

file: dark_matter_profiles.structure.concentration.Prada2011.F90
Description: An implementation of dark matter halo profile concentrations using the Prada et al. [2011] algorithm.
Code lines: 330
Modules used: cosmological_density_field, cosmology_functions, cosmology_parameters, linear_growth

interface: darkmatterprofileconcentrationprada2011
Description: Constructors for the prada2011 dark matter halo profile concentration class.
Code lines: 4
Contained by: file dark_matter_profiles.structure.concentration.Prada2011.F90

function: prada2011b0
Description: The function $B_0(x)$ as defined in eqn. (18) of Prada et al. [2011].
Code lines: 7
Contained by: file dark_matter_profiles.structure.concentration.Prada2011.F90

function: prada2011b1
Description: The function $B_1(x)$ as defined in eqn. (18) of Prada et al. [2011].
Code lines: 7
Contained by: file dark_matter_profiles.structure.concentration.Prada2011.F90

function: `prada2011c`
Description: The function $\mathcal{C}(\sigma')$ as defined in eqn. (17) of Prada et al. [2011].
Code lines: 7
Contained by: file `dark_matter_profiles.structure.concentration.Prada2011.F90`

function: `prada2011cmin`
Description: The function $c_{\rm min}(x)$ as defined in eqn. (19) of Prada et al. [2011].
Code lines: 8
Contained by: file `dark_matter_profiles.structure.concentration.Prada2011.F90`
Modules used: `numerical_constants_math`

function: `prada2011concentration`
Description: Return the concentration of the dark matter halo profile of `node` using the Prada et al. [2011] algorithm.
Code lines: 17
Contained by: file `dark_matter_profiles.structure.concentration.Prada2011.F90`
Modules used: `galacticus_nodes`

function: `prada2011constructorinternal`
Description: Constructor for the `prada2011` dark matter halo profile concentration class.
Code lines: 21
Contained by: file `dark_matter_profiles.structure.concentration.Prada2011.F90`
Modules used: `dark_matter_halo_scales`

function: `prada2011constructorparameters`
Description: Default constructor for the `prada2011` dark matter halo profile concentration class.
Code lines: 145
Contained by: file `dark_matter_profiles.structure.concentration.Prada2011.F90`
Modules used: `input_parameters`

function: `prada2011darkmatterprofiledefinition`
Description: Return a dark matter density profile object defining that used in the definition of concentration in the Prada et al. [2011] algorithm.
Code lines: 9
Contained by: file `dark_matter_profiles.structure.concentration.Prada2011.F90`

function: `prada2011densitycontrastdefinition`
Description: Return a virial density contrast object defining that used in the definition of concentration in the Prada et al. [2011] algorithm.
Code lines: 8
Contained by: file `dark_matter_profiles.structure.concentration.Prada2011.F90`

subroutine: `prada2011destructor`
Description: Destructor for the `prada2011` dark matter halo profile concentration class.
Code lines: 12
Contained by: file `dark_matter_profiles.structure.concentration.Prada2011.F90`

function: `prada2011inversesigmamin`

Description: The function $\sigma_{\rm min}^{-1}(x)$ as defined in eqn. (20) of Prada et al. [2011].
Code lines: 8
Contained by: file dark_matter_profiles.structure.concentration.Prada2011.F90
Modules used: numerical_constants_math

file: dark_matter_profiles.structure.concentration.Schneider2015.F90
Description: An implementation of halo profile concentrations using the algorithm of Schneider [2015].
Code lines: 202
Modules used: cosmological_density_field cosmology_functions root_finder

interface: darkmatterprofileconcentrationschneider2015
Description: Constructors for the Schneider2015 dark matter halo profile concentration class.
Code lines: 4
Contained by: file dark_matter_profiles.structure.concentration.Schneider2015.F90

function: schneider2015concentration
Description: Return the concentration of the dark matter halo profile of node using the algorithm of Schneider [2015].
Code lines: 43
Contained by: file dark_matter_profiles.structure.concentration.Schneider2015.F90
Modules used: galacticus_nodes numerical_constants_math

function: schneider2015constructorinternal
Description: Generic constructor for the schneider2015 dark matter halo concentration class.
Code lines: 11
Contained by: file dark_matter_profiles.structure.concentration.Schneider2015.F90

function: schneider2015constructorparameters
Description: Default constructor for the schneider2015 dark matter halo profile concentration class.
Code lines: 31
Contained by: file dark_matter_profiles.structure.concentration.Schneider2015.F90
Modules used: galacticus_error input_parameters

function: schneider2015darkmatterprofiledefinition
Description: Return a dark matter density profile object defining that used in the definition of concentration in the Schneider [2015] algorithm.
Code lines: 10
Contained by: file dark_matter_profiles.structure.concentration.Schneider2015.F90
Modules used: dark_matter_halo_scales

function: schneider2015densitycontrastdefinition
Description: Return a virial density contrast object defining that used in the definition of concentration in the Schneider [2015] algorithm.
Code lines: 9
Contained by: file dark_matter_profiles.structure.concentration.Schneider2015.F90

subroutine: schneider2015destructor
Description: Destructor for the schneider2015 dark matter halo profile concentration class.

Code lines: 13
Contained by: file dark_matter_profiles.structure.concentration.Schneider2015.F90

function: schneider2015referencecollapsemassroot
Description: Root function used to find the mass collapsing at given time in dark matter halo concentration algorithm of Schneider [2015].
Code lines: 15
Contained by: file dark_matter_profiles.structure.concentration.Schneider2015.F90
Modules used: numerical_constants_math

file: dark_matter_profiles.structure.concentration.WDM.F90
Description: An implementation of warm dark matter halo profile concentrations using the Schneider et al. [2012] modifier.
Code lines: 129
Modules used: transfer_functions

interface: darkmatterprofileconcentrationwdm
Description: Constructors for the WDM dark matter halo profile concentration class.
Code lines: 5
Contained by: file dark_matter_profiles.structure.concentration.WDM.F90

function: wdmconcentration
Description: Return the concentration of the dark matter halo profile of node using the warm dark matter modifier of Schneider et al. [2012].
Code lines: 16
Contained by: file dark_matter_profiles.structure.concentration.WDM.F90
Modules used: galacticus_nodes

function: wdmconstructorinternal
Description: Generic constructor for the WDM dark matter halo concentration class.
Code lines: 9
Contained by: file dark_matter_profiles.structure.concentration.WDM.F90

function: wdmconstructorparameters
Description: Default constructor for the wdm dark matter halo profile concentration class.
Code lines: 16
Contained by: file dark_matter_profiles.structure.concentration.WDM.F90
Modules used: input_parameters

function: wdmdarkmatterprofiledefinition
Description: Return a dark matter density profile object defining that used in the definition of concentration in the warm dark matter modifier of Schneider et al. [2012].
Code lines: 9
Contained by: file dark_matter_profiles.structure.concentration.WDM.F90

function: wdmdensitycontrastdefinition
Description: Return a virial density contrast object defining that used in the definition of concentration in the warm dark matter modifier of Schneider et al. [2012].
Code lines: 9
Contained by: file dark_matter_profiles.structure.concentration.WDM.F90

subroutine: `wdmdestructor`
Description: Destructor for the `wdm` dark matter halo profile concentration class.
Code lines: 8
Contained by: file `dark_matter_profiles.structure.concentration.WDM.F90`

file: `dark_matter_profiles.structure.concentration.Zhao2009.F90`
Description: An implementation of dark matter halo profile concentrations using the Zhao et al. [2009] algorithm.
Code lines: 163
Modules used: `cosmology_functions` `cosmology_parameters` `dark_matter_halo_mass_accretion_histories`

interface: `darkmatterprofileconcentrationzhao2009`
Description: Constructors for the `zhao2009` dark matter halo profile concentration class.
Code lines: 5
Contained by: file `dark_matter_profiles.structure.concentration.Zhao2009.F90`

function: `zhao2009concentration`
Description: Return the concentration of the dark matter halo profile of `node` using the Zhao et al. [2009] algorithm.
Code lines: 22
Contained by: file `dark_matter_profiles.structure.concentration.Zhao2009.F90`
Modules used: `dark_matter_halo_formation_times` `galacticus_nodes`

function: `zhao2009constructorinternal`
Description: Internal constructor for the `zhao2009` dark matter halo profile concentration class.
Code lines: 20
Contained by: file `dark_matter_profiles.structure.concentration.Zhao2009.F90`
Modules used: `dark_matter_halo_scales`

function: `zhao2009constructorparameters`
Description: Constructor for the `zhao2009` dark matter halo profile concentration class which takes an input parameter list.
Code lines: 20
Contained by: file `dark_matter_profiles.structure.concentration.Zhao2009.F90`
Modules used: `input_parameters`

function: `zhao2009darkmatterprofiledefinition`
Description: Return a dark matter density profile object defining that used in the definition of concentration in the Zhao et al. [2009] algorithm.
Code lines: 9
Contained by: file `dark_matter_profiles.structure.concentration.Zhao2009.F90`

function: `zhao2009densitycontrastdefinition`
Description: Return a virial density contrast object defining that used in the definition of concentration in the Zhao et al. [2009] algorithm.
Code lines: 9
Contained by: file `dark_matter_profiles.structure.concentration.Zhao2009.F90`

subroutine: zhao2009destructor
Description: Destructor for the zhao2009 dark matter halo profile concentration class.
Code lines: 11
Contained by: file dark_matter_profiles.structure.concentration.Zhao2009.F90

file: dark_matter_profiles.structure.mass_definitions.F90
Description: Contains a module which implements conversions of total halo mass between different definitions.
Code lines: 79

module: dark_matter_profile_mass_definitions
Description: Implements calculations of dark matter profile scale radii from concentrations.
Code lines: 57
Contained by: file dark_matter_profiles.structure.mass_definitions.F90
Used by:

Modules used: galacticus_error, input_parameters

subroutine: binarydestructor
Description: Destructor for the binary dark matter halo profile concentration class.
Code lines: 9
Contained by: file dark_matter_profiles.structure.scale.binary.F90

function: binaryradius
Description: Return the scale radius of the dark matter halo profile of node.
Code lines: 12
Contained by: file dark_matter_profiles.structure.scale.binary.F90

interface: `darkmatterprofilescaleradiusbinary`
Description: Constructors for the `binary` dark matter halo profile concentration class.
Code lines: 4
Contained by: file dark_matter_profiles.structure.scale.binary.F90

file: `dark_matter_profiles.structure.scale.concentration.F90`
Description: An implementation of dark matter halo profile scale radii in which radii are computed from the concentration.
Code lines: 307
Modules used: cosmology_functions, cosmology_parameters, dark_matter_halo_scales, dark_matter_profiles_concentration, dark_matter_profiles_dmo, galacticus_nodes, virial_density_contrast

function: `concentrationconstructorinternal`
Description: Internal constructor for the `concentration` dark matter halo profile scale radius class.
Code lines: 20
Contained by: file dark_matter_profiles.structure.scale.concentration.F90

function: `concentrationconstructorparameters`
Description: Constructor for the `concentration` dark matter halo profile scale radius class which takes a parameter list as input.
Code lines: 48
Contained by: file dark_matter_profiles.structure.scale.concentration.F90
Modules used: input_parameters

subroutine: `concentrationdestructor`
Description: Destructor for the `concentration` dark matter halo profile scale radius class.
Code lines: 15
Contained by: file dark_matter_profiles.structure.scale.concentration.F90

function: `concentrationmassroot`
Description: Root function used to find the mass of a halo corresponding to the definition used for a particular concentration class.
Code lines: 35
Contained by: file dark_matter_profiles.structure.scale.concentration.F90
Modules used: galacticus_calculations_resets

function: `concentrationradius`
Description: Compute the scale radius of the dark matter profile of `node`.
Code lines: 105
Contained by: file dark_matter_profiles.structure.scale.concentration.F90
Modules used: galacticus_calculations_resets, numerical_comparison, numerical_constants_math, root_finder

type: `concentrationstate`
Code lines: 6
Contained by: file dark_matter_profiles.structure.scale.concentration.F90

interface: `darkmatterprofilescaleradiusconcentration`
Description: Constructors for the `concentration` dark matter halo profile scale radius class.
Code lines: 4
Contained by: file dark_matter_profiles.structure.scale.concentration.F90

file: `dark_matter_profiles.structure.scale.zero.F90`
Description: An implementation of dark matter halo profile scale radii which returns zero radii—useful when scale radii are not relevant.
Code lines: 62

interface: `darkmatterprofilescaleradiuszero`
Description: Constructors for the `zero` dark matter halo profile scale radius class.
Code lines: 3
Contained by: file dark_matter_profiles.structure.scale.zero.F90

function: `zeroconstructorparameters`
Description: Constructor for the `zero` dark matter halo profile scale radius class which takes a parameter list as input.
Code lines: 11
Contained by: file dark_matter_profiles.structure.scale.zero.F90
Modules used: input_parameters

function: `zeroradius`
Description: Compute the scale radius of the dark matter profile of `node`.
Code lines: 9
Contained by: file dark_matter_profiles.structure.scale.zero.F90

file: `dark_matter_profiles.structure.shape.F90`
Description: Contains a module which provides a class that implements concentrations of dark matter halo profiles.
Code lines: 40

module: `dark_matter_profiles_shape`
Description: Provides a class that implements shape parameters of dark matter halo profiles.
Code lines: 18
Contained by: file dark_matter_profiles.structure.shape.F90
Modules used: galacticus_nodes
Used by: subroutine galacticus_function_classes_destroy; subroutine galacticus_state_retrieve; subroutine galacticus_state_store; module node_component_dark_matter_profile_scale_shape; module virial_density_contrast_percolation_utilities

file: `dark_matter_profiles.structure.shape.Gao2008.F90`
Description: An implementation of dark matter halo profile shapes using the Gao et al. [2008] algorithm.
Code lines: 111
Modules used: cosmological_density_field

interface: darkmatterprofileshapegao2008
Description: Constructors for the gao2008 dark matter halo profile shape class.
Code lines: 4
Contained by: file dark_matter_profiles.structure.shape.Gao2008.F90

function: gao2008constructorinternal
Description: Constructor for the gao2008 dark matter halo profile shape class.
Code lines: 10
Contained by: file dark_matter_profiles.structure.shape.Gao2008.F90

function: gao2008constructorparameters
Description: Default constructor for the gao2008 dark matter halo profile shape class.
Code lines: 17
Contained by: file dark_matter_profiles.structure.shape.Gao2008.F90
Modules used: input_parameters

subroutine: gao2008destructor
Description: Destructor for the gao2008 dark matter halo profile shape class.
Code lines: 8
Contained by: file dark_matter_profiles.structure.shape.Gao2008.F90

function: gao2008shape
Description: Return the Einasto profile shape parameter of the dark matter halo profile of node using the Gao et al. [2008] algorithm. More specifically, the parameter is given by:

$$\alpha = \begin{cases} 0.155 + 0.0095\nu^2 & \text{if } \nu < 3.907 \\ 0.3 & \text{if } \nu \geq 3.907, \end{cases} \tag{18.4}$$

where $\nu = \delta_c(t)/\sigma(M)$ is the peak height of the halo.
Code lines: 25
Contained by: file dark_matter_profiles.structure.shape.Gao2008.F90
Modules used: galacticus_nodes

file: dark_matter_profiles.structure.shape.Klypin2015.F90
Description: An implementation of dark matter halo profile shapes using the Klypin et al. [2014] algorithm.
Code lines: 135
Modules used: cosmological_density_field

interface: darkmatterprofileshapeklypin2015
Description: Constructors for the klypin2015 dark matter halo profile shape parameter class.
Code lines: 4
Contained by: file dark_matter_profiles.structure.shape.Klypin2015.F90

function: klypin2015constructorinternal
Description: Constructor for the klypin2015 dark matter halo profile shape class.
Code lines: 13
Contained by: file dark_matter_profiles.structure.shape.Klypin2015.F90

Modules used: galacticus_error

function: klypin2015constructorparameters
Description: Default constructor for the klypin2015 dark matter halo profile shape class.
Code lines: 27
Contained by: file dark_matter_profiles.structure.shape.Klypin2015.F90
Modules used: input_parameters

subroutine: klypin2015destructor
Description: Destructor for the klypin2015 dark matter halo profile shape class.
Code lines: 8
Contained by: file dark_matter_profiles.structure.shape.Klypin2015.F90

function: klypin2015shape
Description: Return the Einasto profile shape parameter of the dark matter halo profile of node using the Klypin et al. [2014] algorithm.
Code lines: 25
Contained by: file dark_matter_profiles.structure.shape.Klypin2015.F90
Modules used: galacticus_error galacticus_nodes

file: dark_matter_profiles.structure_tasks.F90
Description: Contains a module which implements structure tasks related to the dark matter halo density profile.
Code lines: 172

module: dark_matter_profile_structure_tasks
Description: Implements structure tasks related to the dark matter halo density profile.
Code lines: 150
Contained by: file dark_matter_profiles.structure_tasks.F90
Modules used: dark_matter_profiles
Used by: function galactic_structure_density; function galactic_structure_enclosed_mass; function galactic_structure_potential; function galactic_structure_rotation_curve; function galactic_structure_rotation_curve_gradient

function: dark_matter_profile_density_task
Description: Computes the density at a given position for a dark matter profile.
Code lines: 21
Contained by: module dark_matter_profile_structure_tasks
Modules used: galactic_structure_options galacticus_nodes

function: dark_matter_profile_enclosed_mass_task
Description: Computes the mass within a given radius for a dark matter profile.
Code lines: 32
Contained by: module dark_matter_profile_structure_tasks
Modules used: galactic_structure_options galacticus_nodes

function: `dark_matter_profile_potential_task`
Description: Return the potential due to dark matter.
Code lines: 20
Contained by: module `dark_matter_profile_structure_tasks`
Modules used: `galactic_structure_options` `galacticus_error` `galacticus_nodes`

function: `dark_matter_profile_rotation_curve_gradient_task`
Description: Computes the rotation curve gradient for the dark matter.
Code lines: 24
Contained by: module `dark_matter_profile_structure_tasks`
Modules used: `galactic_structure_options` `galacticus_nodes` `numerical_constants_math` `numerical_constants_physical`

function: `dark_matter_profile_rotation_curve_task`
Description: Computes the rotation curve at a given radius for a dark matter profile.
Code lines: 20
Contained by: module `dark_matter_profile_structure_tasks`
Modules used: `galactic_structure_options` `galacticus_nodes` `numerical_constants_physical`

file: `dark_matter_profiles_DMO.Burkert.F90`
Description: An implementation of Burkert [1995] dark matter halo profiles.
Code lines: 1190
Modules used: `kind_numbers` `numerical_constants_math` `tables`

function: `burkertangularmomentumscalefree`
Description: Returns the total angular momentum (in units of the virial mass times scale radius times [assumed constant] rotation speed) in an Burkert dark matter profile with given `concentration`. This is given by:

$$J = \int_0^c 4\pi x^3 \rho(x) \mathrm{d}x \Big/ \int_0^c 4\pi x^2 \rho(x) \mathrm{d}x, \tag{18.5}$$

where x is radius in units of the scale radius and c is concentration. This can be evaluated to give

$$J = \left[2\tan^{-1} c + 2\log(1+c) + \log(1+c^2) - 4c\right] / \left[2\tan^{-1} c - 2\log(1+c) - \log(1+c^2)\right]. \tag{18.6}$$

Code lines: 17
Contained by: file `dark_matter_profiles_DMO.Burkert.F90`

subroutine: `burkertautohook`
Description: Attach to the calculation reset event.
Code lines: 8
Contained by: file `dark_matter_profiles_DMO.Burkert.F90`
Modules used: `events_hooks`

subroutine: `burkertcalculationreset`
Description: Reset the dark matter profile calculation.
Code lines: 10
Contained by: file `dark_matter_profiles_DMO.Burkert.F90`

function: `burkertcircularvelocity`
Description: Returns the circular velocity (in km/s) in the dark matter profile of `node` at the given `radius` (given in units of Mpc).
Code lines: 15
Contained by: file `dark_matter_profiles_DMO.Burkert.F90`
Modules used: `numerical_constants_physical`

function: `burkertcircularvelocitymaximum`
Description: Returns the maximum circular velocity (in km/s) in the dark matter profile of `node`.
Code lines: 23
Contained by: file `dark_matter_profiles_DMO.Burkert.F90`
Modules used: `galacticus_nodes` `numerical_constants_physical`

function: `burkertconstructorinternal`
Description: Generic constructor for the `burkert` dark matter halo profile class.
Code lines: 33
Contained by: file `dark_matter_profiles_DMO.Burkert.F90`
Modules used: `galacticus_error` `galacticus_nodes`

function: `burkertconstructorparameters`
Description: Default constructor for the `burkert` dark matter halo profile class.
Code lines: 13
Contained by: file `dark_matter_profiles_DMO.Burkert.F90`
Modules used: `input_parameters`

function: `burkertdensity`
Description: Returns the density (in $M_\odot$ Mpc^{-3}) in the dark matter profile of `node` at the given `radius` (given in units of Mpc).
Code lines: 19
Contained by: file `dark_matter_profiles_DMO.Burkert.F90`
Modules used: `galacticus_nodes`

function: `burkertdensitylogslope`
Description: Returns the logarithmic slope of the density profile of `node` at the given `radius` (given in units of Mpc).
Code lines: 17
Contained by: file `dark_matter_profiles_DMO.Burkert.F90`
Modules used: `galacticus_nodes`

function: `burkertdensityscalefree`
Description: Returns the density (in units such that the virial mass and scale length are unity) in an Burkert dark matter profile with given `concentration` at the given `radius` (given in units of the scale radius).
Code lines: 11
Contained by: file `dark_matter_profiles_DMO.Burkert.F90`

Modules used: numerical_constants_math

subroutine: burkertdestructor
Description: Destructor for the burkert dark matter halo profile class.
Code lines: 30
Contained by: file dark_matter_profiles_DMO.Burkert.F90
Modules used: events_hooks

function: burkertenclosedmass
Description: Returns the enclosed mass (in $M_\odot$) in the dark matter profile of node at the given radius (given in units of Mpc).
Code lines: 19
Contained by: file dark_matter_profiles_DMO.Burkert.F90
Modules used: galacticus_nodes

function: burkertenclosedmassscalefree
Description: Returns the enclosed mass (in units of the virial mass) in an Burkert dark matter profile with given concentration at the given radius (given in units of the scale radius).
Code lines: 20
Contained by: file dark_matter_profiles_DMO.Burkert.F90

function: burkertenergy
Description: Return the energy of an Burkert halo density profile.
Code lines: 23
Contained by: file dark_matter_profiles_DMO.Burkert.F90
Modules used: galacticus_nodes

function: burkertenergygrowthrate
Description: Return the rate of change of the energy of an Burkert halo density profile.
Code lines: 27
Contained by: file dark_matter_profiles_DMO.Burkert.F90
Modules used: galacticus_nodes

function: burkertfreefallradius
Description: Returns the freefall radius in the Burkert density profile at the specified time (given in Gyr).
Code lines: 37
Contained by: file dark_matter_profiles_DMO.Burkert.F90
Modules used: galacticus_nodes numerical_constants_astronomical

function: burkertfreefallradiusincreaserate
Description: Returns the rate of increase of the freefall radius in the Burkert density profile at the specified time (given in Gyr).
Code lines: 38
Contained by: file dark_matter_profiles_DMO.Burkert.F90
Modules used: galacticus_nodes numerical_constants_astronomical

subroutine: burkertfreefalltabulate
Description: Tabulates the freefall time vs. freefall radius for Burkert halos.
Code lines: 38
Contained by: file dark_matter_profiles_DMO.Burkert.F90

function: `burkertfreefalltimescalefree`
Description: Compute the freefall time in a scale-free Burkert halo.
Code lines: 46
Contained by: file `dark_matter_profiles_DMO.Burkert.F90`
Modules used: `numerical_integration`

function: `burkertfreefalltimescalefreeintegrand`
Description: Integrand function used for finding the free-fall time in Burkert halos.
Code lines: 25
Contained by: function `burkertfreefalltimescalefree`
Modules used: `numerical_constants_math`

subroutine: `burkertinverseangularmomentum`
Description: Tabulates the specific angular momentum vs. radius in an Burkert profile for rapid inversion.
Code lines: 42
Contained by: file `dark_matter_profiles_DMO.Burkert.F90`

function: `burkertkspace`
Description: Returns the Fourier transform of the Burkert density profile at the specified `waveNumber` (given in Mpc^{-1}), using the expression given in Cooray and Sheth (2002; eqn. 81).
Code lines: 28
Contained by: file `dark_matter_profiles_DMO.Burkert.F90`
Modules used: `exponential_integrals` `galacticus_nodes` `numerical_constants_math`

subroutine: `burkertmassnormalizationfactor`
Description: Compute the normalization factor for the burkert mass profile.
Code lines: 19
Contained by: file `dark_matter_profiles_DMO.Burkert.F90`

function: `burkertpotential`
Description: Returns the potential (in $(\mathrm{km/s})^2$) in the dark matter profile of `node` at the given `radius` (given in units of Mpc).
Code lines: 25
Contained by: file `dark_matter_profiles_DMO.Burkert.F90`
Modules used: `galactic_structure_options` `galacticus_nodes` `numerical_constants_math`

function: `burkertprofileenergy`
Description: Computes the total energy of an Burkert profile halo of given `concentration` using the methods of Cole et al. (2000; their Appendix A).
Code lines: 65
Contained by: file `dark_matter_profiles_DMO.Burkert.F90`
Modules used: `numerical_constants_math` `numerical_integration`

function: `burkertjeansequationintegrand`
Description: Integrand for Burkert profile Jeans equation.
Code lines: 7

Contained by: function burkertprofileenergy

function: burkertkineticenergyintegrand
Description: Integrand for Burkert profile kinetic energy.
Code lines: 7
Contained by: function burkertprofileenergy

function: burkertpotentialenergyintegrand
Description: Integrand for Burkert profile potential energy.
Code lines: 7
Contained by: function burkertprofileenergy

function: burkertradialmoment
Description: Returns the density (in $M_\odot$ Mpc^{-3}) in the dark matter profile of node at the given radius (given in units of Mpc).
Code lines: 48
Contained by: file dark_matter_profiles_DMO.Burkert.F90
Modules used: galacticus_nodes numerical_comparison numerical_constants_math

function: radialmoment
Description: Evaluate the radial moment in the Burkert profile.
Code lines: 18
Contained by: function burkertradialmoment
Modules used: hypergeometric_functions numerical_comparison numerical_constants_math

function: burkertradialvelocitydispersion
Description: Returns the radial velocity dispersion (in km/s) in the dark matter profile of node at the given radius (given in units of Mpc).
Code lines: 26
Contained by: file dark_matter_profiles_DMO.Burkert.F90
Modules used: galacticus_nodes

function: burkertradialvelocitydispersionscalefree
Description: Compute the radial velocity dispersion in a scale-free Burkert halo.
Code lines: 33
Contained by: file dark_matter_profiles_DMO.Burkert.F90
Modules used: numerical_integration

function: burkertjeansequationintegrand
Description: Integrand for Burkert drak matter profile Jeans equation.
Code lines: 11
Contained by: function burkertradialvelocitydispersionscalefree

subroutine: burkertradialvelocitydispersiontabulate
Description: Tabulates the radial velocity dispersion vs. radius for Burkert halos.
Code lines: 33
Contained by: file dark_matter_profiles_DMO.Burkert.F90

function: `burkertradiusenclosingdensity`
Description: Null implementation of function to compute the radius enclosing a given density for Burkert dark matter halo profiles.
Code lines: 19
Contained by: file `dark_matter_profiles_DMO.Burkert.F90`
Modules used: `galacticus_nodes`

subroutine: `burkertradiusenclosingdensitytabulate`
Description: Tabulates the radius vs. enclosed density for Burkert halos.
Code lines: 41
Contained by: file `dark_matter_profiles_DMO.Burkert.F90`
Modules used: `numerical_constants_math`

function: `burkertradiusfromspecificangularmomentum`
Description: Returns the radius (in Mpc) in `node` at which a circular orbit has the given `specificAngularMomentum` (given in units of km s^{-1} Mpc)
Code lines: 46
Contained by: file `dark_matter_profiles_DMO.Burkert.F90`
Modules used: `galacticus_nodes`

function: `burkertrotationnormalization`
Description: Return the normalization of the rotation velocity vs. specific angular momentum relation.
Code lines: 21
Contained by: file `dark_matter_profiles_DMO.Burkert.F90`
Modules used: `galacticus_nodes`

function: `burkertspecificangularmomentumscalefree`
Description: Returns the specific angular momentum, normalized to unit scale length and unit velocity at the scale radius, at position `radius` (in units of the scale radius) in an Burkert profile.
Code lines: 9
Contained by: file `dark_matter_profiles_DMO.Burkert.F90`

subroutine: `burkerttabulate`
Description: Tabulate properties of the Burkert halo profile which must be computed numerically.
Code lines: 35
Contained by: file `dark_matter_profiles_DMO.Burkert.F90`

interface: `darkmatterprofiledmoburkert`
Description: Constructors for the `burkert` dark matter halo profile class.
Code lines: 4
Contained by: file `dark_matter_profiles_DMO.Burkert.F90`

file: `dark_matter_profiles_DMO.Einasto.F90`
Description: An implementation of "Einasto" dark matter halo profiles.
Code lines: 1541
Modules used: `fgsl` `kind_numbers` `tables`

interface: `darkmatterprofiledmoeinasto`
Description: Constructors for the `einasto` dark matter halo profile class.
Code lines: 4
Contained by: file dark_matter_profiles_DMO.Einasto.F90

function: `einastocircularvelocity`
Description: Returns the circular velocity (in km/s) in the dark matter profile of `node` at the given `radius` (given in units of Mpc).
Code lines: 15
Contained by: file dark_matter_profiles_DMO.Einasto.F90
Modules used: numerical_constants_physical

function: `einastocircularvelocitymaximum`
Description: Returns the maximum circular velocity (in km/s) in the dark matter profile of `node`.
Code lines: 38
Contained by: file dark_matter_profiles_DMO.Einasto.F90
Modules used: galacticus_nodes numerical_constants_physical root_finder

function: `einastocircularvelocitypeakradius`
Description: Computes the derivative of the square of circular velocity for an Einasto density profile.
Code lines: 8
Contained by: function einastocircularvelocitymaximum
Modules used: gamma_functions

function: `einastoconstructorinternal`
Description: Internal constructor for the `einasto` dark matter halo profile class.
Code lines: 61
Contained by: file dark_matter_profiles_DMO.Einasto.F90
Modules used: array_utilities galacticus_error galacticus_nodes

function: `einastoconstructorparameters`
Description: Constructor for the `einasto` dark matter halo profile class which takes a parameter set as input.
Code lines: 13
Contained by: file dark_matter_profiles_DMO.Einasto.F90
Modules used: input_parameters

function: `einastodensity`
Description: Returns the density (in $M_\odot$ Mpc^{-3}) in the dark matter profile of `node` at the given `radius` (given in units of Mpc).
Code lines: 21
Contained by: file dark_matter_profiles_DMO.Einasto.F90
Modules used: galacticus_nodes

function: `einastodensitylogslope`
Description: Returns the logarithmic slope of the density in the dark matter profile of `node` at the given `radius` (given in units of Mpc).

Code lines: 21
Contained by: file dark_matter_profiles_DMO.Einasto.F90
Modules used: galacticus_nodes

function: einastodensityscalefree
Description: Returns the density (in units such that the virial mass and scale length are unity) in an Einasto dark matter profile with given concentration and alpha at the given radius (given in units of the scale radius).
Code lines: 14
Contained by: file dark_matter_profiles_DMO.Einasto.F90
Modules used: gamma_functions numerical_constants_math

subroutine: einastodestructor
Description: Destructor for the einasto dark matter halo profile class.
Code lines: 19
Contained by: file dark_matter_profiles_DMO.Einasto.F90
Modules used: numerical_interpolation

function: einastoenclosedmass
Description: Returns the enclosed mass (in $M_\odot$) in the dark matter profile of node at the given radius (given in units of Mpc).
Code lines: 21
Contained by: file dark_matter_profiles_DMO.Einasto.F90
Modules used: galacticus_nodes

function: einastoenclosedmassscalefree
Description: Returns the enclosed mass (in units of the virial mass) in an Einasto dark matter profile with given concentration at the given radius (given in units of the scale radius).
Code lines: 11
Contained by: file dark_matter_profiles_DMO.Einasto.F90
Modules used: gamma_functions

function: einastoenergy
Description: Return the energy of an Einasto halo density profile.
Code lines: 41
Contained by: file dark_matter_profiles_DMO.Einasto.F90
Modules used: galacticus_nodes iso_c_binding
numerical_interpolation

function: einastoenergygrowthrate
Description: Return the energy of an Einasto halo density profile.
Code lines: 44
Contained by: file dark_matter_profiles_DMO.Einasto.F90
Modules used: galacticus_nodes iso_c_binding
numerical_interpolation

subroutine: einastoenergytablemake
Description: Create a tabulation of the energy of Einasto profiles as a function of their concentration of α parameter.
Code lines: 123

Contained by: file dark_matter_profiles_DMO.Einasto.F90
Modules used: memory_management, numerical_constants_math, numerical_integration, numerical_interpolation, numerical_ranges

function: einastojeansequationintegrand
Description: Integrand for Einasto profile Jeans equation.
Code lines: 7
Contained by: subroutine einastoenergytablemake

function: einastokineticenergyintegrand
Description: Integrand for Einasto profile kinetic energy.
Code lines: 7
Contained by: subroutine einastoenergytablemake

function: einastopotentialenergyintegrand
Description: Integrand for Einasto profile potential energy.
Code lines: 7
Contained by: subroutine einastoenergytablemake

subroutine: einastofourierprofiletablemake
Description: Create a tabulation of the Fourier transform of Einasto profiles as a function of their α parameter and dimensionless wavenumber.
Code lines: 133
Contained by: file dark_matter_profiles_DMO.Einasto.F90
Modules used: galacticus_display, galacticus_error, memory_management, numerical_integration, numerical_interpolation, numerical_ranges

function: einastofourierprofileintegrand
Description: Integrand for Einasto Fourier profile.
Code lines: 8
Contained by: subroutine einastofourierprofiletablemake
Modules used: numerical_constants_math

function: einastofreefallradius
Description: Returns the freefall radius in the Einasto density profile at the specified time (given in Gyr).
Code lines: 60
Contained by: file dark_matter_profiles_DMO.Einasto.F90
Modules used: galacticus_nodes, gamma_functions, iso_c_binding, numerical_constants_astronomical, numerical_constants_physical, numerical_interpolation

function: einastofreefallradiusincreaserate
Description: Returns the rate of increase of the freefall radius in the Einasto density profile at the specified time (given in Gyr).
Code lines: 61
Contained by: file dark_matter_profiles_DMO.Einasto.F90
Modules used: galacticus_nodes, gamma_functions, iso_c_binding, numerical_constants_astronomical

numerical_constants_physical numerical_interpolation

subroutine: `einastofreefalltabulate`
Description: Tabulates the freefall time vs. freefall radius for Einasto halos.
Code lines: 80
Contained by: file dark_matter_profiles_DMO.Einasto.F90
Modules used: galacticus_display memory_management numerical_interpolation numerical_ranges

function: `einastofreefalltimescalefree`
Description: Compute the freefall time in a scale-free Einasto halo.
Code lines: 27
Contained by: file dark_matter_profiles_DMO.Einasto.F90
Modules used: numerical_integration

function: `einastofreefalltimescalefreeintegrand`
Description: Integrand function used for finding the free-fall time in Einasto halos.
Code lines: 7
Contained by: function einastofreefalltimescalefree

function: `einastokspace`
Description: Returns the Fourier transform of the Einasto density profile at the specified `waveNumber` (given in Mpc^{-1})).
Code lines: 45
Contained by: file dark_matter_profiles_DMO.Einasto.F90
Modules used: galacticus_nodes iso_c_binding numerical_interpolation

function: `einastopotential`
Description: Returns the potential (in $(\mathrm{km/s})^2$) in the dark matter profile of `node` at the given `radius` (given in units of Mpc).
Code lines: 26
Contained by: file dark_matter_profiles_DMO.Einasto.F90
Modules used: galactic_structure_options galacticus_nodes numerical_constants_physical

function: `einastopotentialscalefree`
Description: Returns the gravitational potential (in units where the virial mass and scale radius are unity) in an Einasto dark matter profile with given `concentration` and `alpha` at the given `radius` (given in units of the scale radius). Uses the results from Retana-Montenegro et al. [2012], their equations (19) and (20).
Code lines: 18
Contained by: file dark_matter_profiles_DMO.Einasto.F90
Modules used: gamma_functions

function: `einastoradialmoment`
Description: Returns the density (in $M_\odot$ Mpc^{-3}) in the dark matter profile of `node` at the given `radius` (given in units of Mpc).
Code lines: 41
Contained by: file dark_matter_profiles_DMO.Einasto.F90

Modules used: galacticus_nodes gamma_functions numerical_comparison numerical_constants_math

function: einastoradialmomentscalefree
Description: Provides the scale-free part of the radial moment of the Einasto density profile.
Code lines: 7
Contained by: function einastoradialmoment

function: einastoradialvelocitydispersion
Description: Returns the radial velocity dispersion (in km/s) in the dark matter profile of node at the given radius (given in units of Mpc).
Code lines: 42
Contained by: file dark_matter_profiles_DMO.Einasto.F90
Modules used: galacticus_nodes gamma_functions iso_c_binding numerical_interpolation

function: einastoradialvelocitydispersionscalefree
Description: Compute the radial velocity dispersion in a scale-free Einasto halo.
Code lines: 34
Contained by: file dark_matter_profiles_DMO.Einasto.F90
Modules used: numerical_integration

function: einastojeansequationintegrand
Description: Integrand for Einasto drak matter profile Jeans equation.
Code lines: 12
Contained by: function einastoradialvelocitydispersionscalefree
Modules used: gamma_functions

subroutine: einastoradialvelocitydispersiontabulate
Description: Tabulates the radial velocity dispersion vs. radius for Einasto halos.
Code lines: 72
Contained by: file dark_matter_profiles_DMO.Einasto.F90
Modules used: galacticus_display memory_management numerical_interpolation numerical_ranges

function: einastoradiusenclosingdensity
Description: Implementation of function to compute the radius enclosing a given density for Einasto dark matter halo profiles. This function uses a numerical root finder to find the enclosing radius—this is likely not the most efficient solution...
Code lines: 23
Contained by: file dark_matter_profiles_DMO.Einasto.F90
Modules used: root_finder

function: einastoradiusenclosingdensityroot
Description: Root function used in finding the radius enclosing a given density in Einasto profiles.
Code lines: 8
Contained by: file dark_matter_profiles_DMO.Einasto.F90
Modules used: numerical_constants_math

function: `einastoradiusfromspecificangularmomentum`

Description: Returns the radius (in Mpc) in `node` at which a circular orbit has the given `specificAngularMomentum` (given in units of km s^{-1} Mpc).
Code lines: 23
Contained by: file dark_matter_profiles_DMO.Einasto.F90
Modules used: galacticus_nodes, numerical_constants_physical

function: `einastoradiusfromspecificangularmomentumscalefree`

Description: Comptue the radius at which a circular orbit has the given `specificAngularMomentumScaleFree` in a scale free Einasto profile.
Code lines: 32
Contained by: file dark_matter_profiles_DMO.Einasto.F90
Modules used: iso_c_binding, numerical_interpolation

subroutine: `einastoradiusfromspecificangularmomentumtablemake`

Description: Create a tabulation of the relation between specific angular momentum and radius in an Einasto profile.
Code lines: 69
Contained by: file dark_matter_profiles_DMO.Einasto.F90
Modules used: gamma_functions, memory_management, numerical_interpolation, numerical_ranges

function: `einastorotationnormalization`

Description: Return the rotation normalization of an Einasto halo density profile.
Code lines: 19
Contained by: file dark_matter_profiles_DMO.Einasto.F90
Modules used: galacticus_nodes, gamma_functions, numerical_constants_math

file: `dark_matter_profiles_DMO.F90`

Description: Contains a module which provides an object that implements dark matter halo profiles.
Code lines: 241

module: `dark_matter_profiles_dmo`

Description: Provides an object that implements dark matter halo profiles.
Code lines: 219
Contained by: file dark_matter_profiles_DMO.F90
Modules used: dark_matter_halo_scales, dark_matter_profiles_generic, galacticus_nodes

function: darkmatterprofiledmoenclosedmassroot

Description: Root function used in solving for the radius that encloses a given mass.
Code lines: 7
Contained by: module dark_matter_profiles_dmo

file: dark_matter_profiles_DMO.NFW.F90

Description: An implementation of Navarro et al. [1997] dark matter halo profiles.
Code lines: 1238
Modules used: kind_numbers tables

interface: darkmatterprofiledmonfw

Description: Constructors for the nfw dark matter halo profile class.
Code lines: 4
Contained by: file dark_matter_profiles_DMO.NFW.F90

function: nfwangularmomentumscalefree

Description: Returns the total angular momentum (in units of the virial mass times scale radius times [assumed constant] rotation speed) in an NFW dark matter profile with given concentration. This is given by:

$$J = \int_0^c 4\pi x^3 \rho(x) \mathrm{d}x \Big/ \int_0^c 4\pi x^2 \rho(x) \mathrm{d}x, \tag{18.7}$$

where x is radius in units of the scale radius and c is concentration. This can be evaluated to give

$$J = \left[1 + c - 2\ln(1+c) - \frac{1}{1+c}\right] \Big/ \left[\ln(1+c) - \frac{c}{1+c}\right]. \tag{18.8}$$

Code lines: 17
Contained by: file dark_matter_profiles_DMO.NFW.F90

subroutine: nfwautohook

Description: Attach to the calculation reset event.
Code lines: 8
Contained by: file dark_matter_profiles_DMO.NFW.F90
Modules used: events_hooks

subroutine: `nfwcalculationreset`
Description: Reset the dark matter profile calculation.
Code lines: 15
Contained by: file dark_matter_profiles_DMO.NFW.F90

function: `nfwcircularvelocity`
Description: Returns the circular velocity (in km/s) in the dark matter profile of `node` at the given `radius` (given in units of Mpc).
Code lines: 22
Contained by: file dark_matter_profiles_DMO.NFW.F90
Modules used: numerical_constants_physical

function: `nfwcircularvelocitymaximum`
Description: Returns the maximum circular velocity (in km/s) in the dark matter profile of `node`.
Code lines: 28
Contained by: file dark_matter_profiles_DMO.NFW.F90
Modules used: galacticus_nodes numerical_constants_physical

function: `nfwconstructorinternal`
Description: Generic constructor for the `nfw` dark matter halo profile class.
Code lines: 29
Contained by: file dark_matter_profiles_DMO.NFW.F90
Modules used: galacticus_error galacticus_nodes

function: `nfwconstructorparameters`
Description: Constructor for the `nfw` dark matter halo profile class which takes a parameter set as input.
Code lines: 13
Contained by: file dark_matter_profiles_DMO.NFW.F90
Modules used: input_parameters

function: `nfwdensity`
Description: Returns the density (in $M_\odot$ Mpc^{-3}) in the dark matter profile of `node` at the given `radius` (given in units of Mpc).
Code lines: 19
Contained by: file dark_matter_profiles_DMO.NFW.F90
Modules used: galacticus_nodes

function: `nfwdensityenclosedbyradiusscalefree`
Description: Returns the density (in units of the virial mass per cubic scale radius) in an NFW dark matter profile with given `concentration` which is enclosed a given radius (in units of the scale radius).
Code lines: 10
Contained by: file dark_matter_profiles_DMO.NFW.F90
Modules used: numerical_constants_math

function: `nfwdensitylogslope`
Description: Returns the logarithmic slope of the density in the dark matter profile of `node` at the given `radius` (given in units of Mpc).
Code lines: 19

Contained by: file dark_matter_profiles_DMO.NFW.F90
Modules used: galacticus_nodes

function: nfwdensityscalefree
Description: Returns the density (in units such that the virial mass and scale length are unity) in an NFW dark matter profile with given concentration at the given radius (given in units of the scale radius).
Code lines: 11
Contained by: file dark_matter_profiles_DMO.NFW.F90
Modules used: numerical_constants_math

subroutine: nfwdestructor
Description: Destructor for the nfw dark matter halo profile class.
Code lines: 27
Contained by: file dark_matter_profiles_DMO.NFW.F90
Modules used: events_hooks

subroutine: nfwencloseddensitytabulate
Description: Tabulates the enclosed density vs. radius for NFW halos.
Code lines: 40
Contained by: file dark_matter_profiles_DMO.NFW.F90

function: nfwenclosedmass
Description: Returns the enclosed mass (in $M_\odot$) in the dark matter profile of node at the given radius (given in units of Mpc).
Code lines: 19
Contained by: file dark_matter_profiles_DMO.NFW.F90
Modules used: galacticus_nodes

function: nfwenclosedmassscalefree
Description: Returns the enclosed mass (in units of the virial mass) in an NFW dark matter profile with given concentration at the given radius (given in units of the scale radius).
Code lines: 22
Contained by: file dark_matter_profiles_DMO.NFW.F90

function: nfwenergy
Description: Return the energy of an NFW halo density profile.
Code lines: 23
Contained by: file dark_matter_profiles_DMO.NFW.F90
Modules used: galacticus_nodes

function: nfwenergygrowthrate
Description: Return the rate of change of the energy of an NFW halo density profile.
Code lines: 26
Contained by: file dark_matter_profiles_DMO.NFW.F90
Modules used: galacticus_nodes

function: nfwfreefallradius
Description: Returns the freefall radius in the NFW density profile at the specified time (given in Gyr).
Code lines: 41

Contained by: file dark_matter_profiles_DMO.NFW.F90
Modules used: galacticus_nodes numerical_constants_astronomical

function: nfwfreefallradiusincreaserate
Description: Returns the rate of increase of the freefall radius in the NFW density profile at the specified time (given in Gyr).
Code lines: 42
Contained by: file dark_matter_profiles_DMO.NFW.F90
Modules used: galacticus_nodes numerical_constants_astronomical

subroutine: nfwfreefalltabulate
Description: Tabulates the freefall time vs. freefall radius for NFW halos.
Code lines: 40
Contained by: file dark_matter_profiles_DMO.NFW.F90

function: nfwfreefalltimescalefree
Description: Compute the freefall time in a scale-free NFW halo.
Code lines: 50
Contained by: file dark_matter_profiles_DMO.NFW.F90
Modules used: numerical_integration

function: nfwfreefalltimescalefreeintegrand
Description: Integrand function used for finding the free-fall time in NFW halos.
Code lines: 21
Contained by: function nfwfreefalltimescalefree

subroutine: nfwinverseangularmomentum
Description: Tabulates the specific angular momentum vs. radius in an NFW profile for rapid inversion.
Code lines: 42
Contained by: file dark_matter_profiles_DMO.NFW.F90

function: nfwkspace
Description: Returns the Fourier transform of the NFW density profile at the specified waveNumber (given in Mpc^{-1}), using the expression given in Cooray and Sheth (2002; eqn. 81).
Code lines: 27
Contained by: file dark_matter_profiles_DMO.NFW.F90
Modules used: exponential_integrals galacticus_nodes

subroutine: nfwmassnormalizationfactor
Description: Compute the normalization factor for the NFW mass profile.
Code lines: 19
Contained by: file dark_matter_profiles_DMO.NFW.F90

function: nfwpotential
Description: Returns the potential (in $(\mathrm{km/s})^2$) in the dark matter profile of node at the given radius (given in units of Mpc).
Code lines: 27
Contained by: file dark_matter_profiles_DMO.NFW.F90
Modules used: galactic_structure_options galacticus_nodes

function: `nfwprofileenergy`
Description: Computes the total energy of an NFW profile halo of given `concentration` using the methods of Cole et al. (2000; their Appendix A), except for potential energy which is computed using the result derived by Mo et al. (1998; eqn. 23).
Code lines: 52
Contained by: file `dark_matter_profiles_DMO.NFW.F90`
Modules used: `numerical_constants_math` `numerical_integration`

function: `nfwjeansequationintegrand`
Description: Integrand for NFW profile Jeans equation.
Code lines: 7
Contained by: function `nfwprofileenergy`

function: `nfwkineticenergyintegrand`
Description: Integrand for NFW profile kinetic energy.
Code lines: 7
Contained by: function `nfwprofileenergy`

function: `nfwradialmoment`
Description: Returns the density (in $M_\odot$ Mpc^{-3}) in the dark matter profile of `node` at the given `radius` (given in units of Mpc).
Code lines: 48
Contained by: file `dark_matter_profiles_DMO.NFW.F90`
Modules used: `galacticus_nodes` `numerical_comparison` `numerical_constants_math`

function: `nfwradialmomentscalefree`
Description: Provides the scale-free part of the radial moment of the NFW density profile.
Code lines: 18
Contained by: function `nfwradialmoment`
Modules used: `hypergeometric_functions`

function: `nfwradialvelocitydispersion`
Description: Returns the radial velocity dispersion (in km/s) in the dark matter profile of `node` at the given `radius` (given in units of Mpc).
Code lines: 17
Contained by: file `dark_matter_profiles_DMO.NFW.F90`
Modules used: `galacticus_nodes`

function: `nfwradialvelocitydispersionscalefree`
Description: Returns the radial velocity dispersion (in units of the virial velocity) in an NFW dark matter profile with given `concentration` at the given `radius` (given in units of the scale radius) using the result derived by Łokas and Mamon (2001; eqn. 14). Note that approximate solutions are used at small and large radii.
Code lines: 33
Contained by: file `dark_matter_profiles_DMO.NFW.F90`
Modules used: `fgsl` `numerical_constants_math`

function: `nfwradiusenclosingdensity`

Description: Returns the radius (in units of the scale radius) in an NFW dark matter profile with given `concentration` which encloses a given density (in units of the virial mass per cubic scale radius).
Code lines: 39
Contained by: file dark_matter_profiles_DMO.NFW.F90
Modules used: galacticus_nodes

function: `nfwradiusenclosingmass`
Description: Returns the radius (in Mpc) in an NFW dark matter profile with given `concentration` which encloses a given mass (in $M_\odot$).
Code lines: 40
Contained by: file dark_matter_profiles_DMO.NFW.F90
Modules used: fgsl galacticus_nodes

function: `nfwradiusfromspecificangularmomentum`
Description: Returns the radius (in Mpc) in `node` at which a circular orbit has the given `specificAngularMomentum` (given in units of km s^{-1} Mpc).
Code lines: 45
Contained by: file dark_matter_profiles_DMO.NFW.F90
Modules used: galacticus_nodes

function: `nfwrotationnormalization`
Description: Return the normalization of the rotation velocity vs. specific angular momentum relation.
Code lines: 21
Contained by: file dark_matter_profiles_DMO.NFW.F90
Modules used: galacticus_nodes

function: `nfwspecificangularmomentumscalefree`
Description: Returns the specific angular momentum, normalized to unit scale length and unit velocity at the scale radius, at position `radius` (in units of the scale radius) in an NFW profile.
Code lines: 17
Contained by: file dark_matter_profiles_DMO.NFW.F90

subroutine: `nfwtabulate`
Description: Tabulate properties of the NFW halo profile which must be computed numerically.
Code lines: 35
Contained by: file dark_matter_profiles_DMO.NFW.F90

file: `dark_matter_profiles_DMO.heated.F90`
Description: An implementation of heated dark matter halo profiles.
Code lines: 512
Modules used: dark_matter_profiles_generic kind_numbers

interface: `darkmatterprofiledmoheated`
Description: Constructors for the `heated` dark matter halo profile class.
Code lines: 4
Contained by: file dark_matter_profiles_DMO.heated.F90

subroutine: `heatedautohook`

Description: Attach to the calculation reset event.
Code lines: 8
Contained by: file dark_matter_profiles_DMO.heated.F90
Modules used: events_hooks

subroutine: heatedcalculationreset
Description: Reset the dark matter profile calculation.
Code lines: 10
Contained by: file dark_matter_profiles_DMO.heated.F90

function: heatedcircularvelocity
Description: Returns the circular velocity (in km/s) in the dark matter profile of node at the given radius (given in units of Mpc).
Code lines: 15
Contained by: file dark_matter_profiles_DMO.heated.F90
Modules used: numerical_constants_physical

function: heatedcircularvelocitymaximum
Description: Returns the maximum circular velocity (in km/s) in the dark matter profile of node.
Code lines: 12
Contained by: file dark_matter_profiles_DMO.heated.F90

function: heatedconstructorinternal
Description: Generic constructor for the heated dark matter profile class.
Code lines: 17
Contained by: file dark_matter_profiles_DMO.heated.F90
Modules used: galacticus_error

function: heatedconstructorparameters
Description: Default constructor for the heated dark matter halo profile class.
Code lines: 28
Contained by: file dark_matter_profiles_DMO.heated.F90
Modules used: input_parameters

function: heateddensity
Description: Returns the density (in $M_\odot$ Mpc^{-3}) in the dark matter profile of node at the given radius (given in units of Mpc).
Code lines: 18
Contained by: file dark_matter_profiles_DMO.heated.F90
Modules used: galacticus_display numerical_constants_math numerical_constants_physical

function: heateddensitylogslope
Description: Returns the logarithmic slope of the density in the dark matter profile of node at the given radius (given in units of Mpc).
Code lines: 14
Contained by: file dark_matter_profiles_DMO.heated.F90

subroutine: heateddestructor

Description: Destructor for the `heated` dark matter halo profile class.
Code lines: 11
Contained by: file `dark_matter_profiles_DMO.heated.F90`
Modules used: `events_hooks`

function: `heatedenclosedmass`
Description: Returns the enclosed mass (in $M_\odot$) in the dark matter profile of `node` at the given `radius` (given in units of Mpc).
Code lines: 10
Contained by: file `dark_matter_profiles_DMO.heated.F90`

function: `heatedenergy`
Description: Return the energy of a heated halo density profile.
Code lines: 12
Contained by: file `dark_matter_profiles_DMO.heated.F90`

function: `heatedenergygrowthrate`
Description: Return the rate of change of the energy of a heated halo density profile.
Code lines: 12
Contained by: file `dark_matter_profiles_DMO.heated.F90`

function: `heatedfreefallradius`
Description: Returns the freefall radius in the heated density profile at the specified `time` (given in Gyr).
Code lines: 14
Contained by: file `dark_matter_profiles_DMO.heated.F90`

function: `heatedfreefallradiusincreaserate`
Description: Returns the rate of increase of the freefall radius in the heated density profile at the specified `time` (given in Gyr).
Code lines: 14
Contained by: file `dark_matter_profiles_DMO.heated.F90`

function: `heatedkspace`
Description: Returns the Fourier transform of the heated density profile at the specified `waveNumber` (given in Mpc^{-1}), using the expression given in Cooray and Sheth (2002; eqn. 81).
Code lines: 14
Contained by: file `dark_matter_profiles_DMO.heated.F90`

function: `heatedpotential`
Description: Returns the potential (in $(\mathrm{km/s})^2$) in the dark matter profile of `node` at the given `radius` (given in units of Mpc).
Code lines: 15
Contained by: file `dark_matter_profiles_DMO.heated.F90`

function: `heatedradialmoment`
Description: Returns the density (in $M_\odot$ Mpc^{-3}) in the dark matter profile of `node` at the given `radius` (given in units of Mpc).
Code lines: 15
Contained by: file `dark_matter_profiles_DMO.heated.F90`

function: `heatedradialvelocitydispersion`
Description: Returns the radial velocity dispersion (in km/s) in the dark matter profile of `node` at the given `radius` (given in units of Mpc).
Code lines: 18
Contained by: file dark_matter_profiles_DMO.heated.F90

function: `heatedradiusenclosingdensity`
Description: Returns the radius (in Mpc) in the dark matter profile of `node` which encloses the given `density` (given in units of $M_\odot/\mathrm{Mpc}^{-3}$).
Code lines: 14
Contained by: file dark_matter_profiles_DMO.heated.F90

function: `heatedradiusenclosingmass`
Description: Returns the radius (in Mpc) in the dark matter profile of `node` which encloses the given `mass` (given in units of $M_\odot$).
Code lines: 18
Contained by: file dark_matter_profiles_DMO.heated.F90
Modules used: galactic_structure_options numerical_constants_physical

function: `heatedradiusfromspecificangularmomentum`
Description: Returns the radius (in Mpc) in `node` at which a circular orbit has the given `specificAngularMomentum` (given in units of km s^{-1} Mpc).
Code lines: 14
Contained by: file dark_matter_profiles_DMO.heated.F90

function: `heatedradiusinitial`
Description: Find the initial radius corresponding to the given `radiusFinal` in the heated dark matter profile.
Code lines: 51
Contained by: file dark_matter_profiles_DMO.heated.F90
Modules used: root_finder

function: `heatedradiusinitialroot`
Description: Root function used in finding initial radii in heated dark matter halo profiles.
Code lines: 10
Contained by: file dark_matter_profiles_DMO.heated.F90
Modules used: numerical_constants_physical

function: `heatedrotationnormalization`
Description: Return the normalization of the rotation velocity vs. specific angular momentum relation.
Code lines: 12
Contained by: file dark_matter_profiles_DMO.heated.F90

file: `dark_matter_profiles_DMO.isothermal.F90`
Description: An implementation of isothermal dark matter halo profiles.
Code lines: 342

interface: `darkmatterprofiledmoisothermal`
Description: Constructors for the `isothermal` dark matter halo profile class.

Code lines: 4
Contained by: file dark_matter_profiles_DMO.isothermal.F90

function: isothermalcircularvelocity
Description: Returns the circular velocity (in km/s) in the dark matter profile of node at the given radius (given in units of Mpc). For an isothermal halo this is independent of radius and therefore equal to the virial velocity.
Code lines: 11
Contained by: file dark_matter_profiles_DMO.isothermal.F90

function: isothermalcircularvelocitymaximum
Description: Returns the maximum circular velocity (in km/s) in the dark matter profile of node. For an isothermal halo circular velocity is independent of radius.
Code lines: 9
Contained by: file dark_matter_profiles_DMO.isothermal.F90

function: isothermalconstructorinternal
Description: Generic constructor for the isothermal dark matter halo profile class.
Code lines: 9
Contained by: file dark_matter_profiles_DMO.isothermal.F90
Modules used: input_parameters

function: isothermalconstructorparameters
Description: Default constructor for the isothermal dark matter halo profile class.
Code lines: 13
Contained by: file dark_matter_profiles_DMO.isothermal.F90
Modules used: input_parameters

function: isothermaldensity
Description: Returns the density (in $M_\odot$ Mpc^{-3}) in the dark matter profile of node at the given radius (given in units of Mpc).
Code lines: 14
Contained by: file dark_matter_profiles_DMO.isothermal.F90
Modules used: galacticus_nodes numerical_constants_math

function: isothermaldensitylogslope
Description: Returns the logarithmic slope of the density in the dark matter profile of node at the given radius (given in units of Mpc).
Code lines: 11
Contained by: file dark_matter_profiles_DMO.isothermal.F90

subroutine: isothermaldestructor
Description: Destructor for the isothermal dark matter halo profile class.
Code lines: 7
Contained by: file dark_matter_profiles_DMO.isothermal.F90

function: isothermalenclosedmass
Description: Returns the enclosed mass (in $M_\odot$) in the dark matter profile of node at the given radius (given in units of Mpc).
Code lines: 13

Contained by: file dark_matter_profiles_DMO.isothermal.F90
Modules used: galacticus_nodes

function: isothermalenergy
Description: Return the energy of an isothermal halo density profile.
Code lines: 11
Contained by: file dark_matter_profiles_DMO.isothermal.F90
Modules used: galacticus_nodes

function: isothermalenergygrowthrate
Description: Return the rate of change of the energy of an isothermal halo density profile.
Code lines: 11
Contained by: file dark_matter_profiles_DMO.isothermal.F90
Modules used: galacticus_nodes

function: isothermalfreefallradius
Description: Returns the freefall radius in the isothermal density profile at the specified `time` (given in Gyr). For an isothermal potential, the freefall radius, $r_{\rm ff}(t)$, is:

$$r_{\rm ff}(t) = \sqrt{\frac{2}{\pi}} V_{\rm virial} t. \tag{18.9}$$

Code lines: 14
Contained by: file dark_matter_profiles_DMO.isothermal.F90
Modules used: numerical_constants_astronomical

function: isothermalfreefallradiusincreaserate
Description: Returns the rate of increase of the freefall radius in the isothermal density profile at the specified `time` (given in Gyr). For an isothermal potential, the rate of increase of the freefall radius, $\dot{r}_{\rm ff}(t)$, is:

$$\dot{r}_{\rm ff}(t) = \sqrt{\frac{2}{\pi}} V_{\rm virial}. \tag{18.10}$$

Code lines: 15
Contained by: file dark_matter_profiles_DMO.isothermal.F90
Modules used: numerical_constants_astronomical

function: isothermalkspace
Description: Returns the Fourier transform of the isothermal density profile at the specified `waveNumber` (given in Mpc^{-1}), using the expression given in Cooray and Sheth (2002; table 1).
Code lines: 20
Contained by: file dark_matter_profiles_DMO.isothermal.F90
Modules used: exponential_integrals

function: isothermalpotential
Description: Returns the potential (in (km/s)^2) in the dark matter profile of `node` at the given `radius` (given in units of Mpc).
Code lines: 22
Contained by: file dark_matter_profiles_DMO.isothermal.F90
Modules used: galactic_structure_options galacticus_error

function: isothermalradialmoment

Description: Returns the density (in $M_\odot$ Mpc^{-3}) in the dark matter profile of `node` at the given `radius` (given in units of Mpc).
Code lines: 25
Contained by: file dark_matter_profiles_DMO.isothermal.F90
Modules used: galacticus_nodes numerical_comparison numerical_constants_math

function: `isothermalradialvelocitydispersion`
Description: Returns the radial velocity dispersion (in km/s) in the dark matter profile of `node` at the given `radius` (given in units of Mpc). For an isothermal halo this is independent of radius and equal to the virial velocity divided by $\sqrt{(2)}$.
Code lines: 11
Contained by: file dark_matter_profiles_DMO.isothermal.F90

function: `isothermalradiusenclosingdensity`
Description: Null implementation of function to compute the radius enclosing a given density for isothermal dark matter halo profiles.
Code lines: 13
Contained by: file dark_matter_profiles_DMO.isothermal.F90
Modules used: galacticus_nodes numerical_constants_math

function: `isothermalradiusfromspecificangularmomentum`
Description: Returns the radius (in Mpc) in `node` at which a circular orbit has the given `specificAngularMomentum` (given in units of km s^{-1} Mpc). For an isothermal halo, the circular velocity is constant (and therefore equal to the virial velocity). Therefore, $r = j/V_{\rm virial}$ where j(=`specificAngularMomentum`) is the specific angular momentum and r the required radius.
Code lines: 12
Contained by: file dark_matter_profiles_DMO.isothermal.F90

function: `isothermalrotationnormalization`
Description: Return the normalization of the rotation velocity vs. specific angular momentum relation.
Code lines: 8
Contained by: file dark_matter_profiles_DMO.isothermal.F90

file: `dark_matter_profiles_DMO.truncated.F90`
Description: An implementation of truncated dark matter halo profiles.
Code lines: 497
Modules used: dark_matter_profiles_generic

interface: `darkmatterprofiledmotruncated`
Description: Constructors for the `truncated` dark matter halo profile class.
Code lines: 4
Contained by: file dark_matter_profiles_DMO.truncated.F90

subroutine: `truncatedautohook`
Description: Attach to the calculation reset event.
Code lines: 8
Contained by: file dark_matter_profiles_DMO.truncated.F90

Modules used: events_hooks

subroutine: `truncatedcalculationreset`
Description: Reset the dark matter profile calculation.
Code lines: 13
Contained by: file dark_matter_profiles_DMO.truncated.F90

function: `truncatedcircularvelocity`
Description: Returns the circular velocity (in km/s) in the dark matter profile of `node` at the given `radius` (given in units of Mpc).
Code lines: 14
Contained by: file dark_matter_profiles_DMO.truncated.F90

function: `truncatedcircularvelocitymaximum`
Description: Returns the maximum circular velocity (in km/s) in the dark matter profile of `node`.
Code lines: 12
Contained by: file dark_matter_profiles_DMO.truncated.F90

function: `truncatedconstructorinternal`
Description: Internal constructor for the `truncated` dark matter profile class.
Code lines: 15
Contained by: file dark_matter_profiles_DMO.truncated.F90
Modules used: galacticus_error

function: `truncatedconstructorparameters`
Description: Constructor for the `truncated` dark matter halo profile class which takes a parameter set as input.
Code lines: 42
Contained by: file dark_matter_profiles_DMO.truncated.F90
Modules used: input_parameters

function: `truncateddensity`
Description: Returns the density (in $M_\odot$ Mpc^{-3}) in the dark matter profile of `node` at the given `radius` (given in units of Mpc).
Code lines: 12
Contained by: file dark_matter_profiles_DMO.truncated.F90

function: `truncateddensitylogslope`
Description: Returns the logarithmic slope of the density in the dark matter profile of `node` at the given `radius` (given in units of Mpc).
Code lines: 16
Contained by: file dark_matter_profiles_DMO.truncated.F90

subroutine: `truncateddestructor`
Description: Destructor for the `truncated` dark matter halo profile class.
Code lines: 10
Contained by: file dark_matter_profiles_DMO.truncated.F90
Modules used: events_hooks

function: `truncatedenclosedmass`
Description: Returns the enclosed mass (in $M_\odot$) in the dark matter profile of `node` at the given `radius` (given in units of Mpc).
Code lines: 18
Contained by: file `dark_matter_profiles_DMO.truncated.F90`

function: `truncatedenergy`
Description: Return the energy of a truncated halo density profile.
Code lines: 12
Contained by: file `dark_matter_profiles_DMO.truncated.F90`

function: `truncatedenergygrowthrate`
Description: Return the rate of change of the energy of a truncated halo density profile.
Code lines: 12
Contained by: file `dark_matter_profiles_DMO.truncated.F90`

function: `truncatedfreefallradius`
Description: Returns the freefall radius in the truncated density profile at the specified `time` (given in Gyr).
Code lines: 14
Contained by: file `dark_matter_profiles_DMO.truncated.F90`

function: `truncatedfreefallradiusincreaserate`
Description: Returns the rate of increase of the freefall radius in the truncated density profile at the specified `time` (given in Gyr).
Code lines: 14
Contained by: file `dark_matter_profiles_DMO.truncated.F90`

function: `truncatedkspace`
Description: Returns the Fourier transform of the truncated density profile at the specified `waveNumber` (given in Mpc^{-1}).
Code lines: 14
Contained by: file `dark_matter_profiles_DMO.truncated.F90`

function: `truncatedpotential`
Description: Returns the potential (in $(\mathrm{km/s})^2$) in the dark matter profile of `node` at the given `radius` (given in units of Mpc).
Code lines: 15
Contained by: file `dark_matter_profiles_DMO.truncated.F90`

function: `truncatedradialmoment`
Description: Returns the density (in $M_\odot$ Mpc^{-3}) in the dark matter profile of `node` at the given `radius` (given in units of Mpc).
Code lines: 15
Contained by: file `dark_matter_profiles_DMO.truncated.F90`

function: `truncatedradialvelocitydispersion`
Description: Returns the radial velocity dispersion (in km/s) in the dark matter profile of `node` at the given `radius` (given in units of Mpc).
Code lines: 26

Contained by: file dark_matter_profiles_DMO.truncated.F90

function: truncatedradiusenclosingdensity
Description: Returns the radius (in Mpc) in the dark matter profile of node which encloses the given density (given in units of $M_\odot/\mathrm{Mpc}^{-3}$).
Code lines: 14
Contained by: file dark_matter_profiles_DMO.truncated.F90

function: truncatedradiusenclosingmass
Description: Returns the radius (in Mpc) in the dark matter profile of node which encloses the given mass (given in units of $M_\odot$).
Code lines: 21
Contained by: file dark_matter_profiles_DMO.truncated.F90

function: truncatedradiusfromspecificangularmomentum
Description: Returns the radius (in Mpc) in node at which a circular orbit has the given specificAngularMomentum (given in units of km s^{-1} Mpc).
Code lines: 14
Contained by: file dark_matter_profiles_DMO.truncated.F90

function: truncatedrotationnormalization
Description: Return the normalization of the rotation velocity vs. specific angular momentum relation.
Code lines: 12
Contained by: file dark_matter_profiles_DMO.truncated.F90

subroutine: truncatedtruncationfunction
Description: Return the scaled truncation radial coordinate, and the truncation multiplier.
Code lines: 26
Contained by: file dark_matter_profiles_DMO.truncated.F90

file: dark_matter_profiles_DMO.truncated.exponential.F90
Description: An implementation of exponentially truncated dark matter halo profiles Kazantzidis et al. [2006].
Code lines: 529
Modules used: dark_matter_profiles_generic

interface: darkmatterprofiledmotruncatedexponential
Description: Constructors for the exponentially truncated dark matter halo profile class.
Code lines: 4
Contained by: file dark_matter_profiles_DMO.truncated.exponential.F90

subroutine: recomputekappa
Description: Recompute parameter kappa in the truncation funciton.
Code lines: 16
Contained by: file dark_matter_profiles_DMO.truncated.exponential.F90
Modules used: galacticus_nodes

subroutine: truncatedexponentialautohook
Description: Attach to the calculation reset event.

Code lines: 8
Contained by: file dark_matter_profiles_DMO.truncated.exponential.F90
Modules used: events_hooks

subroutine: truncatedexponentialcalculationreset
Description: Reset the dark matter profile calculation.
Code lines: 10
Contained by: file dark_matter_profiles_DMO.truncated.exponential.F90

function: truncatedexponentialcircularvelocity
Description: Returns the circular velocity (in km/s) in the dark matter profile of node at the given radius (given in units of Mpc).
Code lines: 14
Contained by: file dark_matter_profiles_DMO.truncated.exponential.F90

function: truncatedexponentialcircularvelocitymaximum
Description: Returns the maximum circular velocity (in km/s) in the dark matter profile of node.
Code lines: 12
Contained by: file dark_matter_profiles_DMO.truncated.exponential.F90

function: truncatedexponentialconstructorinternal
Description: Internal constructor for the exponentially truncated dark matter profile class.
Code lines: 15
Contained by: file dark_matter_profiles_DMO.truncated.exponential.F90
Modules used: galacticus_error

function: truncatedexponentialconstructorparameters
Description: Constructor for the exponentially truncated dark matter halo profile class which takes a parameter set as input.
Code lines: 59
Contained by: file dark_matter_profiles_DMO.truncated.exponential.F90
Modules used: galacticus_error input_parameters

function: truncatedexponentialdensity
Description: Returns the density (in $M_\odot$ Mpc^{-3}) in the dark matter profile of node at the given radius (given in units of Mpc).
Code lines: 12
Contained by: file dark_matter_profiles_DMO.truncated.exponential.F90

function: truncatedexponentialdensitylogslope
Description: Returns the logarithmic slope of the density in the dark matter profile of node at the given radius (given in units of Mpc).
Code lines: 17
Contained by: file dark_matter_profiles_DMO.truncated.exponential.F90
Modules used: galacticus_error

subroutine: truncatedexponentialdestructor
Description: Destructor for the exponentially truncated dark matter halo profile class.
Code lines: 10

Contained by: file dark_matter_profiles_DMO.truncated.exponential.F90
Modules used: events_hooks

function: truncatedexponentialenclosedmass
Description: Returns the enclosed mass (in $M_\odot$) in the dark matter profile of node at the given radius (given in units of Mpc).
Code lines: 21
Contained by: file dark_matter_profiles_DMO.truncated.exponential.F90
Modules used: fgsl numerical_constants_math

function: truncatedexponentialenergy
Description: Return the energy of a truncatedExponential halo density profile.
Code lines: 12
Contained by: file dark_matter_profiles_DMO.truncated.exponential.F90

function: truncatedexponentialenergygrowthrate
Description: Return the rate of change of the energy of a truncatedExponential halo density profile.
Code lines: 12
Contained by: file dark_matter_profiles_DMO.truncated.exponential.F90

function: truncatedexponentialfreefallradius
Description: Returns the freefall radius in the truncatedExponential density profile at the specified time (given in Gyr).
Code lines: 14
Contained by: file dark_matter_profiles_DMO.truncated.exponential.F90

function: truncatedexponentialfreefallradiusincreaserate
Description: Returns the rate of increase of the freefall radius in the truncatedExponential density profile at the specified time (given in Gyr).
Code lines: 14
Contained by: file dark_matter_profiles_DMO.truncated.exponential.F90

function: truncatedexponentialkspace
Description: Returns the Fourier transform of the truncatedExponential density profile at the specified waveNumber (given in Mpc^{-1}).
Code lines: 14
Contained by: file dark_matter_profiles_DMO.truncated.exponential.F90

function: truncatedexponentialpotential
Description: Returns the potential (in $(\mathrm{km/s})^2$) in the dark matter profile of node at the given radius (given in units of Mpc).
Code lines: 15
Contained by: file dark_matter_profiles_DMO.truncated.exponential.F90

function: truncatedexponentialradialmoment
Description: Returns the density (in $M_\odot$ Mpc^{-3}) in the dark matter profile of node at the given radius (given in units of Mpc).
Code lines: 15
Contained by: file dark_matter_profiles_DMO.truncated.exponential.F90

function: `truncatedexponentialradialvelocitydispersion`
Description: Returns the radial velocity dispersion (in km/s) in the dark matter profile of `node` at the given `radius` (given in units of Mpc).
Code lines: 25
Contained by: file dark_matter_profiles_DMO.truncated.exponential.F90

function: `truncatedexponentialradiusenclosingdensity`
Description: Returns the radius (in Mpc) in the dark matter profile of `node` which encloses the given `density` (given in units of $M_\odot/\mathrm{Mpc}^{-3}$).
Code lines: 14
Contained by: file dark_matter_profiles_DMO.truncated.exponential.F90

function: `truncatedexponentialradiusenclosingmass`
Description: Returns the radius (in Mpc) in the dark matter profile of `node` which encloses the given `mass` (given in units of $M_\odot$).
Code lines: 19
Contained by: file dark_matter_profiles_DMO.truncated.exponential.F90
Modules used: galacticus_nodes

function: `truncatedexponentialradiusfromspecificangularmomentum`
Description: Returns the radius (in Mpc) in `node` at which a circular orbit has the given `specificAngularMomentum` (given in units of km s^{-1} Mpc).
Code lines: 14
Contained by: file dark_matter_profiles_DMO.truncated.exponential.F90

function: `truncatedexponentialrotationnormalization`
Description: Return the normalization of the rotation velocity vs. specific angular momentum relation.
Code lines: 12
Contained by: file dark_matter_profiles_DMO.truncated.exponential.F90

subroutine: `truncatedexponentialtruncationfunction`
Description: Return the scaled truncation radial coordinate, and the truncation multiplier.
Code lines: 22
Contained by: file dark_matter_profiles_DMO.truncated.exponential.F90

file: `events.branch_jump.F90`
Description: Contains a module which handles node branch jump events.
Code lines: 105

module: `node_branch_jumps`
Description: Handles satellite node branch jump events.
Code lines: 83
Contained by: file events.branch_jump.F90
Used by: subroutine readcreatebranchjumpevent

function: `node_branch_jump`
Description: Moves a satellite node to a different branch of the merger tree.
Code lines: 73

Contained by: module node_branch_jumps
Modules used: galacticus_display, galacticus_nodes, iso_varying_string, merger_trees_evolve_deadlock_status, node_component_satellite_preset, string_handling

file: events.halo_formation.F90
Description: Contains a module which performs tasks associated with "halo formation" events.
Code lines: 73

module: events_halo_formation
Description: Performs tasks associated with "halo formation" events.
Code lines: 51
Contained by: file events.halo_formation.F90
Used by: subroutine node_component_formation_-time_cole2000_create

subroutine: event_halo_formation
Description: Perform tasks associated with a "halo formation" event in thisNode.
Code lines: 41
Contained by: module events_halo_formation
Modules used: galacticus_nodes, node_component_hot_halo_cold_mode, node_component_hot_halo_standard, node_component_satellite_standard, node_component_satellite_very_simple

file: events.hooks.F90
Description: Contains module which handles hooking of objects into events.
Code lines: 294

module: events_hooks
Description: Handles hooking of object function class into events.
Code lines: 272
Contained by: file events.hooks.F90
Used by: program galacticus, subroutine naozbarkana2007autohook, subroutine naozbarkana2007destructor, subroutine coldmodeautohook, subroutine coldmodedestructor, subroutine betaprofileautohook, subroutine betaprofiledestructor, subroutine isothermalautohook, subroutine isothermaldestructor, subroutine simpleautohook, subroutine simpledestructor, subroutine constantrotationautohook, subroutine constantrotationdestructor, subroutine virialdensitycontrastdefinitionautohook, subroutine virialdensitycontrastdefinitiondestructor, subroutine adiabaticgnedin2004autohook, subroutine adiabaticgnedin2004destructor, subroutine burkertautohook, subroutine burkertdestructor, subroutine nfwautohook, subroutine nfwdestructor, subroutine heatedautohook, subroutine heateddestructor, subroutine truncatedautohook, subroutine truncateddestructor, subroutine truncatedexponentialautohook

type: `eventhook`
Description: Class used to define a set of hooked function calls for a given event.
Code lines: 47
Contained by: module events_hooks

function: `eventhookcount`
Description: Return a count of the number of hooks into this event.
Code lines: 11
Contained by: module events_hooks
Modules used: galacticus_error

subroutine: `eventhookdestructor`
Description: Destructor for event hook class.
Code lines: 6

Contained by: module events_hooks

function: `eventhookfirst`
Description: Return a pointer to the first hook into this event.
Code lines: 10
Contained by: module events_hooks
Modules used: galacticus_error

subroutine: `eventhookinitialize`
Description: Initialize the OpenMP lock in an event object.
Code lines: 9
Contained by: module events_hooks

subroutine: `eventhooklock`
Description: Lock the event to avoid race conditions between OpenMP threads.
Code lines: 8
Contained by: module events_hooks

subroutine: `eventhookunlock`
Description: Unlock the event to avoid race conditions between OpenMP threads.
Code lines: 8
Contained by: module events_hooks

type: `eventhookunspecified`
Description: Class used to define a set of hooked function calls for a given event.
Code lines: 21
Contained by: module events_hooks

subroutine: `eventhookunspecifiedattach`
Description: Attach an object to an event hook.
Code lines: 46
Contained by: module events_hooks
Modules used: galacticus_error

subroutine: `eventhookunspecifieddetach`
Description: Attach an object to an event hook.
Code lines: 37
Contained by: module events_hooks
Modules used: galacticus_error

type: `hook`
Description: Base class for individual hooked function calls. Stores the object to be passed as the first argument to the function.
Code lines: 6
Contained by: module events_hooks

type: `hookunspecified`
Description: Class for hooked function calls with unspecified interfaces.
Code lines: 3
Contained by: module events_hooks

file: `events.inter_tree.F90`
Description: Contains a module which handles inter-tree nodes events.
Code lines: 571

module: `node_events_inter_tree`
Description: Handles inter-tree node events.
Code lines: 549
Contained by: file `events.inter_tree.F90`
Modules used: `galacticus_nodes` `iso_c_binding` `kind_numbers`
Used by: subroutine `readassignsplitforestevents` subroutine `evolveforestsperform`

subroutine: `inter_tree_event_post_evolve`
Description: Check that the inter-tree transfer list is empty after universe evolution.
Code lines: 23
Contained by: module `node_events_inter_tree`
Modules used: `galacticus_display` `galacticus_error` `iso_varying_string` `string_handling`

type: `intertreetransfer`
Description: Type used for transfering nodes between trees.
Code lines: 6
Contained by: module `node_events_inter_tree`

function: `node_pull_from_tree`
Description: Pull a node from the tree.
Code lines: 372
Contained by: module `node_events_inter_tree`
Modules used: `galacticus_display` `galacticus_error` `galacticus_nodes` `iso_varying_string` `merger_trees_evolve_deadlock_status` `node_component_satellite_preset` `string_handling`

Contained by: module `node_events_inter_tree`
Modules used: `galacticus_display` `galacticus_error` `galacticus_nodes` `iso_varying_string` `merger_trees_evolve_deadlock_status` `string_handling`

file: `events.node_promotion.index_shift.F90`
Description: Contains a module which optionally shifts the index of a node about to be promoted to its parent node, allowing indices to be tracked along merger trees.
Code lines: 79

module: `node_promotion_index_shifts`
Description: Implements optional shifting of the index of a node about to be promoted to its parent node, allowing indices to be tracked along merger trees.

Code lines: 56
Contained by: file events.node_promotion.index_shift.F90
Used by: subroutine standardpromote

subroutine: node_promotion_index_shift
Description: Shifts the index of thisNode to its parent node just prior to promotion, thereby allowing indices to track galaxies through the tree.
Code lines: 36
Contained by: module node_promotion_index_shifts
Modules used: galacticus_nodes input_parameters

file: events.satellite_merger.remnant_properties.F90
Description: Contains a module which computes remnant properties for satellite mergers.
Code lines: 59

module: satellite_merging_remnant_properties
Description: Computes remnant properties for satellite mergers.
Code lines: 37
Contained by: file events.satellite_merger.remnant_properties.F90
Used by: subroutine satellitemergerprocess
subroutine node_component_age_statistics_standard_satellite_merging

Description: Internal constructor for the "ismMass" galactic filter class.
Code lines: 7
Contained by: file galactic.filters.ISM_mass.F90

function: ismmassconstructorparameters
Description: Constructor for the "ismMass" galactic filter class which takes a parameter set as input.
Code lines: 18
Contained by: file galactic.filters.ISM_mass.F90

Modules used: input_parameters

function: ismmasspasses
Description: Implement an ismMass-pass galactic filter.
Code lines: 15
Contained by: file galactic.filters.ISM_mass.F90
Modules used: galacticus_nodes

file: galactic.filters.all.F90
Description: Contains a module which implements a galactic filter class which is the "all" combination of a set of other filters.
Code lines: 155

function: allconstructorinternal
Description: Internal constructor for the "all" filter class.
Code lines: 14
Contained by: file galactic.filters.all.F90

function: allconstructorparameters
Description: Constructor for the "all" galactic filter class which takes a parameter set as input.
Code lines: 22
Contained by: file galactic.filters.all.F90
Modules used: input_parameters

subroutine: alldeepcopy
Description: Perform a deep copy for the all galactic filter class.
Code lines: 31
Contained by: file galactic.filters.all.F90
Modules used: galacticus_error

subroutine: alldestructor
Description: Destructor for the all galactic filter class.
Code lines: 16
Contained by: file galactic.filters.all.F90

function: allpasses
Description: Apply a set of filters to a node combined with "all" operations.
Code lines: 20
Contained by: file galactic.filters.all.F90

interface: galacticfilterall
Description: Constructors for the all galactic filter class.
Code lines: 4
Contained by: file galactic.filters.all.F90

file: galactic.filters.always.F90
Description: Contains a module which implements a galactic filter which always passes.
Code lines: 60

function: `alwaysconstructorparameters`
Description: Constructor for the "always" galactic filter class which takes a parameter set as input.
Code lines: 10
Contained by: file `galactic.filters.always.F90`
Modules used: `input_parameters`

function: `alwayspasses`
Description: Implement an always-pass galactic filter.
Code lines: 9
Contained by: file `galactic.filters.always.F90`

interface: `galacticfilteralways`
Description: Constructors for the "always" galactic filter class.
Code lines: 3
Contained by: file `galactic.filters.always.F90`

file: `galactic.filters.any.F90`
Description: Contains a module which implements a galactic filter class which is the "any" combination of a set of other filters.
Code lines: 155

function: `anyconstructorinternal`
Description: Internal constructor for the "any" filter class.
Code lines: 14
Contained by: file `galactic.filters.any.F90`

function: `anyconstructorparameters`
Description: Constructor for the "any" galactic filter class which takes a parameter set as input.
Code lines: 22
Contained by: file `galactic.filters.any.F90`
Modules used: `input_parameters`

subroutine: `anydeepcopy`
Description: Perform a deep copy for the `any` galactic filter class.
Code lines: 31
Contained by: file `galactic.filters.any.F90`
Modules used: `galacticus_error`

subroutine: `anydestructor`
Description: Destructor for the "any" galactic filter class.
Code lines: 16
Contained by: file `galactic.filters.any.F90`

function: `anypasses`
Description: Apply a set of filters to a `node` combined with "any" operations.
Code lines: 20
Contained by: file `galactic.filters.any.F90`

interface: `galacticfilterany`
Description: Constructors for the any galactic filter class.
Code lines: 4
Contained by: file `galactic.filters.any.F90`

file: `galactic.filters.basic_mass.F90`
Description: Contains a module which implements a galactic high-pass filter for the default "basic" halo mass.
Code lines: 84

function: `basicmassconstructorinternal`
Description: Internal constructor for the "basicMass" galactic filter class.
Code lines: 7
Contained by: file `galactic.filters.basic_mass.F90`

function: `basicmassconstructorparameters`
Description: Constructor for the "basicMass" galactic filter class which takes a parameter set as input.
Code lines: 18
Contained by: file `galactic.filters.basic_mass.F90`
Modules used: `input_parameters`

function: `basicmasspasses`
Description: Implement a basic mass high-pass galactic filter.
Code lines: 11
Contained by: file `galactic.filters.basic_mass.F90`
Modules used: `galacticus_nodes`

interface: `galacticfilterbasicmass`
Description: Constructors for the "basicMass" galactic filter class.
Code lines: 4
Contained by: file `galactic.filters.basic_mass.F90`

file: `galactic.filters.formation_time.F90`
Description: Contains a module which implements a galactic filter which removes recently-formed halos.
Code lines: 89

function: `formationtimeconstructorinternal`
Description: Internal constructor for the "formationTime" galactic filter class.
Code lines: 8
Contained by: file `galactic.filters.formation_time.F90`

function: `formationtimeconstructorparameters`
Description: Constructor for the "formationTime" galactic filter class which takes a parameter set as input.
Code lines: 20
Contained by: file `galactic.filters.formation_time.F90`
Modules used: `input_parameters`

function: `formationtimepasses`

Description: Implement a filter which rejects halos that formed too recently.
Code lines: 13
Contained by: file galactic.filters.formation_time.F90
Modules used: galacticus_nodes

interface: galacticfilterformationtime
Description: Constructors for the "formationTime" galactic filter class.
Code lines: 4
Contained by: file galactic.filters.formation_time.F90

file: galactic.filters.halo_isolated.F90
Description: Contains a module which implements a filter which passes only isolated halos.
Code lines: 60

interface: galacticfilterhaloisolated
Description: Constructors for the "haloIsolated" galactic filter class.
Code lines: 3
Contained by: file galactic.filters.halo_isolated.F90

function: haloisolatedconstructorparameters
Description: Constructor for the "haloIsolated" galactic filter class which takes a parameter set as input.
Code lines: 10
Contained by: file galactic.filters.halo_isolated.F90
Modules used: input_parameters

function: haloisolatedpasses
Description: Implement a galactic filter which passes only isolated halos.
Code lines: 9
Contained by: file galactic.filters.halo_isolated.F90

file: galactic.filters.halo_mass.F90
Description: Contains a module which implements a galactic high-pass filter for halo mass under a given definition.
Code lines: 104
Modules used: virial_density_contrast

interface: galacticfilterhalomass
Description: Constructors for the "haloMass" galactic filter class.
Code lines: 4
Contained by: file galactic.filters.halo_mass.F90

function: halomassconstructorinternal
Description: Internal constructor for the "haloMass" galactic filter class.
Code lines: 9
Contained by: file galactic.filters.halo_mass.F90

function: halomassconstructorparameters
Description: Constructor for the "haloMass" galactic filter class which takes a parameter set as input.
Code lines: 22

Contained by: file galactic.filters.halo_mass.F90
Modules used: input_parameters

subroutine: halomassdestructor
Description: Destructor for the "haloMass" galactic filter class.
Code lines: 7
Contained by: file galactic.filters.halo_mass.F90

function: halomasspasses
Description: Implement a halo mass high-pass galactic filter.
Code lines: 12
Contained by: file galactic.filters.halo_mass.F90
Modules used: dark_matter_profile_mass_definitions galacticus_nodes

file: galactic.filters.halo_not_isolated.F90
Description: Contains a module which implements a filter which passes only non-isolated halos.
Code lines: 60

interface: galacticfilterhalonotisolated
Description: Constructors for the "haloNotIsolated" galactic filter class.
Code lines: 3
Contained by: file galactic.filters.halo_not_isolated.F90

function: halonotisolatedconstructorparameters
Description: Constructor for the "haloNotIsolated" galactic filter class which takes a parameter set as input.
Code lines: 10
Contained by: file galactic.filters.halo_not_isolated.F90
Modules used: input_parameters

function: halonotisolatedpasses
Description: Implement a galactic filter which passes only isolated halos.
Code lines: 9
Contained by: file galactic.filters.halo_not_isolated.F90

file: galactic.filters.host_mass_range.F90
Description: Implements a galactic filter which passes nodes with host halo basic mass within a specified range.
Code lines: 92

interface: galacticfilterhostmassrange
Description: Constructors for the "hostMassRange" galactic filter class.
Code lines: 4
Contained by: file galactic.filters.host_mass_range.F90

function: hostmassrangeconstructorinternal
Description: Internal constructor for the "hostMassRange" galactic filter class.
Code lines: 7
Contained by: file galactic.filters.host_mass_range.F90

function: `hostmassrangeconstructorparameters`
Description: Constructor for the "hostMassRange" galactic filter class which takes a parameter set as input.
Code lines: 25
Contained by: file `galactic.filters.host_mass_range.F90`
Modules used: `input_parameters`

function: `hostmassrangepasses`
Description: Implement a filter which passes nodes with host halo basic mass in a specified range.
Code lines: 15
Contained by: file `galactic.filters.host_mass_range.F90`
Modules used: `galacticus_nodes`

file: `galactic.filters.lightcone.F90`
Description: Contains a module which implements a galactic filter on lightcone geometry.
Code lines: 88
Modules used: `geometry_lightcones`

interface: `galacticfilterlightcone`
Description: Constructors for the "lightcone" galactic filter class.
Code lines: 4
Contained by: file `galactic.filters.lightcone.F90`

function: `lightconeconstructorinternal`
Description: Internal constructor for the "lightcone" galactic filter class.
Code lines: 8
Contained by: file `galactic.filters.lightcone.F90`

function: `lightconeconstructorparameters`
Description: Constructor for the "lightcone" galactic filter class which takes a parameter set as input.
Code lines: 13
Contained by: file `galactic.filters.lightcone.F90`
Modules used: `input_parameters`

subroutine: `lightconedestructor`
Description: Destructor for the `lightcone` galactic filter class.
Code lines: 7
Contained by: file `galactic.filters.lightcone.F90`

function: `lightconepasses`
Description: Implement a lightcone geometry galactic filter.
Code lines: 8
Contained by: file `galactic.filters.lightcone.F90`

file: `galactic.filters.main_branch.F90`
Description: Contains a module which implements a filter which passes only main branch halos.
Code lines: 60

interface: `galacticfiltermainbranch`
Description: Constructors for the "mainBranch" galactic filter class.
Code lines: 3
Contained by: file `galactic.filters.main_branch.F90`

function: `mainbranchconstructorparameters`
Description: Constructor for the "mainBranch" galactic filter class which takes a parameter set as input.
Code lines: 10
Contained by: file `galactic.filters.main_branch.F90`
Modules used: `input_parameters`

function: `mainbranchpasses`
Description: Implement a galactic filter which passes only main branch halos.
Code lines: 9
Contained by: file `galactic.filters.main_branch.F90`

file: `galactic.filters.major_node_merger.recent.F90`
Description: Contains a module which implements a galactic low-pass filter for time since the last major node merger.
Code lines: 88

interface: `galacticfilternodemajormergerrecent`
Description: Constructors for the "nodeMajorMergerRecent" galactic filter class.
Code lines: 4
Contained by: file `galactic.filters.major_node_merger.recent.F90`

function: `nodemajormergerrecentconstructorinternal`
Description: Internal constructor for the "nodeMajorMergerRecent" galactic filter class.
Code lines: 7
Contained by: file `galactic.filters.major_node_merger.recent.F90`

function: `nodemajormergerrecentconstructorparameters`
Description: Constructor for the "nodeMajorMergerRecent" galactic filter class which takes a parameter set as input.
Code lines: 20
Contained by: file `galactic.filters.major_node_merger.recent.F90`
Modules used: `input_parameters`

function: `nodemajormergerrecentpasses`
Description: Implement a low-pass filter for time since the last major node merger.
Code lines: 13
Contained by: file `galactic.filters.major_node_merger.recent.F90`
Modules used: `galacticus_nodes`

file: `galactic.filters.not.F90`
Description: Contains a module which implements an inverting filter.
Code lines: 84

interface: `galacticfilternot`
Description: Constructors for the "not" galactic filter class.
Code lines: 4
Contained by: file `galactic.filters.not.F90`

function: `notconstructorinternal`
Description: Internal constructor for the "not" galactic filter class.
Code lines: 8
Contained by: file `galactic.filters.not.F90`

function: `notconstructorparameters`
Description: Constructor for the "not" galactic filter class which takes a parameter set as input.
Code lines: 13
Contained by: file `galactic.filters.not.F90`
Modules used: `input_parameters`

subroutine: `notdestructor`
Description: Destructor for the `not` galactic filter class.
Code lines: 7
Contained by: file `galactic.filters.not.F90`

function: `notpasses`
Description: Implement a not galactic filter.
Code lines: 8
Contained by: file `galactic.filters.not.F90`

file: `galactic.filters.root_node.F90`
Description: Contains a module which implements a filter which passes only nodes that are roots of their merger tree.
Code lines: 60

interface: `galacticfilterrootnode`
Description: Constructors for the "rootNode" galactic filter class.
Code lines: 3
Contained by: file `galactic.filters.root_node.F90`

function: `rootnodeconstructorparameters`
Description: Constructor for the "rootNode" galactic filter class which takes a parameter set as input.
Code lines: 10
Contained by: file `galactic.filters.root_node.F90`
Modules used: `input_parameters`

function: `rootnodepasses`
Description: Implement a galactic filter which passes only main branch halos.
Code lines: 9
Contained by: file `galactic.filters.root_node.F90`

file: `galactic.filters.spheroid_stellar_mass.F90`

Description: Contains a module which implements a galactic high-pass filter for spheroid stellar mass.
Code lines: 88

interface: `galacticfilterspheroidstellarmass`
Description: Constructors for the "spheroidStellarMass" galactic filter class.
Code lines: 4
Contained by: file `galactic.filters.spheroid_stellar_mass.F90`

function: `spheroidstellarmassconstructorinternal`
Description: Internal constructor for the "spheroidStellarMass" galactic filter class.
Code lines: 8
Contained by: file `galactic.filters.spheroid_stellar_mass.F90`

function: `spheroidstellarmassconstructorparameters`
Description: Constructor for the "spheroidStellarMass" galactic filter class which takes a parameter set as input.
Code lines: 19
Contained by: file `galactic.filters.spheroid_stellar_mass.F90`
Modules used: `input_parameters`

function: `spheroidstellarmasspasses`
Description: Implement a stellar mass high-pass galactic filter.
Code lines: 13
Contained by: file `galactic.filters.spheroid_stellar_mass.F90`
Modules used: `galacticus_nodes`

file: `galactic.filters.star_formation_rate.F90`
Description: Contains a module which implements a galactic high-pass filter for total star formation rate.
Code lines: 122

interface: `galacticfilterstarformationrate`
Description: Constructors for the "starFormationRate" galactic filter class.
Code lines: 4
Contained by: file `galactic.filters.star_formation_rate.F90`

function: `starformationrateconstructorinternal`
Description: Internal constructor for the "starFormationRate" galactic filter class.
Code lines: 10
Contained by: file `galactic.filters.star_formation_rate.F90`

function: `starformationrateconstructorparameters`
Description: Constructor for the "starFormationRate" galactic filter class which takes a parameter set as input.
Code lines: 37
Contained by: file `galactic.filters.star_formation_rate.F90`
Modules used: `input_parameters`

function: `starformationratepasses`
Description: Implement an starFormationRate-pass galactic filter.

Code lines: 21
Contained by: file galactic.filters.star_formation_rate.F90
Modules used: galacticus_nodes

file: galactic.filters.stellar_absolute_magnitudes.F90
Description: Contains a module which implements a galactic low-pass (i.e. bright-pass) filter for stellar absolute magnitudes.
Code lines: 125

interface: galacticfilterstellarabsolutemagnitudes
Description: Constructors for the "stellarAbsoluteMagnitudes" galactic filter class.
Code lines: 4
Contained by: file galactic.filters.stellar_absolute_magnitudes.F90

function: stellarabsolutemagnitudesconstructorinternal
Description: Internal constructor for the "stellarAbsoluteMagnitudes" galactic filter class.
Code lines: 13
Contained by: file galactic.filters.stellar_absolute_magnitudes.F90
Modules used: galacticus_error stellar_luminosities_structure

function: stellarabsolutemagnitudesconstructorparameters
Description: Constructor for the "stellarAbsoluteMagnitudes" galactic filter class which takes a parameter set as input.
Code lines: 24
Contained by: file galactic.filters.stellar_absolute_magnitudes.F90
Modules used: galacticus_error input_parameters
memory_management stellar_luminosities_structure

function: stellarabsolutemagnitudespasses
Description: Implement a stellar absolute magnitude low-pass galactic filter.
Code lines: 40
Contained by: file galactic.filters.stellar_absolute_magnitudes.F90
Modules used: galactic_structure_enclosed_masses galactic_structure_options
galacticus_nodes stellar_luminosities_structure

file: galactic.filters.stellar_apparent_magnitudes.F90
Description: Contains a module which implements a galactic low-pass (i.e. bright-pass) filter for stellar apparent magnitudes.
Code lines: 152
Modules used: cosmology_functions

interface: galacticfilterstellarapparentmagnitudes
Description: Constructors for the "stellarApparentMagnitudes" galactic filter class.
Code lines: 4
Contained by: file galactic.filters.stellar_apparent_magnitudes.F90

function: stellarapparentmagnitudesconstructorinternal
Description: Internal constructor for the "stellarApparentMagnitudes" galactic filter class.
Code lines: 14

Contained by: file galactic.filters.stellar_apparent_magnitudes.F90
Modules used: galacticus_error stellar_luminosities_structure

function: stellarapparentmagnitudesconstructorparameters
Description: Constructor for the "stellarApparentMagnitudes" galactic filter class which takes a parameter set as input.
Code lines: 27
Contained by: file galactic.filters.stellar_apparent_magnitudes.F90
Modules used: galacticus_error input_parameters memory_management stellar_luminosities_structure

subroutine: stellarapparentmagnitudesdestructor
Description: Destructor for the "stellarApparentMagnitudes" galactic filter class.
Code lines: 7
Contained by: file galactic.filters.stellar_apparent_magnitudes.F90

function: stellarapparentmagnitudespasses
Description: Implement a stellar apparent magnitude low-pass galactic filter.
Code lines: 50
Contained by: file galactic.filters.stellar_apparent_magnitudes.F90
Modules used: galactic_structure_enclosed_masses galactic_structure_options galacticus_nodes stellar_luminosities_structure

file: galactic.filters.stellar_mass.F90
Description: Contains a module which implements a galactic high-pass filter for total stellar mass.
Code lines: 88

interface: galacticfilterstellarmass
Description: Constructors for the "stellarMass" galactic filter class.
Code lines: 4
Contained by: file galactic.filters.stellar_mass.F90

function: stellarmassconstructorinternal
Description: Internal constructor for the "stellarMass" galactic filter class.
Code lines: 7
Contained by: file galactic.filters.stellar_mass.F90

function: stellarmassconstructorparameters
Description: Constructor for the "stellarMass" galactic filter class which takes a parameter set as input.
Code lines: 18
Contained by: file galactic.filters.stellar_mass.F90
Modules used: input_parameters

function: stellarmasspasses
Description: Implement a stellar mass high-pass galactic filter.
Code lines: 15
Contained by: file galactic.filters.stellar_mass.F90
Modules used: galacticus_nodes

file: `galactic.filters.stellar_mass_morphology.F90`
Description: Contains a module which implements a galactic high-pass filter for stellar mass-weighted morphology (i.e. spheroid-to-total ratio).
Code lines: 93

interface: `galacticfilterstellarmassmorphology`
Description: Constructors for the "stellarMassMorphology" galactic filter class.
Code lines: 4
Contained by: file `galactic.filters.stellar_mass_morphology.F90`

function: `stellarmassmorphologyconstructorinternal`
Description: Internal constructor for the "stellarMassMorphology" galactic filter class.
Code lines: 7
Contained by: file `galactic.filters.stellar_mass_morphology.F90`

function: `stellarmassmorphologyconstructorparameters`
Description: Constructor for the "stellarMassMorphology" galactic filter class which takes a parameter set as input.
Code lines: 18
Contained by: file `galactic.filters.stellar_mass_morphology.F90`
Modules used: `input_parameters`

function: `stellarmassmorphologypasses`
Description: Implement a stellar mass-weighted morphology high-pass galactic filter.
Code lines: 19
Contained by: file `galactic.filters.stellar_mass_morphology.F90`
Modules used: `galacticus_nodes`

file: `galactic.filters.survey_geometry.F90`
Description: Contains a module which implements a filter which passes only nodes that lie within a survey geometry.
Code lines: 96
Modules used: `geometry_surveys`

interface: `galacticfiltersurveygeometry`
Description: Constructors for the "surveyGeometry" galactic filter class.
Code lines: 4
Contained by: file `galactic.filters.survey_geometry.F90`

function: `surveygeometryconstructorinternal`
Description: Internal constructor for the "surveyGeometry" galactic filter class.
Code lines: 8
Contained by: file `galactic.filters.survey_geometry.F90`

function: `surveygeometryconstructorparameters`
Description: Constructor for the "surveyGeometry" galactic filter class which takes a parameter set as input.
Code lines: 14
Contained by: file `galactic.filters.survey_geometry.F90`

Modules used: geometry_surveys input_parameters

subroutine: surveygeometrydestructor
Description: Destructor for the "surveyGeometry" galactic filter class.
Code lines: 7
Contained by: file galactic.filters.survey_geometry.F90

function: surveygeometrypasses
Description: Implement a galactic filter which passes only nodes with a survey geometry.
Code lines: 17
Contained by: file galactic.filters.survey_geometry.F90
Modules used: galacticus_nodes

file: galactic.filters.tree_hosted.F90
Description: Contains a module which implements a filter which passes only nodes that are hosted in a merger tree.
Code lines: 60

interface: galacticfiltertreehosted
Description: Constructors for the "treeHosted" galactic filter class.
Code lines: 3
Contained by: file galactic.filters.tree_hosted.F90

function: treehostedconstructorparameters
Description: Constructor for the "treeHosted" galactic filter class which takes a parameter set as input.
Code lines: 10
Contained by: file galactic.filters.tree_hosted.F90
Modules used: input_parameters

function: treehostedpasses
Description: Implement a galactic filter which passes only main branch halos.
Code lines: 9
Contained by: file galactic.filters.tree_hosted.F90

file: galactic_dynamics.bar_instability.Efstathiou1982.F90
Description: Implementation of the Efstathiou et al. [1982] model for galactic disk bar instability.
Code lines: 180

function: efstathiou1982constructorinternal
Description: Internal constructor for the efstathiou1982 model for galactic disk bar instability class.
Code lines: 8
Contained by: file galactic_dynamics.bar_instability.Efstathiou1982.F90

function: efstathiou1982constructorparameters
Description: Constructor for the efstathiou1982 model for galactic disk bar instability class which takes a parameter set as input.
Code lines: 36
Contained by: file galactic_dynamics.bar_instability.Efstathiou1982.F90
Modules used: input_parameters

function: `efstathiou1982estimator`
Description: Compute the stability estimator for the Efstathiou et al. [1982] model for galactic disk bar instability.
Code lines: 26
Contained by: file `galactic_dynamics.bar_instability.Efstathiou1982.F90`
Modules used: `galacticus_nodes` `numerical_constants_astronomical`

subroutine: `efstathiou1982timescale`
Description: Computes a timescale for depletion of a disk to a pseudo-bulge via bar instability based on the criterion of Efstathiou et al. [1982].
Code lines: 50
Contained by: file `galactic_dynamics.bar_instability.Efstathiou1982.F90`
Modules used: `galacticus_nodes` `numerical_constants_astronomical` `numerical_constants_physical` `numerical_constants_prefixes`

interface: `galacticdynamicsbarinstabilityefstathiou1982`
Description: Constructors for the `efstathiou1982` model for galactic disk bar instability class.
Code lines: 4
Contained by: file `galactic_dynamics.bar_instability.Efstathiou1982.F90`

file: `galactic_dynamics.bar_instability.Efstathiou1982Tidal.F90`
Description: Implementation of the Efstathiou et al. [1982] model for galactic disk bar instability, but including the effects of tidal forces.
Code lines: 162
Modules used: `satellites_tidal_fields`

subroutine: `efstathiou1982destructor`
Description: Destructor for the `efstathiou1982` model for galactic disk bar instability class.
Code lines: 7
Contained by: file `galactic_dynamics.bar_instability.Efstathiou1982Tidal.F90`

function: `efstathiou1982tidalconstructorinternal`
Description: Internal constructor for the `efstathiou1982Tidal` model for galactic disk bar instability class.
Code lines: 10
Contained by: file `galactic_dynamics.bar_instability.Efstathiou1982Tidal.F90`

function: `efstathiou1982tidalconstructorparameters`
Description: Constructor for the `efstathiou1982Tidal` model for galactic disk bar instability class which takes a parameter set as input.
Code lines: 21
Contained by: file `galactic_dynamics.bar_instability.Efstathiou1982Tidal.F90`
Modules used: `input_parameters`

function: `efstathiou1982tidalestimator`
Description: Compute the stability estimator for the Efstathiou et al. [1982] model for galactic disk bar instability.
Code lines: 25
Contained by: file `galactic_dynamics.bar_instability.Efstathiou1982Tidal.F90`
Modules used: `galacticus_nodes` `numerical_constants_astronomical`

function: `efstathiou1982tidaltidaltensorradial`
Description: Compute the radial part of the tidal tensor.
Code lines: 15
Contained by: file `galactic_dynamics.bar_instability.Efstathiou1982Tidal.F90`
Modules used: `galacticus_nodes`

subroutine: `efstathiou1982tidaltimescale`
Description: Computes a timescale for depletion of a disk to a pseudo-bulge via bar instability based on the criterion of Efstathiou et al. [1982].
Code lines: 17
Contained by: file `galactic_dynamics.bar_instability.Efstathiou1982Tidal.F90`
Modules used: `galacticus_nodes`

interface: `galacticdynamicsbarinstabilityefstathiou1982tidal`
Description: Constructors for the `efstathiou1982Tidal` model for galactic disk bar instability class.
Code lines: 4
Contained by: file `galactic_dynamics.bar_instability.Efstathiou1982Tidal.F90`

file: `galactic_dynamics.bar_instability.F90`
Description: Contains a module which provides a class that implements calculations of bar instability in galactic disks.
Code lines: 41

module: `galactic_dynamics_bar_instabilities`
Description: Provides a class that implements calculations of bar instability in galactic disks.
Code lines: 19
Contained by: file `galactic_dynamics.bar_instability.F90`
Modules used: `galacticus_nodes`
Used by: subroutine `galacticus_function_classes_destroy`; subroutine `galacticus_state_retrieve`; subroutine `galacticus_state_store`; module `node_component_disk_standard`; module `node_component_dynamics_statistics_bars`

file: `galactic_dynamics.bar_instability.fixed_timescale.F90`
Description: Implementation of a simple model for galactic disk bar instability in which the timescale is fixed.
Code lines: 84

function: `fixedtimescaleconstructorinternal`
Description: Internal constructor for the `fixedTimescale` model for galactic disk bar instability class.
Code lines: 8
Contained by: file `galactic_dynamics.bar_instability.fixed_timescale.F90`

function: `fixedtimescaleconstructorparameters`
Description: Constructor for the `fixedTimescale` model for galactic disk bar instability class which takes a parameter set as input.
Code lines: 20
Contained by: file `galactic_dynamics.bar_instability.fixed_timescale.F90`

Modules used: input_parameters

subroutine: fixedtimescaletimescale
Description: Assume a constant timescale for depletion of a disk to a pseudo-bulge via bar instability.
Code lines: 11
Contained by: file galactic_dynamics.bar_instability.fixed_timescale.F90

interface: galacticdynamicsbarinstabilityfixedtimescale
Description: Constructors for the fixedTimescale model for galactic disk bar instability class.
Code lines: 4
Contained by: file galactic_dynamics.bar_instability.fixed_timescale.F90

file: galactic_dynamics.bar_instability.stable.F90
Description: Implementation of a perfectly stable model for galactic disk bar instability.
Code lines: 68

interface: galacticdynamicsbarinstabilitystable
Description: Constructors for the stable model for galactic disk bar instability class.
Code lines: 3
Contained by: file galactic_dynamics.bar_instability.stable.F90

function: stableconstructorparameters
Description: Constructor for the stable model for galactic disk bar instability class which takes a parameter set as input.
Code lines: 11
Contained by: file galactic_dynamics.bar_instability.stable.F90
Modules used: input_parameters

subroutine: stabletimescale
Description: Computes a timescale for depletion of a disk to a pseudo-bulge via bar instability based on the criterion of Efstathiou et al. [1982].
Code lines: 16
Contained by: file galactic_dynamics.bar_instability.stable.F90
Modules used: numerical_constants_astronomical numerical_constants_physical

file: galactic_structure.density.F90
Description: Contains a module which implements calculations of the density at a specific position.
Code lines: 139

module: galactic_structure_densities
Description: Implements calculations of the density at a specific position.
Code lines: 117
Contained by: file galactic_structure.density.F90
Used by: function standardgrowthrate

file: galactic_structure.potential.F90
Description: Contains a module which implements calculations of gravitationl potential.
Code lines: 183

module: galactic_structure_potentials
Description: Implements calculations of the gravitational potential.
Code lines: 147
Contained by: file galactic_structure.potential.F90
Modules used: galactic_structure_options, kind_numbers
Used by: subroutine galacticus_calculations_-reset, function node_component_black_hole_-noncentral_recoil_escapes, function node_component_black_hole_-standard_recoil_escapes, function equivalent_circular_orbit_-solver, function extremum_solver, function satellite_orbit_convert_to_-current_potential, subroutine satellite_orbit_extremum_-phase_space_coordinates

function: component_potential
Description: Unary function returning the potential in a component. Suitable for mapping over components.
Code lines: 8
Contained by: module galactic_structure_potentials
Modules used: galacticus_nodes

function: galactic_structure_potential
Description: Solve for the gravitational potential at a given radius. Assumes the galactic structure has already been computed.
Code lines: 100
Contained by: module galactic_structure_potentials
Modules used: dark_matter_halo_scales, dark_matter_profile_structure_tasks, galacticus_nodes, node_component_black_hole_simple_-structure, node_component_black_hole_standard_-structure_tasks

subroutine: galactic_structure_potential_standard_reset
Description: Reset calculations for galactic structure potentials.
Code lines: 9
Contained by: module galactic_structure_potentials
Modules used: galacticus_nodes

file: galactic_structure.radius_definition.F90
Description: Contains a module which provides parsing of radii definitions used in output specifiers.
Code lines: 189

module: galactic_structure_radii_definitions
Description: Provides parsing of radii definitions used in output specifiers.

Code lines: 167
Contained by: file galactic_structure.radius_definition.F90
Modules used: iso_varying_string
Used by: file nodes.property_extractor.density.F90; function densityprofileconstructorinternal; function densityprofileextract; file nodes.property_extractor.projected_density.F90; function projecteddensityconstructorinternal; function projecteddensityextract; file nodes.property_extractor.rotation_curve.F90; function rotationcurveconstructorinternal; function rotationcurveextract; file nodes.property_extractor.velocity_dispersion.F90; function velocitydispersionconstructorinternal; function velocitydispersionextract

subroutine: galactic_structure_radii_definition_decode
Description: Decode a set of radii descriptors and return the corresponding specifiers.
Code lines: 121
Contained by: module galactic_structure_radii_definitions
Modules used: galactic_structure_options; galacticus_error; galacticus_nodes; stellar_luminosities_structure; string_handling

type: radiusspecifier
Description: Type used for specifying radii definitions used in output specifiers.
Code lines: 5
Contained by: module galactic_structure_radii_definitions

file: galactic_structure.radius_solver.F90
Description: Contains a module which implements a class for computing radii of galactic components (or more general components).
Code lines: 62

module: galactic_structure_solvers
Description: Implements a class for calculations of sizes of galactic components (or more general components).
Code lines: 40
Contained by: file galactic_structure.radius_solver.F90
Modules used: galacticus_nodes
Used by: subroutine galacticus_function_classes_destroy; subroutine galacticus_state_retrieve; subroutine galacticus_state_store; file merger_trees.evolver.standard.F90; module merger_trees_evolve_node

file: galactic_structure.radius_solver.equilibrium.F90
Description: Implementation of an "equilibrium" solver for galactic structure.
Code lines: 469
Modules used: dark_matter_profiles; dark_matter_profiles_dmo

subroutine: `equilibriumautohook`
Description: Attach to various event hooks.
Code lines: 11
Contained by: file galactic_structure.radius_solver.equilibrium.F90
Modules used: events_hooks

function: `equilibriumconstructorinternal`
Description: Internal constructor for the `equilibrium` galactic structure solver class.
Code lines: 11
Contained by: file galactic_structure.radius_solver.equilibrium.F90

function: `equilibriumconstructorparameters`
Description: Constructor for the `equilibrium` galactic structure solver class which takes a parameter set as input.
Code lines: 51
Contained by: file galactic_structure.radius_solver.equilibrium.F90
Modules used: input_parameters

subroutine: `equilibriumdestructor`
Description: Destructor for the `equilibrium` galactic structure solver class.
Code lines: 13
Contained by: file galactic_structure.radius_solver.equilibrium.F90
Modules used: events_hooks

subroutine: `equilibriumrevert`
Description: Revert radii for the equilibrium galactic structure solve.
Code lines: 10
Contained by: file galactic_structure.radius_solver.equilibrium.F90

subroutine: `equilibriumsolve`
Description: Solve for the structure of galactic components.
Code lines: 271
Contained by: file galactic_structure.radius_solver.equilibrium.F90
Modules used: galacticus_display, galacticus_error, node_component_basic_standard, node_component_dark_matter_profile_scale, node_component_disk_standard, node_component_disk_very_simple_size, node_component_spheroid_standard, node_component_spheroid_very_simple

subroutine: `radiussolve`
Description: Solve for the equilibrium radius of the given component.
Code lines: 152
Contained by: subroutine equilibriumsolve
Modules used: galactic_structure_options, galactic_structure_rotation_curves, galacticus_display, galacticus_error, iso_varying_string, memory_management, numerical_constants_physical, string_handling

subroutine: `equilibriumsolvehook`
Description: Hookable wrapper around the solver.
Code lines: 14
Contained by: file `galactic_structure.radius_solver.equilibrium.F90`
Modules used: `galacticus_error`

subroutine: `equilibriumsolveprederiativehook`
Description: Hookable wrapper around the solver for pre-derivative events.
Code lines: 16
Contained by: file `galactic_structure.radius_solver.equilibrium.F90`
Modules used: `galacticus_error` `galacticus_nodes`

interface: `galacticstructuresolverequilibrium`
Description: Constructors for the `equilibrium` galactic structure solver class.
Code lines: 4
Contained by: file `galactic_structure.radius_solver.equilibrium.F90`

file: `galactic_structure.radius_solver.fixed.F90`
Description: Implementation of a "fixed" solver for galactic structure (no self-gravity of baryons, and size simply scales in proportion to specific angular momentum).
Code lines: 303
Modules used: `dark_matter_halo_scales` `dark_matter_profiles_dmo`

subroutine: `fixedautohook`
Description: Attach to various event hooks.
Code lines: 11
Contained by: file `galactic_structure.radius_solver.fixed.F90`
Modules used: `events_hooks`

function: `fixedconstructorinternal`
Description: Internal constructor for the `fixed` galactic structure solver class.
Code lines: 17
Contained by: file `galactic_structure.radius_solver.fixed.F90`
Modules used: `galacticus_error` `galacticus_nodes`

function: `fixedconstructorparameters`
Description: Constructor for the `fixed` galactic structure solver class which takes a parameter set as input.
Code lines: 36
Contained by: file `galactic_structure.radius_solver.fixed.F90`
Modules used: `input_parameters`

subroutine: `fixeddestructor`
Description: Destructor for the `fixed` galactic structure solver class.
Code lines: 13
Contained by: file `galactic_structure.radius_solver.fixed.F90`
Modules used: `events_hooks`

subroutine: `fixedrevert`
Description: Revert radii for the fixed galactic structure solve. Not necessary for this algorithm.
Code lines: 8
Contained by: file `galactic_structure.radius_solver.fixed.F90`

subroutine: `fixedsolve`
Description: Solve for the structure of galactic components assuming no self-gravity of baryons, and that size simply scales in proportion to specific angular momentum.
Code lines: 112
Contained by: file `galactic_structure.radius_solver.fixed.F90`
Modules used: `node_component_basic_standard` `node_component_dark_matter_profile_scale` `node_component_disk_standard` `node_component_disk_very_simple_size` `node_component_spheroid_standard` `node_component_spheroid_very_simple`

subroutine: `radiussolve`
Description: Solve for the equilibrium radius of the given component.
Code lines: 28
Contained by: subroutine `fixedsolve`
Modules used: `galacticus_nodes`

subroutine: `fixedsolvehook`
Description: Hookable wrapper around the solver.
Code lines: 14
Contained by: file `galactic_structure.radius_solver.fixed.F90`
Modules used: `galacticus_error`

subroutine: `fixedsolveprederiativehook`
Description: Hookable wrapper around the solver.
Code lines: 16
Contained by: file `galactic_structure.radius_solver.fixed.F90`
Modules used: `galacticus_error`

interface: `galacticstructuresolverfixed`
Description: Constructors for the `fixed` galactic structure solver class.
Code lines: 4
Contained by: file `galactic_structure.radius_solver.fixed.F90`

file: `galactic_structure.radius_solver.linear.F90`
Description: Implementation of a "linear" solver for galactic structure (no self-gravity of baryons, and size simply scales in proportion to specific angular momentum).
Code lines: 247
Modules used: `dark_matter_halo_scales`

interface: `galacticstructuresolverlinear`
Description: Constructors for the `linear` galactic structure solver class.
Code lines: 4
Contained by: file `galactic_structure.radius_solver.linear.F90`

subroutine: `linearautohook`
Description: Attach to various event hooks.
Code lines: 11
Contained by: file `galactic_structure.radius_solver.linear.F90`
Modules used: `events_hooks`

function: `linearconstructorinternal`
Description: Internal constructor for the `linear` galactic structure solver class.
Code lines: 8
Contained by: file `galactic_structure.radius_solver.linear.F90`

function: `linearconstructorparameters`
Description: Constructor for the `linear` galactic structure solver class which takes a parameter set as input.
Code lines: 14
Contained by: file `galactic_structure.radius_solver.linear.F90`
Modules used: `input_parameters`

subroutine: `lineardestructor`
Description: Destructor for the `linear` galactic structure solver class.
Code lines: 12
Contained by: file `galactic_structure.radius_solver.linear.F90`
Modules used: `events_hooks`

subroutine: `linearrevert`
Description: Revert radii for the linear galactic structure solve. Not necessary for this algorithm.
Code lines: 8
Contained by: file `galactic_structure.radius_solver.linear.F90`

subroutine: `linearsolve`
Description: Solve for the structure of galactic components assuming no self-gravity of baryons, and that size simply scales in proportion to specific angular momentum.
Code lines: 102
Contained by: file `galactic_structure.radius_solver.linear.F90`
Modules used: `node_component_basic_standard` `node_component_dark_matter_profile_scale` `node_component_disk_standard` `node_component_disk_very_simple_size` `node_component_spheroid_standard` `node_component_spheroid_very_simple`

subroutine: `radiussolve`
Description: Solve for the equilibrium radius of the given component.
Code lines: 19
Contained by: subroutine `linearsolve`

subroutine: `linearsolvehook`
Description: Hookable wrapper around the solver.
Code lines: 14
Contained by: file `galactic_structure.radius_solver.linear.F90`
Modules used: `galacticus_error`

subroutine: `linearsolveprederiativehook`
Description: Hookable wrapper around the solver.
Code lines: 16
Contained by: file `galactic_structure.radius_solver.linear.F90`
Modules used: `galacticus_error`

file: `galactic_structure.radius_solver.simple.F90`
Description: Implementation of a simple solver for galactic structure (self-gravity of baryons is ignored).
Code lines: 277
Modules used: `dark_matter_profiles_dmo`

interface: `galacticstructuresolversimple`
Description: Constructors for the `simple` galactic structure solver class.
Code lines: 4
Contained by: file `galactic_structure.radius_solver.simple.F90`

subroutine: `simpleautohook`
Description: Attach to various event hooks.
Code lines: 11
Contained by: file `galactic_structure.radius_solver.simple.F90`
Modules used: `events_hooks`

function: `simpleconstructorinternal`
Description: Internal constructor for the `simple` galactic structure solver class.
Code lines: 9
Contained by: file `galactic_structure.radius_solver.simple.F90`

function: `simpleconstructorparameters`
Description: Constructor for the `simple` galactic structure solver class which takes a parameter set as input.
Code lines: 23
Contained by: file `galactic_structure.radius_solver.simple.F90`
Modules used: `input_parameters`

subroutine: `simpledestructor`
Description: Destructor for the `simple` galactic structure solver class.
Code lines: 12
Contained by: file `galactic_structure.radius_solver.simple.F90`
Modules used: `events_hooks`

subroutine: `simplerevert`
Description: Revert radii for the simple galactic structure solve. Not necessary for this algorithm.
Code lines: 8
Contained by: file `galactic_structure.radius_solver.simple.F90`

subroutine: `simplesolve`
Description: Solve for the structure of galactic components.
Code lines: 123

Contained by: file galactic_structure.radius_solver.simple.F90
Modules used: galacticus_error, node_component_basic_standard, node_component_dark_matter_profile_scale, node_component_disk_standard, node_component_disk_very_simple_size, node_component_spheroid_standard, node_component_spheroid_very_simple

subroutine: radiussolve
Description: Solve for the equilibrium radius of the given component.
Code lines: 20
Contained by: subroutine simplesolve

subroutine: simplesolvehook
Description: Hookable wrapper around the solver.
Code lines: 14
Contained by: file galactic_structure.radius_solver.simple.F90
Modules used: galacticus_error

subroutine: simplesolveprederiativehook
Description: Hookable wrapper around the solver.
Code lines: 16
Contained by: file galactic_structure.radius_solver.simple.F90
Modules used: galacticus_error

file: galactic_structure.rotation_curve.F90
Description: Contains a module which implements calculations of the rotation curve as a specified radius.
Code lines: 117

module: galactic_structure_rotation_curves
Description: Implements calculations of the rotation curve as a specified radius.
Code lines: 95
Contained by: file galactic_structure.rotation_curve.F90
Modules used: galactic_structure_options
Used by: function standardgrowthrate, subroutine radiussolve, function galactic_structure_rotation_curve_gradient, function rotationcurveextract, function velocitydispersionlambdarintegrand1, function velocitydispersionlambdarintegrand2, function gnedin1999heatingrate, function simpleratemassloss, function simpleratemassloss

function: component_rotation_curve
Description: Unary function returning the squared rotation curve in a component. Suitable for mapping over components.
Code lines: 8
Contained by: module galactic_structure_rotation_curves
Modules used: galacticus_nodes

function: galactic_structure_rotation_curve

Description: Solve for the rotation curve a given radius. Assumes that galactic structure has already been solved for.
Code lines: 70
Contained by: module galactic_structure_rotation_curves
Modules used: dark_matter_profile_structure_tasks, galacticus_nodes, hot_halo_mass_distributions, node_component_black_hole_simple_-structure, node_component_black_hole_standard_-structure_tasks, node_component_hot_halo_cold_mode_-structure_tasks

file: galactic_structure.rotation_curve.gradient.F90
Description: Contains a module which implements calculations of the gradient of the rotation curve.
Code lines: 134

module: galactic_structure_rotation_curve_gradients
Description: Implements calculations of the rotation curve gradient
Code lines: 98
Contained by: file galactic_structure.rotation_curve.gradient.F90
Modules used: galactic_structure_options
Used by: function standardgrowthrate

function: component_rotation_curve_gradient
Description: Unary function returning the gradient of the squared rotation curve in a component. Suitable for mapping over components.
Code lines: 8
Contained by: module galactic_structure_rotation_curve_gradients
Modules used: galacticus_nodes

function: galactic_structure_rotation_curve_gradient
Description: Solve for the rotation curve gradient at a given radius. Assumes the galactic structure has already been computed.
Code lines: 73
Contained by: module galactic_structure_rotation_curve_gradients
Modules used: dark_matter_profile_structure_tasks, galactic_structure_rotation_curves, galacticus_nodes, hot_halo_mass_distributions, node_component_black_hole_simple_-structure, node_component_black_hole_standard_-structure_tasks, node_component_hot_halo_cold_mode_-structure_tasks

file: galactic_structure.surface_density.F90
Description: Contains a module which implements calculations of the surface density at a specific position.
Code lines: 103

module: galactic_structure_surface_densities
Description: Implements calculations of the surface density at a specific position.
Code lines: 81
Contained by: file galactic_structure.surface_density.F90
Modules used: galactic_structure_options

Used by: function velocitydispersionlambdarintegrand1; function velocitydispersionlambdarintegrand2; function simpleratemassloss; function outflowrateintegrand; function blitz2006rate; function kennicuttschmidtrate; subroutine krumholz2009surfacedensityfactors; function extendedschmidtrate

function: `component_surface_density`

Description: Unary function returning the surface density in a component. Suitable for mapping over components.
Code lines: 8
Contained by: module galactic_structure_surface_densities
Modules used: galacticus_nodes

function: `galactic_structure_surface_density`

Description: Compute the density (of given `massType`) at the specified `position`. Assumes that galactic structure has already been computed.
Code lines: 55
Contained by: module galactic_structure_surface_densities
Modules used: coordinate_systems; galacticus_error; galacticus_nodes

file: `galactic_structure.velocity_dispersions.F90`

Description: Contains a module which implements calculations of the velocity dispersions in isotropic spherical systems by solving the Jeans equation.
Code lines: 92

module: `galactic_structure_velocity_dispersions`

Description: Implements calculations of the velocity dispersions in isotropic spherical systems by solving the Jeans equation.
Code lines: 67
Contained by: file galactic_structure.velocity_dispersions.F90
Modules used: galacticus_nodes
Used by: function standardgrowthrate; function velocitydispersionextract; function velocitydispersionvelocitysurfacedensityintegrand

function: `galactic_structure_velocity_dispersion`

Description: Returns the velocity dispersion of the specified `componentType` in `thisNode` at the given `radius`.
Code lines: 36
Contained by: module galactic_structure_velocity_dispersions
Modules used: fgsl; galactic_structure_densities; galactic_structure_enclosed_masses; galactic_structure_options; numerical_integration

function: `velocity_dispersion_integrand`

Description: Integrand function used for finding velocity dispersions using Jeans equation.
Code lines: 14

Contained by: module galactic_structure_velocity_dispersions
Modules used: galactic_structure_densities galactic_structure_enclosed_masses numerical_constants_physical

file: galacticus.banner.F90
Description: Contains a module which displays a banner for Galacticus.
Code lines: 61

module: galacticus_banner
Description: Displays a banner for Galacticus.
Code lines: 39
Contained by: file galacticus.banner.F90
Used by: program galacticus

subroutine: galacticus_banner_show
Description: Displays the Galacticus banner.
Code lines: 29
Contained by: module galacticus_banner
Modules used: galacticus_display mpi_utilities

file: galacticus.calculations_reset.F90
Description: Contains a module which handles resetting of calculations before a new or updated node is processed.
Code lines: 81

module: galacticus_calculations_resets
Description: Handles resetting of calculations before a new or updated node is processed.
Code lines: 59
Contained by: file galacticus.calculations_reset.F90
Used by: function nbodyerrorsdistributionaveraged
function ludlow2016radius
function concentrationradius
function powerspectrumonehalointegrand
subroutine fixedmassconstruct
subroutine standardevolve
subroutine analyzeroutput
function haloradiusrootfunction
subroutine halomassfunctionperform

function virial_density_contrast_percolation_solver
subroutine halomodelgenerateperform

subroutine: galacticus_calculations_reset
Description: Calls any routines required to reset all calculation for a new or updated node.
Code lines: 43
Contained by: module galacticus_calculations_resets
Modules used: galactic_structure_potentials galacticus_nodes node_component_disk_standard node_component_hot_halo_standard node_component_hot_halo_very_simple

file: `galacticus.display.F90`

Description: Contains a module which implements outputting of formatted, indented messages at various vebosity levels from Galacticus.

Code lines: 384

module: `galacticus_display`

Description: Implements outputting of formatted, indented messages at various vebosity levels from Galacticus.

Code lines: 362

Contained by: file galacticus.display.F90

Modules used: iso_varying_string

Used by:

function: galacticus_component_list
Description: Construct a message describing which implementations of a component class provide required functionality.
Code lines: 14
Contained by: module galacticus_error
Modules used: string_handling

subroutine: galacticus_error_handler_register
Description: Register signal handlers.
Code lines: 15
Contained by: module galacticus_error

interface: galacticus_error_report
Code lines: 3
Contained by: module galacticus_error

subroutine: galacticus_error_report_char
Description: Display an error message.
Code lines: 26
Contained by: module galacticus_error

subroutine: galacticus_error_report_varstr
Description: Display an error message.
Code lines: 7
Contained by: module galacticus_error

subroutine: galacticus_error_wait_set
Description: Set the time to wait after an error occurs.
Code lines: 7
Contained by: module galacticus_error

subroutine: galacticus_gsl_error_handler
Description: Handle errors from the GSL library, by flushing all data and then aborting.
Code lines: 52

Contained by: module galacticus_error
Modules used: mpi

subroutine: galacticus_gsl_error_handler_abort_off
Description: Record that we should not abort on GSL errors.
Code lines: 6
Contained by: module galacticus_error

subroutine: galacticus_gsl_error_handler_abort_on
Description: Record that we should abort on GSL errors.
Code lines: 6
Contained by: module galacticus_error

function: galacticus_gsl_error_status
Description: Return current GSL error status.
Code lines: 6
Contained by: module galacticus_error

subroutine: galacticus_signal_handler_sigbus
Description: Handle SIGBUS signals, by flushing all data and then aborting.
Code lines: 43
Contained by: module galacticus_error
Modules used: mpi

subroutine: galacticus_signal_handler_sigfpe
Description: Handle SIGFPE signals, by flushing all data and then aborting.
Code lines: 43
Contained by: module galacticus_error
Modules used: mpi

subroutine: galacticus_signal_handler_sigill
Description: Handle SIGILL signals, by flushing all data and then aborting.
Code lines: 43
Contained by: module galacticus_error
Modules used: mpi

subroutine: galacticus_signal_handler_sigint
Description: Handle SIGINT signals, by flushing all data and then aborting.
Code lines: 43
Contained by: module galacticus_error
Modules used: mpi

subroutine: galacticus_signal_handler_sigsegv
Description: Handle SIGSEGV signals, by flushing all data and then aborting.
Code lines: 43
Contained by: module galacticus_error
Modules used: mpi

subroutine: `galacticus_signal_handler_sigxcpu`
Description: Handle `SIGXCPU` signals, by flushing all data and then aborting.
Code lines: 17
Contained by: module galacticus_error
Modules used: `mpi`

interface: `galacticus_warn`
Code lines: 3
Contained by: module galacticus_error

subroutine: `galacticus_warn_char`
Description: Display a warning message.
Code lines: 30
Contained by: module galacticus_error
Modules used: galacticus_display

subroutine: `galacticus_warn_review`
Description: Review any warning messages emitted during the run.
Code lines: 16
Contained by: module galacticus_error

subroutine: `galacticus_warn_varstr`
Description: Display a warning message
Code lines: 7
Contained by: module galacticus_error

type: `warning`
Code lines: 3
Contained by: module galacticus_error

file: `galacticus.error.wait.F90`
Description: Contains a module which handles setting of error wait times.
Code lines: 50

module: `galacticus_error_wait`
Description: Handle setting of error wait times.
Code lines: 28
Contained by: file galacticus.error.wait.F90
Used by: program galacticus

subroutine: `galacticus_error_wait_set_from_parameters`
Description: Read the parameter that controls the verbosity level, and set that level.
Code lines: 18
Contained by: module galacticus_error_wait
Modules used: galacticus_error input_parameters

file: `galacticus.function_class_destroy.F90`
Description: Contains a module which handles destruction of default `functionClass` objects.

Code lines: 362

module: `galacticus_function_classes_destroys`

Description: Handles resetting of calculations before a new or updated node is processed.
Code lines: 340
Contained by: file galacticus.function_class_destroy.F90
Used by:

program galacticus	subroutine evolveforestsperform

function: galacticuspath
Description: Returns the path to various Galacticus resources.
Code lines: 34
Contained by: module galacticus_paths

subroutine: pathsretrieve
Description: Retrieve the Galacticus input data path from the environment.
Code lines: 14
Contained by: module galacticus_paths

file: galacticus.meta.evolver_profiler.F90
Description: Contains a module which constructs a profile of Galacticus ODE evolver statistics.
Code lines: 152

module: galacticus_meta_evolver_profiler
Description: Constructs a profile of Galacticus ODE evolver statistics.
Code lines: 130
Contained by: file galacticus.meta.evolver_profiler.F90
Modules used: hashes
Used by: subroutine galacticus_output_close_file, subroutine standardsteperroranalyzer

subroutine: galacticus_meta_evolver_profile
Description: Record profiling information on the ODE evolver.
Code lines: 66
Contained by: module galacticus_meta_evolver_profiler
Modules used: arrays_search, input_parameters, iso_c_binding, iso_varying_string, memory_management, numerical_ranges

subroutine: galacticus_meta_evolver_profiler_output
Description: Outputs collected meta-data on tree evolution.
Code lines: 38
Contained by: module galacticus_meta_evolver_profiler

Modules used: galacticus_hdf5 iso_varying_string numerical_constants_astronomical

file: galacticus.meta.tree_timing.F90
Description: Contains a module which records and outputs timing and memory usage data for processing trees.
Code lines: 298

module: galacticus_meta_tree_timing
Description: Records and outputs timing data for processing trees.
Code lines: 276
Contained by: file galacticus.meta.tree_timing.F90
Modules used: iso_c_binding kind_numbers
Used by: subroutine galacticus_output_close_file subroutine standardevolve subroutine evolveforestsperform

subroutine: meta_tree_timing_initialize
Description: Initialize the tree timing meta-data module.
Code lines: 34
Contained by: module galacticus_meta_tree_timing
Modules used: galacticus_error input_parameters

subroutine: meta_tree_timing_output
Description: Outputs collected meta-data on tree evolution.

file: galacticus.output.analyses.Local_Group_mass_functions.F90
Description: Contains a module which implements an output analysis class that computes mass functions for Local Group satellite galaxies.
Code lines: 562

subroutine: localgroupmassfunctionanalyze
Description: Implement a localGroupMassFunction output analysis.
Code lines: 11
Contained by: file galacticus.output.analyses.Local_Group_mass_functions.F90

function: localgroupmassfunctionconstructorinternal
Description: Constructor for the "localGroupMassFunction" output analysis class for internal use.

Code lines: 266
Contained by: file galacticus.output.analyses.Local_Group_mass_functions.F90
Modules used: galactic_filters, geometry_surveys, interface_local_group_db, node_property_extractors, numerical_comparison, numerical_constants_astronomical, numerical_ranges, output_analysis_distribution_-normalizers, output_analysis_distribution_-operators, output_analysis_property_operators, output_analysis_weight_operators, output_times

function: localgroupmassfunctionconstructorparameters
Description: Constructor for the "localGroupMassFunction" output analysis class which takes a parameter set as input.
Code lines: 100
Contained by: file galacticus.output.analyses.Local_Group_mass_functions.F90
Modules used: input_parameters, output_times

subroutine: localgroupmassfunctiondestructor
Description: Destructor for the localGroupMassFunction output analysis class.
Code lines: 8
Contained by: file galacticus.output.analyses.Local_Group_mass_functions.F90

subroutine: localgroupmassfunctionfinalize
Description: Implement a localGroupMassFunction output analysis finalization.
Code lines: 37
Contained by: file galacticus.output.analyses.Local_Group_mass_functions.F90
Modules used: galacticus_hdf5, io_hdf5, numerical_constants_astronomical

subroutine: localgroupmassfunctionfinalizeanalysis
Description: Finalize analysis of a localGroupMassFunction output analysis.
Code lines: 26
Contained by: file galacticus.output.analyses.Local_Group_mass_functions.F90

function: localgroupmassfunctionloglikelihood
Description: Return the log-likelihood of a localGroupMassFunction output analysis. The likelihood function assumes that the model prediction for the number of satellite galaxies in any given mass bin follows a negative binomial distribution as was found for dark matter subhalos [Boylan-Kolchin et al., 2010, see also Lu et al. 2016]. This has been confirmed by examining the results of many tree realizations, although it in principal could be model-dependent.
Code lines: 21
Contained by: file galacticus.output.analyses.Local_Group_mass_functions.F90
Modules used: statistics_distributions_discrete

subroutine: localgroupmassfunctionreduce
Description: Implement a localGroupMassFunction output analysis reduction.
Code lines: 15
Contained by: file galacticus.output.analyses.Local_Group_mass_functions.F90

Modules used: galacticus_error

interface: `outputanalysislocalgroupmassfunction`
Description: Constructors for the "localGroupMassFunction" output analysis class.
Code lines: 4
Contained by: file galacticus.output.analyses.Local_Group_mass_functions.F90

file: `galacticus.output.analyses.black_hole_bulge_relation.F90`
Description: Contains a module which implements a mass-metallicity relation analysis class.
Code lines: 262

function: `blackholebulgerelationconstructorinternal`
Description: Constructor for the "blackHoleBulgeRelation" output analysis class for internal use.
Code lines: 161
Contained by: file galacticus.output.analyses.black_hole_bulge_relation.F90

power_spectra

subroutine: `correlationfunctionaccumulatehalo`

Description: Assumulate a single halo's contributions to the halo model one- and two-halo terms. For the one-halo term we count contributions from central-satellite pairs, and from satellite-satellite pairs. Contributions differ in the scalings applied to the Fourier-transformed dark matter halo density profile—see [Cooray and Sheth, 2002, §6.1] for a discussion of this. The number of satellites in the halo is assumed to follow a Poisson binomial distribution.

Code lines: 160

Contained by: file `galacticus.output.analyses.correlation_function.F90`

Modules used: `galacticus_nodes` `halo_model_power_spectrum_modifiers` `linear_algebra` `math_distributions_poisson_binomial` `vectors`

subroutine: `correlationfunctionaccumulatenode`

Description: Accumulate a single galaxy to the population of the current halo. Since galaxy masses have random errors, each galaxy added is assigned an inclusion probability, which will be taken into account when evaluating the one- and two-halo terms from this halo in the halo model.

Code lines: 42

Contained by: file `galacticus.output.analyses.correlation_function.F90`

subroutine: `correlationfunctionanalyze`

Description: Implement a correlationFunction output analysis.

Code lines: 28

Contained by: file `galacticus.output.analyses.correlation_function.F90`

function: `correlationfunctionconstructorfile`

Description: Constructor for the "correlation" output analysis class which reads bin information from a standard format file.

Code lines: 56

Contained by: file `galacticus.output.analyses.correlation_function.F90`

Modules used: `cosmology_functions` `cosmology_parameters` `io_hdf5`

function: `correlationfunctionconstructorinternal`

Description: Constructor for the "correlationFunction" output analysis class for internal use.

Code lines: 83

Contained by: file `galacticus.output.analyses.correlation_function.F90`

Modules used: `galacticus_error` `iso_c_binding` `memory_management` `numerical_ranges` `output_analysis_utilities`

function: `correlationfunctionconstructorparameters`

Description: Constructor for the "correlationFunction" output analysis class which takes a parameter set as input.

Contained by: file `galacticus.output.analyses.correlation_function.F90`

Modules used: `galacticus_error` `input_parameters`

subroutine: `correlationfunctiondestructor`

Description: Destructor for the "correlationFunction" output analysis class.

Code lines: 19
Contained by: file galacticus.output.analyses.correlation_function.F90

subroutine: correlationfunctionfinalize
Description: Implement a correlationFunction output analysis finalization.
Code lines: 57
Contained by: file galacticus.output.analyses.correlation_function.F90
Modules used: galacticus_hdf5 io_hdf5 numerical_constants_astronomical

subroutine: correlationfunctionfinalizeanalysis
Description: Compute final covariances and normalize.
Code lines: 264
Contained by: file galacticus.output.analyses.correlation_function.F90
Modules used: fftlogs linear_algebra memory_management mpi_utilities numerical_constants_math table_labels tables vectors

function: binningintegrandweight
Description: The weight function applied to the projected correlation function when integrating into bins.
Code lines: 7
Contained by: subroutine correlationfunctionfinalizeanalysis

function: projectionintegrandweight
Description: The weight function applied to the correlation function when integrating to get the projected correlation function.
Code lines: 11
Contained by: subroutine correlationfunctionfinalizeanalysis

function: correlationfunctionloglikelihood
Description: Return the log-likelihood of a correlationFunction output analysis.
Code lines: 31
Contained by: file galacticus.output.analyses.correlation_function.F90
Modules used: galacticus_error linear_algebra numerical_constants_math

subroutine: correlationfunctionreduce
Description: Implement a correlationFunction output analysis reduction.
Code lines: 23
Contained by: file galacticus.output.analyses.correlation_function.F90
Modules used: galacticus_error

subroutine: correlationfunctiontermindices
Description: Return the indices in the term covariances array at which one-halo, two-halo, and density terms are stored for the given mass.
Code lines: 11
Contained by: file galacticus.output.analyses.correlation_function.F90

interface: outputanalysiscorrelationfunction

Description: Constructors for the "correlationFunction" output analysis class.
Code lines: 5
Contained by: file galacticus.output.analyses.correlation_function.F90

file: galacticus.output.analyses.correlation_function.Hearin2014_SDSS.F90
Description: Contains a module which implements a correlation function output analysis class for the Hearin et al. [2013] analysis.
Code lines: 261

function: correlationfunctionhearin2013sdssconstructorinternal
Description: Constructor for the "correlationFunctionHearin2013SDSS" output analysis class for internal use.

Code lines: 67

function: binwidthconstructorparameters
Description: Constructor for the "binWidth" output analysis distribution normalizer class which takes a parameter set as input.
Code lines: 10
Contained by: file galacticus.output.analyses.distribution_normalizer.bin_width.F90
Modules used: input_parameters

subroutine: binwidthnormalize
Description: Implement a bin width output analysis distribution normalizer.
Code lines: 16
Contained by: file galacticus.output.analyses.distribution_normalizer.bin_width.F90
Modules used: iso_c_binding

interface: outputanalysisdistributionnormalizerbinwidth
Description: Constructors for the "binWidth" output analysis distribution normalizer class.
Code lines: 3
Contained by: file galacticus.output.analyses.distribution_normalizer.bin_width.F90

file: galacticus.output.analyses.distribution_normalizer.identity.F90
Description: Contains a module which implements an identity output analysis distribution normalizer class.
Code lines: 62

function: identityconstructorparameters
Description: Constructor for the "identity" output analysis distribution normalizer class which takes a parameter set as input.
Code lines: 10
Contained by: file galacticus.output.analyses.distribution_normalizer.identity.F90
Modules used: input_parameters

subroutine: identitynormalize
Description: Implement a bin width output analysis distribution normalizer.
Code lines: 11
Contained by: file galacticus.output.analyses.distribution_normalizer.identity.F90

interface: outputanalysisdistributionnormalizeridentity
Description: Constructors for the "identity" output analysis distribution normalizer class.
Code lines: 3
Contained by: file galacticus.output.analyses.distribution_normalizer.identity.F90

file: galacticus.output.analyses.distribution_normalizer.log10_to_log.F90
Description: Contains a module which implements a $\log_{10} \rightarrow$ log output analysis distribution normalizer class.
Code lines: 63

function: `log10tologconstructorparameters`
Description: Constructor for the "log10ToLog" output analysis distribution normalizer class which takes a parameter set as input.
Code lines: 10
Contained by: file `galacticus.output.analyses.distribution_normalizer.log10_to_log.F90`
Modules used: `input_parameters`

subroutine: `log10tolognormalize`
Description: Implement a bin width output analysis distribution normalizer.
Code lines: 12
Contained by: file `galacticus.output.analyses.distribution_normalizer.log10_to_log.F90`

interface: `outputanalysisdistributionnormalizerlog10tolog`
Description: Constructors for the "log10ToLog" output analysis distribution normalizer class.
Code lines: 3
Contained by: file `galacticus.output.analyses.distribution_normalizer.log10_to_log.F90`

file: `galacticus.output.analyses.distribution_normalizer.sequence.F90`
Description: Contains a module which implements a sequence of normalizers on on-the-fly outputs.
Code lines: 155

type: `normalizerlist`
Code lines: 3
Contained by: file `galacticus.output.analyses.distribution_normalizer.sequence.F90`

interface: `outputanalysisdistributionnormalizersequence`
Description: Constructors for the sequence on-the-fly output distribution normalizer class.
Code lines: 4
Contained by: file `galacticus.output.analyses.distribution_normalizer.sequence.F90`

function: `sequenceconstructorinternal`
Description: Internal constructor for the sequence merger tree normalizer class.
Code lines: 14
Contained by: file `galacticus.output.analyses.distribution_normalizer.sequence.F90`

function: `sequenceconstructorparameters`
Description: Constructor for the sequence on-the-fly output normalizer class which takes a parameter set as input.
Code lines: 22
Contained by: file `galacticus.output.analyses.distribution_normalizer.sequence.F90`
Modules used: `input_parameters`

subroutine: `sequencedeepcopy`
Description: Perform a deep copy for the `sequence` output analysis distribution normalizer operator class.
Code lines: 31
Contained by: file `galacticus.output.analyses.distribution_normalizer.sequence.F90`
Modules used: `galacticus_error`

subroutine: `sequencedestructor`
Description: Destructor for the merger tree normalizer function class.
Code lines: 16
Contained by: file galacticus.output.analyses.distribution_normalizer.sequence.F90

subroutine: `sequencenormalize`
Description: Perform a sequence normalization on an on-the-fly output distribution.
Code lines: 15
Contained by: file galacticus.output.analyses.distribution_normalizer.sequence.F90

file: `galacticus.output.analyses.distribution_normalizer.unitarity.F90`
Description: Contains a module which implements a unitarity output analysis distribution normalizer class.
Code lines: 68

interface: `outputanalysisdistributionnormalizerunitarity`
Description: Constructors for the "unitarity" output analysis distribution normalizer class.
Code lines: 3
Contained by: file galacticus.output.analyses.distribution_normalizer.unitarity.F90

function: `unitarityconstructorparameters`
Description: Constructor for the "unitarity" output analysis distribution normalizer class which takes a parameter set as input.
Code lines: 10
Contained by: file galacticus.output.analyses.distribution_normalizer.unitarity.F90
Modules used: input_parameters

subroutine: `unitaritynormalize`
Description: Implement a unitarity output analysis distribution normalizer.
Code lines: 17
Contained by: file galacticus.output.analyses.distribution_normalizer.unitarity.F90

file: `galacticus.output.analyses.distribution_operator.F90`
Description: Contains a module which provides a class that operators on distributions used in on-the-fly output analyses.
Code lines: 55

module: `output_analysis_distribution_operators`
Description: Provides a class that operators on distributions used in on-the-fly output analyses.
Code lines: 33
Contained by: file galacticus.output.analyses.distribution_operator.F90
Modules used: galacticus_nodes, iso_c_binding
Used by: subroutine galacticus_function_classes_destroy, function hivshalomassrelationpadmanabhan2017constructorin, function localgroupmassfunctionconstructorinterna, function blackholebulgerelationconstructorinternal, function concentrationvshalomasscdmludlow2016const, file galacticus.output.analyses.correlation_function.F90

file: galacticus.output.analyses.distribution_operator.disk_size_inclination.F90

Description: Contains a module which implements the effects of inclination on disk size in an output analysis distribution operator class.
Code lines: 206
Modules used: tables

function: disksizeinclinationconstructorinternal

Description: Internal constructor for the "diskSizeInclination" output analysis distribution operator class.
Code lines: 61
Contained by: file galacticus.output.analyses.distribution_operator.disk_size_inclination.F90
Modules used: file_utilities, galacticus_paths, io_hdf5, iso_varying_string, numerical_constants_math, root_finder, table_labels

function: disksizeinclinationconstructorparameters

Description: Constructor for the "diskSizeInclination" output analysis distribution operator operator class which takes a parameter set as input.
Code lines: 10
Contained by: file galacticus.output.analyses.distribution_operator.disk_size_inclination.F90
Modules used: input_parameters

function: disksizeinclinationoperatedistribution

Description: Implement a disk size inclination output analysis distribution operator.
Code lines: 16

Contained by: file galacticus.output.analyses.distribution_operator.disk_size_inclination.F90
Modules used: galacticus_error

function: disksizeinclinationoperatescalar
Description: Implement a disk size inclination output analysis distribution operator.
Code lines: 20
Contained by: file galacticus.output.analyses.distribution_operator.disk_size_inclination.F90

function: disksizeinclntnintegrandphi
Description: Integral for half-light radius.
Code lines: 7
Contained by: file galacticus.output.analyses.distribution_operator.disk_size_inclination.F90

function: disksizeinclntnintegrandx
Description: Integral for half-light radius.
Code lines: 15
Contained by: file galacticus.output.analyses.distribution_operator.disk_size_inclination.F90
Modules used: fgsl numerical_constants_math numerical_integration

function: disksizeinclntnroot
Description: Function used in solving for the half-light radii of inclined disks.
Code lines: 16
Contained by: file galacticus.output.analyses.distribution_operator.disk_size_inclination.F90
Modules used: fgsl numerical_constants_math numerical_integration

interface: outputanalysisdistributionoperatordisksizeinclntn
Description: Constructors for the "diskSizeInclination" output distribution operator class.
Code lines: 4
Contained by: file galacticus.output.analyses.distribution_operator.disk_size_inclination.F90

file: galacticus.output.analyses.distribution_operator.gravitational_lensing.F90
Description: Contains a module which implements a gravitational lensing output analysis distribution operator class.
Code lines: 228
Modules used: gravitational_lensing locks output_times

function: grvtnllnsngconstructorinternal
Description: Internal constructor for the "gravitational lensing" output analysis distribution operator class.
Code lines: 18
Contained by: file galacticus.output.analyses.distribution_operator.gravitational_lensing.F90
Modules used: iso_c_binding

function: grvtnllnsngconstructorparameters
Description: Constructor for the "gravitational lensing" output analysis distribution operator class which takes a parameter set as input.
Code lines: 27

Contained by: file galacticus.output.analyses.distribution_operator.gravitational_lensing.F90
Modules used: input_parameters

subroutine: grvtnllnsngdestructor
Description: Destructor for the "gravitational lensing" output analysis distribution operator class.
Code lines: 8
Contained by: file galacticus.output.analyses.distribution_operator.gravitational_lensing.F90

function: grvtnllnsngoperatedistribution
Description: Implement a gravitational lensing output analysis distribution operator.
Code lines: 90
Contained by: file galacticus.output.analyses.distribution_operator.gravitational_lensing.F90
Modules used: fgsl memory_management numerical_integration output_analyses_options

function: magnificationcdfintegrand
Description: Integrand over the gravitational lensing magnification cumulative distribution.
Code lines: 26
Contained by: function grvtnllnsngoperatedistribution
Modules used: galacticus_error output_analyses_options

function: grvtnllnsngoperatescalar
Description: Implement a gravitational lensing output analysis distribution operator.
Code lines: 16
Contained by: file galacticus.output.analyses.distribution_operator.gravitational_lensing.F90
Modules used: galacticus_error

type: grvtnllnsngtransfermatrix
Code lines: 2
Contained by: file galacticus.output.analyses.distribution_operator.gravitational_lensing.F90

interface: outputanalysisdistributionoperatorgrvtnllnsng
Description: Constructors for the "gravitational lensing" output analysis distribution operator class.
Code lines: 4
Contained by: file galacticus.output.analyses.distribution_operator.gravitational_lensing.F90

file: galacticus.output.analyses.distribution_operator.identity.F90
Description: Contains a module which implements a identity output analysis distribution operator class.
Code lines: 92

function: identityconstructorparameters
Description: Constructor for the "identity" output analysis distribution operator class which takes a parameter set as input.
Code lines: 10
Contained by: file galacticus.output.analyses.distribution_operator.identity.F90
Modules used: input_parameters

function: identityoperatedistribution
Description: Implement a identity output analysis distribution operator.

Code lines: 15
Contained by: file galacticus.output.analyses.distribution_operator.identity.F90
Modules used: galacticus_error

function: identityoperatescalar
Description: Implement a identity output analysis distribution operator.
Code lines: 23
Contained by: file galacticus.output.analyses.distribution_operator.identity.F90
Modules used: arrays_search

interface: outputanalysisdistributionoperatoridentity
Description: Constructors for the "identity" output analysis class.
Code lines: 3
Contained by: file galacticus.output.analyses.distribution_operator.identity.F90

file: galacticus.output.analyses.distribution_operator.random_error.F90
Description: Contains a module which implements a random error output analysis distribution operator class.
Code lines: 92

type: outputanalysisdistributionoperatorrandomerror
Description: A random error output distribution operator class.
Code lines: 16
Contained by: file galacticus.output.analyses.distribution_operator.random_error.F90

function: randomerroroperatedistribution
Description: Implement a random error output analysis distribution operator.
Code lines: 16
Contained by: file galacticus.output.analyses.distribution_operator.random_error.F90
Modules used: galacticus_error

function: randomerroroperatescalar
Description: Implement a random error output analysis distribution operator.
Code lines: 20
Contained by: file galacticus.output.analyses.distribution_operator.random_error.F90

file: galacticus.output.analyses.distribution_operator.random_error.HI_mass_ALFALFA.F90
Description: Contains a module which implements a random error output analysis distribution operator class providing errors in HI mass for the ALFALFA survey.
Code lines: 133
Modules used: output_analysis_molecular_ratios

interface: outputanalysisdistributionoperatorrandomerroralflf
Description: Constructors for the "randomErrorHIALFALFA" output analysis distribution operator class.
Code lines: 4
Contained by: file galacticus.output.analyses.distribution_operator.random_error.HI_mass_ALFALFA.F90

function: randomerrorhialfalfaconstructorinternal
Description: Internal constructor for the "randomErrorHIALFALFA" output analysis distribution operator class.

Code lines: 9
Contained by: file galacticus.output.analyses.distribution_operator.random_error.HI_mass_ALFALFA.F90

function: randomerrorhialfalfaconstructorparameters
Description: Constructor for the "randomErrorHIALFALFA" output analysis distribution operator class which takes a parameter set as input.
Code lines: 43
Contained by: file galacticus.output.analyses.distribution_operator.random_error.HI_mass_ALFALFA.F90
Modules used: input_parameters

subroutine: randomerrorhialfalfadestructor
Description: Destructor for the "randomErrorHIALFALFA" output analysis distribution operator class.
Code lines: 7
Contained by: file galacticus.output.analyses.distribution_operator.random_error.HI_mass_ALFALFA.F90

function: randomerrorhialfalfarootvariance
Description: Computes errors on $\log_{10}$(HI masses) for the ALFALFA survey analysis. Uses a simple fitting function. See constraints/dataAnalysis/hiMassFunction_ALFALFA_z0.00/alfalfaHIMassErrorModel.pl for details.
Code lines: 22
Contained by: file galacticus.output.analyses.distribution_operator.random_error.HI_mass_ALFALFA.F90

file: galacticus.output.analyses.distribution_operator.random_error.N-body_concentration.F90
Description: Contains a module which implements a random error output analysis distribution operator class providing errors in $\log_{10}$ of N-body halo concentration.
Code lines: 135
Modules used: node_property_extractors

interface: outputanalysisdistributionoperatorrndmerrnbdycnc
Description: Constructors for the "randomErrorNbdyCnc" output analysis distribution operator class.
Code lines: 4
Contained by: file galacticus.output.analyses.distribution_operator.random_error.N-body_concentration.F90

function: randomerrornbdycncconstructorinternal
Description: Internal constructor for the "randomErrorNbdyCnc" output analysis distribution operator class.
Code lines: 17
Contained by: file galacticus.output.analyses.distribution_operator.random_error.N-body_concentration.F90
Modules used: galacticus_error

function: randomerrornbdycncconstructorparameters
Description: Constructor for the "randomErrorNbdyCnc" output analysis distribution operator class which takes a parameter set as input.
Code lines: 37
Contained by: file galacticus.output.analyses.distribution_operator.random_error.N-body_concentration.F90
Modules used: input_parameters

subroutine: randomerrornbdycncdestructor
Description: Destructor for the "nbodyConcentration" output analysis distribution operator class.
Code lines: 6

Contained by: file galacticus.output.analyses.distribution_operator.random_error.N-body_concentration.F90

function: randomerrornbdycncrootvariance
Description: Computes errors on $\log_{10}$(halo concentration) for N-body halos.
Code lines: 22
Contained by: file galacticus.output.analyses.distribution_operator.random_error.N-body_concentration.F90

file: galacticus.output.analyses.distribution_operator.random_error.N-body_mass.F90
Description: Contains a module which implements a random error output analysis distribution operator class providing errors in $\log_{10}$ of N-body halo mass.
Code lines: 90
Modules used: statistics_nbody_halo_mass_errors

interface: outputanalysisdistributionoperatorrndmerrnbodymass
Description: Constructors for the "randomErrorNbodyMass" output analysis distribution operator class.
Code lines: 4
Contained by: file galacticus.output.analyses.distribution_operator.random_error.N-body_mass.F90

function: randomerrornbodymassconstructorinternal
Description: Internal constructor for the "randomErrorNbodyMass" output analysis distribution operator class.
Code lines: 8
Contained by: file galacticus.output.analyses.distribution_operator.random_error.N-body_mass.F90

function: randomerrornbodymassconstructorparameters
Description: Constructor for the "randomErrorNbodyMass" output analysis distribution operator class which takes a parameter set as input.
Code lines: 13
Contained by: file galacticus.output.analyses.distribution_operator.random_error.N-body_mass.F90
Modules used: input_parameters

subroutine: randomerrornbodymassdestructor
Description: Destructor for the "randomErrorNbodyMass" output analysis distribution operator class.
Code lines: 7
Contained by: file galacticus.output.analyses.distribution_operator.random_error.N-body_mass.F90

function: randomerrornbodymassrootvariance
Description: Computes errors on $\log_{10}$(halo masses) for N-body halos.
Code lines: 11
Contained by: file galacticus.output.analyses.distribution_operator.random_error.N-body_mass.F90

file: galacticus.output.analyses.distribution_operator.random_error.fixed.F90
Description: Contains a module which implements a random error output analysis distribution operator class.
Code lines: 83

interface: outputanalysisdistributionoperatorrandomerrorfixed
Description: Constructors for the "randomErrorFixed" output analysis distribution operator class.
Code lines: 4
Contained by: file galacticus.output.analyses.distribution_operator.random_error.fixed.F90

function: `randomerrorfixedconstructorinternal`
Description: Internal constructor for the "randomErrorFixed" output analysis distribution operator class.
Code lines: 8
Contained by: file `galacticus.output.analyses.distribution_operator.random_error.fixed.F90`

function: `randomerrorfixedconstructorparameters`
Description: Constructor for the "randomErrorFixed" output analysis distribution operator class which takes a parameter set as input.
Code lines: 21
Contained by: file `galacticus.output.analyses.distribution_operator.random_error.fixed.F90`
Modules used: `input_parameters`

function: `randomerrorfixedrootvariance`
Description: Return the root-variance in the fixed random error distribution operator.
Code lines: 10
Contained by: file `galacticus.output.analyses.distribution_operator.random_error.fixed.F90`

file: `galacticus.output.analyses.distribution_operator.random_error.polynomial.F90`
Description: Contains a module which implements a random error output analysis distribution operator class with an error magnitude that is a polynomial function of the property value.
Code lines: 119

interface: `outputanalysisdistributionoperatorrandomerrorplynml`
Description: Constructors for the "randomErrorPolynomial" output analysis distribution operator class.
Code lines: 4
Contained by: file `galacticus.output.analyses.distribution_operator.random_error.polynomial.F90`

function: `randomerrorpolynomialconstructorinternal`
Description: Internal constructor for the "randomErrorPolynomial" output analysis distribution operator class.
Code lines: 9
Contained by: file `galacticus.output.analyses.distribution_operator.random_error.polynomial.F90`

function: `randomerrorpolynomialconstructorparameters`
Description: Constructor for the "randomErrorPolynomial" output analysis distribution operator class which takes a parameter set as input.
Code lines: 47
Contained by: file `galacticus.output.analyses.distribution_operator.random_error.polynomial.F90`
Modules used: `input_parameters`

function: `randomerrorpolynomialrootvariance`
Description: Rerturn the root-variance in the polynomial random error distribution operator.
Code lines: 15
Contained by: file `galacticus.output.analyses.distribution_operator.random_error.polynomial.F90`

file: `galacticus.output.analyses.distribution_operator.sequence.F90`
Description: Contains a module which implements a sequence output analysis distribution operator class.
Code lines: 210

type: `distributionoperatorlist`
Code lines: 3
Contained by: file `galacticus.output.analyses.distribution_operator.sequence.F90`

interface: `outputanalysisdistributionoperatorsequence`
Description: Constructors for the "sequence" output analysis class.
Code lines: 4
Contained by: file `galacticus.output.analyses.distribution_operator.sequence.F90`

function: `sequenceconstructorinternal`
Description: Internal constructor for the sequence merger tree normalizer class.
Code lines: 14
Contained by: file `galacticus.output.analyses.distribution_operator.sequence.F90`

function: `sequenceconstructorparameters`
Description: Constructor for the "sequence" output analysis distribution operator class which takes a parameter set as input.
Code lines: 22
Contained by: file `galacticus.output.analyses.distribution_operator.sequence.F90`
Modules used: `input_parameters`

subroutine: `sequencedeepcopy`
Description: Perform a deep copy for the `sequence` output analysis distribution operator class.
Code lines: 31
Contained by: file `galacticus.output.analyses.distribution_operator.sequence.F90`
Modules used: `galacticus_error`

subroutine: `sequencedestructor`
Description: Destructor for the sequence distribution operator class.
Code lines: 16
Contained by: file `galacticus.output.analyses.distribution_operator.sequence.F90`

function: `sequenceoperatedistribution`
Description: Implement a random error output analysis distribution operator.
Code lines: 20
Contained by: file `galacticus.output.analyses.distribution_operator.sequence.F90`
Modules used: `galacticus_error`

function: `sequenceoperatescalar`
Description: Implement an sequence output analysis distribution operator.
Code lines: 23
Contained by: file `galacticus.output.analyses.distribution_operator.sequence.F90`

subroutine: `sequenceprepend`
Description: Prepend an operator to the sequence.
Code lines: 12
Contained by: file `galacticus.output.analyses.distribution_operator.sequence.F90`

file: galacticus.output.analyses.distribution_operator.spin_N-body_errors.F90
Description: Contains a module which implements an output analysis distribution operator class to account for errors on N-body measurements of halo spin.
Code lines: 169
Modules used: halo_spin_distributions

interface: outputanalysisdistributionoperatorspinnbodyerrors
Description: Constructors for the "spinNBodyErrors" output analysis distribution operator class.
Code lines: 4
Contained by: file galacticus.output.analyses.distribution_operator.spin_N-body_errors.F90

function: spinnbodyerrorsconstructorinternal
Description: Internal constructor for the "spinNBodyErrors" output analysis distribution operator class.
Code lines: 17
Contained by: file galacticus.output.analyses.distribution_operator.spin_N-body_errors.F90
Modules used: galacticus_error

function: spinnbodyerrorsconstructorparameters
Description: Constructor for the "spinNBodyErrors" output analysis distribution operator class which takes a parameter set as input.
Code lines: 14
Contained by: file galacticus.output.analyses.distribution_operator.spin_N-body_errors.F90
Modules used: input_parameters

subroutine: spinnbodyerrorsdestructor
Description: Destructor for the "spinNBodyErrors" output analysis distribution operator class.
Code lines: 7
Contained by: file galacticus.output.analyses.distribution_operator.spin_N-body_errors.F90

function: spinnbodyerrorsoperatedistribution
Description: Implement an output analysis distribution operator which accounts for errors in N-body measurements of halo spin.
Code lines: 16
Contained by: file galacticus.output.analyses.distribution_operator.spin_N-body_errors.F90
Modules used: galacticus_error

function: spinnbodyerrorsoperatescalar
Description: Implement an output analysis distribution operator which accounts for errors in N-body measurements of halo spin.
Code lines: 62
Contained by: file galacticus.output.analyses.distribution_operator.spin_N-body_errors.F90
Modules used: fgsl galacticus_error numerical_integration output_analyses_options

function: spindistributionintegrate
Description: Integrand function used to find cumulative spin distribution over a bin.
Code lines: 12
Contained by: function spinnbodyerrorsoperatescalar

file: galacticus.output.analyses.galaxy_sizes_SDSS.F90
Description: Contains a module which implements a galaxy size output analysis class for SDSS data.
Code lines: 334
Modules used: cosmology_functions

function: galaxysizessdssconstructorinternal
Description: Internal constructor for the "galaxySizesSDSS" output analysis class.
Code lines: 245
Contained by: file galacticus.output.analyses.galaxy_sizes_SDSS.F90
Modules used: cosmology_parameters, galacticus_error, galacticus_paths, io_hdf5, iso_varying_string, memory_management, numerical_comparison, numerical_constants_astronomical, numerical_constants_prefixes, output_analyses_options, output_analysis_utilities, output_times

function: galaxysizessdssconstructorparameters
Description: Constructor for the "galaxySizesSDSS" output analysis class which takes a parameter set as input.
Code lines: 33
Contained by: file galacticus.output.analyses.galaxy_sizes_SDSS.F90
Modules used: input_parameters

subroutine: galaxysizessdssdestructor
Description: Destructor for the "galaxySizesSDSS" output analysis class.
Code lines: 7
Contained by: file galacticus.output.analyses.galaxy_sizes_SDSS.F90

interface: outputanalysisgalaxysizessdss
Description: Constructors for the "galaxySizesSDSS" output analysis class.
Code lines: 4
Contained by: file galacticus.output.analyses.galaxy_sizes_SDSS.F90

file: galacticus.output.analyses.luminosity_function.F90
Description: Contains a module which implements a luminosity function output analysis class.
Code lines: 334
Modules used: cosmology_functions, geometry_surveys

function: luminosityfunctionconstructorfile
Description: Constructor for the "luminosityFunction" output analysis class which reads bin information from a standard format file.
Code lines: 49
Contained by: file galacticus.output.analyses.luminosity_function.F90
Modules used: io_hdf5

function: luminosityfunctionconstructorinternal
Description: Constructor for the "luminosityFunction" output analysis class which takes a parameter set as input.
Code lines: 94

Contained by: file galacticus.output.analyses.luminosity_function.F90
Modules used: galacticus_error, iso_varying_string, memory_management, numerical_constants_astronomical, output_analyses_options, output_analysis_utilities, string_handling

function: luminosityfunctionconstructorparameters
Description: Constructor for the "luminosityFunction" output analysis class which takes a parameter set as input.
Code lines: 130
Contained by: file galacticus.output.analyses.luminosity_function.F90
Modules used: input_parameters

subroutine: luminosityfunctiondestructor
Description: Destructor for the "luminosityFunction" output analysis class.
Code lines: 8
Contained by: file galacticus.output.analyses.luminosity_function.F90

interface: outputanalysisluminosityfunction
Description: Constructors for the "luminosityFunction" output analysis class.
Code lines: 5
Contained by: file galacticus.output.analyses.luminosity_function.F90

file: galacticus.output.analyses.luminosity_function.Halpha.F90
Description: Contains a module which implements a luminosity function output analysis class.
Code lines: 381
Modules used: cosmology_functions, geometry_surveys, stellar_spectra_dust_attenuations

function: luminosityfunctionhalphaconstructorfile
Description: Constructor for the "luminosityFunctionHalpha" output analysis class which reads bin information from a standard format file.
Code lines: 50
Contained by: file galacticus.output.analyses.luminosity_function.Halpha.F90
Modules used: io_hdf5

function: luminosityfunctionhalphaconstructorinternal
Description: Constructor for the "luminosityFunctionHalpha" output analysis class which takes a parameter set as input.
Code lines: 120
Contained by: file galacticus.output.analyses.luminosity_function.Halpha.F90
Modules used: galacticus_error, iso_varying_string, memory_management, numerical_constants_astronomical, numerical_constants_units, output_analyses_options, output_analysis_utilities, output_times, string_handling

function: luminosityfunctionhalphaconstructorparameters
Description: Constructor for the "luminosityFunctionHalpha" output analysis class which takes a parameter set as input.

Code lines: 147
Contained by: file galacticus.output.analyses.luminosity_function.Halpha.F90
Modules used: input_parameters

subroutine: luminosityfunctionhalphadestructor
Description: Destructor for the "luminosityFunctionHalpha" output analysis class.
Code lines: 9
Contained by: file galacticus.output.analyses.luminosity_function.Halpha.F90

interface: outputanalysisluminosityfunctionhalpha
Description: Constructors for the "luminosityFunctionHalpha" output analysis class.
Code lines: 5
Contained by: file galacticus.output.analyses.luminosity_function.Halpha.F90

file: galacticus.output.analyses.luminosity_function.Halpha.Gunawardhana2013.SDSS.F90
Description: Contains a module which implements a stellar mass function output analysis class.
Code lines: 266
Modules used: gravitational_lensing

function: luminosityfunctiongunawardhana2013sdssconstructorinternal
Description: Constructor for the "luminosityFunctionGunawardhana2013SDSS" output analysis class for internal use.
Code lines: 107
Contained by: file galacticus.output.analyses.luminosity_function.Halpha.Gunawardhana2013.SDSS.F90
Modules used: cosmology_parameters, galacticus_error, galacticus_paths, input_parameters, output_analysis_distribution_operators

function: luminosityfunctiongunawardhana2013sdssconstructorparameters
Description: Constructor for the "luminosityFunctionGunawardhana2013SDSS" output analysis class which takes a parameter set as input.
Code lines: 117
Contained by: file galacticus.output.analyses.luminosity_function.Halpha.Gunawardhana2013.SDSS.F90
Modules used: input_parameters

interface: outputanalysisluminosityfunctiongunawardhana2013sdss
Description: Constructors for the "luminosityFunctionGunawardhana2013SDSS" output analysis class.
Code lines: 4
Contained by: file galacticus.output.analyses.luminosity_function.Halpha.Gunawardhana2013.SDSS.F90

file: galacticus.output.analyses.luminosity_function.Halpha.Sobral2013.HiZELS.F90
Description: Contains a module which implements a stellar mass function output analysis class.
Code lines: 292
Modules used: gravitational_lensing

function: luminosityfunctionsobral2013hizelsconstructorinternal
Description: Constructor for the "luminosityFunctionSobral2013HiZELS" output analysis class for internal use.
Code lines: 125

Contained by: file galacticus.output.analyses.luminosity_function.Halpha.Sobral2013.HiZELS.F90
Modules used: cosmology_parameters, galacticus_error, galacticus_paths, input_parameters, output_analysis_distribution_operators, string_handling

function: luminosityfunctionsobral2013hizelsconstructorparameters
Description: Constructor for the "luminosityFunctionSobral2013HiZELS" output analysis class which takes a parameter set as input.
Code lines: 125
Contained by: file galacticus.output.analyses.luminosity_function.Halpha.Sobral2013.HiZELS.F90
Modules used: input_parameters

interface: outputanalysisluminosityfunctionsobral2013hizels
Description: Constructors for the "luminosityFunctionSobral2013HiZELS" output analysis class.
Code lines: 4
Contained by: file galacticus.output.analyses.luminosity_function.Halpha.Sobral2013.HiZELS.F90

file: galacticus.output.analyses.luminosity_function.Montero-Dorta2009.SDSS.F90
Description: Contains a module which implements a stellar mass function output analysis class.
Code lines: 282
Modules used: gravitational_lensing

function: luminosityfunctionmonterodorta2009sdssconstructorinternal
Description: Constructor for the "luminosityFunctionMonteroDorta2009SDSS" output analysis class for internal use.
Code lines: 122
Contained by: file galacticus.output.analyses.luminosity_function.Montero-Dorta2009.SDSS.F90
Modules used: cosmology_parameters, galacticus_error, galacticus_paths, input_parameters, output_analysis_distribution_operators

function: luminosityfunctionmonterodorta2009sdssconstructorparameters
Description: Constructor for the "luminosityFunctionMonteroDorta2009SDSS" output analysis class which takes a parameter set as input.
Code lines: 117
Contained by: file galacticus.output.analyses.luminosity_function.Montero-Dorta2009.SDSS.F90
Modules used: input_parameters

interface: outputanalysisluminosityfunctionmonterodorta2009sdss
Description: Constructors for the "luminosityFunctionMonteroDorta2009SDSS" output analysis class.
Code lines: 4
Contained by: file galacticus.output.analyses.luminosity_function.Montero-Dorta2009.SDSS.F90

file: galacticus.output.analyses.mass_function_HI.ALFALFA_Martin2010.F90
Description: Contains a module which implements an ALFALFA HI mass function output analysis class.
Code lines: 222
Modules used: gravitational_lensing

function: `massfunctionhialfalfamartin2010constructorinternal`

Description: Constructor for the "massFunctionHIALFALFAMartin2010" output analysis class for internal use.
Code lines: 95
Contained by: file `galacticus.output.analyses.mass_function_HI.ALFALFA_Martin2010.F90`
Modules used: `cosmology_parameters`, `galacticus_paths`, `input_parameters`, `output_analysis_distribution_operators`, `output_analysis_molecular_ratios`

function: `massfunctionhialfalfamartin2010constructorparameters`

Description: Constructor for the "massFunctionHIALFALFAMartin2010" output analysis class which takes a parameter set as input.
Code lines: 85
Contained by: file `galacticus.output.analyses.mass_function_HI.ALFALFA_Martin2010.F90`
Modules used: `cosmology_parameters`, `input_parameters`, `output_analysis_molecular_ratios`

interface: `outputanalysismassfunctionhialfalfamartin2010`

Description: Constructors for the "massFunctionHIALFALFAMartin2010" output analysis class.
Code lines: 4
Contained by: file `galacticus.output.analyses.mass_function_HI.ALFALFA_Martin2010.F90`

file: `galacticus.output.analyses.mass_function_HI.F90`

Description: Contains a module which implements an HI mass function output analysis class.
Code lines: 353
Modules used: `cosmology_functions`, `geometry_surveys`

function: `massfunctionhiconstructorfile`

Description: Constructor for the "massFunctionHI" output analysis class which reads bin information from a standard format file.
Code lines: 42
Contained by: file `galacticus.output.analyses.mass_function_HI.F90`
Modules used: `io_hdf5`, `output_analysis_molecular_ratios`

function: `massfunctionhiconstructorinternal`

Description: Constructor for the "massFunctionHI" output analysis class which takes a parameter set as input.
Code lines: 117
Contained by: file `galacticus.output.analyses.mass_function_HI.F90`
Modules used: `galacticus_error`, `iso_varying_string`, `memory_management`, `numerical_constants_astronomical`, `output_analyses_options`, `output_analysis_molecular_ratios`, `output_analysis_utilities`, `output_times`, `string_handling`

function: `massfunctionhiconstructorparameters`

Description: Constructor for the "massFunctionHI" output analysis class which takes a parameter set as input.
Code lines: 134

Contained by: file galacticus.output.analyses.mass_function_HI.F90
Modules used: input_parameters output_analysis_molecular_ratios

subroutine: massfunctionhidestructor
Description: Destructor for the "massFunctionHI" output analysis class.
Code lines: 8
Contained by: file galacticus.output.analyses.mass_function_HI.F90

interface: outputanalysismassfunctionhi
Description: Constructors for the "massFunctionHI" output analysis class.
Code lines: 5
Contained by: file galacticus.output.analyses.mass_function_HI.F90

file: galacticus.output.analyses.mass_function_stellar.Bernardi_SDSS.F90
Description: Contains a module which implements an output analyis class for the Bernardi et al. [2013] stellar mass function.
Code lines: 253
Modules used: gravitational_lensing

function: massfunctionstellarbernardi2013sdssconstructorinternal
Description: Constructor for the "massFunctionStellarBernardi2013SDSS" output analysis class for internal use.
Code lines: 105
Contained by: file galacticus.output.analyses.mass_function_stellar.Bernardi_SDSS.F90
Modules used: cosmology_parameters galacticus_paths input_parameters output_analysis_distribution_operators

function: massfunctionstellarbernardi2013sdssconstructorparameters
Description: Constructor for the "massFunctionStellarBernardi2013SDSS" output analysis class which takes a parameter set as input.
Code lines: 106
Contained by: file galacticus.output.analyses.mass_function_stellar.Bernardi_SDSS.F90
Modules used: input_parameters

interface: outputanalysismassfunctionstellarbernardi2013sdss
Description: Constructors for the "massFunctionStellarBernardi2013SDSS" output analysis class.
Code lines: 4
Contained by: file galacticus.output.analyses.mass_function_stellar.Bernardi_SDSS.F90

file: galacticus.output.analyses.mass_function_stellar.F90
Description: Contains a module which implements a stellar mass function output analysis class.
Code lines: 339
Modules used: cosmology_functions geometry_surveys

function: massfunctionstellarconstructorfile
Description: Constructor for the "massFunctionStellar" output analysis class which reads bin information from a standard format file.
Code lines: 40
Contained by: file galacticus.output.analyses.mass_function_stellar.F90
Modules used: io_hdf5

function: `massfunctionstellarconstructorinternal`

Description: Constructor for the "massFunctionStellar" output analysis class which takes a parameter set as input.
Code lines: 108
Contained by: file `galacticus.output.analyses.mass_function_stellar.F90`
Modules used: `galacticus_error` `iso_varying_string` `memory_management` `numerical_constants_astronomical` `output_analyses_options` `output_analysis_utilities` `string_handling`

function: `massfunctionstellarconstructorparameters`

Description: Constructor for the "massFunctionStellar" output analysis class which takes a parameter set as input.
Code lines: 131
Contained by: file `galacticus.output.analyses.mass_function_stellar.F90`
Modules used: `galacticus_error` `input_parameters`

subroutine: `massfunctionstellardestructor`

Description: Destructor for the "massFunctionStellar" output analysis class.
Code lines: 8
Contained by: file `galacticus.output.analyses.mass_function_stellar.F90`

interface: `outputanalysismassfunctionstellar`

Description: Constructors for the "massFunctionStellar" output analysis class.
Code lines: 5
Contained by: file `galacticus.output.analyses.mass_function_stellar.F90`

file: `galacticus.output.analyses.mass_function_stellar.GAMA.F90`

Description: Contains a module which implements an output analysis class for the Baldry et al. [2012] stellar mass function.
Code lines: 253
Modules used: `gravitational_lensing`

function: `massfunctionstellarbaldry2012gamaconstructorinternal`

Description: Constructor for the "massFunctionStellarBaldry2012GAMA" output analysis class for internal use.
Code lines: 105
Contained by: file `galacticus.output.analyses.mass_function_stellar.GAMA.F90`
Modules used: `cosmology_parameters` `galacticus_paths` `input_parameters` `output_analysis_distribution_operators`

function: `massfunctionstellarbaldry2012gamaconstructorparameters`

Description: Constructor for the "massFunctionStellarBaldry2012GAMA" output analysis class which takes a parameter set as input.
Code lines: 106
Contained by: file `galacticus.output.analyses.mass_function_stellar.GAMA.F90`
Modules used: `input_parameters`

interface: `outputanalysismassfunctionstellarbaldry2012gama`
Description: Constructors for the "massFunctionStellarBaldry2012GAMA" output analysis class.
Code lines: 4
Contained by: file `galacticus.output.analyses.mass_function_stellar.GAMA.F90`

file: `galacticus.output.analyses.mass_function_stellar.PRIMUS.F90`
Description: Contains a module which implements a stellar mass function output analysis class for the PRIMUS survey of Moustakas et al. [2013].
Code lines: 290
Modules used: `gravitational_lensing`

function: `massfunctionstellarprimusconstructorinternal`
Description: Constructor for the "massFunctionStellarPRIMUS" output analysis class for internal use.
Code lines: 134
Contained by: file `galacticus.output.analyses.mass_function_stellar.PRIMUS.F90`
Modules used: `cosmology_parameters`, `galacticus_error`, `galacticus_paths`, `input_parameters`, `iso_varying_string`, `output_analysis_distribution_operators`, `string_handling`

function: `massfunctionstellarprimusconstructorparameters`
Description: Constructor for the "massFunctionStellarPRIMUS" output analysis class which takes a parameter set as input.
Code lines: 114
Contained by: file `galacticus.output.analyses.mass_function_stellar.PRIMUS.F90`
Modules used: `input_parameters`

interface: `outputanalysismassfunctionstellarprimus`
Description: Constructors for the "massFunctionStellarPRIMUS" output analysis class.
Code lines: 4
Contained by: file `galacticus.output.analyses.mass_function_stellar.PRIMUS.F90`

file: `galacticus.output.analyses.mass_function_stellar.SDSS.F90`
Description: Contains a module which implements a stellar mass function output analysis class.
Code lines: 253
Modules used: `gravitational_lensing`

function: `massfunctionstellarsdssconstructorinternal`
Description: Constructor for the "massFunctionStellarSDSS" output analysis class for internal use.
Code lines: 105
Contained by: file `galacticus.output.analyses.mass_function_stellar.SDSS.F90`
Modules used: `cosmology_parameters`, `galacticus_paths`, `input_parameters`, `output_analysis_distribution_operators`

function: `massfunctionstellarsdssconstructorparameters`
Description: Constructor for the "massFunctionStellarSDSS" output analysis class which takes a parameter set as input.

Code lines: 106
Contained by: file galacticus.output.analyses.mass_function_stellar.SDSS.F90
Modules used: input_parameters

interface: outputanalysismassfunctionstellarsdss
Description: Constructors for the "massFunctionStellarSDSS" output analysis class.
Code lines: 4
Contained by: file galacticus.output.analyses.mass_function_stellar.SDSS.F90

file: galacticus.output.analyses.mass_function_stellar.UKIDSS_UDS.F90
Description: Contains a module which implements a stellar mass function output analysis class for the UKIDSS UDS survey of Caputi et al. [2011].
Code lines: 281
Modules used: gravitational_lensing

function: massfunctionstellarukidssudsconstructorinternal
Description: Constructor for the "massFunctionStellarUKIDSSUDS" output analysis class for internal use.
Code lines: 125
Contained by: file galacticus.output.analyses.mass_function_stellar.UKIDSS_UDS.F90
Modules used: cosmology_parameters, galacticus_error, galacticus_paths, input_parameters, iso_varying_string, output_analysis_distribution_operators, string_handling

function: massfunctionstellarukidssudsconstructorparameters
Description: Constructor for the "massFunctionStellarUKIDSSUDS" output analysis class which takes a parameter set as input.
Code lines: 114
Contained by: file galacticus.output.analyses.mass_function_stellar.UKIDSS_UDS.F90
Modules used: input_parameters

interface: outputanalysismassfunctionstellarukidssuds
Description: Constructors for the "massFunctionStellarUKIDSSUDS" output analysis class.
Code lines: 4
Contained by: file galacticus.output.analyses.mass_function_stellar.UKIDSS_UDS.F90

file: galacticus.output.analyses.mass_function_stellar.ULTRAVISTA.F90
Description: Contains a module which implements a stellar mass function output analysis class for the ULTRAVISTA survey of Muzzin et al. [2013].
Code lines: 293
Modules used: gravitational_lensing

function: massfunctionstellarultravistaconstructorinternal
Description: Constructor for the "massFunctionStellarULTRAVISTA" output analysis class for internal use.
Code lines: 137
Contained by: file galacticus.output.analyses.mass_function_stellar.ULTRAVISTA.F90
Modules used: cosmology_parameters, galacticus_error

galacticus_paths
iso_varying_string
string_handling
input_parameters
output_analysis_distribution_operators

function: massfunctionstellarultravistaconstructorparameters
Description: Constructor for the "massFunctionStellarULTRAVISTA" output analysis class which takes a parameter set as input.
Code lines: 114
Contained by: file galacticus.output.analyses.mass_function_stellar.ULTRAVISTA.F90
Modules used: input_parameters

interface: outputanalysismassfunctionstellarultravista
Description: Constructors for the "massFunctionStellarULTRAVISTA" output analysis class.
Code lines: 4
Contained by: file galacticus.output.analyses.mass_function_stellar.ULTRAVISTA.F90

file: galacticus.output.analyses.mass_function_stellar.VIPERS.F90
Description: Contains a module which implements a stellar mass function output analysis class for the VIPERS survey of Davidzon et al. [2013].
Code lines: 281
Modules used: gravitational_lensing

function: massfunctionstellarvipersconstructorinternal
Description: Constructor for the "massFunctionStellarVIPERS" output analysis class for internal use.
Code lines: 125
Contained by: file galacticus.output.analyses.mass_function_stellar.VIPERS.F90
Modules used: cosmology_parameters, galacticus_error, galacticus_paths, input_parameters, iso_varying_string, output_analysis_distribution_operators, string_handling

function: massfunctionstellarvipersconstructorparameters
Description: Constructor for the "massFunctionStellarVIPERS" output analysis class which takes a parameter set as input.
Code lines: 114
Contained by: file galacticus.output.analyses.mass_function_stellar.VIPERS.F90
Modules used: input_parameters

interface: outputanalysismassfunctionstellarvipers
Description: Constructors for the "massFunctionStellarVIPERS" output analysis class.
Code lines: 4
Contained by: file galacticus.output.analyses.mass_function_stellar.VIPERS.F90

file: galacticus.output.analyses.mass_function_stellar.ZFOURGE.F90
Description: Contains a module which implements a stellar mass function output analysis class for the ZFOURGE survey of Tomczak et al. [2014].
Code lines: 296
Modules used: gravitational_lensing

function: massfunctionstellarzfourgeconstructorinternal
Description: Constructor for the "massFunctionStellarZFOURGE" output analysis class for internal use.
Code lines: 140
Contained by: file galacticus.output.analyses.mass_function_stellar.ZFOURGE.F90
Modules used: cosmology_parameters, galacticus_error, galacticus_paths, input_parameters, iso_varying_string, output_analysis_distribution_operators, string_handling

function: massfunctionstellarzfourgeconstructorparameters
Description: Constructor for the "massFunctionStellarZFOURGE" output analysis class which takes a parameter set as input.
Code lines: 114
Contained by: file galacticus.output.analyses.mass_function_stellar.ZFOURGE.F90
Modules used: input_parameters

interface: outputanalysismassfunctionstellarzfourge
Description: Constructors for the "massFunctionStellarZFOURGE" output analysis class.
Code lines: 4
Contained by: file galacticus.output.analyses.mass_function_stellar.ZFOURGE.F90

file: galacticus.output.analyses.mass_metallicity_relation.Andrews2013.F90
Description: Contains a module which implements a mass-metallicity relation analysis class.
Code lines: 319

function: massmetallicityandrews2013constructorinternal
Description: Constructor for the "massMetallicityAndrews2013" output analysis class for internal use.
Code lines: 208
Contained by: file galacticus.output.analyses.mass_metallicity_relation.Andrews2013.F90
Modules used: abundances_structure, atomic_data, cosmology_functions, cosmology_parameters, galacticus_error, galacticus_paths, io_hdf5, memory_management, node_property_extractors, numerical_constants_astronomical, output_analysis_distribution_operators, output_analysis_property_operators, output_analysis_utilities, output_analysis_weight_operators, output_times

function: massmetallicityandrews2013constructorparameters
Description: Constructor for the "massMetallicityAndrews2013" output analysis class which takes a parameter set as input.
Code lines: 70
Contained by: file galacticus.output.analyses.mass_metallicity_relation.Andrews2013.F90
Modules used: cosmology_functions, input_parameters

interface: outputanalysismassmetallicityandrews2013

Description: Constructors for the "massMetallicityAndrews2013" output analysis class.
Code lines: 4
Contained by: file galacticus.output.analyses.mass_metallicity_relation.Andrews2013.F90

file: galacticus.output.analyses.mass_metallicity_relation.Blanc2017.F90
Description: Contains a module which implements a mass-metallicity relation analysis class.
Code lines: 323

function: massmetallicityblanc2017constructorinternal
Description: Constructor for the "massMetallicityBlanc2017" output analysis class for internal use.
Code lines: 212
Contained by: file galacticus.output.analyses.mass_metallicity_relation.Blanc2017.F90
Modules used: abundances_structure, atomic_data, cosmology_functions, cosmology_parameters, galacticus_error, galacticus_paths, io_hdf5, memory_management, node_property_extractors, numerical_constants_astronomical, output_analysis_distribution_operators, output_analysis_property_operators, output_analysis_utilities, output_analysis_weight_operators, output_times

function: massmetallicityblanc2017constructorparameters
Description: Constructor for the "massMetallicityBlanc2017" output analysis class which takes a parameter set as input.
Code lines: 70
Contained by: file galacticus.output.analyses.mass_metallicity_relation.Blanc2017.F90
Modules used: cosmology_functions, input_parameters

interface: outputanalysismassmetallicityblanc2017
Description: Constructors for the "massMetallicityBlanc2017" output analysis class.
Code lines: 4
Contained by: file galacticus.output.analyses.mass_metallicity_relation.Blanc2017.F90

file: galacticus.output.analyses.mean_function_1d.F90
Description: Contains a module which implements a generic 1D mean function (i.e. mean value of some property weighted by number density of objects binned by some property) output analysis class.
Code lines: 812
Modules used: galactic_filters, iso_c_binding, iso_varying_string, node_property_extractors, output_analyses_options, output_analysis_distribution_normalizers, output_analysis_distribution_operators, output_analysis_property_operators, output_analysis_weight_operators, output_times

subroutine: meanfunction1danalyze
Description: Implement a meanFunction1D output analysis.

Code lines: 12
Contained by: file galacticus.output.analyses.mean_function_1d.F90

function: meanfunction1dconstructorinternal
Description: Constructor for the "meanFunction1D" output analysis class for internal use.
Code lines: 226
Contained by: file galacticus.output.analyses.mean_function_1d.F90
Modules used: memory_management

function: meanfunction1dconstructorparameters
Description: Constructor for the "meanFunction1D" output analysis class which takes a parameter set as input.
Code lines: 300
Contained by: file galacticus.output.analyses.mean_function_1d.F90
Modules used: galacticus_error input_parameters memory_management

subroutine: meanfunction1ddestructor
Description: Destructor for the meanFunction1D output analysis class.
Code lines: 9
Contained by: file galacticus.output.analyses.mean_function_1d.F90

subroutine: meanfunction1dfinalize
Description: Implement a meanFunction1D output analysis finalization.
Code lines: 56
Contained by: file galacticus.output.analyses.mean_function_1d.F90
Modules used: galacticus_hdf5 io_hdf5

subroutine: meanfunction1dfinalizeanalysis
Description: Finalize analysis of a meanFunction1D output analysis.
Code lines: 34
Contained by: file galacticus.output.analyses.mean_function_1d.F90

function: meanfunction1dloglikelihood
Description: Return the log-likelihood of a meanFunction1D output analysis.
Code lines: 32
Contained by: file galacticus.output.analyses.mean_function_1d.F90
Modules used: galacticus_error linear_algebra numerical_constants_math

subroutine: meanfunction1dreduce
Description: Implement a volumeFunction1D output analysis reduction.
Code lines: 16
Contained by: file galacticus.output.analyses.mean_function_1d.F90
Modules used: galacticus_error

subroutine: meanfunction1dresults
Description: Implement a meanFunction1D output analysis finalization.
Code lines: 27

Contained by: file galacticus.output.analyses.mean_function_1d.F90
Modules used: memory_management

interface: outputanalysismeanfunction1d
Description: Constructors for the "meanFunction1D" output analysis class.
Code lines: 4
Contained by: file galacticus.output.analyses.mean_function_1d.F90

file: galacticus.output.analyses.molecular_ratio.F90
Description: Contains a module which provides a class that implements on-the-fly analyses.
Code lines: 49

module: output_analysis_molecular_ratios
Description: Provides a class that implements operators on properties for on-the-fly analyses.
Code lines: 27
Contained by: file galacticus.output.analyses.molecular_ratio.F90
Modules used: galacticus_nodes, iso_c_binding
Used by: subroutine galacticus_function_classes_destroy; function hivshalomassrelationpadmanabhan2017constructorin; function hivshalomassrelationpadmanabhan2017constructorpa; file galacticus.output.analyses.distribution_operator.random_error.HI_mass_ALFALFA.F90; function massfunctionhialfalfamartin2010constructorfile; function massfunctionhialfalfamartin2010constructorinternal; function massfunctionhialfalfamartin2010constructorparame; function massfunctionhiconstructorfile; function massfunctionhiconstructorinternal; function massfunctionhiconstructorparameters; file galacticus.output.analyses.property_operator.HI_mass.F90; subroutine galacticus_state_retrieve; subroutine galacticus_state_store

file: galacticus.output.analyses.molecular_ratio.Obreschkow2009.F90
Description: Contains a module which implements a molecular ratio class that assumes the model of Obreschkow et al. [2009].
Code lines: 181

function: obreschkow2009constructorinternal
Description: Internal constructor for the "obreschkow2009" output analysis distribution operator class.
Code lines: 9
Contained by: file galacticus.output.analyses.molecular_ratio.Obreschkow2009.F90
Modules used: input_parameters

function: obreschkow2009constructorparameters
Description: Constructor for the "obreschkow2009" output analysis property operator class which takes a parameter set as input.
Code lines: 86
Contained by: file galacticus.output.analyses.molecular_ratio.Obreschkow2009.F90
Modules used: input_parameters

function: `obreschkow2009ratio`
Description: Compute the molecular fraction in the `obreschkow2009` class.
Code lines: 28
Contained by: file `galacticus.output.analyses.molecular_ratio.Obreschkow2009.F90`
Modules used: `galacticus_nodes` `iso_c_binding` `numerical_constants_astronomical`

function: `obreschkow2009ratioscatter`
Description: Compute the scatter in molecular fraction in the `obreschkow2009` class.
Code lines: 10
Contained by: file `galacticus.output.analyses.molecular_ratio.Obreschkow2009.F90`

interface: `outputanalysismolecularratioobreschkow2009`
Description: Constructors for the "obreschkow2009" output analysis class.
Code lines: 4
Contained by: file `galacticus.output.analyses.molecular_ratio.Obreschkow2009.F90`

file: `galacticus.output.analyses.morphological_fraction.GAMA_Moffett2016.F90`
Description: Contains a module which implements a stellar vs halo mass relation analysis class.
Code lines: 430

function: `morphologicalfractiongamamoffett2016constructorinternal`
Description: Constructor for the "morphologicalFractionGAMAMoffett2016" output analysis class for internal use.
Code lines: 211
Contained by: file `galacticus.output.analyses.morphological_fraction.GAMA_Moffett2016.F90`
Modules used: `cosmology_functions` `cosmology_parameters` `galacticus_paths` `io_hdf5` `memory_management` `node_property_extractors` `numerical_constants_astronomical` `output_analysis_distribution_operators` `output_analysis_property_operators` `output_analysis_utilities` `output_analysis_weight_operators` `output_times` `statistics_distributions`

function: `morphologicalfractiongamamoffett2016constructorparameters`
Description: Constructor for the "morphologicalFractionGAMAMoffett2016" output analysis class which takes a parameter set as input.
Code lines: 76
Contained by: file `galacticus.output.analyses.morphological_fraction.GAMA_Moffett2016.F90`
Modules used: `cosmology_functions` `input_parameters`

subroutine: `morphologicalfractiongamamoffett2016finalize`
Description: Implement a `morphologicalFractionGAMAMoffett2016` output analysis finalization.
Code lines: 59
Contained by: file `galacticus.output.analyses.morphological_fraction.GAMA_Moffett2016.F90`
Modules used: `galacticus_hdf5` `io_hdf5`

function: `morphologicalfractiongamamoffett2016loglikelihood`
Description: Return the log-likelihood of a morphologicalFractionGAMAMoffett2016 output analysis.
Code lines: 35
Contained by: file galacticus.output.analyses.morphological_fraction.GAMA_Moffett2016.F90
Modules used: models_likelihoods_constants

interface: `outputanalysismorphologicalfractiongamamoffett2016`
Description: Constructors for the "morphologicalFractionGAMAMoffett2016" output analysis class.
Code lines: 4
Contained by: file galacticus.output.analyses.morphological_fraction.GAMA_Moffett2016.F90

file: `galacticus.output.analyses.multi.F90`
Description: Implements a merger trees analysis class which combines multiple other analyses.
Code lines: 208

type: `multianalysislist`
Code lines: 3
Contained by: file galacticus.output.analyses.multi.F90

subroutine: `multianalyze`
Description: Output from all analyses.
Code lines: 14
Contained by: file galacticus.output.analyses.multi.F90

function: `multiconstructorinternal`
Description: Internal constructor for the `multi` analysis class.
Code lines: 14
Contained by: file galacticus.output.analyses.multi.F90

function: `multiconstructorparameters`
Description: Constructor for the `multi` merger tree analysis class which takes a parameter set as input.
Code lines: 22
Contained by: file galacticus.output.analyses.multi.F90
Modules used: input_parameters

subroutine: `multideepcopy`
Description: Perform a deep copy for the `multi` analysis class.
Code lines: 31
Contained by: file galacticus.output.analyses.multi.F90
Modules used: galacticus_error

subroutine: `multidestructor`
Description: Destructor for the `multi` analysis class.
Code lines: 16
Contained by: file galacticus.output.analyses.multi.F90

subroutine: `multifinalize`
Description: Finalize all analyses.

Code lines: 12
Contained by: file galacticus.output.analyses.multi.F90

function: multiloglikelihood
Description: Find the log-likelihood over all analyses. This asumes that the analyses are independent.
Code lines: 13
Contained by: file galacticus.output.analyses.multi.F90

subroutine: multireduce
Description: Reduce over the analysis.
Code lines: 21
Contained by: file galacticus.output.analyses.multi.F90
Modules used: galacticus_error

interface: outputanalysismulti
Description: Constructors for the multi merger tree analysis.
Code lines: 4
Contained by: file galacticus.output.analyses.multi.F90

file: galacticus.output.analyses.null.F90
Description: Contains a module which implements a null output analysis class.
Code lines: 92

subroutine: nullanalyze
Description: Implement a null output analysis.
Code lines: 9
Contained by: file galacticus.output.analyses.null.F90

function: nullconstructorparameters
Description: Constructor for the "null" output analysis class which takes a parameter set as input.
Code lines: 10
Contained by: file galacticus.output.analyses.null.F90
Modules used: input_parameters

subroutine: nullfinalize
Description: Implement a null output analysis finalization.
Code lines: 7
Contained by: file galacticus.output.analyses.null.F90

function: nullloglikelihood
Description: Return the log-likelihood of a null output analysis.
Code lines: 8
Contained by: file galacticus.output.analyses.null.F90

subroutine: nullreduce
Description: Implement a null output analysis reduction.
Code lines: 8
Contained by: file galacticus.output.analyses.null.F90

interface: `outputanalysisnull`
Description: Constructors for the "null" output analysis class.
Code lines: 3
Contained by: file galacticus.output.analyses.null.F90

file: `galacticus.output.analyses.options.F90`
Description: Contains a module which provides options and enuemrations for on-the-fly analyses.
Code lines: 51

module: `output_analyses_options`
Description: Provides options and enuemrations for on-the-fly analyses.
Code lines: 29
Contained by: file galacticus.output.analyses.options.F90

file: galacticus.output.analyses.property_operator.HI_mass.F90
Description: Contains a module which implements a conversion of ISM mass to HI mass analysis property operator class.
Code lines: 97
Modules used: output_analysis_molecular_ratios

function: himassconstructorinternal
Description: Internal constructor for the "hiMass" output analysis distribution operator class.
Code lines: 9
Contained by: file galacticus.output.analyses.property_operator.HI_mass.F90
Modules used: input_parameters

function: himassconstructorparameters
Description: Constructor for the "hiMass" output analysis property operator class which takes a parameter set as input.
Code lines: 14
Contained by: file galacticus.output.analyses.property_operator.HI_mass.F90
Modules used: input_parameters

subroutine: himassdestructor
Description: Destructor for the "hiMass" output analysis distribution operator class.
Code lines: 8
Contained by: file galacticus.output.analyses.property_operator.HI_mass.F90
Modules used: input_parameters

function: himassoperate
Description: Implement an hiMass output analysis property operator.
Code lines: 16
Contained by: file galacticus.output.analyses.property_operator.HI_mass.F90
Modules used: galacticus_error iso_c_binding numerical_constants_astronomical

interface: outputanalysispropertyoperatorhimass
Description: Constructors for the "hiMass" output analysis class.
Code lines: 4
Contained by: file galacticus.output.analyses.property_operator.HI_mass.F90

file: galacticus.output.analyses.property_operator.antiLog10.F90
Description: Contains a module which implements an anti-$\log_{10}()$ output analysis property operator class.
Code lines: 73

function: antilog10constructorparameters
Description: Constructor for the "antiLog10" output analysis property operator class which takes a parameter set as input.
Code lines: 10
Contained by: file galacticus.output.analyses.property_operator.antiLog10.F90
Modules used: input_parameters

function: `antilog10operate`
Description: Implement an antiLog10 output analysis property operator.
Code lines: 22
Contained by: file galacticus.output.analyses.property_operator.antiLog10.F90
Modules used: iso_c_binding output_analyses_options

interface: `outputanalysispropertyoperatorantilog10`
Description: Constructors for the "antiLog10" output analysis class.
Code lines: 3
Contained by: file galacticus.output.analyses.property_operator.antiLog10.F90

file: `galacticus.output.analyses.property_operator.boolean.F90`
Description: Contains a module which implements a boolean analysis property operator class.
Code lines: 68

function: `booleanconstructorparameters`
Description: Constructor for the "boolean" output analysis property operator class which takes a parameter set as input.
Code lines: 10
Contained by: file galacticus.output.analyses.property_operator.boolean.F90
Modules used: input_parameters

function: `booleanoperate`
Description: Implement an boolean output analysis property operator.
Code lines: 17
Contained by: file galacticus.output.analyses.property_operator.boolean.F90
Modules used: iso_c_binding

interface: `outputanalysispropertyoperatorboolean`
Description: Constructors for the "boolean" output analysis class.
Code lines: 3
Contained by: file galacticus.output.analyses.property_operator.boolean.F90

file: `galacticus.output.analyses.property_operator.cosmology.angular_distance.F90`
Description: Contains a module which implements a cosmological angular distance corrector analysis property operator class.
Code lines: 140
Modules used: cosmology_functions iso_c_binding output_times

function: `csmlgyangulardistanceconstructorinternal`
Description: Internal constructor for the "randomErrorPolynomial" output analysis property operator class.
Code lines: 37
Contained by: file galacticus.output.analyses.property_operator.cosmology.angular_distance.F90
Modules used: galacticus_error iso_c_binding memory_management

function: csmlgyangulardistanceconstructorparameters
Description: Constructor for the "csmlgyAngularDistance" output analysis property operator class which takes a parameter set as input.
Code lines: 22
Contained by: file galacticus.output.analyses.property_operator.cosmology.angular_distance.F90
Modules used: input_parameters

subroutine: csmlgyangulardistancedestructor
Description: Destructor for the "csmlgyAnglrDstnc" output analysis property operator class.
Code lines: 11
Contained by: file galacticus.output.analyses.property_operator.cosmology.angular_distance.F90
Modules used: memory_management

function: csmlgyangulardistanceoperate
Description: Implement an csmlgyAngularDistance output analysis property operator.
Code lines: 16
Contained by: file galacticus.output.analyses.property_operator.cosmology.angular_distance.F90
Modules used: galacticus_error

interface: outputanalysispropertyoperatorcsmlgyanglrdstnc
Description: Constructors for the "csmlgyAngularDistance" output analysis class.
Code lines: 4
Contained by: file galacticus.output.analyses.property_operator.cosmology.angular_distance.F90

file: galacticus.output.analyses.property_operator.cosmology.luminosity_distance.F90
Description: Contains a module which implements a cosmological luminosity distance corrector analysis property operator class.
Code lines: 150
Modules used: cosmology_functions iso_c_binding output_times

function: csmlgyluminositydistanceconstructorinternal
Description: Internal constructor for the "randomErrorPolynomial" output analysis property operator class.
Code lines: 38
Contained by: file galacticus.output.analyses.property_operator.cosmology.luminosity_distance.F90
Modules used: galacticus_error iso_c_binding memory_management

function: csmlgyluminositydistanceconstructorparameters
Description: Constructor for the "csmlgyLuminosityDistance" output analysis property operator class which takes a parameter set as input.
Code lines: 22
Contained by: file galacticus.output.analyses.property_operator.cosmology.luminosity_distance.F90
Modules used: input_parameters

subroutine: csmlgyluminositydistancedestructor
Description: Destructorfor the "randomErrorPolynomial" output analysis property operator class.

Code lines: 11
Contained by: file galacticus.output.analyses.property_operator.cosmology.luminosity_distance.F90
Modules used: memory_management

function: csmlgyluminositydistanceoperate
Description: Implement an csmlgyLuminosityDistance output analysis property operator.
Code lines: 25
Contained by: file galacticus.output.analyses.property_operator.cosmology.luminosity_distance.F90
Modules used: galacticus_error output_analyses_options

interface: outputanalysispropertyoperatorcsmlgylmnstydstnc
Description: Constructors for the "csmlgyLuminosityDistance" output analysis class.
Code lines: 4
Contained by: file galacticus.output.analyses.property_operator.cosmology.luminosity_distance.F90

file: galacticus.output.analyses.property_operator.filter.high_pass.F90
Description: Contains a module which implements a high-pass filter analysis property operator class.
Code lines: 91

function: filterhighpassconstructorinternal
Description: Internal constructor for the "filterHighPass" output analysis distribution operator class.
Code lines: 9
Contained by: file galacticus.output.analyses.property_operator.filter.high_pass.F90
Modules used: input_parameters

function: filterhighpassconstructorparameters
Description: Constructor for the "filterHighPass" output analysis property operator class which takes a parameter set as input.
Code lines: 20
Contained by: file galacticus.output.analyses.property_operator.filter.high_pass.F90
Modules used: input_parameters

function: filterhighpassoperate
Description: Implement an filterHighPass output analysis property operator.
Code lines: 17
Contained by: file galacticus.output.analyses.property_operator.filter.high_pass.F90
Modules used: iso_c_binding

interface: outputanalysispropertyoperatorfilterhighpass
Description: Constructors for the "filterHighPass" output analysis class.
Code lines: 4
Contained by: file galacticus.output.analyses.property_operator.filter.high_pass.F90

file: galacticus.output.analyses.property_operator.identity.F90
Description: Contains a module which implements an identity output analysis property operator class.
Code lines: 64

function: identityconstructorparameters
Description: Constructor for the "identity" output analysis property operateor class which takes a parameter set as input.

Code lines: 10
Contained by: file galacticus.output.analyses.property_operator.identity.F90
Modules used: input_parameters

function: identityoperate
Description: Implement an identity output analysis property operator.
Code lines: 13
Contained by: file galacticus.output.analyses.property_operator.identity.F90
Modules used: iso_c_binding

interface: outputanalysispropertyoperatoridentity
Description: Constructors for the "identity" output analysis class.
Code lines: 3
Contained by: file galacticus.output.analyses.property_operator.identity.F90

file: galacticus.output.analyses.property_operator.log10.F90
Description: Contains a module which implements an log10 output analysis property operator class.
Code lines: 77

function: log10constructorparameters
Description: Constructor for the "log10" output analysis property operator class which takes a parameter set as input.
Code lines: 10
Contained by: file galacticus.output.analyses.property_operator.log10.F90
Modules used: input_parameters

function: log10operate
Description: Implement an log10 output analysis property operator.
Code lines: 26
Contained by: file galacticus.output.analyses.property_operator.log10.F90
Modules used: iso_c_binding output_analyses_options

interface: outputanalysispropertyoperatorlog10
Description: Constructors for the "log10" output analysis class.
Code lines: 3
Contained by: file galacticus.output.analyses.property_operator.log10.F90

file: galacticus.output.analyses.property_operator.magnitude.F90
Description: Contains a module which implements an output analysis property operator class which converts luminosity to absolute magnitude.
Code lines: 77

function: magnitudeconstructorparameters
Description: Constructor for the "magnitude" output analysis property operator class which takes a parameter set as input.
Code lines: 10
Contained by: file galacticus.output.analyses.property_operator.magnitude.F90
Modules used: input_parameters

function: magnitudeoperate

Description: Implement an magnitude output analysis property operator.
Code lines: 26
Contained by: file galacticus.output.analyses.property_operator.magnitude.F90
Modules used: iso_c_binding output_analyses_options

interface: outputanalysispropertyoperatormagnitude
Description: Constructors for the "magnitude" output analysis class.
Code lines: 3
Contained by: file galacticus.output.analyses.property_operator.magnitude.F90

file: galacticus.output.analyses.property_operator.metallicity.F90
Description: Contains a module which implements a property operator class which converts a metallicity, assumed to be a mass ratio of a given element to hydrogen, to $12 + \log_{10}(\mathrm{N/H})$ form.
Code lines: 95

function: metallicity12lognhconstructorinternal
Description: Internal constructor for the "metallicity12LogNH" output analysis distribution operator class.
Code lines: 8
Contained by: file galacticus.output.analyses.property_operator.metallicity.F90

function: metallicity12lognhconstructorparameters
Description: Constructor for the "metallicity12LogNH" output analysis property operator class which takes a parameter set as input.
Code lines: 20
Contained by: file galacticus.output.analyses.property_operator.metallicity.F90
Modules used: abundances_structure input_parameters

function: metallicity12lognhoperate
Description: Implement an metallicity output analysis property operator.
Code lines: 20
Contained by: file galacticus.output.analyses.property_operator.metallicity.F90
Modules used: iso_c_binding numerical_constants_atomic

interface: outputanalysispropertyoperatormetallicity12lognh
Description: Constructors for the "metallicity" output analysis class.
Code lines: 4
Contained by: file galacticus.output.analyses.property_operator.metallicity.F90

file: galacticus.output.analyses.property_operator.minmax.F90
Description: Contains a module which implements a min-max analysis property operator class.
Code lines: 93

function: minmaxconstructorinternal
Description: Internal constructor for the "minMax" output analysis distribution operator class.
Code lines: 9
Contained by: file galacticus.output.analyses.property_operator.minmax.F90
Modules used: input_parameters

function: `minmaxconstructorparameters`
Description: Constructor for the "minMax" output analysis property operator class which takes a parameter set as input.
Code lines: 26
Contained by: file `galacticus.output.analyses.property_operator.minmax.F90`
Modules used: `input_parameters`

function: `minmaxoperate`
Description: Implement an minMax output analysis property operator.
Code lines: 13
Contained by: file `galacticus.output.analyses.property_operator.minmax.F90`
Modules used: `iso_c_binding`

interface: `outputanalysispropertyoperatorminmax`
Description: Constructors for the "minMax" output analysis class.
Code lines: 4
Contained by: file `galacticus.output.analyses.property_operator.minmax.F90`

file: `galacticus.output.analyses.property_operator.multiply.F90`
Description: Contains a module which implements a multiplication analysis property operator class.
Code lines: 87

function: `multiplyconstructorinternal`
Description: Internal constructor for the "multiply" output analysis distribution operator class.
Code lines: 9
Contained by: file `galacticus.output.analyses.property_operator.multiply.F90`
Modules used: `input_parameters`

function: `multiplyconstructorparameters`
Description: Constructor for the "multiply" output analysis property operator class which takes a parameter set as input.
Code lines: 20
Contained by: file `galacticus.output.analyses.property_operator.multiply.F90`
Modules used: `input_parameters`

function: `multiplyoperate`
Description: Implement an multiply output analysis property operator.
Code lines: 13
Contained by: file `galacticus.output.analyses.property_operator.multiply.F90`
Modules used: `iso_c_binding`

interface: `outputanalysispropertyoperatormultiply`
Description: Constructors for the "multiply" output analysis class.
Code lines: 4
Contained by: file `galacticus.output.analyses.property_operator.multiply.F90`

file: `galacticus.output.analyses.property_operator.normal.F90`
Description: Contains a module which implements a property operator class in which the property value is replaced with an integral over a normal distribution between given limits, using the property value at the mean of the distribution.

Code lines: 118

function: `normalconstructorinternal`
Description: Internal constructor for the "normal" output analysis distribution operator class.
Code lines: 9
Contained by: file `galacticus.output.analyses.property_operator.normal.F90`
Modules used: `input_parameters`

function: `normalconstructorparameters`
Description: Constructor for the "normal" output analysis property operator class which takes a parameter set as input.
Code lines: 49
Contained by: file `galacticus.output.analyses.property_operator.normal.F90`
Modules used: `input_parameters`

function: `normaloperate`
Description: Implement an normal output analysis property operator.
Code lines: 14
Contained by: file `galacticus.output.analyses.property_operator.normal.F90`
Modules used: `error_functions` `iso_c_binding`

interface: `outputanalysispropertyoperatornormal`
Description: Constructors for the "normal" output analysis class.
Code lines: 4
Contained by: file `galacticus.output.analyses.property_operator.normal.F90`

file: `galacticus.output.analyses.property_operator.sequence.F90`
Description: Contains a module which implements a sequence output analysis property operator class.
Code lines: 181

interface: `outputanalysispropertyoperatorsequence`
Description: Constructors for the "sequence" output analysis class.
Code lines: 4
Contained by: file `galacticus.output.analyses.property_operator.sequence.F90`

type: `propertyoperatorlist`
Code lines: 3
Contained by: file `galacticus.output.analyses.property_operator.sequence.F90`

function: `sequenceconstructorinternal`
Description: Internal constructor for the sequence merger tree normalizer class.
Code lines: 14
Contained by: file `galacticus.output.analyses.property_operator.sequence.F90`

function: `sequenceconstructorparameters`
Description: Constructor for the "sequence" output analysis property operator class which takes a parameter set as input.
Code lines: 22
Contained by: file `galacticus.output.analyses.property_operator.sequence.F90`
Modules used: `input_parameters`

subroutine: `sequencedeepcopy`
Description: Perform a deep copy for the `sequence` output analysis property operator class.
Code lines: 31
Contained by: file `galacticus.output.analyses.property_operator.sequence.F90`
Modules used: `galacticus_error`

subroutine: `sequencedestructor`
Description: Destructor for the sequence property operator class.
Code lines: 16
Contained by: file `galacticus.output.analyses.property_operator.sequence.F90`

function: `sequenceoperate`
Description: Implement an sequence output analysis property operator.
Code lines: 17
Contained by: file `galacticus.output.analyses.property_operator.sequence.F90`

subroutine: `sequenceprepend`
Description: Prepend an operator to the sequence.
Code lines: 12
Contained by: file `galacticus.output.analyses.property_operator.sequence.F90`

file: `galacticus.output.analyses.property_operator.square.F90`
Description: Contains a module which implements a square output analysis property operator class.
Code lines: 65

interface: `outputanalysispropertyoperatorsquare`
Description: Constructors for the "square" output analysis class.
Code lines: 3
Contained by: file `galacticus.output.analyses.property_operator.square.F90`

function: `squareconstructorparameters`
Description: Constructor for the "square" output analysis property operateor class which takes a parameter set as input.
Code lines: 10
Contained by: file `galacticus.output.analyses.property_operator.square.F90`
Modules used: `input_parameters`

function: `squareoperate`
Description: Implement an square root output analysis property operator.
Code lines: 14
Contained by: file `galacticus.output.analyses.property_operator.square.F90`
Modules used: `galacticus_error` `iso_c_binding`

file: `galacticus.output.analyses.property_operator.square_root.F90`
Description: Contains a module which implements an square root output analysis property operator class.
Code lines: 66

interface: `outputanalysispropertyoperatorsquareroot`

Description: Constructors for the "squareRoot" output analysis class.
Code lines: 3
Contained by: file galacticus.output.analyses.property_operator.square_root.F90

function: squarerootconstructorparameters
Description: Constructor for the "squareRoot" output analysis property operateor class which takes a parameter set as input.
Code lines: 10
Contained by: file galacticus.output.analyses.property_operator.square_root.F90
Modules used: input_parameters

function: squarerootoperate
Description: Implement an square root output analysis property operator.
Code lines: 15
Contained by: file galacticus.output.analyses.property_operator.square_root.F90
Modules used: galacticus_error iso_c_binding

file: galacticus.output.analyses.property_operator.systematic.polynomial.F90
Description: Contains a module which implements a polynomial systematic shift output analysis property operator class.
Code lines: 103

interface: outputanalysispropertyoperatorsystmtcpolynomial
Description: Constructors for the "systmtcPolynomial" output analysis class.
Code lines: 4
Contained by: file galacticus.output.analyses.property_operator.systematic.polynomial.F90

function: systmtcpolynomialconstructorinternal
Description: Internal constructor for the "randomErrorPolynomial" output analysis distribution operator class.
Code lines: 9
Contained by: file galacticus.output.analyses.property_operator.systematic.polynomial.F90

function: systmtcpolynomialconstructorparameters
Description: Constructor for the "systmtcPolynomial" output analysis property operator class which takes a parameter set as input.
Code lines: 31
Contained by: file galacticus.output.analyses.property_operator.systematic.polynomial.F90
Modules used: input_parameters

function: systmtcpolynomialoperate
Description: Implement an systmtcPolynomial output analysis property operator.
Code lines: 17
Contained by: file galacticus.output.analyses.property_operator.systematic.polynomial.F90
Modules used: iso_c_binding

file: galacticus.output.analyses.scatter_function_1d.F90
Description: Contains a module which implements a generic 1D scatter function (i.e. the scatter of some property weighted by number density of objects binned by some property) output analysis class.
Code lines: 651

Modules used: galactic_filters, iso_c_binding, iso_varying_string, node_property_extractors, output_analyses_options, output_analysis_distribution_-normalizers, output_analysis_distribution_-operators, output_analysis_property_operators, output_analysis_weight_operators, output_times

interface: `outputanalysisscatterfunction1d`
Description: Constructors for the "scatterFunction1D" output analysis class.
Code lines: 4
Contained by: file galacticus.output.analyses.scatter_function_1d.F90

subroutine: `scatterfunction1danalyze`
Description: Implement a scatterFunction1D output analysis.
Code lines: 11
Contained by: file galacticus.output.analyses.scatter_function_1d.F90

function: `scatterfunction1dconstructorinternal`
Description: Constructor for the "scatterFunction1D" output analysis class for internal use.
Code lines: 116
Contained by: file galacticus.output.analyses.scatter_function_1d.F90
Modules used: memory_management

function: `scatterfunction1dconstructorparameters`
Description: Constructor for the "scatterFunction1D" output analysis class which takes a parameter set as input.
Code lines: 300
Contained by: file galacticus.output.analyses.scatter_function_1d.F90
Modules used: galacticus_error, input_parameters, memory_management

subroutine: `scatterfunction1ddestructor`
Description: Destructor for the `scatterFunction1D` output analysis class.
Code lines: 8
Contained by: file galacticus.output.analyses.scatter_function_1d.F90

subroutine: `scatterfunction1dfinalize`
Description: Implement a `scatterFunction1D` output analysis finalization.
Code lines: 56
Contained by: file galacticus.output.analyses.scatter_function_1d.F90
Modules used: galacticus_hdf5, io_hdf5

subroutine: `scatterfunction1dfinalizeanalysis`
Description: Finalize analysis of a `scatterFunction1D` output analysis.
Code lines: 32
Contained by: file galacticus.output.analyses.scatter_function_1d.F90

function: `scatterfunction1dloglikelihood`

Description: Return the log-likelihood of a scatterFunction1D output analysis.
Code lines: 32
Contained by: file galacticus.output.analyses.scatter_function_1d.F90
Modules used: galacticus_error linear_algebra numerical_constants_math

subroutine: scatterfunction1dreduce
Description: Implement a scatterFunction1D output analysis reduction.
Code lines: 15
Contained by: file galacticus.output.analyses.scatter_function_1d.F90
Modules used: galacticus_error

file: galacticus.output.analyses.spin_distribution.Bett2007.F90
Description: Contains a module which implements a spin parameter distribution output analysis class.
Code lines: 271
Modules used: cosmology_functions dark_matter_halo_scales dark_matter_profile_scales dark_matter_profiles_dmo halo_mass_functions statistics_nbody_halo_mass_errors

interface: outputanalysisspindistributionbett2007
Description: Constructors for the "spinDistributionBett2007" output analysis class.
Code lines: 4
Contained by: file galacticus.output.analyses.spin_distribution.Bett2007.F90

function: spindistributionbett2007constructorinternal
Description: Internal constructor for the "spinDistributionBett2007" output analysis class.
Code lines: 182
Contained by: file galacticus.output.analyses.spin_distribution.Bett2007.F90
Modules used: galacticus_error galacticus_paths halo_spin_distributions io_hdf5 iso_varying_string memory_management numerical_comparison output_analyses_options output_times virial_density_contrast

function: spindistributionbett2007constructorparameters
Description: Constructor for the "spinDistributionBett2007" output analysis class which takes a parameter set as input.
Code lines: 42
Contained by: file galacticus.output.analyses.spin_distribution.Bett2007.F90
Modules used: functions_global input_parameters

file: galacticus.output.analyses.stellar_vs_halo_mass_relation.COSMOS_Leauthaud2012.F90
Description: Contains a module which implements a stellar vs halo mass relation analysis class.
Code lines: 508
Modules used: iso_c_binding

interface: outputanalysisstellarvshalomassrelationleauthaud2012
Description: Constructors for the "stellarVsHaloMassRelationLeauthaud2012" output analysis class.
Code lines: 4

Contained by: file galacticus.output.analyses.stellar_vs_halo_mass_relation.COSMOS_Leauthaud2012.F90

subroutine: stellarvshalomassrelationleauthaud2012analyze
Description: Implement a stellarVsHaloMassRelationLeauthaud2012 output analysis.
Code lines: 9
Contained by: file galacticus.output.analyses.stellar_vs_halo_mass_relation.COSMOS_Leauthaud2012.F90

function: stellarvshalomassrelationleauthaud2012constructorinternal
Description: Constructor for the "stellarVsHaloMassRelationLeauthaud2012" output analysis class for internal use.
Code lines: 338
Contained by: file galacticus.output.analyses.stellar_vs_halo_mass_relation.COSMOS_Leauthaud2012.F90
Modules used:

cosmology_functions	cosmology_parameters

virial_density_contrast	

function: stellarvshalomassrelationleauthaud2012constructorparameters
Description: Constructor for the "stellarVsHaloMassRelationLeauthaud2012" output analysis class which takes a parameter set as input.
Code lines: 66
Contained by: file galacticus.output.analyses.stellar_vs_halo_mass_relation.COSMOS_Leauthaud2012.F90
Modules used:

cosmology_functions	cosmology_parameters
input_parameters	

subroutine: stellarvshalomassrelationleauthaud2012destructor
Description: Destructor for the stellarVsHaloMassRelationLeauthaud2012 output analysis class.
Code lines: 7
Contained by: file galacticus.output.analyses.stellar_vs_halo_mass_relation.COSMOS_Leauthaud2012.F90

subroutine: stellarvshalomassrelationleauthaud2012finalize
Description: Implement a stellarVsHaloMassRelationLeauthaud2012 output analysis finalization.
Code lines: 7
Contained by: file galacticus.output.analyses.stellar_vs_halo_mass_relation.COSMOS_Leauthaud2012.F90

function: stellarvshalomassrelationleauthaud2012loglikelihood
Description: Return the log-likelihood of a stellarVsHaloMassRelationLeauthaud2012 output analysis.
Code lines: 7
Contained by: file galacticus.output.analyses.stellar_vs_halo_mass_relation.COSMOS_Leauthaud2012.F90

subroutine: stellarvshalomassrelationleauthaud2012reduce
Description: Implement reduction for the stellarVsHaloMassRelationLeauthaud2012 output analysis class.
Code lines: 14

Contained by: file galacticus.output.analyses.stellar_vs_halo_mass_relation.COSMOS_Leauthaud2012.F90
Modules used: galacticus_error

file: galacticus.output.analyses.utilities.F90
Description: Contains a module which provides a collection of utilities useful for on-the-fly analyses.
Code lines: 122

module: output_analysis_utilities
Description: Provides a collection of utilities useful for on-the-fly analyses.

subroutine: `volumefunction1dfinalize`
Description: Implement a volumeFunction1D output analysis finalization.
Code lines: 56
Contained by: file `galacticus.output.analyses.volume_function_1d.F90`
Modules used: `galacticus_hdf5` `io_hdf5`

subroutine: `volumefunction1dfinalizeanalysis`
Description: Compute final covariances and normalize.
Code lines: 47
Contained by: file `galacticus.output.analyses.volume_function_1d.F90`
Modules used: `mpi_utilities`

function: `volumefunction1dloglikelihood`
Description: Return the log-likelihood of a volumeFunction1D output analysis.
Code lines: 32
Contained by: file `galacticus.output.analyses.volume_function_1d.F90`
Modules used: `galacticus_error` `linear_algebra` `numerical_constants_math`

subroutine: `volumefunction1dreduce`
Description: Implement a volumeFunction1D output analysis reduction.
Code lines: 21
Contained by: file galacticus.output.analyses.volume_function_1d.F90
Modules used: galacticus_error

subroutine: `volumefunction1dresults`
Description: Implement a volumeFunction1D output analysis finalization.
Code lines: 27
Contained by: file galacticus.output.analyses.volume_function_1d.F90
Modules used: memory_management

file: `galacticus.output.analyses.weight_operator.F90`
Description: Contains a module which provides a class that implements weight on operators for on-the-fly analyses.
Code lines: 45

module: `output_analysis_weight_operators`
Description: Provides a class that implements operators on weights for on-the-fly analyses.
Code lines: 23
Contained by: file galacticus.output.analyses.weight_operator.F90
Modules used: galacticus_nodes, iso_c_binding
Used by: subroutine galacticus_function_classes_destroy, function hivshalomassrelationpadmanabhan2017constructorin, function localgroupmassfunctionconstructorinterna, function blackholebulgerelationconstructorinternal, function concentrationvshalomasscdmludlow2016constructorinternal, function massmetallicityandrews2013constructorinternal, function massmetallicityblanc2017constructorinternal, file galacticus.output.analyses.mean_function_1d.F90, function morphologicalfractiongamamoffett2016constructorinternal, file galacticus.output.analyses.scatter_function_1d.F90, function stellarvshalomassrelationleauthaud2012constructorinternal, file galacticus.output.analyses.volume_function_1d.F90, subroutine galacticus_state_retrieve, subroutine galacticus_state_store

file: `galacticus.output.analyses.weight_operator.N-body_mass.F90`
Description: Contains a module which implements a weight operator class in which the weight is multiplied by an integral over the N-body halo mass distribution.
Code lines: 135
Modules used: statistics_nbody_halo_mass_errors

function: `nbodymassconstructorinternal`
Description: Internal constructor for the "nbodyMass" output analysis distribution operator class.
Code lines: 18
Contained by: file galacticus.output.analyses.weight_operator.N-body_mass.F90

Modules used: galacticus_error

function: nbodymassconstructorparameters
Description: Constructor for the "nbodyMass" output analysis weight operator class which takes a parameter set as input.
Code lines: 35
Contained by: file galacticus.output.analyses.weight_operator.N-body_mass.F90
Modules used: input_parameters

subroutine: nbodymassdestructor
Description: Destructor for the "nbodyMass" output analysis weight operator class.
Code lines: 8
Contained by: file galacticus.output.analyses.weight_operator.N-body_mass.F90

function: nbodymassrootvariance
Description: Return the root variance for use in the "nbodyMass" output analysis weight operator class.
Code lines: 22
Contained by: file galacticus.output.analyses.weight_operator.N-body_mass.F90

interface: outputanalysisweightoperatornbodymass
Description: Constructors for the "nbodyMass" output analysis class.
Code lines: 4
Contained by: file galacticus.output.analyses.weight_operator.N-body_mass.F90

file: galacticus.output.analyses.weight_operator.cosmology.volume.F90
Description: Contains a module which implements a cosmological volume corrector analysis weight operator class.
Code lines: 162
Modules used: cosmology_functions geometry_surveys

function: csmlgyvolumeconstructorinternal
Description: Internal constructor for the "csmlgyVolume" output analysis weight operator class.
Code lines: 9
Contained by: file galacticus.output.analyses.weight_operator.cosmology.volume.F90

function: csmlgyvolumeconstructorparameters
Description: Constructor for the "csmlgyVolume" output analysis weight operator class which takes a parameter set as input.
Code lines: 22
Contained by: file galacticus.output.analyses.weight_operator.cosmology.volume.F90
Modules used: input_parameters

subroutine: csmlgyvolumedestructor
Description: Destructor for the "csmlgyVolume" output analysis weight operator class.
Code lines: 9
Contained by: file galacticus.output.analyses.weight_operator.cosmology.volume.F90

function: csmlgyvolumeoperate
Description: Implement an csmlgyVolume output analysis weight operator.

Code lines: 70
Contained by: file galacticus.output.analyses.weight_operator.cosmology.volume.F90
Modules used: galacticus_error iso_c_binding output_analyses_options output_times

interface: outputanalysisweightoperatorcsmlgyvolume
Description: Constructors for the "csmlgyVolume" output analysis class.
Code lines: 4
Contained by: file galacticus.output.analyses.weight_operator.cosmology.volume.F90

file: galacticus.output.analyses.weight_operator.filter.high_pass.F90
Description: Contains a module which implements a high-pass filter analysis weight operator class.
Code lines: 91

function: filterhighpassconstructorinternal
Description: Internal constructor for the "filterHighPass" output analysis distribution operator class.
Code lines: 9
Contained by: file galacticus.output.analyses.weight_operator.filter.high_pass.F90
Modules used: input_parameters

function: filterhighpassconstructorparameters
Description: Constructor for the "filterHighPass" output analysis weight operator class which takes a parameter set as input.
Code lines: 20
Contained by: file galacticus.output.analyses.weight_operator.filter.high_pass.F90
Modules used: input_parameters

function: filterhighpassoperate
Description: Implement an filterHighPass output analysis weight operator.
Code lines: 17
Contained by: file galacticus.output.analyses.weight_operator.filter.high_pass.F90
Modules used: iso_c_binding

interface: outputanalysisweightoperatorfilterhighpass
Description: Constructors for the "filterHighPass" output analysis class.
Code lines: 4
Contained by: file galacticus.output.analyses.weight_operator.filter.high_pass.F90

file: galacticus.output.analyses.weight_operator.identity.F90
Description: Contains a module which implements an identity analysis weight operator class.
Code lines: 65

function: identityconstructorparameters
Description: Constructor for the "identity" output analysis weight operator class which takes a parameter set as input.
Code lines: 11
Contained by: file galacticus.output.analyses.weight_operator.identity.F90
Modules used: input_parameters

function: `identityoperate`
Description: Implement an identity output analysis weight operator.
Code lines: 13
Contained by: file `galacticus.output.analyses.weight_operator.identity.F90`
Modules used: `iso_c_binding`

interface: `outputanalysisweightoperatoridentity`
Description: Constructors for the "identity" output analysis class.
Code lines: 3
Contained by: file `galacticus.output.analyses.weight_operator.identity.F90`

file: `galacticus.output.analyses.weight_operator.normal.F90`
Description: Contains a module which implements a weight operator class in which the weight is multiplied by an integral over a normal distribution.
Code lines: 173
Modules used: `node_property_extractors` `output_analysis_property_operators`

function: `normalconstructorinternal`
Description: Internal constructor for the "normal" output analysis distribution operator class.
Code lines: 18
Contained by: file `galacticus.output.analyses.weight_operator.normal.F90`
Modules used: `galacticus_error` `input_parameters`

function: `normalconstructorparameters`
Description: Constructor for the "normal" output analysis weight operator class which takes a parameter set as input.
Code lines: 40
Contained by: file `galacticus.output.analyses.weight_operator.normal.F90`
Modules used: `input_parameters`

subroutine: `normaldestructor`
Description: Destructor for the "normal" output analysis weight operator class.
Code lines: 7
Contained by: file `galacticus.output.analyses.weight_operator.normal.F90`

function: `normaloperate`
Description: Implement an normal output analysis weight operator.
Code lines: 31
Contained by: file `galacticus.output.analyses.weight_operator.normal.F90`
Modules used: `error_functions` `iso_c_binding`

function: `normalrootvariance`
Description: Return the root variance for use in the "normal" output analysis weight operator class.
Code lines: 12
Contained by: file `galacticus.output.analyses.weight_operator.normal.F90`

interface: `outputanalysisweightoperatornormal`
Description: Constructors for the "normal" output analysis class.

Code lines: 4
Contained by: file galacticus.output.analyses.weight_operator.normal.F90

file: galacticus.output.analyses.weight_operator.property.F90
Description: Contains a module which implements an analysis weight operator class which weights by a property value.
Code lines: 115
Modules used: node_property_extractors output_analysis_property_operators

interface: outputanalysisweightoperatorproperty
Description: Constructors for the "property" output analysis class.
Code lines: 4
Contained by: file galacticus.output.analyses.weight_operator.property.F90

function: propertyconstructorinternal
Description: Internal constructor for the "property" output analysis weight operator class.
Code lines: 16
Contained by: file galacticus.output.analyses.weight_operator.property.F90
Modules used: galacticus_error

function: propertyconstructorparameters
Description: Constructor for the "property" output analysis weight operator class which takes a parameter set as input.
Code lines: 18
Contained by: file galacticus.output.analyses.weight_operator.property.F90
Modules used: input_parameters

subroutine: propertydestructor
Description: Destructor for the "property" output analysis weight operator class.
Code lines: 8
Contained by: file galacticus.output.analyses.weight_operator.property.F90

function: propertyoperate
Description: Implement an property output analysis weight operator.
Code lines: 22
Contained by: file galacticus.output.analyses.weight_operator.property.F90
Modules used: iso_c_binding

file: galacticus.output.analyses.weight_operator.sequence.F90
Description: Contains a module which implements a sequence output analysis weight operator class.
Code lines: 180

interface: outputanalysisweightoperatorsequence
Description: Constructors for the "sequence" output analysis class.
Code lines: 4
Contained by: file galacticus.output.analyses.weight_operator.sequence.F90

function: sequenceconstructorinternal
Description: Internal constructor for the sequence output analysis weight operator class.

Code lines: 14
Contained by: file galacticus.output.analyses.weight_operator.sequence.F90

function: sequenceconstructorparameters
Description: Constructor for the "sequence" output analysis weight operator class which takes a parameter set as input.
Code lines: 22
Contained by: file galacticus.output.analyses.weight_operator.sequence.F90
Modules used: input_parameters

subroutine: sequencedeepcopy
Description: Perform a deep copy for the sequence output analysis weight operator class.
Code lines: 31
Contained by: file galacticus.output.analyses.weight_operator.sequence.F90
Modules used: galacticus_error

subroutine: sequencedestructor
Description: Destructor for the sequence weight operator class.
Code lines: 16
Contained by: file galacticus.output.analyses.weight_operator.sequence.F90

function: sequenceoperate
Description: Implement an sequence output analysis weight operator.
Code lines: 17
Contained by: file galacticus.output.analyses.weight_operator.sequence.F90

subroutine: sequenceprepend
Description: Prepend an operator to the sequence.
Code lines: 12
Contained by: file galacticus.output.analyses.weight_operator.sequence.F90

type: weightoperatorlist
Code lines: 3
Contained by: file galacticus.output.analyses.weight_operator.sequence.F90

file: galacticus.output.build.F90
Description: Contains a module which implements writing of Galacticus build information to the Galacticus output file.
Code lines: 212

module: galacticus_build
Description: Implements writing of Galacticus build information to the Galacticus output file.
Code lines: 187
Contained by: file galacticus.output.build.F90
Modules used: iso_c_binding
Used by: subroutine galacticus_output_open_file subroutine reportperform module input_parameters

subroutine: galacticus_build_output

Description: Output build information to the main output file.
Code lines: 94
Contained by: module galacticus_build
Modules used: fgsl, file_utilities, fox_common, galacticus_error, galacticus_hdf5, galacticus_paths, iso_varying_string, string_handling

function: galacticus_build_string
Description: Returns a string describing the build environment of Galacticus.
Code lines: 69
Contained by: module galacticus_build
Modules used: fgsl, fox_common, galacticus_error, hdf5, iso_varying_string, string_handling

file: galacticus.output.merger_tree.halo_model.F90
Description: Contains a module which handles outputting of data required by the halo model of galaxy clustering to the Galacticus output file.
Code lines: 196

module: galacticus_output_halo_models
Description: Handles outputting of data required by the halo model of galaxy clustering to the Galacticus output file.
Code lines: 174
Contained by: file galacticus.output.merger_tree.halo_model.F90
Used by: subroutine evolveforestsperform

subroutine: galacticus_extra_output_halo_fourier_profile
Description: Store Fourier-space halo profiles to the output file.
Code lines: 76
Contained by: module galacticus_output_halo_models
Modules used: cosmology_functions, dark_matter_profiles_dmo, galacticus_hdf5, galacticus_nodes, iso_c_binding, iso_varying_string, kind_numbers, memory_management, string_handling

subroutine: galacticus_output_halo_model_initialize
Description: Initializes the module by determining whether or not halo model data should be output.
Code lines: 69
Contained by: module galacticus_output_halo_models
Modules used: galacticus_hdf5, input_parameters, io_hdf5, numerical_constants_astronomical, numerical_ranges

file: galacticus.output.version.F90
Description: Contains a module which implements writing of the version number and run time to the Galacticus output file.
Code lines: 124

module: galacticus_versioning
Description: Implements writing of the version number and run time to the Galacticus output file.
Code lines: 102
Contained by: file galacticus.output.version.F90
Used by: subroutine galacticus_output_open_file, subroutine reportperform, module input_parameters

subroutine: galacticus_version
Description: Return version information
Code lines: 13
Contained by: module galacticus_versioning
Modules used: iso_varying_string

subroutine: galacticus_version_output
Description: Output version information to the main output file.
Code lines: 56
Contained by: module galacticus_versioning
Modules used: dates_and_times, file_utilities, fox_dom, fox_utils, galacticus_error, galacticus_hdf5, io_hdf5, io_xml, iso_varying_string

function: galacticus_version_string
Description: Returns a string describing the version of Galacticus.
Code lines: 9
Contained by: module galacticus_versioning
Modules used: iso_varying_string, string_handling

file: galacticus.state.F90
Description: Contains a module which implements storage and recovery of the Galacticus internal state. Used for restoring random number generator sequences for example.
Code lines: 887

module: galacticus_state
Description: Implements storage and recovery of the Galacticus internal state. Used for restoring random number generator sequences for example.
Code lines: 864
Contained by: file galacticus.state.F90
Modules used: iso_c_binding, iso_varying_string, tables
Used by: subroutine functions_global_set

subroutine: galacticus_state_retrieve
Description: Retrieve the internal state.
Code lines: 390
Contained by: module galacticus_state

subroutine: `state_initialize`

Description: Initialize the state module by getting the name of the file to which states should be stored and whether or not we are to retrieve a state.
Code lines: 36
Contained by: module galacticus_state
Modules used: input_parameters

file: `geometry.coordinate_systems.F90`

Description: Contains a module which implements calculations related to coordinate systems and transformations.
Code lines: 105

module: `coordinate_systems`

Description: Implements calculations related to coordinate systems and transformations.
Code lines: 83
Contained by: file geometry.coordinate_systems.F90
Used by: function galactic_structure_density
function galactic_structure_surface_density
program test_coordinate_systems

function: `coordinates_cartesian_to_cylindrical`

Description: Convert (x, y, z) in Cartesian coordinates into (r, ϕ, z) in cylindrical coordinates, with $\phi = 0$ corresponding to the x-axis.
Code lines: 13
Contained by: module coordinate_systems

function: `coordinates_cartesian_to_spherical`

Description: Convert (x, y, z) in Cartesian coordinates into (r, θ, ϕ) in spherical coordinates, with $\theta = 0$ corresponding to the z-axis and $\phi = 0$ corresponding to the x-axis.
Code lines: 20

Contained by: module coordinate_systems

function: coordinates_cylindrical_to_spherical
Description: Convert (R, ϕ, z) in cylindrical coordinates into (r, θ, ϕ) in spherical coordinates, with $\phi = 0$ corresponding to the x-axis.
Code lines: 20
Contained by: module coordinate_systems

function: coordinates_spherical_to_cylindrical
Description: Convert (r, θ, ϕ) in spherical coordinates into (R, ϕ, z) in cylindrical coordinates, with $\phi = 0$ corresponding to the x-axis.
Code lines: 14
Contained by: module coordinate_systems

file: geometry.lightcones.F90
Description: Contains a module which implements lightcone geometries.
Code lines: 69

module: geometry_lightcones
Description: Implements geometries of lightcones.
Code lines: 47
Contained by: file geometry.lightcones.F90
Modules used: galacticus_nodes, iso_c_binding
Used by: file galactic.filters.lightcone.F90, subroutine galacticus_function_classes_destroy, subroutine galacticus_state_retrieve, subroutine galacticus_state_store, file merger_trees.operators.prune_lightcone.F90, file nodes.property_extractor.lightcone.F90

file: geometry.lightcones.square.F90
Description: An implementation of the lightcone geometry class which assumes a square field of view.
Code lines: 718
Modules used: cosmology_functions

interface: geometrylightconesquare
Description: Constructors for the square dark matter halo spin distribution class.
Code lines: 4
Contained by: file geometry.lightcones.square.F90

function: squareconstructorinternal
Description: Internal constructor for the square lightcone geometry distribution class.
Code lines: 102
Contained by: file geometry.lightcones.square.F90
Modules used: galacticus_error, iso_varying_string, memory_management, numerical_constants_math, sort, string_handling, trigonometric_functions, vectors

function: `inversecosineintegral`
Description: Integral of $\sin(x) * \cos^{-1}[a/tan(x)]$ evaluated using Wolfram Alpha.
Code lines: 10
Contained by: function `squareconstructorinternal`

function: `squareconstructorparameters`
Description: Constructor for the `square` lightcone geometry distribution class which takes a parameter list as input.
Code lines: 125
Contained by: file `geometry.lightcones.square.F90`
Modules used: `cosmology_parameters`, `galacticus_error`, `input_parameters`, `numerical_constants_astronomical`

subroutine: `squaredestructor`
Description: Destructor for the `square` lightcone geometry distribution class.
Code lines: 7
Contained by: file `geometry.lightcones.square.F90`

function: `squareisinlightcone`
Description: Determine if the given `node` lies within the lightcone.
Code lines: 145
Contained by: file `geometry.lightcones.square.F90`
Modules used: `arrays_search`, `galacticus_error`, `galacticus_nodes`, `iso_c_binding`, `iso_varying_string`, `memory_management`, `numerical_comparison`, `string_handling`, `vectors`

function: `squareposition`
Description: Return the position of the node in lightcone coordinates.
Code lines: 36
Contained by: file `geometry.lightcones.square.F90`
Modules used: `arrays_search`, `galacticus_error`, `galacticus_nodes`, `iso_c_binding`, `iso_varying_string`, `numerical_comparison`, `string_handling`

function: `squarepositionatoutput`
Description: Return the position of the node in lightcone coordinates.
Code lines: 12
Contained by: file `geometry.lightcones.square.F90`
Modules used: `iso_c_binding`

subroutine: `squarereplicants`
Description: Compute quantities related to the number of replicants in which a node appears.
Code lines: 107
Contained by: file `geometry.lightcones.square.F90`

Modules used: galacticus_error iso_c_binding vectors

function: squarereplicationcount
Description: Determine the number of times node appears in the lightcone.
Code lines: 18
Contained by: file geometry.lightcones.square.F90
Modules used: arrays_search galacticus_nodes iso_c_binding

function: squaresolidangle
Description: Return the solid angle (in steradians) of a square lightcone.
Code lines: 7
Contained by: file geometry.lightcones.square.F90

function: squarevelocity
Description: Return the velocity of the node in lightcone coordinates.
Code lines: 19
Contained by: file geometry.lightcones.square.F90
Modules used: galacticus_nodes

file: geometry.mangle.F90
Description: Contains a module which implements functions utilizing MANGLE survey geometry definitions.
Code lines: 412

module: geometry_mangle
Description: Implements functions utilizing MANGLE survey geometry definitions.
Code lines: 390
Contained by: file geometry.mangle.F90
Modules used: iso_c_binding
Used by: file geometry.surveys.mangle.F90

type: cap
Description: A class to hold MANGLE caps.
Code lines: 15
Contained by: module geometry_mangle

function: cappointincluded
Description: Return true if a given Cartesian point lies within a MANGLE cap.
Code lines: 17
Contained by: module geometry_mangle
Modules used: vectors

function: geometrymangleangularpower
Description: Compute the angular power spectra of a MANGLE geometry.
Code lines: 113
Contained by: module geometry_mangle
Modules used: file_utilities galacticus_error

galacticus_paths io_hdf5
iso_varying_string numerical_constants_math
string_handling system_command

subroutine: geometrymanglebuild
Description: Download and build the MANGLE code.
Code lines: 22
Contained by: module geometry_mangle
Modules used: file_utilities galacticus_error
galacticus_paths iso_varying_string
system_command

function: geometrymanglesolidangle
Description: Compute the solid angle of a MANGLE geometry.
Code lines: 69
Contained by: module geometry_mangle
Modules used: file_utilities galacticus_error
galacticus_paths io_hdf5
iso_varying_string numerical_constants_math
string_handling system_command

type: polygon
Description: A class to hold MANGLE polygons.
Code lines: 16
Contained by: module geometry_mangle

function: polygonpointincluded
Description: Return true if a given Cartesian point lies within a MANGLE polygon, i.e. lies within *all* of the polygons caps.
Code lines: 14
Contained by: module geometry_mangle
Modules used: vectors

type: window
Description: A class to hold MANGLE windows.
Code lines: 23
Contained by: module geometry_mangle

function: windowpointincluded
Description: Return true if the given Cartesian point lies inside a MANGLE window, i.e. if it lies within any polygon of the window.
Code lines: 16
Contained by: module geometry_mangle

subroutine: windowread
Description: Read a MANGLE window definition from file.
Code lines: 57
Contained by: module geometry_mangle
Modules used: galacticus_display galacticus_error

iso_varying_string sort
string_handling

file: geometry.surveys.Baldry-2012-GAMA.F90
Description: Implements the geometry of the GAMA survey used by Baldry et al. [2012].
Code lines: 163
Modules used: cosmology_functions galacticus_paths

function: baldry2012gamaangularpowermaximumdegree
Description: Return the maximum degree for which angular power is computed for the Bernardi et al. [2013] survey.
Code lines: 8
Contained by: file geometry.surveys.Baldry-2012-GAMA.F90

function: baldry2012gamaconstructorinternal
Description: Internal constructor for the Baldry et al. [2012] conditional mass function class.
Code lines: 12
Contained by: file geometry.surveys.Baldry-2012-GAMA.F90
Modules used: cosmology_functions_options

function: baldry2012gamaconstructorparameters
Description: Constructor for the Baldry et al. [2012] conditional mass function class which takes a parameter set as input.
Code lines: 16
Contained by: file geometry.surveys.Baldry-2012-GAMA.F90
Modules used: cosmology_functions input_parameters

subroutine: baldry2012gamadestructor
Description: Destructor for the "baldry2012GAMA" survey geometry class.
Code lines: 7
Contained by: file geometry.surveys.Baldry-2012-GAMA.F90

function: baldry2012gamadistancemaximum
Description: Compute the maximum distance at which a galaxy is visible.
Code lines: 25
Contained by: file geometry.surveys.Baldry-2012-GAMA.F90
Modules used: galacticus_error

function: baldry2012gamafieldcount
Description: Return the number of fields in this sample.
Code lines: 8
Contained by: file geometry.surveys.Baldry-2012-GAMA.F90

function: baldry2012gamamangledirectory
Description: Return the path to the directory containing MANGLE files.
Code lines: 9
Contained by: file geometry.surveys.Baldry-2012-GAMA.F90

subroutine: baldry2012gamamanglefiles

Description: Return a list of MANGLE files.
Code lines: 9
Contained by: file `geometry.surveys.Baldry-2012-GAMA.F90`

interface: `surveygeometrybaldry2012gama`
Description: Constructors for the Baldry et al. [2012] survey geometry class.
Code lines: 4
Contained by: file `geometry.surveys.Baldry-2012-GAMA.F90`

file: `geometry.surveys.Bernardi-2013-SDSS.F90`
Description: Implements the geometry of the SDSS survey used by Bernardi et al. [2013].
Code lines: 170
Modules used: `galacticus_paths`

function: `bernardi2013sdssangularpowermaximumdegree`
Description: Return the maximum degree for which angular power is computed for the Bernardi et al. [2013] survey.
Code lines: 8
Contained by: file `geometry.surveys.Bernardi-2013-SDSS.F90`

function: `bernardi2013sdssconstructorinternal`
Description: Default constructor for the Bernardi et al. [2013] conditional mass function class.
Code lines: 8
Contained by: file `geometry.surveys.Bernardi-2013-SDSS.F90`
Modules used: `input_parameters`

function: `bernardi2013sdssconstructorparameters`
Description: Constructor for the Bernardi et al. [2013] conditional mass function class which takes a parameter set as input.
Code lines: 11
Contained by: file `geometry.surveys.Bernardi-2013-SDSS.F90`
Modules used: `input_parameters`

function: `bernardi2013sdssdistancemaximum`
Description: Compute the maximum distance at which a galaxy is visible.
Code lines: 15
Contained by: file `geometry.surveys.Bernardi-2013-SDSS.F90`
Modules used: `galacticus_error`

function: `bernardi2013sdssfieldcount`
Description: Return the number of fields in this sample.
Code lines: 8
Contained by: file `geometry.surveys.Bernardi-2013-SDSS.F90`

function: `bernardi2013sdssmangledirectory`
Description: Return the path to the directory containing MANGLE files.
Code lines: 9
Contained by: file `geometry.surveys.Bernardi-2013-SDSS.F90`

subroutine: `bernardi2013sdssmanglefiles`
Description: Return a list of MANGLE files.
Code lines: 23
Contained by: file `geometry.surveys.Bernardi-2013-SDSS.F90`
Modules used: `file_utilities` `galacticus_error` `system_command`

function: `bernardi2013sdsspointincluded`
Description: Return true if a point is included in the survey geometry.
Code lines: 26
Contained by: file `geometry.surveys.Bernardi-2013-SDSS.F90`
Modules used: `numerical_constants_units` `vectors`

interface: `surveygeometrybernardi2013sdss`
Description: Constructors for the Bernardi et al. [2013] survey geometry class.
Code lines: 4
Contained by: file `geometry.surveys.Bernardi-2013-SDSS.F90`

file: `geometry.surveys.Caputi-2011-UKIDSS-UDS.F90`
Description: Implements the survey geometry used by Caputi et al. [2011].
Code lines: 206
Modules used: `cosmology_functions`

function: `caputi2011ukidssudsconstructorinternal`
Description: Internal constructor for the Caputi et al. [2011] conditional mass function class.
Code lines: 28
Contained by: file `geometry.surveys.Caputi-2011-UKIDSS-UDS.F90`
Modules used: `cosmology_functions_options` `galacticus_error`

function: `caputi2011ukidssudsconstructorparameters`
Description: Default constructor for the Caputi et al. [2011] conditional mass function class.
Code lines: 22
Contained by: file `geometry.surveys.Caputi-2011-UKIDSS-UDS.F90`
Modules used: `input_parameters`

subroutine: `caputi2011ukidssudsdestructor`
Description: Destructor for the "caputi2011UKIDSSUDS" survey geometry class.
Code lines: 7
Contained by: file `geometry.surveys.Caputi-2011-UKIDSS-UDS.F90`

function: `caputi2011ukidssudsdistancemaximum`
Description: Compute the maximum distance at which a galaxy is visible.
Code lines: 22
Contained by: file `geometry.surveys.Caputi-2011-UKIDSS-UDS.F90`
Modules used: `cosmology_functions_options` `galacticus_error`

function: `caputi2011ukidssudsdistanceminimum`

Description: Compute the minimum distance at which a galaxy is included.
Code lines: 10
Contained by: file geometry.surveys.Caputi-2011-UKIDSS-UDS.F90

subroutine: caputi2011ukidssudsrandomsinitialize
Description: Load random points for the survey.
Code lines: 29
Contained by: file geometry.surveys.Caputi-2011-UKIDSS-UDS.F90
Modules used: file_utilities, galacticus_display, galacticus_error, galacticus_paths, io_hdf5, iso_varying_string, memory_management, numerical_constants_math, string_handling, system_command

function: caputi2011ukidssudssolidangle
Description: Return the solid angle of the Caputi et al. [2011] sample. Computed from survey mask (see constraints/dataAnalysis/stellarMassFunctions_UKIDSS_UDS_z3_-5/surveyGeometryRandoms.pl).
Code lines: 14
Contained by: file geometry.surveys.Caputi-2011-UKIDSS-UDS.F90
Modules used: galacticus_error

function: caputi2011ukidssudsvolumemaximum
Description: Compute the maximum volume within which a galaxy is visible.
Code lines: 13
Contained by: file geometry.surveys.Caputi-2011-UKIDSS-UDS.F90
Modules used: galacticus_error

interface: surveygeometrycaputi2011ukidssuds
Description: Constructors for the Caputi et al. [2011] survey geometry class.
Code lines: 4
Contained by: file geometry.surveys.Caputi-2011-UKIDSS-UDS.F90

file: geometry.surveys.Davidzon-2013-VIPERS.F90
Description: Implements the geometry of the VIPERS survey used by Davidzon et al. [2013].
Code lines: 218
Modules used: cosmology_functions, galacticus_paths

function: davidzon2013vipersangularpowermaximumdegree
Description: Return the maximum degree for which angular power is computed for the Davidzon et al. [2013] survey.
Code lines: 8
Contained by: file geometry.surveys.Davidzon-2013-VIPERS.F90

function: davidzon2013viperssconstructorinternal
Description: Generic constructor for the Davidzon et al. [2013] mass function class.
Code lines: 31
Contained by: file geometry.surveys.Davidzon-2013-VIPERS.F90
Modules used: cosmology_functions, cosmology_functions_options

galacticus_error input_parameters

function: davidzon2013vipersconstructorparameters
Description: Constructor for the Davidzon et al. [2013] conditional mass function class which takes a parameter set as input.
Code lines: 22
Contained by: file geometry.surveys.Davidzon-2013-VIPERS.F90
Modules used: input_parameters

subroutine: davidzon2013vipersdestructor
Description: Destructor for the "baldry2012GAMA" survey geometry class.
Code lines: 7
Contained by: file geometry.surveys.Davidzon-2013-VIPERS.F90

function: davidzon2013vipersdistancemaximum
Description: Compute the maximum distance at which a galaxy is visible.
Code lines: 27
Contained by: file geometry.surveys.Davidzon-2013-VIPERS.F90
Modules used: galacticus_error

function: davidzon2013vipersdistanceminimum
Description: Compute the minimum distance at which a galaxy is included.
Code lines: 10
Contained by: file geometry.surveys.Davidzon-2013-VIPERS.F90

function: davidzon2013vipersfieldcount
Description: Return the number of fields in this sample.
Code lines: 8
Contained by: file geometry.surveys.Davidzon-2013-VIPERS.F90

function: davidzon2013vipersmangledirectory
Description: Return the path to the directory containing MANGLE files.
Code lines: 9
Contained by: file geometry.surveys.Davidzon-2013-VIPERS.F90

subroutine: davidzon2013vipersmanglefiles
Description: Return a list of MANGLE files.
Code lines: 9
Contained by: file geometry.surveys.Davidzon-2013-VIPERS.F90

file: `geometry.surveys.Kelvin-2014-GAMAnear.F90`
Description: Implements the geometry of the GAMAnear survey used by Kelvin et al. [2014].
Code lines: 105
Modules used: `galacticus_paths`

function: `kelvin2014gamanearconstructorinternal`
Description: Internal constructor for the Kelvin et al. [2014] conditional mass function class.
Code lines: 14
Contained by: file `geometry.surveys.Kelvin-2014-GAMAnear.F90`
Modules used: `cosmology_functions_options`

function: `kelvin2014gamanearconstructorparameters`
Description: Default constructor for the Kelvin et al. [2014] conditional mass function class.
Code lines: 15
Contained by: file `geometry.surveys.Kelvin-2014-GAMAnear.F90`
Modules used: `input_parameters`

function: `kelvin2014gamaneardistancemaximum`
Description: Compute the maximum distance at which a galaxy is visible.
Code lines: 17
Contained by: file `geometry.surveys.Kelvin-2014-GAMAnear.F90`
Modules used: `galacticus_error`

function: `kelvin2014gamaneardistanceminimum`
Description: Compute the minimum distance at which a galaxy is included in the survey.
Code lines: 11
Contained by: file `geometry.surveys.Kelvin-2014-GAMAnear.F90`
Modules used: `galacticus_error`

interface: `surveygeometrykelvin2014gamanear`
Description: Constructors for the Kelvin et al. [2014] survey geometry class.
Code lines: 4
Contained by: file `geometry.surveys.Kelvin-2014-GAMAnear.F90`

file: geometry.surveys.Li-White-2009-SDSS.F90
Description: Implements the survey geometry of the SDSS sample used by Li and White [2009].
Code lines: 210
Modules used: cosmology_functions

function: liwhite2009sdssconstructorinternal
Description: Constructor for the Li and White [2009] survey geometry class which allows specification of minimum and maximum redshifts.
Code lines: 18
Contained by: file geometry.surveys.Li-White-2009-SDSS.F90
Modules used: cosmology_functions cosmology_functions_options

function: liwhite2009sdssconstructorparameters
Description: Constructor for the Li and White [2009] survey geometry class which takes a parameter set as input.
Code lines: 32
Contained by: file geometry.surveys.Li-White-2009-SDSS.F90
Modules used: input_parameters

subroutine: liwhite2009sdssdestructor
Description: Destructor for the "liWhite2009SDSS" survey geometry class.
Code lines: 7
Contained by: file geometry.surveys.Li-White-2009-SDSS.F90

function: liwhite2009sdssdistancemaximum
Description: Compute the maximum distance at which a galaxy is visible.
Code lines: 20
Contained by: file geometry.surveys.Li-White-2009-SDSS.F90
Modules used: cosmology_functions_options galacticus_error

function: liwhite2009sdssdistanceminimum
Description: Compute the minimum distance at which a galaxy is visible.
Code lines: 10
Contained by: file geometry.surveys.Li-White-2009-SDSS.F90

subroutine: liwhite2009sdssrandomsinitialize
Description: Compute the window function for the survey.
Code lines: 51
Contained by: file geometry.surveys.Li-White-2009-SDSS.F90
Modules used: file_utilities galacticus_display
galacticus_error galacticus_paths
iso_varying_string memory_management
numerical_constants_math string_handling
system_command

function: liwhite2009sdsssolidangle
Description: Return the solid angle of the Li and White [2009] sample.
Code lines: 13
Contained by: file geometry.surveys.Li-White-2009-SDSS.F90

Modules used: galacticus_error

interface: surveygeometryliwhite2009sdss
Description: Constructors for the Li and White [2009] survey geometry class.
Code lines: 4
Contained by: file geometry.surveys.Li-White-2009-SDSS.F90

file: geometry.surveys.Local_Group_DES.F90
Description: Implements the geometry of the DES survey for Local Group dwarfs.
Code lines: 139
Modules used: galacticus_paths

function: localgroupdesangularpowermaximumdegree
Description: Return the maximum degree for which angular power is computed for the localGroupDES survey.
Code lines: 8
Contained by: file geometry.surveys.Local_Group_DES.F90

function: localgroupdesconstructorinternal
Description: Internal constructor for the localGroupDES survey geometry class.
Code lines: 9
Contained by: file geometry.surveys.Local_Group_DES.F90

function: localgroupdesconstructorparameters
Description: Constructor for the localGroupDES conditional mass function class which takes a parameter set as input.
Code lines: 19
Contained by: file geometry.surveys.Local_Group_DES.F90
Modules used: input_parameters

function: localgroupdesdistancemaximum
Description: Compute the maximum distance at which a galaxy is visible.
Code lines: 17
Contained by: file geometry.surveys.Local_Group_DES.F90
Modules used: galacticus_error

function: localgroupdesfieldcount
Description: Return the number of fields in this sample.
Code lines: 8
Contained by: file geometry.surveys.Local_Group_DES.F90

function: localgroupdesmangledirectory
Description: Return the path to the directory containing MANGLE files.
Code lines: 9
Contained by: file geometry.surveys.Local_Group_DES.F90

subroutine: localgroupdesmanglefiles
Description: Return a list of MANGLE files.
Code lines: 9

Contained by: file geometry.surveys.Local_Group_DES.F90

interface: surveygeometrylocalgroupdes
Description: Constructors for the localGroupDES survey geometry class.
Code lines: 4
Contained by: file geometry.surveys.Local_Group_DES.F90

file: geometry.surveys.Local_Group_SDSS.F90
Description: Implements the geometry of the SDSS survey with a depth for Local Group dwarf detection.
Code lines: 86

function: localgroupsdssconstructorinternal
Description: Internal constructor for the Local Group SDSS survey geometry class
Code lines: 9
Contained by: file geometry.surveys.Local_Group_SDSS.F90

function: localgroupsdssconstructorparameters
Description: Constructor for the Local Group SDSS survey geometry class which takes a parameter set as input.
Code lines: 19
Contained by: file geometry.surveys.Local_Group_SDSS.F90
Modules used: input_parameters

function: localgroupsdsssdistancemaximum
Description: Compute the maximum distance at which a galaxy is visible.
Code lines: 15
Contained by: file geometry.surveys.Local_Group_SDSS.F90
Modules used: galacticus_error

interface: surveygeometrylocalgroupsdss
Description: Constructors for the Bernardi et al. [2013] survey geometry class.
Code lines: 4
Contained by: file geometry.surveys.Local_Group_SDSS.F90

file: geometry.surveys.Local_Group_classical.F90
Description: Implements a geometry corresponding to the detectability of classical Local Group galaxies.
Code lines: 150
Modules used: galacticus_paths

function: localgroupclassicalangularpowermaximumdegree
Description: Return the maximum degree for which angular power is computed for the Local Group Classical galaxies survey.
Code lines: 8
Contained by: file geometry.surveys.Local_Group_classical.F90

function: localgroupclassicalconstructorinternal
Description: Internal constructor for the Baldry et al. [2012] conditional mass function class.
Code lines: 9
Contained by: file geometry.surveys.Local_Group_classical.F90

function: `localgroupclassicalconstructorparameters`
Description: Constructor for the `localGroupClassical` survey geometry class which takes a parameter set as input.
Code lines: 27
Contained by: file `geometry.surveys.Local_Group_classical.F90`
Modules used: `input_parameters`

function: `localgroupclassicaldistancemaximum`
Description: Compute the maximum distance at which a galaxy is visible.
Code lines: 16
Contained by: file `geometry.surveys.Local_Group_classical.F90`

function: `localgroupclassicalfieldcount`
Description: Return the number of fields in this sample.
Code lines: 8
Contained by: file `geometry.surveys.Local_Group_classical.F90`

function: `localgroupclassicalmangledirectory`
Description: Return the path to the directory containing MANGLE files.
Code lines: 9
Contained by: file `geometry.surveys.Local_Group_classical.F90`

subroutine: `localgroupclassicalmanglefiles`
Description: Return a list of MANGLE files.
Code lines: 9
Contained by: file `geometry.surveys.Local_Group_classical.F90`

interface: `surveygeometrylocalgroupclassical`
Description: Constructors for the Baldry et al. [2012] survey geometry class.
Code lines: 4
Contained by: file `geometry.surveys.Local_Group_classical.F90`

file: `geometry.surveys.Martin-2010-ALFALFA.F90`
Description: Implements the survey geometry used by Martin et al. [2010].
Code lines: 200
Modules used: `cosmology_parameters`

function: `martin2010alfalfaconstructorinternal`
Description: Internal constructor for the Martin et al. [2010] conditional mass function class.
Code lines: 10
Contained by: file `geometry.surveys.Martin-2010-ALFALFA.F90`
Modules used: `input_parameters`

function: `martin2010alfalfaconstructorparameters`
Description: Constructor for the Martin et al. [2010] conditional mass function class which takes a parameter list as input.
Code lines: 15
Contained by: file `geometry.surveys.Martin-2010-ALFALFA.F90`
Modules used: `input_parameters`

subroutine: martin2010alfalfadestructor
Description: Destructor for the "martin2010ALFALFA" survey geometry class.
Code lines: 7
Contained by: file geometry.surveys.Martin-2010-ALFALFA.F90

function: martin2010alfalfadistancemaximum
Description: Compute the maximum distance at which a galaxy is visible.
Code lines: 38
Contained by: file geometry.surveys.Martin-2010-ALFALFA.F90
Modules used: cosmology_parameters, galacticus_error

subroutine: martin2010alfalfarandomsinitialize
Description: Initialize random points for the survey.
Code lines: 60
Contained by: file geometry.surveys.Martin-2010-ALFALFA.F90
Modules used: cosmology_functions, cosmology_parameters, file_utilities, galacticus_display, galacticus_error, galacticus_paths, iso_c_binding, iso_varying_string, memory_management, meshes, numerical_constants_astronomical, numerical_constants_math, pseudo_random, string_handling, system_command, vectors

function: martin2010alfalfasolidangle
Description: Return the solid angle of the Martin et al. [2010] sample.
Code lines: 13
Contained by: file geometry.surveys.Martin-2010-ALFALFA.F90
Modules used: galacticus_error

interface: surveygeometrymartin2010alfalfa
Description: Constructors for the Martin et al. [2010] survey geometry class.
Code lines: 4
Contained by: file geometry.surveys.Martin-2010-ALFALFA.F90

file: geometry.surveys.Montero-Dorta-2009-SDSS.F90
Description: Implements the geometry of the SDSS survey used by Montero-Dorta and Prada [2009].
Code lines: 169
Modules used: cosmology_functions, galacticus_paths

function: monterodorta2009sdssconstructorinternal
Description: Default constructor for the Montero-Dorta and Prada [2009] survey geometry class.
Code lines: 46
Contained by: file geometry.surveys.Montero-Dorta-2009-SDSS.F90
Modules used: galacticus_error

function: monterodorta2009sdssconstructorparameters
Description: Constructor for the Montero-Dorta and Prada [2009] conditional mass function class which takes a parameter set as input.

Code lines: 21
Contained by: file geometry.surveys.Montero-Dorta-2009-SDSS.F90
Modules used: input_parameters

subroutine: monterodorta2009sdssdestructor
Description: Destructor for the "monteroDorta2009SDSS" survey geometry class.
Code lines: 7
Contained by: file geometry.surveys.Montero-Dorta-2009-SDSS.F90

function: monterodorta2009sdssdistancemaximum
Description: Compute the maximum distance at which a galaxy is visible.
Code lines: 26
Contained by: file geometry.surveys.Montero-Dorta-2009-SDSS.F90
Modules used: cosmology_functions_options galacticus_error

function: monterodorta2009sdssdistanceminimum
Description: Compute the maximum distance at which a galaxy is visible.
Code lines: 15
Contained by: file geometry.surveys.Montero-Dorta-2009-SDSS.F90
Modules used: cosmology_functions_options galacticus_error

interface: surveygeometrymonterodorta2009sdss
Description: Constructors for the Montero-Dorta and Prada [2009] survey geometry class.
Code lines: 4
Contained by: file geometry.surveys.Montero-Dorta-2009-SDSS.F90

file: geometry.surveys.Moustakas-2013-PRIMUS.F90
Description: Implements the geometry of the PRIMUS survey used by Moustakas et al. [2013].
Code lines: 252
Modules used: cosmology_functions galacticus_paths

function: moustakas2013primusangularpowermaximumdegree
Description: Return the maximum degree for which angular power is computed for the Moustakas et al. [2013] survey.
Code lines: 8
Contained by: file geometry.surveys.Moustakas-2013-PRIMUS.F90

function: moustakas2013primusconstructorinternal
Description: Generic constructor for the Moustakas et al. [2013] mass function class.
Code lines: 42
Contained by: file geometry.surveys.Moustakas-2013-PRIMUS.F90
Modules used: cosmology_functions cosmology_functions_options galacticus_error input_parameters

function: moustakas2013primusconstructorparameters
Description: Default constructor for the Moustakas et al. [2013] conditional mass function class.
Code lines: 22
Contained by: file geometry.surveys.Moustakas-2013-PRIMUS.F90
Modules used: input_parameters

subroutine: `moustakas2013primusdestructor`
Description: Destructor for the "moustakas2013PRIMUS" survey geometry class.
Code lines: 7
Contained by: file `geometry.surveys.Moustakas-2013-PRIMUS.F90`

function: `moustakas2013primusdistancemaximum`
Description: Compute the maximum distance at which a galaxy is visible.
Code lines: 36
Contained by: file `geometry.surveys.Moustakas-2013-PRIMUS.F90`
Modules used: `cosmology_functions_options` `galacticus_error`

function: `moustakas2013primusdistanceminimum`
Description: Compute the minimum distance at which a galaxy is included.
Code lines: 10
Contained by: file `geometry.surveys.Moustakas-2013-PRIMUS.F90`

function: `moustakas2013primusfieldcount`
Description: Return the number of fields in this sample.
Code lines: 8
Contained by: file `geometry.surveys.Moustakas-2013-PRIMUS.F90`

function: `moustakas2013primusfieldpairindex`
Description: Compute the index of a pair of fields in the Moustakas et al. [2013] survey.
Code lines: 10
Contained by: file `geometry.surveys.Moustakas-2013-PRIMUS.F90`

function: `moustakas2013primusmangledirectory`
Description: Return the path to the directory containing MANGLE files.
Code lines: 9
Contained by: file `geometry.surveys.Moustakas-2013-PRIMUS.F90`

subroutine: `moustakas2013primusmanglefiles`
Description: Return a list of MANGLE files.
Code lines: 9
Contained by: file `geometry.surveys.Moustakas-2013-PRIMUS.F90`

function: `moustakas2013primusvolumemaximum`
Description: Compute the maximum volume within which a galaxy is visible.
Code lines: 14
Contained by: file `geometry.surveys.Moustakas-2013-PRIMUS.F90`
Modules used: `galacticus_error`

interface: `surveygeometrymoustakas2013primus`
Description: Constructors for the Moustakas et al. [2013] survey geometry class.
Code lines: 4
Contained by: file `geometry.surveys.Moustakas-2013-PRIMUS.F90`

file: `geometry.surveys.Muzzin-2013-ULTRAVISTA.F90`
Description: Implements the geometry of the ULTRAVISTA survey used by Muzzin et al. [2013].
Code lines: 231
Modules used: `cosmology_functions` `galacticus_paths`

function: `muzzin2013ultravistaangularpowermaximumdegree`
Description: Return the maximum degree for which angular power is computed for the Muzzin et al. [2013] survey.
Code lines: 8
Contained by: file `geometry.surveys.Muzzin-2013-ULTRAVISTA.F90`

function: `muzzin2013ultravistaconstructorinternal`
Description: Internal constructor for the Muzzin et al. [2013] mass function class.
Code lines: 41
Contained by: file `geometry.surveys.Muzzin-2013-ULTRAVISTA.F90`
Modules used: `cosmology_functions_options` `galacticus_error`

function: `muzzin2013ultravistaconstructorparameters`
Description: Default constructor for the Muzzin et al. [2013] conditional mass function class.
Code lines: 22
Contained by: file `geometry.surveys.Muzzin-2013-ULTRAVISTA.F90`
Modules used: `input_parameters`

subroutine: `muzzin2013ultravistadestructor`
Description: Destructor for the "muzzin2013ULTRAVISTA" survey geometry class.
Code lines: 7
Contained by: file `geometry.surveys.Muzzin-2013-ULTRAVISTA.F90`

function: `muzzin2013ultravistadistancemaximum`
Description: Compute the maximum distance at which a galaxy is visible.
Code lines: 29
Contained by: file `geometry.surveys.Muzzin-2013-ULTRAVISTA.F90`
Modules used: `cosmology_functions_options` `galacticus_error`

function: `muzzin2013ultravistadistanceminimum`
Description: Compute the minimum distance at which a galaxy is included.
Code lines: 10
Contained by: file `geometry.surveys.Muzzin-2013-ULTRAVISTA.F90`

function: `muzzin2013ultravistafieldcount`
Description: Return the number of fields in this sample.
Code lines: 8
Contained by: file `geometry.surveys.Muzzin-2013-ULTRAVISTA.F90`

function: `muzzin2013ultravistamangledirectory`
Description: Return the path to the directory containing MANGLE files.
Code lines: 9
Contained by: file `geometry.surveys.Muzzin-2013-ULTRAVISTA.F90`

subroutine: `muzzin2013ultravistamanglefiles`
Description: Return a list of MANGLE files.
Code lines: 10
Contained by: file `geometry.surveys.Muzzin-2013-ULTRAVISTA.F90`

function: `muzzin2013ultravistavolumemaximum`
Description: Compute the maximum volume within which a galaxy is visible.
Code lines: 11
Contained by: file `geometry.surveys.Muzzin-2013-ULTRAVISTA.F90`
Modules used: `galacticus_error`

interface: `surveygeometrymuzzin2013ultravista`
Description: Constructors for the Muzzin et al. [2013] survey geometry class.
Code lines: 4
Contained by: file `geometry.surveys.Muzzin-2013-ULTRAVISTA.F90`

file: `geometry.surveys.Tomczak-2014-ZFOURGE.F90`
Description: Implements the geometry of the ZFOURGE survey used by Tomczak et al. [2014].
Code lines: 233
Modules used: `cosmology_functions` `galacticus_paths`

interface: `surveygeometrytomczak2014zfourge`
Description: Constructors for the Tomczak et al. [2014] survey geometry class.
Code lines: 4
Contained by: file `geometry.surveys.Tomczak-2014-ZFOURGE.F90`

function: `tomczak2014zfourgeangularpowermaximumdegree`
Description: Return the maximum degree for which angular power is computed for the Tomczak et al. [2014] survey.
Code lines: 8
Contained by: file `geometry.surveys.Tomczak-2014-ZFOURGE.F90`

function: `tomczak2014zfourgeconstructorinternal`
Description: Generic constructor for the Tomczak et al. [2014] mass function class.
Code lines: 43
Contained by: file `geometry.surveys.Tomczak-2014-ZFOURGE.F90`
Modules used: `cosmology_functions_options` `galacticus_error`

function: `tomczak2014zfourgeconstructorparameters`
Description: Default constructor for the Tomczak et al. [2014] conditional mass function class.
Code lines: 22
Contained by: file `geometry.surveys.Tomczak-2014-ZFOURGE.F90`
Modules used: `input_parameters`

subroutine: `tomczak2014zfourgedestructor`
Description: Destructor for the "tomczak2014ZFOURGE" survey geometry class.
Code lines: 7
Contained by: file `geometry.surveys.Tomczak-2014-ZFOURGE.F90`

function: `tomczak2014zfourgedistancemaximum`
Description: Compute the maximum distance at which a galaxy is visible.
Code lines: 30
Contained by: file `geometry.surveys.Tomczak-2014-ZFOURGE.F90`
Modules used: `cosmology_functions_options` `galacticus_error`

function: `tomczak2014zfourgedistanceminimum`
Description: Compute the minimum distance at which a galaxy is included.
Code lines: 10
Contained by: file `geometry.surveys.Tomczak-2014-ZFOURGE.F90`

function: `tomczak2014zfourgefieldcount`
Description: Return the number of fields in this sample.
Code lines: 8
Contained by: file `geometry.surveys.Tomczak-2014-ZFOURGE.F90`

function: `tomczak2014zfourgemangledirectory`
Description: Return the path to the directory containing MANGLE files.
Code lines: 9
Contained by: file `geometry.surveys.Tomczak-2014-ZFOURGE.F90`

subroutine: `tomczak2014zfourgemanglefiles`
Description: Return a list of MANGLE files.
Code lines: 9
Contained by: file `geometry.surveys.Tomczak-2014-ZFOURGE.F90`

function: `tomczak2014zfourgevolumemaximum`
Description: Compute the maximum volume within which a galaxy is visible.
Code lines: 11
Contained by: file `geometry.surveys.Tomczak-2014-ZFOURGE.F90`
Modules used: `galacticus_error`

file: `geometry.surveys.combined.F90`
Description: Implements a survey geometry which combines multiple other surveys.
Code lines: 220

function: `combinedangularpower`
Description: Return the survey angular power C_ℓ^{ij} from MANGLE polygons.
Code lines: 11
Contained by: file `geometry.surveys.combined.F90`
Modules used: `galacticus_error`

function: `combinedangularpoweravailable`
Description: Return false to indicate that survey angular power is not available.
Code lines: 8
Contained by: file `geometry.surveys.combined.F90`

function: `combinedconstructorinternal`
Description: Internal constructor for the combined output analysis weight operator class.
Code lines: 14
Contained by: file geometry.surveys.combined.F90

function: `combinedconstructorparameters`
Description: Constructor for the "combined" survey geometry class which takes a parameter set as input.
Code lines: 22
Contained by: file geometry.surveys.combined.F90
Modules used: input_parameters

subroutine: `combineddeepcopy`
Description: Perform a deep copy for the `combined` surveyGeometry class.
Code lines: 31
Contained by: file geometry.surveys.combined.F90
Modules used: galacticus_error

subroutine: `combineddestructor`
Description: Destructor for the combined weight operator class.
Code lines: 16
Contained by: file geometry.surveys.combined.F90

function: `combinedpointincluded`
Description: Return true if a point is included in the combined survey geometry.
Code lines: 17
Contained by: file geometry.surveys.combined.F90
Modules used: galacticus_error

function: `combinedsolidangle`
Description: Return the survey solid angle.
Code lines: 11
Contained by: file geometry.surveys.combined.F90
Modules used: galacticus_error

function: `combinedwindowfunctionavailable`
Description: Return false to indicate that survey window function is not available.
Code lines: 8
Contained by: file geometry.surveys.combined.F90

subroutine: `combinedwindowfunctions`
Description: Provides window functions for combined survey geometries.
Code lines: 14
Contained by: file geometry.surveys.combined.F90
Modules used: galacticus_error iso_c_binding

interface: `surveygeometrycombined`
Code lines: 3
Contained by: file geometry.surveys.combined.F90

type: `surveygeometrylist`
Code lines: 3
Contained by: file `geometry.surveys.combined.F90`

file: `geometry.surveys.full_sky.F90`
Description: Implements survey geometries over the full sky.
Code lines: 268
Modules used: `cosmology_functions`

function: `fullskyangularpower`
Description: Return the angular power for the full sky.
Code lines: 14
Contained by: file `geometry.surveys.full_sky.F90`
Modules used: `numerical_constants_math`

function: `fullskyangularpoweravailable`
Description: Return true to indicate that survey angular power is available.
Code lines: 8
Contained by: file `geometry.surveys.full_sky.F90`

function: `fullskyconstructorinternal`
Description: Constructor for the full sky survey class which allows specification of minimum and maximum redshifts.
Code lines: 16
Contained by: file `geometry.surveys.full_sky.F90`
Modules used: `cosmology_functions_options`

function: `fullskyconstructorparameters`
Description: Default constructor for the full sky survey geometry.
Code lines: 32
Contained by: file `geometry.surveys.full_sky.F90`
Modules used: `input_parameters`

subroutine: `fullskydestructor`
Description: Destructor for the "fullSky" survey geometry class.
Code lines: 7
Contained by: file `geometry.surveys.full_sky.F90`

function: `fullskydistancemaximum`
Description: Compute the maximum distance at which a galaxy is visible.
Code lines: 10
Contained by: file `geometry.surveys.full_sky.F90`

function: `fullskydistanceminimum`
Description: Compute the minimum distance at which a galaxy is visible.
Code lines: 10
Contained by: file `geometry.surveys.full_sky.F90`

function: `fullskypointincluded`
Description: Return true if a point is included in the survey geometry.
Code lines: 13
Contained by: file `geometry.surveys.full_sky.F90`
Modules used: `vectors`

function: `fullskysolidangle`
Description: Return the solid angle of the Li and White [2009] sample.
Code lines: 10
Contained by: file `geometry.surveys.full_sky.F90`
Modules used: `numerical_constants_math`

function: `fullskywindowfunctionavailable`
Description: Return true to indicate that survey window function is available.
Code lines: 8
Contained by: file `geometry.surveys.full_sky.F90`

subroutine: `fullskywindowfunctions`
Description: Compute the window function for the survey.
Code lines: 69
Contained by: file `geometry.surveys.full_sky.F90`
Modules used: `fftw3`, `galacticus_display`, `galacticus_error`, `iso_c_binding`, `iso_varying_string`, `memory_management`, `meshes`, `numerical_constants_math`, `pseudo_random`, `string_handling`, `vectors`

interface: `surveygeometryfullsky`
Description: Constructors for the full sky survey geometry class.
Code lines: 4
Contained by: file `geometry.surveys.full_sky.F90`

file: `geometry.surveys.mangle.F90`
Description: Implements an abstract survey geometry using MANGLE polygons.
Code lines: 255
Modules used: `galacticus_paths`, `geometry_mangle`

function: `mangleangularpower`
Description: Return the survey angular power C_ℓ^{ij} from MANGLE polygons.
Code lines: 37
Contained by: file `geometry.surveys.mangle.F90`
Modules used: `file_utilities`, `galacticus_error`, `io_hdf5`, `memory_management`, `string_handling`, `system_command`

function: `mangleangularpoweravailable`

Description: Return true to indicate that survey angular power is available.
Code lines: 8
Contained by: file geometry.surveys.mangle.F90

function: manglefieldpairindex
Description: Compute the index of a pair of fields in MANGLE-based survey geometries.
Code lines: 11
Contained by: file geometry.surveys.mangle.F90

subroutine: mangleinitialize
Description: Internal constructor for the MANGLE conditional mass function class.
Code lines: 9
Contained by: file geometry.surveys.mangle.F90

function: manglepointincluded
Description: Return true if a point is included in the survey geometry.
Code lines: 28
Contained by: file geometry.surveys.mangle.F90
Modules used: galacticus_error vectors

function: manglesolidangle
Description: Return the survey solid angle computed from MANGLE polygons.
Code lines: 35
Contained by: file geometry.surveys.mangle.F90
Modules used: galacticus_error string_handling

function: manglewindowfunctionavailable
Description: Return false to indicate that survey window function is not available.
Code lines: 8
Contained by: file geometry.surveys.mangle.F90

subroutine: manglewindowfunctions
Description: Provides window functions for MANGLE-based survey geometries.
Code lines: 14

file: halo_model.conditional_mass_function.Behroozi2010.F90
Description: Implements a class for the conditional mass functions using the Behroozi et al. [2010] fitting function.
Code lines: 370
Modules used: tables

subroutine: behroozi2010compute
Description: Computes the cumulative conditional mass function, $\langle N(M_\star|M_{\rm halo})\rangle \equiv \phi(M_\star|M_{\rm halo})$ using the fitting formula of Behroozi et al. [2010].
Code lines: 63
Contained by: file halo_model.conditional_mass_function.Behroozi2010.F90
Modules used: table_labels

function: behroozi2010constructorinternal
Description: Internal constructor for the Behroozi et al. [2010] conditional mass function class.
Code lines: 14
Contained by: file halo_model.conditional_mass_function.Behroozi2010.F90

function: `behroozi2010constructorparameters`
Description: Constructor for the `behroozi2010` conditional mass function class which builds the object from a parameter set.
Code lines: 122
Contained by: file `halo_model.conditional_mass_function.Behroozi2010.F90`
Modules used: `input_parameters`

subroutine: `behroozi2010destructor`
Description: Destructor for the Behroozi et al. [2010] conditional mass function class.
Code lines: 8
Contained by: file `halo_model.conditional_mass_function.Behroozi2010.F90`

function: `behroozi2010fshmrinverse`
Description: The median mass vs. halo mass relation functional form from Behroozi et al. [2010].
Code lines: 17
Contained by: file `halo_model.conditional_mass_function.Behroozi2010.F90`

function: `behroozi2010massfunction`
Description: Compute the cumulative conditional mass function, $\langle N(M_\star|M_{\rm halo})\rangle \equiv \phi(M_\star|M_{\rm halo})$ using the fitting formula of Behroozi et al. [2010].
Code lines: 33
Contained by: file `halo_model.conditional_mass_function.Behroozi2010.F90`
Modules used: `galacticus_error`

function: `behroozi2010massfunctionvariance`
Description: Computes the variance in the cumulative conditional mass function, $\langle N(M_\star|M_{\rm halo})\rangle \equiv \phi(M_\star|M_{\rm halo})$ using the fitting formula of Behroozi et al. [2010]. Assumes that the number of satellite galaxies is Poisson distributed, while the number of central galaxies follows a Bernoulli distribution, and that the numbers of satellites and centrals are uncorrelated.
Code lines: 18
Contained by: file `halo_model.conditional_mass_function.Behroozi2010.F90`

subroutine galacticus_state_store

file: halo_model.power_spectrum_modifier.identity.F90
Description: Implements a identity modifier for power spectra in the halo model of clustering.
Code lines: 64

interface: halomodelpowerspectrummodifieridentity
Description: Constructors for the identity halo model power spectrum modifier class.
Code lines: 3
Contained by: file halo_model.power_spectrum_modifier.identity.F90

function: identityconstructorparameters
Description: Default constructor for the identity hot halo outflow reincorporation class which takes a parameter set as input.
Code lines: 11
Contained by: file halo_model.power_spectrum_modifier.identity.F90
Modules used: input_parameters

subroutine: identitymodify
Description: Applies a identity modification to a halo model power spectrum.
Code lines: 14
Contained by: file halo_model.power_spectrum_modifier.identity.F90

file: halo_model.power_spectrum_modifier.triaxiality.F90

Description: Implements a triaxiality modifier for power spectra in the halo model of clustering based on the results of Smith and Watts [2005].
Code lines: 147
Modules used: cosmology_parameters tables

interface: halomodelpowerspectrummodifiertriaxiality
Description: Constructors for the triaxiality halo model power spectrum modifier class.
Code lines: 4
Contained by: file halo_model.power_spectrum_modifier.triaxiality.F90

function: triaxialityconstructorinternal
Description: Default constructor for the triaxiality hot halo outflow reincorporation class.

subroutine: triaxialitydestructor
Description: Destructor for the triaxiality halo model power spectrum modifier class.
Code lines: 7
Contained by: file halo_model.power_spectrum_modifier.triaxiality.F90

subroutine: triaxialitymodify
Description: Applies a triaxiality modification to a halo model power spectrum based on the results of Smith and Watts [2005].
Code lines: 52
Contained by: file halo_model.power_spectrum_modifier.triaxiality.F90
Modules used: galacticus_error vectors

file: halo_model.projected_correlation_function.F90
Description: Contains a module which implements calculations of projected correlation functions using the halo model.
Code lines: 332

module: halo_model_projected_correlations
Description: Implements calculations of projected correlation functions using the halo model.
Code lines: 310
Contained by: file halo_model.projected_correlation_function.F90
Used by:

function	subroutine
projectedcorrelationfunctionevaluate	halomodelprojectedcorrelationfunctionperform

subroutine: halo_model_projected_correlation
Description: Compute the projected correlation function of galaxies above a specified mass using the halo model.

Code lines: 295
Contained by: module halo_model_projected_correlations
Modules used: conditional_mass_functions, cosmology_functions, dark_matter_halo_biases, dark_matter_halo_scales, dark_matter_profile_scales, dark_matter_profiles_dmo, fftlogs, fgsl, galacticus_error, galacticus_nodes, geometry_surveys, halo_mass_functions, linear_growth, memory_management, node_component_dark_matter_profile_scale, numerical_constants_math, numerical_integration, numerical_ranges, power_spectra, table_labels, tables

function: binningintegrandweight
Description: The weight function applied to the projected correlation function when integrating into bins.
Code lines: 7
Contained by: subroutine halo_model_projected_correlation

function: normalizationintegrand
Description: Integrand for the normalization term in the power spectrum.
Code lines: 7
Contained by: subroutine halo_model_projected_correlation

function: normalizationtimeintegrand
Description: Time integrand for the normalization term in the power spectrum.
Code lines: 13
Contained by: subroutine halo_model_projected_correlation

function: powerspectrumonehalointegrand
Description: Integrand for the one-halo term in the power spectrum.
Code lines: 26
Contained by: subroutine halo_model_projected_correlation
Modules used: galacticus_calculations_resets

function: powerspectrumonehalotimeintegrand
Description: Time integrand for the one-halo term in the power spectrum.
Code lines: 22
Contained by: subroutine halo_model_projected_correlation
Modules used: galacticus_display

function: powerspectrumtwohalointegrand
Description: Integrand for the two-halo term in the power spectrum.
Code lines: 20
Contained by: subroutine halo_model_projected_correlation
Modules used: galacticus_calculations_resets

function: `powerspectrumtwohalotimeintegrand`
Description: Time integrand for the two-halo term in the power spectrum.
Code lines: 22
Contained by: subroutine `halo_model_projected_correlation`
Modules used: `galacticus_display`

function: `projectionintegrandweight`
Description: The weight function applied to the correlation function when integrating to get the projected correlation function.
Code lines: 11
Contained by: subroutine `halo_model_projected_correlation`

function: `volumetimeintegrand`
Description: Volume integrand for the normalization term in the power spectrum.
Code lines: 8
Contained by: subroutine `halo_model_projected_correlation`

file: `hdf5FCInterop.F90`
Description: Contains a program which determine C interoperable types corresponding to HDF5 types.
Code lines: 70

program: `hdf5fcinterop`
Description: Determine C interoperable types corresponding to HDF5 types. This allows us to avoid compiler warnings about possible C non-interoperability if we were to use the types provided directly by HDF5.
Code lines: 44
Contained by: file `hdf5FCInterop.F90`
Modules used: `hdf5` `iso_c_binding`

file: `hiiRegions.emission_lines.F90`
Description: Contains a module that provides functions for emission line calculations.

Contained by: file `hiiRegions.emission_lines.F90`
Modules used: `iso_varying_string`
Used by: subroutine `filter_response_load` subroutine `stellar_luminosities_initialize` subroutine `stellar_luminosities_special_cases`

subroutine: `emissionlinedatabaseinitialize`
Description: Initialize a database of emission line properties.
Code lines: 28
Contained by: module `hii_region_emission_lines`
Modules used: `galacticus_paths` `io_hdf5`

function: `emissionlinewavelength`
Description: Return the wavelength of a named emission line.
Code lines: 19
Contained by: module hii_region_emission_lines
Modules used: galacticus_error

file: `hot_halo.cold_mode.density_profile.core_radius.F90`
Description: Contains a module which provides a class that implements core radii for cored cold mode hot halo mass distributions.
Code lines: 40

module: `hot_halo_cold_mode_density_core_radii`
Description: Provides a module which provides a class that implements core radii for cored cold mode hot halo mass distributions.
Code lines: 18
Contained by: file hot_halo.cold_mode.density_profile.core_radius.F90
Modules used: galacticus_nodes
Used by: subroutine galacticus_function_classes_destroy; subroutine galacticus_state_retrieve; subroutine galacticus_state_store; subroutine node_component_hot_halo_cold_mode_thread_initialize; module node_component_hot_halo_cold_mode_structure_tasks

file: `hot_halo.cold_mode.density_profile.core_radius.virial_radius.F90`
Description: Implements a cold mode hot halo mass distribution core radius class which sets the core radius to a fraction of the virial radius.
Code lines: 100
Modules used: dark_matter_halo_scales

interface: `hothalocoldmodecoreradiivirialfraction`
Description: Constructors for the `virialRadiusFraction` hot halo mass distribution core radius class.
Code lines: 4
Contained by: file hot_halo.cold_mode.density_profile.core_radius.virial_radius.F90

function: `virialradiusfractionconstructorinternal`
Description: Default constructor for the `virialRadiusFraction` cold mode hot halo mass distribution core radius class.
Code lines: 10
Contained by: file hot_halo.cold_mode.density_profile.core_radius.virial_radius.F90
Modules used: input_parameters

function: `virialradiusfractionconstructorparameters`
Description: A constructor for the `virialRadiusFraction` cold mode hot halo mass distribution core radius class which builds the object from a parameter set.
Code lines: 23
Contained by: file hot_halo.cold_mode.density_profile.core_radius.virial_radius.F90
Modules used: input_parameters

subroutine: `virialradiusfractiondestructor`

Description: Destructor for the `virialRadiusFraction` cold mode hot halo mass distribution core radius class.
Code lines: 7
Contained by: file `hot_halo.cold_mode.density_profile.core_radius.virial_radius.F90`

function: `virialradiusfractionradius`
Description: Return the core radius of the hot halo mass distribution.
Code lines: 8
Contained by: file `hot_halo.cold_mode.density_profile.core_radius.virial_radius.F90`

file: `hot_halo.mass_distribution.Enzo_hydrostatic.F90`
Description: An implementation of the hot halo mass distribution class which uses the "hydrostatic" profile used by the Enzo simulation code.
Code lines: 279
Modules used: `hot_halo_mass_distributions_core_radii` `hot_halo_temperature_profiles`

function: `enzohydrostaticconstructorinternal`
Description: Generic constructor for the `enzoHydrostatic` hot halo mass distribution class.
Code lines: 11
Contained by: file `hot_halo.mass_distribution.Enzo_hydrostatic.F90`
Modules used: `array_utilities` `galacticus_error`

function: `enzohydrostaticconstructorparameters`
Description: Default constructor for the `enzoHydrostatic` hot halo mass distribution class.
Code lines: 16
Contained by: file `hot_halo.mass_distribution.Enzo_hydrostatic.F90`
Modules used: `input_parameters`

function: `enzohydrostaticdensity`
Description: Return the density in a `enzoHydrostatic` hot halo mass distribution.
Code lines: 13
Contained by: file `hot_halo.mass_distribution.Enzo_hydrostatic.F90`

function: `enzohydrostaticdensitylogslope`
Description: Return the logarithmic slope of the density profile in a `enzoHydrostatic` hot halo mass distribution.
Code lines: 16
Contained by: file `hot_halo.mass_distribution.Enzo_hydrostatic.F90`

function: `enzohydrostaticdensitynormalization`
Description: Return the density normalization in a `enzoHydrostatic` hot halo mass distribution.
Code lines: 29
Contained by: file `hot_halo.mass_distribution.Enzo_hydrostatic.F90`
Modules used: `fgsl` `galacticus_nodes` `numerical_integration`

subroutine: `enzohydrostaticdestructor`
Description: Destructor for the `enzoHydrostatic` hot halo mass distribution class.
Code lines: 8

Contained by: file hot_halo.mass_distribution.Enzo_hydrostatic.F90

function: enzohydrostaticenclosedmass
Description: Return the enclosed mass in a enzoHydrostatic hot halo mass distribution.
Code lines: 30
Contained by: file hot_halo.mass_distribution.Enzo_hydrostatic.F90
Modules used: fgsl galacticus_nodes numerical_integration

function: enzohydrostaticenclosedmassintegrand
Description: Integrand used in finding the normalization of the enzoHydrostatic hot halo mass distribution.
Code lines: 15
Contained by: file hot_halo.mass_distribution.Enzo_hydrostatic.F90
Modules used: numerical_constants_math

function: enzohydrostaticradialmoment
Description: Return a radial moment of an enzoHydrostatic hot halo mass distribution.
Code lines: 45
Contained by: file hot_halo.mass_distribution.Enzo_hydrostatic.F90
Modules used: fgsl galacticus_nodes iso_c_binding numerical_integration

function: enzohydrostaticradialmomentintegrand
Description: Integrand used in finding the normalization of the enzoHydrostatic hot halo mass distribution.
Code lines: 15
Contained by: function enzohydrostaticradialmoment
Modules used: hot_halo_temperature_profiles

function: enzohydrostaticrotationnormalization
Description: Return the relation between specific angular momentum and rotation velocity (assuming a rotation velocity that is constant in radius) for node. Specifically, the normalization, A, returned is such that $V_{\rm rot} = AJ/M$.
Code lines: 13
Contained by: file hot_halo.mass_distribution.Enzo_hydrostatic.F90
Modules used: galacticus_nodes

interface: hothalomassdistributionenzohydrostatic
Description: Constructors for the enzoHydrostatic hot halo mass distribution class.
Code lines: 4
Contained by: file hot_halo.mass_distribution.Enzo_hydrostatic.F90

file: hot_halo.mass_distribution.F90
Description: Contains a module which provides a hot halo mass distribution class.
Code lines: 176

module: hot_halo_mass_distributions
Description: Provides an object which provides a hot halo mass distribution class.

Code lines: 26
Contained by: file `hot_halo.mass_distribution.PatejLoeb2015.F90`
Modules used: `galacticus_nodes`

function: `patejloeb2015radialmoment`

Description: Compute a radial moment in a `patejLoeb2015` hot halo mass distribution. For this profile we have:

$$\rho_{\rm g}(r) = f\Gamma(r/s)^{3\Gamma-3}\rho_{\rm DM}(s[r/s]^\Gamma). \tag{18.11}$$

Defining $R = s[r/s]^\Gamma$, such that $r/s = (R/s)^{1/\Gamma}$, and $\mathrm{d}r = \Gamma^{-1}(R/s)^{1/\Gamma-1}\mathrm{d}R$, then

$$\int r^m \rho_{\rm g}(r)\mathrm{d}r = f s^{(m-2)(\Gamma-1)/\Gamma} \int R^{(2\Gamma-2+m)/\Gamma}\rho_{\rm DM}(R)\mathrm{d}R, \tag{18.12}$$

or

$$\mathcal{R}_{\rm g}(r;m) = f s^{(m-2)(\Gamma-1)/\Gamma}\mathcal{R}_{\rm DM}(r;(2\Gamma-2+m)/\Gamma), \tag{18.13}$$

where $\mathcal{R}(r;m)$ is the $m^{\rm th}$ radial moment of the density profile.

Code lines: 39
Contained by: file `hot_halo.mass_distribution.PatejLoeb2015.F90`
Modules used: `galacticus_nodes`

function: `patejloeb2015rotationnormalization`

Description: Returns the relation between specific angular momentum and rotation velocity (assuming a rotation velocity that is constant in radius) for `node`. Specifically, the normalization, A, returned is such that $V_{\rm rot} = AJ/M$.

function: `betaprofileconstructorparameters`
Description: Constructor for the null `betaProfile` hot halo mass distributionclass which builds the object from a parameter set.
Code lines: 37
Contained by: file `hot_halo.mass_distribution.beta_profile.F90`
Modules used: `array_utilities` `galacticus_error` `galacticus_nodes` `input_parameters`

function: `betaprofiledensity`
Description: Return the density in a single-betaProfile hot halo mass distribution.
Code lines: 13
Contained by: file `hot_halo.mass_distribution.beta_profile.F90`
Modules used: `coordinates`

function: `betaprofiledensitylogslope`
Description: Return the logarithmic slope of the density of the hot halo at the given `radius`.
Code lines: 13
Contained by: file `hot_halo.mass_distribution.beta_profile.F90`
Modules used: `coordinates`

subroutine: `betaprofiledestructor`
Description: Destructor for the `betaProfile` hot halo mass distribution class.
Code lines: 7
Contained by: file `hot_halo.mass_distribution.beta_profile.F90`

function: `betaprofileenclosedmass`
Description: Return the mass enclosed in the hot halo at the given `radius`.
Code lines: 17
Contained by: file hot_halo.mass_distribution.beta_profile.F90
Modules used: galacticus_nodes

subroutine: `betaprofileinitialize`
Description: Initialize the β-profile hot halo density profile for the given `node`.
Code lines: 20
Contained by: file hot_halo.mass_distribution.beta_profile.F90
Modules used: galacticus_nodes

function: `betaprofileradialmoment`
Description: Return the radial moment of the density profile of the hot halo to the given `radius`.
Code lines: 13
Contained by: file hot_halo.mass_distribution.beta_profile.F90
Modules used: galacticus_nodes

function: `betaprofilerotationnormalization`
Description: Returns the relation between specific angular momentum and rotation velocity (assuming a rotation velocity that is constant in radius) for `node`. Specifically, the normalization, A, returned is such that $V_{\rm rot} = AJ/M$.
Code lines: 13
Contained by: file hot_halo.mass_distribution.beta_profile.F90
Modules used: galacticus_nodes

interface: `hothalomassdistributionbetaprofile`
Description: Constructors for the β-profile hot halo mass distribution class.
Code lines: 4
Contained by: file hot_halo.mass_distribution.beta_profile.F90

file: `hot_halo.mass_distribution.cored.core_radius.F90`
Description: Contains a module which provides an object that implements core radii for cored hot halo mass distributions.
Code lines: 40

module: `hot_halo_mass_distributions_core_radii`
Description: Provides an object that implements core radii for hot halo mass distributions.
Code lines: 18
Contained by: file hot_halo.mass_distribution.cored.core_radius.F90
Modules used: galacticus_nodes
Used by: subroutine galacticus_function_classes_destroy; subroutine galacticus_state_retrieve; subroutine galacticus_state_store; file hot_halo.mass_distribution.Enzo_hydrostatic.F90; file hot_halo.mass_distribution.beta_profile.F90

file: `hot_halo.mass_distribution.cored.core_radius.growing.F90`
Description: An implementation of the hot halo mass distribution core radius class in which the core grows as the hot halo content is depleted.
Code lines: 186
Modules used: `cosmology_parameters` `dark_matter_halo_scales` `tables`

function: `growingconstructorinternal`
Description: Default constructor for the `growing` hot halo mass distribution core radius class.
Code lines: 14
Contained by: file `hot_halo.mass_distribution.cored.core_radius.growing.F90`
Modules used: `galacticus_error` `galacticus_nodes`

function: `growingconstructorparameters`
Description: Constructor for the `growing` hot halo mass distribution core radius class which builds the object from a parameter set.
Code lines: 34
Contained by: file `hot_halo.mass_distribution.cored.core_radius.growing.F90`
Modules used: `input_parameters`

function: `growingcorevirialdensityfunction`
Description: Returns the function $(1+r_c^2)[1-r_c \tan^{-1}(1/r_c]$ which is proportional to the density at the virial radius of a cored isothermal profile with core radius r_c (in units of the virial radius) per unit mass.
Code lines: 8
Contained by: file `hot_halo.mass_distribution.cored.core_radius.growing.F90`

subroutine: `growingdestructor`
Description: Destructor for the `growing` hot halo mass distribution class.
Code lines: 9
Contained by: file `hot_halo.mass_distribution.cored.core_radius.growing.F90`

function: `growingradius`
Description: Return the core radius of the hot halo mass distribution.
Code lines: 57
Contained by: file `hot_halo.mass_distribution.cored.core_radius.growing.F90`
Modules used: `galacticus_nodes`

interface: `hothalomassdistributioncoreradiusgrowing`
Description: Constructors for the `growing` hot halo mass distribution core radius class.
Code lines: 4
Contained by: file `hot_halo.mass_distribution.cored.core_radius.growing.F90`

file: `hot_halo.mass_distribution.cored.core_radius.virial_radius_fraction.F90`
Description: Implements a hot halo mass distribution core radius class which sets the core radius to a fraction of the virial radius.
Code lines: 99
Modules used: `dark_matter_halo_scales`

interface: `hothalomassdistributioncoreradiusvirialfraction`
Description: Constructors for the `virialFraction` hot halo mass distribution core radius class.
Code lines: 4
Contained by: file `hot_halo.mass_distribution.cored.core_radius.virial_radius_fraction.F90`

function: `virialfractionconstructorinternal`
Description: Default constructor for the `virialFraction` hot halo mass distribution core radius class.
Code lines: 10
Contained by: file `hot_halo.mass_distribution.cored.core_radius.virial_radius_fraction.F90`
Modules used: `input_parameters`

function: `virialfractionconstructorparameters`
Description: A constructor for the `virialFraction` hot halo mass distribution core radius class which builds the object from a parameter set.
Code lines: 23
Contained by: file `hot_halo.mass_distribution.cored.core_radius.virial_radius_fraction.F90`
Modules used: `input_parameters`

subroutine: `virialfractiondestructor`
Description: Destructor for the `virialFraction` hot halo mass distribution core radius class.
Code lines: 7
Contained by: file `hot_halo.mass_distribution.cored.core_radius.virial_radius_fraction.F90`

function: `virialfractionradius`
Description: Return the core radius of the hot halo mass distribution.
Code lines: 8
Contained by: file `hot_halo.mass_distribution.cored.core_radius.virial_radius_fraction.F90`

file: `hot_halo.mass_distribution.null.F90`
Description: A null implementation of the hot halo mass distribution class.
Code lines: 115

interface: `hothalomassdistributionnull`
Description: Constructors for the null hot halo mass distribution class.
Code lines: 3
Contained by: file `hot_halo.mass_distribution.null.F90`

function: `nullconstructorparameters`
Description: Constructor for the null hot halo mass distribution class which builds the object from a parameter set.
Code lines: 10
Contained by: file `hot_halo.mass_distribution.null.F90`
Modules used: `input_parameters`

function: `nulldensity`
Description: Return the density in a null hot halo mass distribution.
Code lines: 10
Contained by: file `hot_halo.mass_distribution.null.F90`

function: `nulldensitylogslope`
Description: Return the logarithmic slope of the density of the hot halo at the given `radius`.
Code lines: 10
Contained by: file `hot_halo.mass_distribution.null.F90`

function: `nullenclosedmass`
Description: Return the mass enclosed in the hot halo at the given `radius`.
Code lines: 10
Contained by: file `hot_halo.mass_distribution.null.F90`

function: `nullradialmoment`
Description: Return the density of the hot halo at the given `radius`.
Code lines: 10
Contained by: file `hot_halo.mass_distribution.null.F90`

function: `nullrotationnormalization`
Description: Returns the relation between specific angular momentum and rotation velocity (assuming a rotation velocity that is constant in radius) for `node`. Specifically, the normalization, A, returned is such that $V_{\rm rot} = AJ/M$.
Code lines: 11
Contained by: file `hot_halo.mass_distribution.null.F90`

file: `hot_halo.outflow_reincorporation.F90`
Description: Contains a module which provides a class that implements reincorporation of outflowed mass into the hot halo.
Code lines: 41

module: `hot_halo_outflows_reincorporations`
Description: Provides a class that implements reincorporation of outflowed mass into the hot halo.
Code lines: 19
Contained by: file `hot_halo.outflow_reincorporation.F90`
Modules used: `galacticus_nodes`
Used by: subroutine `galacticus_function_classes_destroy`; subroutine `galacticus_state_retrieve`; subroutine `galacticus_state_store`; module `node_component_hot_halo_standard`; subroutine `node_component_hot_halo_vs_delayed_rate_compute`

file: `hot_halo.outflow_reincorporation.Henriques2013.F90`
Description: An implementation of the hot halo outflow reincorporation class in which implements the model of Henriques et al. [2013].
Code lines: 135
Modules used: `cosmology_functions`; `dark_matter_halo_scales`

function: `henriques2013constructorinternal`
Description: Default constructor for the `henriques2013` hot halo outflow reincorporation class.
Code lines: 10

Contained by: file hot_halo.outflow_reincorporation.Henriques2013.F90

function: henriques2013constructorparameters
Description: Constructor for the henriques2013 hot halo outflow reincorporation class which takes a parameter set as input.
Code lines: 44
Contained by: file hot_halo.outflow_reincorporation.Henriques2013.F90
Modules used: input_parameters

subroutine: henriques2013destructor
Description: Destructor for the henriques2013 hot halo outflow reincorporation class.
Code lines: 8
Contained by: file hot_halo.outflow_reincorporation.Henriques2013.F90

function: henriques2013rate
Description: Return the rate of mass reincorporation for outflowed gas in the hot halo.
Code lines: 14
Contained by: file hot_halo.outflow_reincorporation.Henriques2013.F90
Modules used: galacticus_nodes

interface: hothalooutflowreincorporationhenriques2013
Description: Constructors for the henriques2013 hot halo outflow reincorporation class.
Code lines: 4
Contained by: file hot_halo.outflow_reincorporation.Henriques2013.F90

file: hot_halo.outflow_reincorporation.halo_dynamical_time.F90
Description: An implementation of the hot halo outflow reincorporation class in which reincorporation occurs on a multiple of the halo dynamical timescale.
Code lines: 102
Modules used: dark_matter_halo_scales

function: halodynamicaltimeconstructorinternal
Description: Default constructor for the haloDynamicalTime hot halo outflow reincorporation class.
Code lines: 9
Contained by: file hot_halo.outflow_reincorporation.halo_dynamical_time.F90

function: halodynamicaltimeconstructorparameters
Description: Default constructor for the haloDynamicalTime hot halo outflow reincorporation class which takes a parameter set as input.
Code lines: 23
Contained by: file hot_halo.outflow_reincorporation.halo_dynamical_time.F90
Modules used: input_parameters

subroutine: halodynamicaltimedestructor
Description: Destructor for the haloDynamicalTime hot halo outflow reincorporation class.
Code lines: 7
Contained by: file hot_halo.outflow_reincorporation.halo_dynamical_time.F90

function: halodynamicaltimerate

Description: Return the rate of mass reincorporation for outflowed gas in the hot halo.
Code lines: 11
Contained by: file hot_halo.outflow_reincorporation.halo_dynamical_time.F90
Modules used: galacticus_nodes

interface: hothalooutflowreincorporationhalodynamicaltime
Description: Constructors for the haloDynamicalTime hot halo outflow reincorporation class.
Code lines: 4
Contained by: file hot_halo.outflow_reincorporation.halo_dynamical_time.F90

file: hot_halo.outflow_reincorporation.velocity_maximum_scaling.F90
Description: An implementation of the hot halo outflow reincorporation class which uses simple scalings based on the halo maximum circular velocity.
Code lines: 217
Modules used: cosmology_functions, dark_matter_profiles_dmo, kind_numbers, math_exponentiation

interface: hothalooutflowreincorporationvelocitymaximumscaling
Description: Constructors for the velocityMaximumScaling hot halo outflow reincorporation class.
Code lines: 4
Contained by: file hot_halo.outflow_reincorporation.velocity_maximum_scaling.F90

subroutine: velocitymaximumscalingautohook
Description: Attach to the calculation reset event.
Code lines: 8
Contained by: file hot_halo.outflow_reincorporation.velocity_maximum_scaling.F90
Modules used: events_hooks

subroutine: velocitymaximumscalingcalculationreset
Description: Reset the halo scales calculation.
Code lines: 11
Contained by: file hot_halo.outflow_reincorporation.velocity_maximum_scaling.F90

function: velocitymaximumscalingconstructorinternal
Description: Default constructor for the velocityMaximumScaling hot halo outflow reincorporation class.
Code lines: 26
Contained by: file hot_halo.outflow_reincorporation.velocity_maximum_scaling.F90
Modules used: galacticus_error, galacticus_nodes

function: velocitymaximumscalingconstructorparameters
Description: Default constructor for the velocityMaximumScaling hot halo outflow reincorporation class which takes a parameter set as input.
Code lines: 50
Contained by: file hot_halo.outflow_reincorporation.velocity_maximum_scaling.F90
Modules used: input_parameters

subroutine: velocitymaximumscalingdestructor
Description: Destructor for the Galacticus format merger tree importer class.
Code lines: 10

Contained by: file hot_halo.outflow_reincorporation.velocity_maximum_scaling.F90
Modules used: events_hooks

function: velocitymaximumscalingrate
Description: Return the rate of mass reincorporation for outflowed gas in the hot halo.
Code lines: 34
Contained by: file hot_halo.outflow_reincorporation.velocity_maximum_scaling.F90
Modules used: galacticus_nodes

file: hot_halo.outflow_reincorporation.zero.F90
Description: An implementation of the hot halo outflow reincorporation class which gives zero reincorporation rate.
Code lines: 61

interface: hothalooutflowreincorporationzero
Description: Constructors for the zero hot halo outflow reincorporation class.
Code lines: 3
Contained by: file hot_halo.outflow_reincorporation.zero.F90

function: zeroconstructorparameters
Description: Default constructor for the zero hot halo outflow reincorporation class which takes a parameter set as input.
Code lines: 11
Contained by: file hot_halo.outflow_reincorporation.zero.F90
Modules used: input_parameters

function: zerorate
Description: Return the rate of mass reincorporation for outflowed gas in the hot halo.
Code lines: 9
Contained by: file hot_halo.outflow_reincorporation.zero.F90

file: hot_halo.ram_pressure_force.F90
Description: Contains a module that implements a class which provides calculations of ram pressure force.
Code lines: 40

module: hot_halo_ram_pressure_forces
Description: Implements a class which provides calculations of ram pressure force.
Code lines: 18
Contained by: file hot_halo.ram_pressure_force.F90
Modules used: galacticus_nodes
Used by:
- subroutine galacticus_function_classes_destroy
- subroutine galacticus_state_retrieve
- subroutine galacticus_state_store
- file hot_halo.ram_pressure_stripping.Font2008.F90
- file hot_halo.ram_pressure_stripping.timescale.ram_pressure_acceleration.F90
- file ram_pressure_stripping.mass_loss_rate.disks.simple.F90

file ram_pressure_stripping.mass_loss_-
rate.spheroids.simple.F90

file: hot_halo.ram_pressure_force.Font2008.F90
Description: Implements a model of ram pressure stripping of hot halos based on the methods of Font et al. [2008].
Code lines: 103
Modules used: hot_halo_mass_distributions

function: font2008constructorinternal
Description: Internal constructor for the font2008 hot halo ram pressure force class.
Code lines: 9
Contained by: file hot_halo.ram_pressure_force.Font2008.F90
Modules used: input_parameters

function: font2008constructorparameters
Description: Constructor for the font2008 hot halo ram pressure force class which builds the object from a parameter set.
Code lines: 13
Contained by: file hot_halo.ram_pressure_force.Font2008.F90
Modules used: input_parameters

subroutine: font2008destructor
Description: Destructor for the font2008 hot halo ram pressure force class.
Code lines: 7
Contained by: file hot_halo.ram_pressure_force.Font2008.F90

function: font2008force
Description: Return a ram pressure force due to the hot halo using the model of Font et al. [2008].
Code lines: 24
Contained by: file hot_halo.ram_pressure_force.Font2008.F90
Modules used: galacticus_nodes kepler_orbits satellite_orbits

interface: hothalorampressureforcefont2008
Description: Constructors for the font2008 hot halo ram pressure force class.
Code lines: 4
Contained by: file hot_halo.ram_pressure_force.Font2008.F90

file: hot_halo.ram_pressure_force.zero.F90
Description: Implements a model of ram pressure stripping of hot halos which always returns zero force.
Code lines: 60

interface: hothalorampressureforcezero
Description: Constructors for the zero hot halo ram pressure force class.
Code lines: 3
Contained by: file hot_halo.ram_pressure_force.zero.F90

function: zeroconstructorparameters

Description: Constructor for the `zero` hot halo ram pressure force class which builds the object from a parameter set.
Code lines: 10
Contained by: file hot_halo.ram_pressure_force.zero.F90
Modules used: input_parameters

function: `zeroforce`
Description: Return a zero ram pressure force due to the hot halo.
Code lines: 9
Contained by: file hot_halo.ram_pressure_force.zero.F90

file: `hot_halo.ram_pressure_stripping.F90`
Description: Contains a module that implements a class for calculations of ram pressure stripping of hot halos.
Code lines: 41

module: `hot_halo_ram_pressure_stripping`
Description: Implements a class for calculations of ram pressure stripping of hot halos.
Code lines: 19
Contained by: file hot_halo.ram_pressure_stripping.F90
Modules used: galacticus_nodes
Used by: subroutine galacticus_function_classes_destroy; subroutine galacticus_state_retrieve; subroutine galacticus_state_store; subroutine node_component_hot_halo_cold_mode_rate_compute; module node_component_hot_halo_standard

file: `hot_halo.ram_pressure_stripping.Font2008.F90`
Description: Implements a class for ram pressure stripping of hot halos based on the methods of Font et al. [2008].
Code lines: 217
Modules used: dark_matter_halo_scales; hot_halo_mass_distributions; hot_halo_ram_pressure_forces; kind_numbers

function: `font2008constructorinternal`
Description: Internal constructor for the `font2008` hot halo ram pressure stripping class.
Code lines: 12
Contained by: file hot_halo.ram_pressure_stripping.Font2008.F90
Modules used: input_parameters

function: `font2008constructorparameters`
Description: Constructor for the `font2008` hot halo ram pressure stripping class which builds the object from a parameter set.
Code lines: 29
Contained by: file hot_halo.ram_pressure_stripping.Font2008.F90
Modules used: input_parameters

subroutine: `font2008destructor`
Description: Destructor for the `font2008` hot halo ram pressure stripping class.

Code lines: 9
Contained by: file hot_halo.ram_pressure_stripping.Font2008.F90

function: font2008radiussolver
Description: Root function used in finding the ram pressure stripping radius.
Code lines: 19
Contained by: file hot_halo.ram_pressure_stripping.Font2008.F90
Modules used: galactic_structure_enclosed_masses galactic_structure_options numerical_constants_physical

function: font2008radiusstripped
Description: Return the ram pressure stripping radius due to the hot halo using the model of Font et al. [2008].
Code lines: 82
Contained by: file hot_halo.ram_pressure_stripping.Font2008.F90
Modules used: galacticus_display galacticus_error root_finder

interface: hothalorampressurestrippingfont2008
Description: Constructors for the font2008 hot halo ram pressure timescale class.
Code lines: 4
Contained by: file hot_halo.ram_pressure_stripping.Font2008.F90

file: hot_halo.ram_pressure_stripping.timescale.F90
Description: Contains a module that implements a class for calculations of ram pressure stripping timescales for hot halos.
Code lines: 40

module: hot_halo_ram_pressure_stripping_timescales
Description: Implements a class for calculations of ram pressure stripping timescales for hot halos.
Code lines: 18
Contained by: file hot_halo.ram_pressure_stripping.timescale.F90
Modules used: galacticus_nodes
Used by: subroutine galacticus_function_classes_destroy; subroutine galacticus_state_retrieve; subroutine galacticus_state_store; module node_component_hot_halo_standard

file: hot_halo.ram_pressure_stripping.timescale.halo_dynamical_time.F90
Description: Implements a class for the timescale of ram pressure stripping of hot halos in which the timescale is equal to the halo dynamical timescale.
Code lines: 89
Modules used: dark_matter_halo_scales

function: halodynamicaltimeconstructorinternal
Description: Internal constructor for the haloDynamicalTime hot halo ram pressure timescale class.
Code lines: 9
Contained by: file hot_halo.ram_pressure_stripping.timescale.halo_dynamical_time.F90
Modules used: input_parameters

function: `halodynamicaltimeconstructorparameters`
Description: Constructor for the `haloDynamicalTime` hot halo ram pressure timescale class which builds the object from a parameter set.
Code lines: 14
Contained by: file hot_halo.ram_pressure_stripping.timescale.halo_dynamical_time.F90
Modules used: input_parameters

subroutine: `halodynamicaltimedestructor`
Description: Destructor for the `haloDynamicalTime` hot halo ram pressure timescale class.
Code lines: 7
Contained by: file hot_halo.ram_pressure_stripping.timescale.halo_dynamical_time.F90

function: `halodynamicaltimetimescale`
Description: Return a ram pressure timescale due to the hot halo assuming that it equals the halo dynamical time.
Code lines: 8
Contained by: file hot_halo.ram_pressure_stripping.timescale.halo_dynamical_time.F90

interface: `hothalorampressuretimescalehalodynamicaltime`
Description: Constructors for the `haloDynamicalTime` hot halo ram pressure timescale class.
Code lines: 4
Contained by: file hot_halo.ram_pressure_stripping.timescale.halo_dynamical_time.F90

file: `hot_halo.ram_pressure_stripping.timescale.ram_pressure_acceleration.F90`
Description: Implements a class for the timescale of ram pressure stripping of hot halos in which the timescale is estimated from the ram pressure acceleration.
Code lines: 135
Modules used: dark_matter_halo_scales hot_halo_mass_distributions hot_halo_ram_pressure_forces

interface: `hothalorampressuretimescalerampressureacceleration`
Description: Constructors for the `ramPressureAcceleration` hot halo ram pressure timescale class.
Code lines: 4
Contained by: file hot_halo.ram_pressure_stripping.timescale.ram_pressure_acceleration.F90

function: `rampressureaccelerationconstructorinternal`
Description: Internal constructor for the `ramPressureAcceleration` hot halo ram pressure timescale class.
Code lines: 11
Contained by: file hot_halo.ram_pressure_stripping.timescale.ram_pressure_acceleration.F90
Modules used: input_parameters

function: `rampressureaccelerationconstructorparameters`
Description: Constructor for the `ramPressureAcceleration` hot halo ram pressure timescale class which builds the object from a parameter set.
Code lines: 19
Contained by: file hot_halo.ram_pressure_stripping.timescale.ram_pressure_acceleration.F90
Modules used: input_parameters

subroutine: `rampressureaccelerationdestructor`
Description: Destructor for the `ramPressureAcceleration` hot halo ram pressure timescale class.
Code lines: 9
Contained by: file `hot_halo.ram_pressure_stripping.timescale.ram_pressure_acceleration.F90`

function: `rampressureaccelerationtimescale`
Description: Computes the hot halo ram pressure stripping timescale, based on the acceleration due to ram pressure forces. This timescale is approximated as [Roediger and BrÃČÅŠggen, 2007] $\tau \approx \sqrt{2 r_\mathrm{outer} \Sigma_\mathrm{outer} / P_\mathrm{ram}}$, where r_outer is the current outer radius of the hot halo, Σ_outer is the surface density at that radius, and P_ram is the ram pressure force (per unit area). The surface density is approximated as $\Sigma_\mathrm{outer} \approx r_\mathrm{outer} \rho_\mathrm{outer}$, where ρ_outer is the density at the outer radius.
Code lines: 40
Contained by: file `hot_halo.ram_pressure_stripping.timescale.ram_pressure_acceleration.F90`
Modules used: `galacticus_nodes` `numerical_constants_astronomical` `numerical_constants_physical` `numerical_constants_prefixes`

file: `hot_halo.ram_pressure_stripping.virial_radius.F90`
Description: Implements a class for ram pressure stripping which simply returns the virial radius.
Code lines: 86
Modules used: `dark_matter_halo_scales`

interface: `hothalorampressurestrippingvirialradius`
Description: Constructors for the `virialRadius` hot halo ram pressure stripping class.
Code lines: 4
Contained by: file `hot_halo.ram_pressure_stripping.virial_radius.F90`

function: `virialradiusconstructorinternal`
Description: Internal constructor for the `virialRadius` hot halo ram pressure stripping class.
Code lines: 8
Contained by: file `hot_halo.ram_pressure_stripping.virial_radius.F90`

function: `virialradiusconstructorparameters`
Description: Constructor for the `virialRadius` hot halo ram pressure stripping class which builds the object from a parameter set.
Code lines: 13
Contained by: file `hot_halo.ram_pressure_stripping.virial_radius.F90`
Modules used: `input_parameters`

subroutine: `virialradiusdestructor`
Description: Destructor for the `virialRadius` hot halo ram pressure stripping class.
Code lines: 7
Contained by: file `hot_halo.ram_pressure_stripping.virial_radius.F90`

function: `virialradiusradiusstripped`
Description: Return the ram pressure stripping radius which is assumed to be equal to the virial radius.
Code lines: 8
Contained by: file `hot_halo.ram_pressure_stripping.virial_radius.F90`

file: `hot_halo.temperature_profile.Enzo_hydrostatic.F90`
Description: An implementation of the hot halo temperature class which uses the "hydrostatic" solution from the Enzo code.
Code lines: 121
Modules used: `dark_matter_profiles_dmo`

function: `enzohydrostaticconstructorinternal`
Description: Internal constructor for the enzoHydrostatic cooling rate class.
Code lines: 8
Contained by: file `hot_halo.temperature_profile.Enzo_hydrostatic.F90`

function: `enzohydrostaticconstructorparameters`
Description: Constructor for the enzoHydrostatic cooling rate class which builds the object from a parameter set.
Code lines: 13
Contained by: file `hot_halo.temperature_profile.Enzo_hydrostatic.F90`
Modules used: `input_parameters`

subroutine: `enzohydrostaticdestructor`
Description: Destructor for the `enzoHydrostatic` hot halo temperature profile class.
Code lines: 7
Contained by: file `hot_halo.temperature_profile.Enzo_hydrostatic.F90`

function: `enzohydrostatictemperature`
Description: Return the density in a `enzoHydrostatic` hot halo mass distribution.
Code lines: 19
Contained by: file `hot_halo.temperature_profile.Enzo_hydrostatic.F90`
Modules used: `numerical_constants_astronomical` `numerical_constants_atomic` `numerical_constants_physical` `numerical_constants_prefixes`

function: `enzohydrostatictemperaturelogslope`
Description: Return the logarithmic slope of the density profile in a `enzoHydrostatic` hot halo mass distribution.
Code lines: 18
Contained by: file `hot_halo.temperature_profile.Enzo_hydrostatic.F90`
Modules used: `numerical_constants_math`

interface: `hothalotemperatureprofileenzohydrostatic`
Description: Constructors for the enzoHydrostatic hot halo temperature profile class.
Code lines: 4
Contained by: file `hot_halo.temperature_profile.Enzo_hydrostatic.F90`

file: `hot_halo.temperature_profile.F90`
Description: Contains a module which provides a hot halo temperature profile class.
Code lines: 48

module: `hot_halo_temperature_profiles`
Description: Provides a hot halo temperature profile class.

Code lines: 26
Contained by: file hot_halo.temperature_profile.F90
Modules used: galacticus_nodes
Used by: file cooling.cooling_radius.beta_profile.F90; file cooling.cooling_radius.isothermal_profile.F90; file cooling.cooling_radius.simple.F90; subroutine galacticus_function_classes_destroy; subroutine galacticus_state_retrieve; subroutine galacticus_state_store; file hot_halo.mass_distribution.Enzo_hydrostatic.F90; function enzohydrostaticradialmomentintegrand; file nodes.property_extractor.ICM_SZ.F90; file nodes.property_extractor.ICM_Xray_luminosity.F90; module node_component_black_hole_standard

file: hot_halo.temperature_profile.virial.F90
Description: An implementation of the hot halo temperature class which uses an isothermal virial temperature.
Code lines: 103
Modules used: dark_matter_halo_scales

interface: hothalotemperatureprofilevirial
Description: Constructors for the virial hot halo temperature profile class.
Code lines: 4
Contained by: file hot_halo.temperature_profile.virial.F90

function: virialconstructorinternal
Description: Internal constructor for the virial cooling rate class.
Code lines: 8
Contained by: file hot_halo.temperature_profile.virial.F90

function: virialconstructorparameters
Description: Constructor for the virial cooling rate class which builds the object from a parameter set.
Code lines: 13
Contained by: file hot_halo.temperature_profile.virial.F90
Modules used: input_parameters

subroutine: virialdestructor
Description: Destructor for the virial hot halo temperature profile class.
Code lines: 7
Contained by: file hot_halo.temperature_profile.virial.F90

function: virialtemperature
Description: Return the density in a virial hot halo mass distribution.
Code lines: 10
Contained by: file hot_halo.temperature_profile.virial.F90

function: virialtemperaturelogslope
Description: Return the logarithmic slope of the density profile in a virial hot halo mass distribution.

Code lines: 11
Contained by: file hot_halo.temperature_profile.virial.F90

file: `instruments.filters.F90`
Description: Contains a module which implements calculations of filter response curves.
Code lines: 303

module: `instruments_filters`
Description: Implements calculations of filter response curves.
Code lines: 279
Contained by: file instruments.filters.F90
Modules used: `fgsl`, iso_varying_string
Used by: program benchmark_stellar_populations_luminosities, function sedfitconstructorinternal, function lmnstyemssnlineconstructorinternal, function lmnstystllrchrltfll2000constructorinternal, subroutine stellar_luminosities_initialize, subroutine stellar_luminosities_state_restore

subroutine stellar_population_luminosity_tabulate
function filter_luminosity_integrand_ab
function filter_luminosity_integrand
program test_stellar_populations_luminosities

function: filter_extent
Description: Return an array containing the minimum and maximum wavelengths tabulated for this specified filter.
Code lines: 11
Contained by: module instruments_filters

function: filter_get_index
Description: Return the index for the specified filter, loading that filter if necessary.
Code lines: 26
Contained by: module instruments_filters

function: filter_name
Description: Return the name of the specified filter.
Code lines: 8
Contained by: module instruments_filters

function: filter_response
Description: Return the filter response function at the given wavelength (specified in Angstroms). Note that we follow the convention of Hogg et al. [2002] and assume that the filter response gives the fraction of incident photons received by the detector at a given wavelength, multiplied by the relative photon response (which will be 1 for a photon-counting detector such as a CCD, or proportional to the photon energy for a bolometer/calorimeter type detector.
Code lines: 15
Contained by: module instruments_filters
Modules used: numerical_interpolation

subroutine: filter_response_load
Description: Load a filter response curve.
Code lines: 161
Contained by: module instruments_filters
Modules used: file_utilities, fox_dom, galacticus_error, galacticus_hdf5, galacticus_paths, hii_region_emission_lines, io_hdf5, io_xml, memory_management, numerical_constants_units, string_handling

function: filter_vega_offset
Description: Return the Vega to AB magnitude offset for the specified filter.
Code lines: 9
Contained by: module instruments_filters
Modules used: galacticus_error

function: filter_wavelength_effective

Description: Return the effective wavelength for the specified filter.
Code lines: 9
Contained by: module instruments_filters
Modules used: galacticus_error

type: filtertype
Description: A structure which holds filter response curves.
Code lines: 11
Contained by: module instruments_filters

file: interface.CAMB.F90
Description: Contains a module which provides various interfaces to the CAMB code.
Code lines: 511

module: interfaces_camb
Description: Provides various interfaces to the CAMB code.
Code lines: 489
Contained by: file interface.CAMB.F90
Modules used: file_utilities
Used by: subroutine cambcheckrange, subroutine buildtoolcambperform

subroutine: interface_camb_initialize
Description: Initialize the interface with CAMB, including downloading and compiling CAMB if necessary.
Code lines: 60
Contained by: module interfaces_camb
Modules used: file_utilities, galacticus_display, galacticus_error, galacticus_paths, iso_varying_string, system_command

function: flagsretrieve
Description: Retrieve the compiler flags.
Code lines: 10
Contained by: subroutine interface_camb_initialize

subroutine: interface_camb_transfer_function
Description: Run CAMB as necessary to compute transfer functions.
Code lines: 394
Contained by: module interfaces_camb
Modules used: cosmology_parameters, fgsl, file_utilities, galacticus_error, galacticus_paths, hashes_cryptographic, hdf5, input_parameters, io_hdf5, iso_c_binding, iso_varying_string, numerical_constants_astronomical, sort, string_handling, system_command, table_labels, tables

file: `interface.Cloudy.F90`
Description: Contains a module which provides various interfaces to the Cloudy code.
Code lines: 94

module: `interfaces_cloudy`
Description: Provides various interfaces to the Cloudy code.
Code lines: 72
Contained by: file `interface.Cloudy.F90`
Used by: subroutine `interface_cloudy_cie_tabulate` subroutine `buildtoolcloudyperform`

subroutine: `interface_cloudy_initialize`
Description: Initialize the interface with Cloudy, including downloading and compiling Cloudy if necessary.
Code lines: 63
Contained by: module `interfaces_cloudy`
Modules used: `file_utilities` `galacticus_display` `galacticus_error` `galacticus_paths` `iso_varying_string` `system_command`

file: `interface.Cloudy.collisional_ionization_equilibrium.F90`
Description: Contains a module which provides an interface to the Cloudy code for computing tables of cooling functions and chemical state in collisional ionization equilibrium.
Code lines: 233

module: `interfaces_cloudy_cie`
Description: Provides an interface to the Cloudy code for computing tables of cooling functions and chemical state in collisional ionization equilibrium.
Code lines: 211
Contained by: file `interface.Cloudy.collisional_ionization_equilibrium.F90`
Modules used: `file_utilities`
Used by: subroutine `atomiccieclоudytabulate` subroutine `atomiccieclоudytabulate`

subroutine: `interface_cloudy_cie_tabulate`
Description: An interface to the Cloudy code for computing tables of cooling functions and chemical state in collisional ionization equilibrium.
Code lines: 197
Contained by: module `interfaces_cloudy_cie`
Modules used: `galacticus_display` `galacticus_error` `interfaces_cloudy` `io_hdf5` `iso_varying_string` `numerical_ranges` `string_handling` `system_command`

file: `interface.FSPS.F90`
Description: Contains a module which provides various interfaces to the FSPS code [Conroy et al., 2009].
Code lines: 219

module: `interfaces_fsps`

Description: Provides various interfaces to the FSPS code [Conroy et al., 2009].
Code lines: 197
Contained by: file interface.FSPS.F90
Used by: subroutine fspsreadfile, subroutine buildtoolfspsperform

subroutine: interface_fsps_initialize
Description: Initialize the interface with FSPS, including downloading and compiling FSPS if necessary.
Code lines: 70
Contained by: module interfaces_fsps
Modules used: file_utilities, galacticus_display, galacticus_error, galacticus_paths, iso_varying_string, string_handling, system_command

subroutine: interface_fsps_ssps_tabulate
Description: Tabulate simple stellar populations for the given IMF using FSPS.
Code lines: 116
Contained by: module interfaces_fsps
Modules used: dates_and_times, file_utilities, galacticus_error, io_hdf5, iso_varying_string, numerical_constants_astronomical, string_handling, system_command, tables

file: interface.GSL.F90
Description: Contains a module which interfaces with low-level aspects of the GSL library.
Code lines: 77

module: interface_gsl
Description: Interfaces with low-level aspects of the GSL library.
Code lines: 51
Contained by: file interface.GSL.F90
Modules used: iso_c_binding
Used by: module numerical_differentiation

function: gslfunction
Description: Return a c_ptr object for the given function f.
Code lines: 9
Contained by: module interface_gsl
Modules used: iso_c_binding

subroutine: gslfunctiondestroy
Description: Destroy a c_ptr to a gsl_function object.
Code lines: 7
Contained by: module interface_gsl

file: interface.Local_Group_database.F90
Description: Contains a module which interfaces with the Local Group database.
Code lines: 547

module: `interface_local_group_db`
Description: Interfaces with the Local Group database.
Code lines: 525
Contained by: file `interface.Local_Group_database.F90`
Modules used: `fox_dom`
Used by: function subroutine `localgroupdatabaseperform` `localgroupmassfunctionconstructorinternal`

interface: `localgroupdb`
Description: Constructors for the Local Group database class.
Code lines: 3
Contained by: module `interface_local_group_db`

function: `localgroupdbconstructorinternal`
Description: Constructor for the Local Group database class.
Code lines: 14
Contained by: module `interface_local_group_db`
Modules used: `fox_dom` `galacticus_paths` `io_xml` `iso_varying_string`

subroutine: `localgroupdbdestructor`
Description: Destructor for the Local Group database class.
Code lines: 8
Contained by: module `interface_local_group_db`
Modules used: `fox_dom`

subroutine: `localgroupdbgetproperty`
Description: Get a named text property from the Local Group database.
Code lines: 69
Contained by: module `interface_local_group_db`
Modules used: `fox_dom` `galacticus_error` `iso_varying_string`

subroutine: `localgroupdbselect`
Description: Impose a selection on the database.
Code lines: 51
Contained by: module `interface_local_group_db`
Modules used: `fox_dom` `galacticus_error` `iso_varying_string`

subroutine: `localgroupdbselectall`
Description: Select all galaxies in the database.
Code lines: 7
Contained by: module `interface_local_group_db`

subroutine: `localgroupdbupdate`
Description: Update the database.
Code lines: 252

Contained by: module interface_local_group_db
Modules used: fox_dom, galacticus_paths, iso_varying_string, numerical_constants_astronomical

type: vector3d
Description: Vector type.
Code lines: 9
Contained by: module interface_local_group_db

function: vector3dcomparisonunimplemented
Description: Unimplemented comparison operators for 3D vectors.
Code lines: 10
Contained by: module interface_local_group_db
Modules used: galacticus_error

function: vector3dequals
Description: Equality comparison operator for two 3D vectors.
Code lines: 7
Contained by: module interface_local_group_db

file: interface.RecFast.F90
Description: Contains a module which provides various interfaces to the RecFast code.
Code lines: 92

module: interfaces_recfast
Description: Provides various interfaces to the RecFast code.
Code lines: 70
Contained by: file interface.RecFast.F90
Used by: function recfastconstructorinternal, subroutine buildtoolrecfastperform

subroutine: interface_recfast_initialize
Description: Initialize the interface with RecFast, including downloading and compiling RecFast if necessary.
Code lines: 61
Contained by: module interfaces_recfast
Modules used: file_utilities, galacticus_display, galacticus_error, galacticus_paths, iso_varying_string, system_command

file: intergalactic_medium.filtering_mass.F90
Description: Contains a module which provides a class for filtering masses.
Code lines: 39

module: intergalactic_medium_filtering_masses
Description: Provides a class for filtering masses.
Code lines: 17
Contained by: file intergalactic_medium.filtering_mass.F90
Used by: file accretion.halo.Naoz_Barkana_-2007.F90, subroutine galacticus_function_-classes_destroy

subroutine galacticus_state_retrieve
file tasks.intergalactic_medium_-state.F90
function intergalacticmediumstateevolveodes

subroutine galacticus_state_store
function intergalacticmediumstateevolveconstructorinternal

file: intergalactic_medium.filtering_mass.Gnedin2000.F90

Description: Implements the Gnedin [2000] filtering mass calculation.
Code lines: 365
Modules used: cosmology_functions, cosmology_parameters, intergalactic_medium_state, linear_growth, tables

function: gnedin2000coefficientsearlyepoch

Description: Return the coefficients of the fitting function for the filtering mass at early epochs from Naoz and Barkana [2007]. Checks for valid range of redshift and cosmology for the fit to be valid.
Code lines: 23
Contained by: file intergalactic_medium.filtering_mass.Gnedin2000.F90
Modules used: galacticus_error

subroutine: gnedin2000conditionsinitialodes

Description: Compute initial conditions for a system of three variables used to solve for the evolution of the filtering mass. The ODE system to be solved is

$$\dot{y}_1 = y_2 \tag{18.14}$$
$$\dot{y}_2 = -2(\dot{a}/a)D(t)(1+r_{\rm LSS}(t))y_2 f_{\rm DM}{\rm k_B}T(t)/\mu m_{\rm H}a^2 \tag{18.15}$$
$$\dot{y}_3 = 4\pi^4\bar{\rho}(t)\dot{k}_{\rm F}(t)/k_{\rm F}^4(t) \tag{18.16}$$

with initial conditions

$$y_1 = D(t)/k_{\rm F}^2(t) \tag{18.17}$$
$$y_2 = \dot{y}_1 \tag{18.18}$$
$$y_3 = M_{\rm F}(t) \tag{18.19}$$

and where

$$k_{\rm F}(t) = \pi/[M_{\rm F}(t)3/4\pi\bar{\rho}(t)]^{1/3} \tag{18.20}$$

, and $r_{\rm LSS}(t)$ is the function defined by Naoz and Barkana [2007].
Code lines: 48
Contained by: file intergalactic_medium.filtering_mass.Gnedin2000.F90
Modules used: cosmology_parameters, numerical_constants_math

function: gnedin2000constructorinternal

Description: Constructor for the filtering mass class.
Code lines: 12
Contained by: file intergalactic_medium.filtering_mass.Gnedin2000.F90

function: gnedin2000constructorparameters

Description: Default constructor for the file IGM state class.
Code lines: 22
Contained by: file intergalactic_medium.filtering_mass.Gnedin2000.F90
Modules used: input_parameters

subroutine: gnedin2000destructor
Description: Destructor for the filtering mass class.
Code lines: 10
Contained by: file intergalactic_medium.filtering_mass.Gnedin2000.F90

function: gnedin2000massfiltering
Description: Return the filtering mass at the given time.
Code lines: 9
Contained by: file intergalactic_medium.filtering_mass.Gnedin2000.F90

function: gnedin2000massfilteringearlyepoch
Description: Fitting function for the filtering mass at early epochs from Naoz and Barkana [2007]. Checks for valid range of redshift and cosmology for the fit to be valid.
Code lines: 18
Contained by: file intergalactic_medium.filtering_mass.Gnedin2000.F90

function: gnedin2000odes
Description: Compute the rates of change of the filtering mass ODE system.
Code lines: 31
Contained by: file intergalactic_medium.filtering_mass.Gnedin2000.F90
Modules used: numerical_constants_astronomical numerical_constants_math numerical_constants_physical

function: gnedin2000rlss
Description: Evaluate the $r_{\rm LSS}$ parameter of Naoz and Barkana [2007] using their fitting formula.
Code lines: 13
Contained by: file intergalactic_medium.filtering_mass.Gnedin2000.F90

subroutine: gnedin2000tabulate
Description: Construct a table of filtering mass as a function of cosmological time.
Code lines: 70
Contained by: file intergalactic_medium.filtering_mass.Gnedin2000.F90
Modules used: fodeiv2 galacticus_error numerical_constants_math odeiv2_solver

function: massfilteringodes
Description: Evaluates the ODEs controlling the evolution temperature.
Code lines: 20
Contained by: subroutine gnedin2000tabulate
Modules used: fgsl numerical_constants_astronomical numerical_constants_atomic

interface: intergalacticmediumfilteringmassgnedin2000
Description: Constructors for the filtering mass class.

Code lines: 4
Contained by: file intergalactic_medium.filtering_mass.Gnedin2000.F90

file: intergalactic_medium.state.F90
Description: Contains a module which provides a class for calculations of the intergalactic medium thermal and ionization state.
Code lines: 247

module: intergalactic_medium_state
Description: Provides a class for calculations of the intergalactic medium thermal and ionization state.
Code lines: 225
Contained by: file intergalactic_medium.state.F90
Modules used: cosmology_functions, cosmology_parameters, tables
Used by: file accretion.halo.simple.F90; subroutine galacticus_function_classes_destroy; subroutine galacticus_state_retrieve; subroutine galacticus_state_store; file intergalactic_medium.filtering_mass.Gnedin2000.F90; file radiation.intergalactic_background.internal.F90; file tasks.intergalactic_medium_state.F90; file universe.operators.intergalactic_medium_state_evolve.F90

subroutine: intergalacticmediumstateelectronscatteringtabulate
Description: Construct a table of electron scattering optical depth as a function of cosmological time.
Code lines: 61
Contained by: module intergalactic_medium_state
Modules used: fgsl, numerical_integration

function: intergalacticmediumstateelectronscatteringintegrand
Description: Integrand for electron scattering optical depth calculations.
Code lines: 16
Contained by: subroutine intergalacticmediumstateelectronscatteringtabulate
Modules used: numerical_constants_astronomical, numerical_constants_physical

file: intergalactic_medium.state.RecFast.F90
Description: An implementation of the intergalactic medium state class in which state is computed using RecFast.
Code lines: 183
Modules used: file_utilities

interface: intergalacticmediumstaterecfast
Description: Constructors for the RecFast intergalactic medium state class.
Code lines: 4
Contained by: file intergalactic_medium.state.RecFast.F90

function: recfastconstructorinternal
Description: Constructor for the RecFast IGM state class.
Code lines: 121
Contained by: file intergalactic_medium.state.RecFast.F90

Modules used: cosmology_parameters, dates_and_times, file_utilities, galacticus_display, galacticus_error, galacticus_paths, interfaces_recfast, io_hdf5, numerical_constants_astronomical, system_command

function: recfastconstructorparameters
Description: Default constructor for the RecFast IGM state class.
Code lines: 17
Contained by: file intergalactic_medium.state.RecFast.F90
Modules used: input_parameters

file: intergalactic_medium.state.file.F90
Description: An implementation of the intergalactic medium state class in which state is read from file.
Code lines: 229
Modules used: fgsl

function: fileconstructorinternal
Description: Constructor for the file IGM state class.
Code lines: 12
Contained by: file intergalactic_medium.state.file.F90
Modules used: file_utilities

function: fileconstructorparameters
Description: Default constructor for the file IGM state class.
Code lines: 25
Contained by: file intergalactic_medium.state.file.F90
Modules used: input_parameters

subroutine: filedestructor
Description: Destructor for the file IGM state class.
Code lines: 8
Contained by: file intergalactic_medium.state.file.F90

function: fileelectronfraction
Description: Return the electron fraction in the intergalactic medium at the specified time by interpolating in tabulated data,
Code lines: 12
Contained by: file intergalactic_medium.state.file.F90
Modules used: numerical_interpolation

function: fileneutralheliumfraction
Description: Return the neutral helium fraction in the intergalactic medium at the specified time by interpolating in tabulated data,
Code lines: 12
Contained by: file intergalactic_medium.state.file.F90
Modules used: numerical_interpolation

function: fileneutralhydrogenfraction
Description: Return the neutral hydrogen fraction in the intergalactic medium at the specified time by interpolating in tabulated data,

Code lines: 12
Contained by: file intergalactic_medium.state.file.F90
Modules used: numerical_interpolation

subroutine: filereaddata
Description: Read in data describing the state of the intergalactic medium.
Code lines: 44
Contained by: file intergalactic_medium.state.file.F90
Modules used: file_utilities galacticus_error io_hdf5 table_labels

function: filesinglyionizedheliumfraction
Description: Return the neutral helium fraction in the intergalactic medium at the specified time by interpolating in tabulated data,
Code lines: 12
Contained by: file intergalactic_medium.state.file.F90
Modules used: numerical_interpolation

function: filetemperature
Description: Return the temperature of the intergalactic medium at the specified time by interpolating in tabulated data.
Code lines: 12
Contained by: file intergalactic_medium.state.file.F90
Modules used: numerical_interpolation

interface: intergalacticmediumstatefile
Description: Constructors for the file intergalactic medium state class.
Code lines: 4
Contained by: file intergalactic_medium.state.file.F90

file: intergalactic_medium.state.instant_reionization.F90
Description: An implementation of the intergalactic medium state class for a simplistic model of instantaneous and full reionization with some other class providing the pre-reionization state.
Code lines: 271

subroutine: instantreionizationdestructor
Description: Destructor for the instant reionization intergalactic medium state class.
Code lines: 9
Contained by: file intergalactic_medium.state.instant_reionization.F90

function: instantreionizationelectronfraction
Description: Return the electron fraction of the IGM in the instantReionization model.
Code lines: 13
Contained by: file intergalactic_medium.state.instant_reionization.F90
Modules used: numerical_constants_astronomical

function: instantreionizationigmconstructorinternal
Description: Constructor for the instantReionization IGM state class.
Code lines: 63
Contained by: file intergalactic_medium.state.instant_reionization.F90

Modules used: galacticus_error root_finder

function: opticaldepth
Description: Compute the optical depth to electron scattering assuming instant reionization at the given time. Subtract from this the target optical depth so that we have a function whose root gives the epoch of instantaneous reionization.
Code lines: 12
Contained by: function instantreionizationigmconstructorinternal

function: instantreionizationigmconstructorparameters
Description: Constructor for the instantReionization IGM state class which takes a parameter set as input.
Code lines: 70
Contained by: file intergalactic_medium.state.instant_reionization.F90
Modules used: input_parameters

function: instantreionizationneutralheliumfraction
Description: Return the neutral helium fraction of the IGM in the instantReionization model.
Code lines: 13
Contained by: file intergalactic_medium.state.instant_reionization.F90
Modules used: numerical_constants_astronomical

function: instantreionizationneutralhydrogenfraction
Description: Return the neutral hydrogen fraction of the IGM in the instantReionization model.
Code lines: 13
Contained by: file intergalactic_medium.state.instant_reionization.F90
Modules used: numerical_constants_astronomical

function: instantreionizationsinglyionizedheliumfraction
Description: Return the singly-ionized helium fraction of the IGM in the instantReionization model.
Code lines: 13
Contained by: file intergalactic_medium.state.instant_reionization.F90
Modules used: numerical_constants_astronomical

function: instantreionizationtemperature
Description: Return the temperature of the IGM in the instantReionization model.
Code lines: 15
Contained by: file intergalactic_medium.state.instant_reionization.F90

interface: intergalacticmediumstateinstantreionization
Description: Constructors for the instantReionization intergalactic medium state class.
Code lines: 4
Contained by: file intergalactic_medium.state.instant_reionization.F90

file: intergalactic_medium.state.internal.F90
Description: An implementation of the intergalactic medium state class for an internal model of instantaneous and full reionization.
Code lines: 334

interface: intergalacticmediumstateinternal

Description: Constructors for the internal intergalactic medium state class.
Code lines: 4
Contained by: file intergalactic_medium.state.internal.F90

subroutine: `internalautohook`
Description: Hook into the internal intergalactic medium state evolver to receive updates.
Code lines: 8
Contained by: file intergalactic_medium.state.internal.F90
Modules used: events_hooks

function: `internalconstructorinternal`
Description: Internal constructor for the `internal` IGM state class.
Code lines: 25
Contained by: file intergalactic_medium.state.internal.F90

function: `internalconstructorparameters`
Description: Constructor for the `internal` IGM state class which takes a parameter set as input.
Code lines: 16
Contained by: file intergalactic_medium.state.internal.F90
Modules used: input_parameters

subroutine: `internaldestructor`
Description: Destructor for the internal IGM state class.
Code lines: 8
Contained by: file intergalactic_medium.state.internal.F90

function: `internalelectronfraction`
Description: Return the electron fraction of the IGM in the internal model.
Code lines: 37
Contained by: file intergalactic_medium.state.internal.F90
Modules used: fgsl iso_c_binding numerical_interpolation

function: `internalneutralheliumfraction`
Description: Return the neutral helium fraction of the IGM in the internal model.
Code lines: 35
Contained by: file intergalactic_medium.state.internal.F90
Modules used: fgsl iso_c_binding numerical_interpolation

function: `internalneutralhydrogenfraction`
Description: Return the neutral hydrogen fraction of the IGM in the internal model.
Code lines: 35
Contained by: file intergalactic_medium.state.internal.F90
Modules used: fgsl iso_c_binding numerical_interpolation

function: `internalsinglyionizedheliumfraction`
Description: Return the singly ionized helium fraction of the IGM in the internal model.
Code lines: 35

Contained by: file intergalactic_medium.state.internal.F90
Modules used: fgsl iso_c_binding numerical_interpolation

subroutine: internalstateset
Description: Set state in the internal intergalatic medium state class.
Code lines: 38
Contained by: file intergalactic_medium.state.internal.F90
Modules used: galacticus_error memory_management

function: internaltemperature
Description: Return the temperature of the IGM in the internal model.
Code lines: 31
Contained by: file intergalactic_medium.state.internal.F90
Modules used: fgsl iso_c_binding numerical_interpolation

file: intergalactic_medium.state.simple.F90
Description: An implementation of the intergalactic medium state class for a simplistic model of instantaneous and full reionization.
Code lines: 191

interface: intergalacticmediumstatesimple
Description: Constructors for the simple intergalactic medium state class.
Code lines: 4
Contained by: file intergalactic_medium.state.simple.F90

subroutine: simpledestructor
Description: Destructor for the simple IGM state class.
Code lines: 8
Contained by: file intergalactic_medium.state.simple.F90

function: simpleelectronfraction
Description: Return the electron fraction of the IGM in the simple model.
Code lines: 13
Contained by: file intergalactic_medium.state.simple.F90
Modules used: numerical_constants_astronomical

function: simpleigmconstructorinternal
Description: Constructor for the simple IGM state class.
Code lines: 11
Contained by: file intergalactic_medium.state.simple.F90

function: simpleigmconstructorparameters
Description: Constructor for the simple IGM state class which takes a parameter set as input.
Code lines: 47
Contained by: file intergalactic_medium.state.simple.F90
Modules used: input_parameters

function: `simpleneutralheliumfraction`
Description: Return the neutral helium fraction of the IGM in the simple model.
Code lines: 13
Contained by: file `intergalactic_medium.state.simple.F90`
Modules used: `numerical_constants_astronomical`

function: `simpleneutralhydrogenfraction`
Description: Return the neutral hydrogen fraction of the IGM in the simple model.
Code lines: 13
Contained by: file `intergalactic_medium.state.simple.F90`
Modules used: `numerical_constants_astronomical`

function: `simplesinglyionizedheliumfraction`
Description: Return the singly-ionized helium fraction of the IGM in the simple model.
Code lines: 13
Contained by: file `intergalactic_medium.state.simple.F90`
Modules used: `numerical_constants_astronomical`

function: `simpletemperature`
Description: Return the temperature of the IGM in the simple model.
Code lines: 12
Contained by: file `intergalactic_medium.state.simple.F90`

file: `iso_varying_string.F90`
Code lines: 2731

module: `iso_varying_string`
Code lines: 2690
Contained by: file `iso_varying_string.F90`

Contained by: module `iso_varying_string`

subroutine: `vsfinalize`
Description: Destroy a varying string object by deallocating it. Can be necessary to avoid memory leaks in some instances.
Code lines: 6
Contained by: module `iso_varying_string`

subroutine: `vsstaterestore`
Description: Restore the state of a `varying_string` object from file.
Code lines: 17
Contained by: module `iso_varying_string`
Modules used: `iso_c_binding`

subroutine: `vsstatestore`
Description: Store the state of a `varying_string` object to file.
Code lines: 13
Contained by: module `iso_varying_string`
Modules used: `iso_c_binding`

file: `libmatheval_config.cpp`

file: `mass_distributions.F90`
Description: Contains a module which implements a class that provides mass distributions.
Code lines: 96

module: `mass_distributions`
Description: Implements a class that provides mass distributions.
Code lines: 74
Contained by: file `mass_distributions.F90`
Modules used: `coordinates`
Used by:
- subroutine `galacticus_function_classes_destroy`
- subroutine `galacticus_state_retrieve`
- subroutine `galacticus_state_store`
- file `hot_halo.mass_distribution.beta_profile.F90`
- function `node_component_spheroid_standard_half_mass_radius`
- module `node_component_disk_standard_data`
- module `node_component_hot_halo_cold_mode_structure_tasks`
- module `node_component_spheroid_standard_data`
- program `test_mass_distributions`

file: `mass_distributions.cylindrical.F90`
Description: Implementation of an abstract mass distribution class for cylindrically symmetric distributions.
Code lines: 120

function: `cylindricalsymmetry`
Description: Returns symmetry label for mass dsitributions with cylindrical symmetry.
Code lines: 8
Contained by: file `mass_distributions.cylindrical.F90`

type: `massdistributioncylindrical`
Description: Implementation of an abstract mass distribution class for cylindrically symmetric distributions.
Code lines: 43
Contained by: file `mass_distributions.cylindrical.F90`

file: `mass_distributions.cylindrical.Miyamoto_Nagai.F90`
Description: Implementation of an Miyamoto-Nagai model [Miyamoto and Nagai, 1975] mass distribution class.
Code lines: 446
Modules used: `tables`

interface: `massdistributionmiyamotonagai`
Description: Constructors for the `miyamotoNagai` mass distribution class.
Code lines: 4
Contained by: file `mass_distributions.cylindrical.Miyamoto_Nagai.F90`

function: `miyamotonagaiconstructorinternal`
Description: Internal constructor for "miyamotoNagai" mass distribution class.
Code lines: 43
Contained by: file `mass_distributions.cylindrical.Miyamoto_Nagai.F90`
Modules used: `galacticus_error` `numerical_comparison` `numerical_constants_math`

function: `miyamotonagaiconstructorparameters`
Description: Constructor for the `miyamotoNagai` mass distribution class which builds the object from a parameter set.
Code lines: 52
Contained by: file `mass_distributions.cylindrical.Miyamoto_Nagai.F90`
Modules used: `input_parameters` `numerical_constants_math`

function: `miyamotonagaidensity`
Description: Return the density at the specified `coordinates` in an exponential disk mass distribution.
Code lines: 17
Contained by: file `mass_distributions.cylindrical.Miyamoto_Nagai.F90`
Modules used: `coordinates`

function: `miyamotonagaimassenclosedbysphere`
Description: Computes the mass enclosed within a sphere of given `radius` for exponential disk mass distributions.
Code lines: 12
Contained by: file `mass_distributions.cylindrical.Miyamoto_Nagai.F90`
Modules used: `numerical_constants_math`

subroutine: `miyamotonagaimassenclosedtabulate`
Description: Construct a tabulation of the mass enclosed by a sphere in a Miyamoto-Nagai mass distribution.
Code lines: 62
Contained by: file `mass_distributions.cylindrical.Miyamoto_Nagai.F90`
Modules used: `fgsl` `numerical_constants_math` `numerical_integration` `table_labels`

function: `integrandr`
Description: Integrand function used for finding the mass enclosed by a sphere in Miyamoto-Nagai disks.
Code lines: 12

Contained by: subroutine miyamotonagaimassenclosedtabulate
Modules used: coordinates

function: integrandz
Description: Integrand function used for finding the mass enclosed by a sphere in Miyamoto-Nagai disks.
Code lines: 10
Contained by: subroutine miyamotonagaimassenclosedtabulate
Modules used: coordinates

function: miyamotonagaipotential
Description: Return the gravitational potential for an exponential disk.
Code lines: 20
Contained by: file mass_distributions.cylindrical.Miyamoto_Nagai.F90
Modules used: coordinates numerical_constants_physical

function: miyamotonagairadiushalfmass
Description: Return the half-mass radius in a Miyamoto-Nagai mass distribution.
Code lines: 10
Contained by: file mass_distributions.cylindrical.Miyamoto_Nagai.F90

function: miyamotonagairotationcurve
Description: Return the mid-plane rotation curve for a Miyamoto-Nagai mass distribution.
Code lines: 16
Contained by: file mass_distributions.cylindrical.Miyamoto_Nagai.F90
Modules used: coordinates numerical_constants_physical

function: miyamotonagairotationcurvegradient
Description: Return the mid-plane rotation curve gradient for an exponential disk.
Code lines: 16
Contained by: file mass_distributions.cylindrical.Miyamoto_Nagai.F90
Modules used: coordinates numerical_constants_physical

function: miyamotonagaisurfacedensity
Description: Return the surface density at the specified coordinates in a Miyamoto-Nagai mass distribution.
Code lines: 14
Contained by: file mass_distributions.cylindrical.Miyamoto_Nagai.F90
Modules used: coordinates

function: miyamotonagaisurfacedensityradialmoment
Description: Compute radial moments of the Miyamoto-Nagai mass distribution surface density profile.
Code lines: 52
Contained by: file mass_distributions.cylindrical.Miyamoto_Nagai.F90
Modules used: galacticus_error

function: momentweight
Description: The weight function used in computing radial moments of the Miyamoto-Nagai mass distribution surface density.
Code lines: 7
Contained by: function miyamotonagaisurfacedensityradialmoment

subroutine: `miyamotonagaisurfacedensitytabulate`
Description: Construct a tabulation of the surface density profile in a Miyamoto-Nagai mass distribution.
Code lines: 42
Contained by: file `mass_distributions.cylindrical.Miyamoto_Nagai.F90`
Modules used: `fgsl` `numerical_integration` `table_labels`

function: `integrandsurfacedensity`
Description: Integrand function used for finding the surface density of Miyamoto-Nagai disks.
Code lines: 10
Contained by: subroutine `miyamotonagaisurfacedensitytabulate`
Modules used: `coordinates`

file: `mass_distributions.cylindrical.exponential_disk.F90`
Description: Implementation of an exponential disk mass distribution class.
Code lines: 578
Modules used: `tables`

function: `exponentialdiskbesselfactorpotential`
Description: Compute Bessel function factors appearing in the expression for an razor-thin exponential disk gravitational potential.
Code lines: 21
Contained by: file `mass_distributions.cylindrical.exponential_disk.F90`
Modules used: `bessel_functions` `numerical_constants_math`

function: `exponentialdiskbesselfactorrotationcurve`
Description: Compute Bessel function factors appearing in the expression for an razor-thin exponential disk rotation curve.
Code lines: 48
Contained by: file `mass_distributions.cylindrical.exponential_disk.F90`
Modules used: `bessel_functions` `numerical_constants_math`

function: `exponentialdiskbesselfactorrotationcurvegradient`
Description: Compute Bessel function factors appearing in the expression for a razor-thin exponential disk rotation curve gradient.
Code lines: 46
Contained by: file `mass_distributions.cylindrical.exponential_disk.F90`
Modules used: `bessel_functions` `numerical_constants_math`

function: `exponentialdiskconstructorinternal`
Description: Internal constructor for “exponentialDisk” mass distribution class.
Code lines: 61
Contained by: file `mass_distributions.cylindrical.exponential_disk.F90`
Modules used: `galacticus_error` `numerical_comparison` `numerical_constants_math`

function: `exponentialdiskconstructorparameters`
Description: Constructor for the `exponentialDisk` mass distribution class which builds the object from a parameter set.

Code lines: 52
Contained by: file mass_distributions.cylindrical.exponential_disk.F90
Modules used: input_parameters numerical_constants_math

function: exponentialdiskdensity
Description: Return the density at the specified coordinates in an exponential disk mass distribution.
Code lines: 25
Contained by: file mass_distributions.cylindrical.exponential_disk.F90
Modules used: coordinates galacticus_error

subroutine: exponentialdiskdestructor
Description: Destructor for exponential disk mass distributions.
Code lines: 13
Contained by: file mass_distributions.cylindrical.exponential_disk.F90

function: exponentialdiskmassenclosedbysphere
Description: Computes the mass enclosed within a sphere of given radius for exponential disk mass distributions.
Code lines: 11
Contained by: file mass_distributions.cylindrical.exponential_disk.F90
Modules used: numerical_constants_math

function: exponentialdiskpotential
Description: Return the gravitational potential for an exponential disk.
Code lines: 36
Contained by: file mass_distributions.cylindrical.exponential_disk.F90
Modules used: bessel_functions coordinates numerical_constants_physical

function: exponentialdiskradiushalfmass
Description: Return the half-mass radius in an exponential disk mass distribution.
Code lines: 8
Contained by: file mass_distributions.cylindrical.exponential_disk.F90

function: exponentialdiskrotationcurve
Description: Return the mid-plane rotation curve for an exponential disk.
Code lines: 38
Contained by: file mass_distributions.cylindrical.exponential_disk.F90
Modules used: coordinates numerical_constants_physical

function: exponentialdiskrotationcurvegradient
Description: Return the mid-plane rotation curve gradient for an exponential disk.
Code lines: 24
Contained by: file mass_distributions.cylindrical.exponential_disk.F90
Modules used: coordinates numerical_constants_physical

function: exponentialdisksurfacedensity
Description: Return the surface density at the specified coordinates in an exponential disk mass distribution.
Code lines: 13

Contained by: file mass_distributions.cylindrical.exponential_disk.F90
Modules used: coordinates

function: exponentialdisksurfacedensityradialmoment
Description: Compute radial moments of the exponential disk mass distribution surface density profile.
Code lines: 31
Contained by: file mass_distributions.cylindrical.exponential_disk.F90
Modules used: galacticus_error gamma_functions

subroutine: exponentialdisktabulate
Description: Build tables used for exponential disk mass distributions.
Code lines: 25
Contained by: file mass_distributions.cylindrical.exponential_disk.F90
Modules used: bessel_functions table_labels

interface: massdistributionexponentialdisk
Description: Constructors for the exponentialDisk mass distribution class.
Code lines: 4
Contained by: file mass_distributions.cylindrical.exponential_disk.F90

file: mass_distributions.spherical.F90
Description: Implementation of an abstract mass distribution class for spherically symmetric distributions.
Code lines: 120

type: massdistributionspherical
Description: Implementation of an abstract mass distribution class for spherically symmetric distributions.
Code lines: 16
Contained by: file mass_distributions.spherical.F90

function: sphericalmassenclosedbysphere
Description: Computes the mass enclosed within a sphere of given radius for spherically-symmetric mass distributions using numerical integration.
Code lines: 18
Contained by: file mass_distributions.spherical.F90
Modules used: fgsl numerical_constants_math numerical_integration

function: sphericalmassenclosedbysphereintegrand
Description: Enclosed mass integrand for spherical mass distributions.
Code lines: 10
Contained by: file mass_distributions.spherical.F90
Modules used: coordinates

function: sphericalmassroot
Description: Root function used in finding half mass radii of spherically symmetric mass distributions.
Code lines: 7
Contained by: file mass_distributions.spherical.F90

function: `sphericalradiushalfmass`
Description: Computes the half-mass radius of a spherically symmetric mass distribution using numerical root finding.
Code lines: 19
Contained by: file `mass_distributions.spherical.F90`
Modules used: `fgsl` `root_finder`

function: `sphericalsymmetry`
Description: Returns symmetry label for mass dsitributions with spherical symmetry.
Code lines: 8
Contained by: file `mass_distributions.spherical.F90`

file: `mass_distributions.spherical.Hernquist.F90`
Description: Implementation of a Hernquist [1990] mass distribution class.
Code lines: 241

function: `hernquistconstructorinternal`
Description: Internal constructor for "hernquist" mass distribution class.
Code lines: 44
Contained by: file `mass_distributions.spherical.Hernquist.F90`
Modules used: `galacticus_error` `numerical_comparison` `numerical_constants_math`

function: `hernquistconstructorparameters`
Description: Constructor for the `hernquist` mass distribution class which builds the object from a parameter set.
Code lines: 52
Contained by: file `mass_distributions.spherical.Hernquist.F90`
Modules used: `input_parameters` `numerical_constants_math`

function: `hernquistdensity`
Description: Return the density at the specified `coordinates` in a Hernquist mass distribution.
Code lines: 15
Contained by: file `mass_distributions.spherical.Hernquist.F90`
Modules used: `coordinates`

function: `hernquistdensityradialmoment`
Description: Returns a radial density moment for the Hernquist mass distribution.
Code lines: 34
Contained by: file `mass_distributions.spherical.Hernquist.F90`
Modules used: `galacticus_error` `numerical_comparison` `numerical_constants_math`

function: `hernquistmassenclosedbysphere`
Description: Computes the mass enclosed within a sphere of given `radius` for Hernquist mass distributions.
Code lines: 17
Contained by: file `mass_distributions.spherical.Hernquist.F90`
Modules used: `numerical_constants_math`

function: `hernquistpotential`
Description: Return the potential at the specified `coordinates` in a Hernquist mass distribution.
Code lines: 15
Contained by: file `mass_distributions.spherical.Hernquist.F90`
Modules used: `coordinates` `numerical_constants_physical`

function: `hernquistradiushalfmass`
Description: Return the half-mass radius of a Hernquist mass distribution.
Code lines: 8
Contained by: file `mass_distributions.spherical.Hernquist.F90`

interface: `massdistributionhernquist`
Description: Constructors for the `hernquist` mass distribution class.
Code lines: 4
Contained by: file `mass_distributions.spherical.Hernquist.F90`

file: `mass_distributions.spherical.NFW.F90`
Description: Implementation of an NFW [Navarro et al., 1996] mass distribution class.
Code lines: 164

interface: `massdistributionnfw`
Description: Constructors for the `nfw` mass distribution class.
Code lines: 4
Contained by: file `mass_distributions.spherical.NFW.F90`

function: `nfwconstructorinternal`
Description: Internal constructor for "nfw" mass distribution class.
Code lines: 35
Contained by: file `mass_distributions.spherical.NFW.F90`
Modules used: `galacticus_error` `numerical_comparison` `numerical_constants_math`

function: `nfwconstructorparameters`
Description: Constructor for the `nfw` mass distribution class which builds the object from a parameter set.
Code lines: 70
Contained by: file `mass_distributions.spherical.NFW.F90`
Modules used: `input_parameters` `numerical_constants_math`

function: `nfwdensity`
Description: Return the density at the specified `coordinates` in an NFW mass distribution.
Code lines: 15
Contained by: file `mass_distributions.spherical.NFW.F90`
Modules used: `coordinates`

file: `mass_distributions.spherical.Sersic.F90`
Description: Implementation of a Sérsic mass distribution class.
Code lines: 458

Modules used: fgsl

interface: massdistributionsersic
Description: Constructors for the sersic mass distribution class.
Code lines: 4
Contained by: file mass_distributions.spherical.Sersic.F90

function: sersicabelintegrand
Description: The integrand in the Abel integral used to invert the Sérsic profile to get the corresponding 3-D profile.
Code lines: 12
Contained by: file mass_distributions.spherical.Sersic.F90
Modules used: numerical_constants_math

function: sersiccoefficientroot
Description: Root function used in finding the coefficient for Sérsic profiles.
Code lines: 8
Contained by: file mass_distributions.spherical.Sersic.F90
Modules used: gamma_functions

function: sersicconstructorinternal
Description: Internal constructor for "sersic" mass distribution class.
Code lines: 47
Contained by: file mass_distributions.spherical.Sersic.F90
Modules used: galacticus_error numerical_comparison numerical_constants_math

function: sersicconstructorparameters
Description: Constructor for the sersic mass distribution class which builds the object from a parameter set.
Code lines: 51
Contained by: file mass_distributions.spherical.Sersic.F90
Modules used: input_parameters

function: sersicdensity
Description: Return the density at the specified coordinates in a Sérsic mass distribution.
Code lines: 20
Contained by: file mass_distributions.spherical.Sersic.F90
Modules used: coordinates numerical_interpolation table_labels

function: sersicdensityradialmoment
Description: Returns a radial density moment for the Sérsic mass distribution.
Code lines: 40
Contained by: file mass_distributions.spherical.Sersic.F90
Modules used: galacticus_error numerical_comparison numerical_constants_math

function: sersicmassenclosedbysphere
Description: Computes the mass enclosed within a sphere of given radius for Sérsic mass distributions.

Code lines: 23
Contained by: file mass_distributions.spherical.Sersic.F90
Modules used: numerical_constants_math numerical_interpolation

function: sersicpotential
Description: Return the potential at the specified coordinates in a Sérsic mass distribution.
Code lines: 25
Contained by: file mass_distributions.spherical.Sersic.F90
Modules used: coordinates numerical_constants_physical numerical_interpolation

function: sersicradiushalfmass
Description: Return the half-mass radius of a Sérsic mass distribution.
Code lines: 9
Contained by: file mass_distributions.spherical.Sersic.F90

function: sersicradiushalfmassprojected
Description: Return the half-mass radius in projection of a Sérsic mass distribution.
Code lines: 7
Contained by: file mass_distributions.spherical.Sersic.F90

subroutine: sersictabulate
Description: Tabulate the density and enclosed mass in a dimensionless Sérsic profile.
Code lines: 113
Contained by: file mass_distributions.spherical.Sersic.F90
Modules used: memory_management numerical_constants_math numerical_integration numerical_interpolation numerical_ranges root_finder

file: mass_distributions.spherical.beta_profile.F90
Description: Implementation of a β-profile mass distribution class.
Code lines: 404

function: betaprofileconstructorinternal
Description: Constructor for "betaProfile" convergence class.
Code lines: 88
Contained by: file mass_distributions.spherical.beta_profile.F90
Modules used: galacticus_display galacticus_error hypergeometric_functions numerical_comparison numerical_constants_math

function: betaprofileconstructorparameters
Description: Constructor for the betaProfile mass distribution class which builds the object from a parameter set.
Code lines: 63
Contained by: file mass_distributions.spherical.beta_profile.F90
Modules used: input_parameters

function: betaprofiledensity

Description: Return the density at the specified `coordinates` in a β-profile mass distribution.
Code lines: 14
Contained by: file mass_distributions.spherical.beta_profile.F90

function: `betaprofiledensitygradientradial`
Description: Return the density at the specified `coordinates` in a β-profile mass distribution.
Code lines: 23
Contained by: file mass_distributions.spherical.beta_profile.F90

function: `betaprofiledensityradialmoment`
Description: Computes radial moments of the density in a β-profile mass distribution.
Code lines: 98
Contained by: file mass_distributions.spherical.beta_profile.F90
Modules used: hypergeometric_functions numerical_comparison

function: `radialmomenttwothirds`
Description: Special case of radial moment for $\beta = 2/3$ β-profile.
Code lines: 45
Contained by: function betaprofiledensityradialmoment
Modules used: galacticus_error

function: `betaprofilemassenclosedbysphere`
Description: Computes the mass enclosed within a sphere of given `radius` for β-profile mass distributions. Result computed using Wolfram Alpha.
Code lines: 25
Contained by: file mass_distributions.spherical.beta_profile.F90
Modules used: hypergeometric_functions numerical_constants_math

function: `betaprofilepotential`
Description: Return the potential at the specified `coordinates` in a β-profile mass distribution. Calculated using Wolfram Alpha.
Code lines: 36
Contained by: file mass_distributions.spherical.beta_profile.F90
Modules used: coordinates hypergeometric_functions
numerical_comparison numerical_constants_math
numerical_constants_physical

interface: `massdistributionbetaprofile`
Description: Constructors for the `betaProfile` mass distribution class.
Code lines: 4
Contained by: file mass_distributions.spherical.beta_profile.F90

file: `math.Bessel_functions.F90`
Description: Contains a module which implements calculations of Bessel functions.
Code lines: 67

module: `bessel_functions`
Description: Implements calculations of Bessel functions.
Code lines: 45

Contained by: file math.Bessel_functions.F90
Modules used: fgsl
Used by: function exponentialdiskbesselfactorpotential; function exponentialdiskbesselfactorrotationcurve; function exponentialdiskbesselfactorrotationcurvegradient; function exponentialdiskpotential; subroutine exponentialdisktabulate; function node_component_disk_standard_potential; function jiang2014distributionvelocitytangential; program test_math_special_functions

function: bessel_function_i0
Description: Computes the I_0 Bessel function.
Code lines: 7
Contained by: module bessel_functions

function: bessel_function_i1
Description: Computes the I_1 Bessel function.
Code lines: 7
Contained by: module bessel_functions

function: bessel_function_k0
Description: Computes the K_0 Bessel function.
Code lines: 7
Contained by: module bessel_functions

function: bessel_function_k1
Description: Computes the K_1 Bessel function.
Code lines: 7
Contained by: module bessel_functions

file: math.Struve_functions.F90
Description: Contains a module which implements Struve functions.
Code lines: 144

module: struve_functions
Description: Implements Struve functions.
Code lines: 122
Contained by: file math.Struve_functions.F90
Used by: function jiang2014distributionvelocitytangential

function: struve_function_l1
Description: Evaluate and return the Struve L_1 function.
Code lines: 7
Contained by: module struve_functions

subroutine: stvl1
Code lines: 91

Contained by: module struve_functions

file: math.beta_functions.F90
Description: Contains a module which implements beta functions.
Code lines: 68

module: beta_functions
Description: Implements beta functions.
Code lines: 46
Contained by: file math.beta_functions.F90
Modules used: fgsl iso_c_binding
Used by: function betacumulative function betadensity

function: beta_function
Description: Evaluate the beta function, $B(a, b)$.
Code lines: 7
Contained by: module beta_functions

function: beta_function_incomplete_normalized
Description: Evaluate the normalized incomplete beta function, $B_x(a, b)/B(a, b)$.
Code lines: 7
Contained by: module beta_functions

file: math.distributions.Gaussian.F90
Description: Contains a module which implements Gaussian distributions.
Code lines: 40

module: math_distributions_gaussian
Description: Implements Gaussian distributions.
Code lines: 18
Contained by: file math.distributions.Gaussian.F90
Used by: function zhanghuig1 function zhanghuig2
function zhanghuig2integrand

function: gaussian_distribution
Description: Computes the Gaussian distribution with dispersion sigma at argument x.
Code lines: 9
Contained by: module math_distributions_gaussian
Modules used: numerical_constants_math

file: math.distributions.Poisson_binomial.F90
Description: Contains a module which implements Poisson binomial distributions.
Code lines: 140

module: math_distributions_poisson_binomial
Description: Implements Poisson binomial distributions.
Code lines: 118
Contained by: file math.distributions.Poisson_binomial.F90
Used by: subroutine program test_math_distributions
correlationfunctionaccumulatehalo

function: `poisson_binomial_distribution`
Description: Computes the Poisson binomial distribution with event probabilities `p` at argument `k`. Uses the discrete Fourier transform method proposed by Fernandez and Williams [2010].
Code lines: 31
Contained by: module `math_distributions_poisson_binomial`
Modules used: `numerical_constants_math`

function: `poisson_binomial_distribution_jacobian`
Description: Computes the Jacobian of the Poisson binomial distribution with event probabilities `p` at argument `k`. Uses the discrete Fourier transform method proposed by Fernandez and Williams [2010].
Code lines: 31
Contained by: module `math_distributions_poisson_binomial`
Modules used: `numerical_constants_math`

function: `poisson_binomial_distribution_mean`
Description: Computes the mean of a Poisson binomial distribution.
Code lines: 7
Contained by: module `math_distributions_poisson_binomial`

function: `poisson_binomial_distribution_mean_pairs`
Description: Computes the mean number of pairs expected from a Poisson binomial distribution with event probabilities `p`. Assumes that pair order is significant, i.e. both AB and BA are counted.
Code lines: 13
Contained by: module `math_distributions_poisson_binomial`

function: `poisson_binomial_distribution_mean_pairs_jacobian`
Description: Computes the Jacobian of the mean number of pairs expected from a Poisson binomial distribution with event probabilities `p`. Assumes that pair order is significant, i.e. both AB and BA are counted.
Code lines: 10
Contained by: module `math_distributions_poisson_binomial`

function: `poisson_binomial_distribution_variance`
Description: Computes the mean of a Poisson binomial distribution.
Code lines: 7
Contained by: module `math_distributions_poisson_binomial`

file: `math.error_function.F90`
Description: Contains a module which implements calculations of error functions.
Code lines: 130

module: `error_functions`
Description: Implements calculations of error functions.
Code lines: 108
Contained by: file `math.error_function.F90`
Used by: function `normaloperate` function `normaloperate`

interface: `erfapproximate`
Code lines: 2
Contained by: module error_functions

function: `erfapproximatequad`
Description: An approximation to the error function that is designed to be very accurate in the vicinity of zero and infinity.
Code lines: 18
Contained by: module error_functions
Modules used: kind_numbers numerical_constants_math

interface: `error_function`
Code lines: 3
Contained by: module error_functions

interface: `error_function_complementary`
Code lines: 3
Contained by: module error_functions

function: `error_function_complementary_complex`
Description: Computes the complex complementary error function, using the algorithm of Abrarov and Quine [2013].
Code lines: 26
Contained by: module error_functions
Modules used: numerical_constants_math

function: `error_function_complementary_real`
Description: Computes the complementary error function.
Code lines: 8
Contained by: module error_functions
Modules used: fgsl

function: `error_function_complex`
Description: Computes the complex complementary error function.
Code lines: 7
Contained by: module error_functions

function: `error_function_real`
Description: Computes the error function.
Code lines: 8
Contained by: module `error_functions`
Modules used: `fgsl`

function: `faddeeva`
Description: The Fadeeva function.
Code lines: 7
Contained by: module `error_functions`

file: `math.exponential_integrals.F90`
Description: Contains a module which implements exponential integrals.
Code lines: 193

module: `exponential_integrals`
Description: Implements exponential integrals.
Code lines: 171
Contained by: file `math.exponential_integrals.F90`
Modules used: `fgsl`
Used by: function `burkertkspace`, function `isothermalkspace`, function `nfwkspace`, program `test_math_special_functions`

function: `cosine_integral`
Description: Evaluate the $\mathrm{Ci}(x) \equiv \int_0^x \mathrm{d}t \cos(t)/t$ cosine integral.
Code lines: 7
Contained by: module `exponential_integrals`

subroutine: `e1z`
Code lines: 85
Contained by: module `exponential_integrals`

interface: `exponential_integral`
Code lines: 3
Contained by: module `exponential_integrals`

function: `exponential_integral_double`
Description: Exponential integral for real argument `x`.
Code lines: 7
Contained by: module `exponential_integrals`

function: `exponential_integral_double_complex`
Description: Exponential integral, $E_\mathrm{i}(z)$, for complex argument `z`.
Code lines: 9
Contained by: module `exponential_integrals`
Modules used: `numerical_constants_math`

function: `sine_integral`

Description: Evaluate the $\mathrm{Si}(x) \equiv \int_0^x \mathrm{d}t \sin(t)/t$ sine integral.
Code lines: 7
Contained by: module exponential_integrals

file: math.exponentiation.F90
Description: Contains a module which provides fast exponentiation utilizing tables.
Code lines: 113

module: math_exponentiation
Description: Provides a fast exponentiation class which utilizes tables to do rapid exponentiation in a limited range of argument for fixed exponent, along with other exponentiation functions.
Code lines: 91
Contained by: file math.exponentiation.F90
Modules used: tables
Used by:

program test_math_fast

function: cuberoot
Description: Utilize the fast cbrt() function from the standard C library for computing cube roots.
Code lines: 16
Contained by: module math_exponentiation
Modules used: iso_c_binding

interface: fastexponentiator
Code lines: 2
Contained by: module math_exponentiation

function: fastexponentiatorconstructor
Description: Constructor for the fast exponentiator class.
Code lines: 14
Contained by: module math_exponentiation

function: fastexponentiatorexponentiate

Description: Evaluate the result of an exponentiation operation.
Code lines: 20
Contained by: module math_exponentiation
Modules used: galacticus_error

file: math.factorial.F90
Description: Contains a module which implements calculations of factorials.
Code lines: 55

module: factorials
Description: Implements calculations of factorials
Code lines: 33
Contained by: file math.factorial.F90
Used by: subroutine informationcontentoperate; function polynomialcoefficientcount; function binomialmass; function inoue2014multiplier; function meiksin2006multiplier; program test_math_special_functions

function: factorial
Description: Computes the factorial of argument.
Code lines: 8
Contained by: module factorials
Modules used: fgsl

function: logarithmic_double_factorial
Description: Computes the natural logarithm of the double factorial, $k!!$.
Code lines: 13
Contained by: module factorials

file: math.gamma_function.F90
Description: Contains a module which implements calculations of gamma functions.
Code lines: 113

module: gamma_functions
Description: Implements calculations of gamma functions.
Code lines: 91

subroutine: arraytomatrixassign
Description: Assign an array to a matrix.
Code lines: 9
Contained by: module linear_algebra

subroutine: arraytovectorassign
Description: Assign an array to a vector.
Code lines: 9
Contained by: module linear_algebra

interface: assignment(=)
Code lines: 6
Contained by: module linear_algebra

type: matrix
Description: Matrix class.
Code lines: 79
Contained by: module linear_algebra

subroutine: matrixcholeskydecompose
Description: Find the Cholesky decomposition of a matrix.
Code lines: 14
Contained by: module linear_algebra

function: matrixcovarianceproduct
Description: Compute the quantity $yC^{-1}y^{\mathrm{T}}$ as appears in likelihood functions utilizing covariance matrices. Instead of directly inverting the covariance matrix (which is computationally slow and can be inaccurate), we solve the linear system $y = Cx$ for x, and then evaluate yx.
Code lines: 10
Contained by: module linear_algebra

subroutine: matrixdestroy
Description: Destroy a matrix object.
Code lines: 7
Contained by: module linear_algebra

function: `matrixdeterminant`
Description: Return the of a matrix.
Code lines: 22
Contained by: module `linear_algebra`

subroutine: `matrixeigensystem`
Description: Find eigenvectors and eigenvalues of a real symmetric matrix.
Code lines: 34
Contained by: module `linear_algebra`

function: `matrixinvert`
Description: Invert a matrix.
Code lines: 29
Contained by: module `linear_algebra`

function: `matrixlinearsystemsolve`
Description: Solve the linear system $y = A \cdot x$.
Code lines: 32
Contained by: module `linear_algebra`

function: `matrixlogarithmicdeterminant`
Description: Return the logarithm of the determinant of a matrix.
Code lines: 22
Contained by: module `linear_algebra`

subroutine: `matrixmakesemipositivedefinite`
Description: Make a matrix semi-positive definite by setting any negative eigenvalues to zero and reconstructing the matrix from its eigenvectors.
Code lines: 29
Contained by: module `linear_algebra`

function: `matrixmatrixmultiply`
Description: Multiply a matrix by a matrix, returning a matrix.
Code lines: 11
Contained by: module `linear_algebra`
Modules used: `galacticus_error`

subroutine: `matrixsymmetrize`
Description: Symmetrize a matrix.
Code lines: 7
Contained by: module `linear_algebra`

subroutine: `matrixtoarrayassign`
Description: Assign a matrix to an array.
Code lines: 8
Contained by: module `linear_algebra`

function: `matrixtranspose`

Description: Transpose a matrix.
Code lines: 9
Contained by: module `linear_algebra`

function: `matrixvectormultiply`
Description: Multiply a matrix by a vector, returning a vector.
Code lines: 13
Contained by: module `linear_algebra`

interface: `operator(*)`
Code lines: 4
Contained by: module `linear_algebra`

type: `vector`
Description: Vector class.
Code lines: 25
Contained by: module `linear_algebra`

function: `vectoradd`
Description: Add one vector to another.
Code lines: 9
Contained by: module `linear_algebra`

subroutine: `vectordestroy`
Description: Destroy a vector object.
Code lines: 7
Contained by: module `linear_algebra`

function: `vectorsubtract`
Description: Subtract one vector from another.
Code lines: 9
Contained by: module `linear_algebra`

subroutine: `vectortoarrayassign`
Description: Assign a vector to an array.
Code lines: 8
Contained by: module `linear_algebra`

subroutine: `vectortovectorassign`
Description: Assign a vector to an array.
Code lines: 9
Contained by: module `linear_algebra`

function: `vectorvectormultiply`
Description: Multiply a vector by a vector, returning a scalar.
Code lines: 8
Contained by: module `linear_algebra`

file: `math.operators.unary.F90`

Description: Contains a module that implements a class of parameter mapping functions.
Code lines: 45

module: `math_operators_unary`
Description: Implements a class of unary operators.
Code lines: 23
Contained by: file `math.operators.unary.F90`
Used by: subroutine `galacticus_function_classes_destroy`; subroutine `galacticus_state_retrieve`; subroutine `galacticus_state_store`; file `models.parameters.active.F90`

file: `math.operators.unary.identity.F90`
Description: Implementation of an identity unary operator.
Code lines: 73

function: `identityconstructorparameters`
Description: Constructor for the `identity` 1D distribution function class which builds the object from a parameter set.
Code lines: 11
Contained by: file `math.operators.unary.identity.F90`
Modules used: `input_parameters`

function: `identityoperate`
Description: Apply an identity operation.
Code lines: 9
Contained by: file `math.operators.unary.identity.F90`

function: `identityunoperate`
Description: Unapply an identity operation.
Code lines: 9
Contained by: file `math.operators.unary.identity.F90`

interface: `operatorunaryidentity`
Description: Constructors for the `identity` 1D distribution function class.
Code lines: 3
Contained by: file `math.operators.unary.identity.F90`

file: `math.operators.unary.inverse.F90`
Description: Implementation of an inverse unary operator.
Code lines: 73

function: `inverseconstructorparameters`
Description: Constructor for the `inverse` 1D distribution function class which builds the object from a parameter set.
Code lines: 11
Contained by: file `math.operators.unary.inverse.F90`
Modules used: `input_parameters`

function: `inverseoperate`

Description: Apply an inverse operation.
Code lines: 9
Contained by: file math.operators.unary.inverse.F90

function: inverseunoperate
Description: Unapply an inverse operation.
Code lines: 9
Contained by: file math.operators.unary.inverse.F90

interface: operatorunaryinverse
Description: Constructors for the inverse 1D distribution function class.
Code lines: 3
Contained by: file math.operators.unary.inverse.F90

file: math.operators.unary.logarithm.F90
Description: Implementation of a logarithm unary operator.
Code lines: 80

function: logarithmconstructorparameters
Description: Constructor for the logarithm 1D distribution function class which builds the object from a parameter set.
Code lines: 11
Contained by: file math.operators.unary.logarithm.F90
Modules used: input_parameters

function: logarithmoperate
Description: Apply an logarithm operation.
Code lines: 9
Contained by: file math.operators.unary.logarithm.F90

function: logarithmunoperate
Description: Unapply an logarithm operation.
Code lines: 13
Contained by: file math.operators.unary.logarithm.F90

interface: operatorunarylogarithm
Description: Constructors for the logarithm 1D distribution function class.
Code lines: 3
Contained by: file math.operators.unary.logarithm.F90

file: math.trigonometric_functions.F90
Description: Contains a module which implements trigonometric functions.
Code lines: 76

module: trigonometric_functions
Description: Implements trigonometric functions.
Code lines: 54
Contained by: file math.trigonometric_functions.F90
Used by: function squareconstructorinternal

interface: `cosec`
Code lines: 3
Contained by: module `trigonometric_functions`

function: `cosecdouble`
Description: Implements cosecant for double precision `x`.
Code lines: 7
Contained by: module `trigonometric_functions`

function: `cosecdoublecomplex`
Description: Implements cosecant for double precision complex `x`.
Code lines: 7
Contained by: module `trigonometric_functions`

interface: `cot`
Code lines: 3
Contained by: module `trigonometric_functions`

function: `cotdouble`
Description: Implements cotangent for double precision `x`.
Code lines: 7
Contained by: module `trigonometric_functions`

function: `cotdoublecomplex`
Description: Implements cotangent for double precision complex `x`.
Code lines: 7
Contained by: module `trigonometric_functions`

file: `math.vector.F90`
Description: Contains a module which implements calculations of vectors.
Code lines: 157

module: `vectors`
Description: Implements calculations of vectors.
Code lines: 135
Contained by: file `math.vector.F90`
Used by:
subroutine `correlationfunctionaccumulatehalo`
subroutine `correlationfunctionfinalizeanalysis`
function `squareconstructorinternal`
function `squareisinlightcone`

function: matrix_copy_upper_to_lower_triangle
Description: Copies the upper triangle of a square matrix to the lower triangle.
Code lines: 16
Contained by: module vectors
Modules used: galacticus_error

function: vector_magnitude
Description: Computes the magnitude of vector1.
Code lines: 7
Contained by: module vectors

function: vector_matrix_multiply
Description: Returns the product of a vector with a matrix.
Code lines: 10
Contained by: module vectors

interface: vector_outer_product
Code lines: 3
Contained by: module vectors

interface: vector_outer_product_accumulate
Code lines: 2
Contained by: module vectors

subroutine: vector_outer_product_accumulate_self
Description: Compute the outer product of a vector with itself and accumulate it to the given matrix. Compute only the upper triangle unless the symmetrize option is set to true. If the sparse option is set to true, assume a sparse matrix and accumulate only non-zero terms.
Code lines: 39
Contained by: module vectors

function: vector_outer_product_distinct
Description: Returns the outer product of two vectors.
Code lines: 10
Contained by: module vectors

function: vector_outer_product_self
Description: Returns the outer product of a vector with itself.
Code lines: 12

Contained by: module vectors

function: vector_product
Description: Computes the vector product of vector1 and vector2.
Code lines: 10
Contained by: module vectors

file: merger_trees.branching_probability.F90
Description: Contains a module which implements a merger tree branching probability class.
Code lines: 82

module: merger_tree_branching
Description: Implements a merger tree branching probability class.
Code lines: 60
Contained by: file merger_trees.branching_probability.F90
Modules used: galacticus_nodes, pseudo_random
Used by: subroutine galacticus_function_classes_destroy, subroutine galacticus_state_retrieve, subroutine galacticus_state_store, file merger_trees.construct.builder.Cole2000.F90

file: merger_trees.branching_probability.Parkinson_Cole_Helly.F90
Description: Implements a merger tree branching probability class using the algorithm of Parkinson et al. [2008].
Code lines: 750
Modules used: cosmological_density_field, tables

interface: mergertreebranchingprobabilityparkinsoncolehelly
Description: Constructors for the parkinsonColeHelly merger tree builder class.
Code lines: 4
Contained by: file merger_trees.branching_probability.Parkinson_Cole_Helly.F90

subroutine: parkinsoncolehellycomputecommonfactors
Description: Precomputes some useful factors that are used in the modified Press-Schechter branching integrals.
Code lines: 15
Contained by: file merger_trees.branching_probability.Parkinson_Cole_Helly.F90
Modules used: numerical_constants_math

function: parkinsoncolehellyconstructorinternal
Description: Internal constructor for the "parkinsonColeHelly" merger tree branching probability class.
Code lines: 18
Contained by: file merger_trees.branching_probability.Parkinson_Cole_Helly.F90
Modules used: galacticus_error

function: parkinsoncolehellyconstructorparameters
Description: Constructor for the "parkinsonColeHelly" merger tree branching probability class which reads parameters from a provided parameter list.
Code lines: 73
Contained by: file merger_trees.branching_probability.Parkinson_Cole_Helly.F90

subroutine: `parkinsoncolehellydestructor`
Code lines: 8
Contained by: file `merger_trees.branching_probability.Parkinson_Cole_Helly.F90`

function: `parkinsoncolehellyfractionsubresolution`
Description: Return the fraction of mass accreted in subresolution halos, i.e. those below `massResolution`, per unit change in $\delta_{\rm crit}$ for a halo of mass `haloMass` at time `deltaCritical`. The integral is computed analytically in terms of the ${}_2F_1$ hypergeometric function.
Code lines: 37
Contained by: file `merger_trees.branching_probability.Parkinson_Cole_Helly.F90`
Modules used: `hypergeometric_functions` `numerical_constants_math`

function: `parkinsoncolehellymassbranch`
Description: A merger tree branch split mass function.
Code lines: 127
Contained by: file `merger_trees.branching_probability.Parkinson_Cole_Helly.F90`

function: `massbranchcdmassumptions`
Description: A merger tree branch split mass function which assumes a CDM-like power spectrum. With these assumptions, it can employ the mass sampling algorithm of Parkinson et al. [2008]. One difference with respect to the algorithm of Parkinson et al. [2008] is that here the normalization of their function $S(q)$ (eqn. A2) is irrelevant, since a branch split has already been decided to have occcurred—all that remains necessary is to determine its mass. Variable and function names follow Parkinson et al. [2008].
Code lines: 39
Contained by: function `parkinsoncolehellymassbranch`
Modules used: `pseudo_random`

function: `massbranchgeneric`
Description: Determine the mass of one of the halos to which the given halo branches, given the branching probability, `probability`. Typically, `probabilityFraction` is found by multiplying `probability` by a random variable drawn in the interval 0–1 if a halo branches. This routine then finds the progenitor mass corresponding to this value.
Code lines: 42
Contained by: function `parkinsoncolehellymassbranch`
Modules used: `fgsl` `pseudo_random` `root_finder`

function: `r`
Description: The function $R(q)$ from [Parkinson et al., 2008, eqn. A3].
Code lines: 9
Contained by: function `parkinsoncolehellymassbranch`

function: `v`
Description: The function $V(q)$ from [Parkinson et al., 2008, eqn. A4].
Code lines: 9
Contained by: function `parkinsoncolehellymassbranch`

function: `parkinsoncolehellymassbranchroot`

Description: Used to find the mass of a merger tree branching event.
Code lines: 21
Contained by: file `merger_trees.branching_probability.Parkinson_Cole_Helly.F90`
Modules used: `fgsl` `numerical_integration`

function: `parkinsoncolehellymassbranchrootderivative`

Description: Used to find the mass of a merger tree branching event.
Code lines: 11
Contained by: file `merger_trees.branching_probability.Parkinson_Cole_Helly.F90`
Modules used: `galacticus_error` `numerical_integration`

function: `parkinsoncolehellymergingrate`

Description: Merging rate from Press-Schechter. The constant factor of sqrt(2/pi) not included here—instead it is included in a multiplicative prefactor by which integrals over this function are multiplied.
Code lines: 14
Contained by: file `merger_trees.branching_probability.Parkinson_Cole_Helly.F90`

function: `parkinsoncolehellymodifier`

Description: Empirical modification of the progenitor mass function from Parkinson et al. [2008]. The constant factors of $G_0(\delta_\mathrm{p}/\sigma_\mathrm{p})^{\gamma_2}$ and $1/\sigma_\mathrm{p}^{\gamma_1}$ are not included here—instead they are included in a multiplicative prefactor by which integrals over this function are multiplied.
Code lines: 9
Contained by: file `merger_trees.branching_probability.Parkinson_Cole_Helly.F90`

function: `parkinsoncolehellyprobability`

Description: Return the probability per unit change in δ_crit that a halo of mass `haloMass` at time `deltaCritical` will undergo a branching to progenitors with mass greater than `massResolution`.
Code lines: 33
Contained by: file `merger_trees.branching_probability.Parkinson_Cole_Helly.F90`
Modules used: `fgsl` `numerical_integration`

function: `parkinsoncolehellyprobabilitybound`

Description: Return a bound on the probability per unit change in δ_crit that a halo of mass `haloMass` at time `deltaCritical` will undergo a branching to progenitors with mass greater than `massResolution`.
Code lines: 140
Contained by: file `merger_trees.branching_probability.Parkinson_Cole_Helly.F90`
Modules used: `fgsl` `galacticus_display` `galacticus_error` `hypergeometric_functions` `numerical_comparison` `numerical_constants_math`

function: `parkinsoncolehellyprobabilityintegrandlogarithmic`

Description: Integrand for the branching probability.
Code lines: 10
Contained by: file `merger_trees.branching_probability.Parkinson_Cole_Helly.F90`

function: `parkinsoncolehellyprogenitormassfunction`
Description: Progenitor mass function from Press-Schechter. The constant factor of the parent halo mass is not included here—instead it is included in a multiplicative prefactor by which integrals over this function are multiplied.
Code lines: 8
Contained by: file `merger_trees.branching_probability.Parkinson_Cole_Helly.F90`

function: `parkinsoncolehellystepmaximum`
Description: Return the maximum allowed step in $\delta_{\rm crit}$ that a halo of mass `haloMass` at time `deltaCritical` should be allowed to take.
Code lines: 19
Contained by: file `merger_trees.branching_probability.Parkinson_Cole_Helly.F90`

subroutine: `parkinsoncolehellysubresolutionhypergeometrictabulate`
Description: Tabulate the hypergeometric term appearing in the subresolution merger fraction expression.
Code lines: 46
Contained by: file `merger_trees.branching_probability.Parkinson_Cole_Helly.F90`
Modules used: `galacticus_error` `hypergeometric_functions` `numerical_constants_math` `table_labels`

subroutine: `parkinsoncolehellyupperboundhypergeometrictabulate`
Description: Tabulate the hypergeometric term appearing in the upper bound branching probability rate expression.
Code lines: 54
Contained by: file `merger_trees.branching_probability.Parkinson_Cole_Helly.F90`
Modules used: `galacticus_error` `hypergeometric_functions` `numerical_constants_math` `table_labels`

file: `merger_trees.branching_probability.generalized_Press_Schechter.F90`
Description: Implements a merger tree branching probability class using a generalized Press-Schechter approach.
Code lines: 469
Modules used: `cosmological_density_field` `cosmology_functions` `excursion_sets_first_crossings` `merger_tree_branching_modifiers`

subroutine: `generalizedpressschechtercomputecommonfactors`
Description: Precomputes some useful factors that are used in the generalized Press-Schechter branching integrals.
Code lines: 16
Contained by: file `merger_trees.branching_probability.generalized_Press_Schechter.F90`
Modules used: `cosmological_density_field`

function: `generalizedpressschechterconstructorinternal`
Description: Internal constructor for the Cole et al. [2000] merger tree building class.
Code lines: 18
Contained by: file `merger_trees.branching_probability.generalized_Press_Schechter.F90`
Modules used: `galacticus_error`

function: `generalizedpressschechterconstructorparameters`
Description: Constructor for the "generalizedPressSchechter" merger tree branching probability class which reads parameters from a provided parameter list.
Code lines: 51
Contained by: file `merger_trees.branching_probability.generalized_Press_Schechter.F90`

subroutine: `generalizedpressschechterdestructor`
Code lines: 10
Contained by: file `merger_trees.branching_probability.generalized_Press_Schechter.F90`

subroutine: `generalizedpressschechterexcursionsettest`
Description: Make a call to excursion set routines with the maximum σ that we will use to ensure that they can handle it.
Code lines: 18
Contained by: file `merger_trees.branching_probability.generalized_Press_Schechter.F90`

function: `generalizedpressschechterfractionsubresolution`
Description: Return the fraction of mass accreted in subresolution halos, i.e. those below `massResolution`, per unit change in $\delta_{\rm crit}$ for a halo of mass `haloMass` at time `deltaCritical`. The integral is computed numerically.
Code lines: 57
Contained by: file `merger_trees.branching_probability.generalized_Press_Schechter.F90`
Modules used: `fgsl` `galacticus_display` `galacticus_error` `iso_varying_string` `numerical_integration`

function: `generalizedpressschechterfractionsubresolutionintegrand`
Description: Integrand for the subresolution fraction.
Code lines: 13
Contained by: file `merger_trees.branching_probability.generalized_Press_Schechter.F90`

function: `generalizedpressschechtermassbranch`
Description: Determine the mass of one of the halos to which the given halo branches, given the branching probability, `probabilityFraction`. Typically, `probabilityFraction` is found by multiplying `Generalized_Press_Schechter_Branching_Probability()` by a random variable drawn in the interval 0–1 if a halo branches. This routine then finds the progenitor mass corresponding to this value.
Code lines: 63
Contained by: file `merger_trees.branching_probability.generalized_Press_Schechter.F90`
Modules used: `galacticus_display` `galacticus_error` `iso_varying_string` `pseudo_random` `root_finder`

function: `generalizedpressschechtermassbranchroot`
Description: Root function used in solving for the branch mass.
Code lines: 12
Contained by: file `merger_trees.branching_probability.generalized_Press_Schechter.F90`
Modules used: `fgsl` `numerical_integration`

function: `generalizedpressschechtermergingrate`

Description: Computes the merging rate of dark matter halos in the generalized Press-Schechter algorithm. This "merging rate" is specifically defined as

$$\frac{\mathrm{d}^2 f}{\mathrm{d}\ln M_{\rm child}\mathrm{d}\delta_{\rm c}} = 2\sigma^2(M_{\rm child})\left.\frac{\mathrm{d}\ln\sigma}{\mathrm{d}\ln M}\right|_{M=M_{\rm child}}\frac{\mathrm{d}t}{\mathrm{d}\delta_{\rm c}}\frac{\mathrm{d}f_{12}}{\mathrm{d}t}, \tag{18.21}$$

where $\mathrm{d}f_{12}/\mathrm{d}t$ is the excursion set barrier crossing probabilty per unit time for the effective barrier $B'(S_{\rm child}|S_{\rm parent},t) \equiv B(S_{\rm child},t-\delta t) - B(S_{\rm parent},t)$ in the limit $\delta t \rightarrow 0$.

Code lines: 16

Contained by: file `merger_trees.branching_probability.generalized_Press_Schechter.F90`

function: `generalizedpressschechterprobability`

Description: Return the probability per unit change in $\delta_{\rm crit}$ that a halo of mass `haloMass` at time `deltaCritical` will undergo a branching to progenitors with mass greater than `massResolution`.

Code lines: 27

Contained by: file `merger_trees.branching_probability.generalized_Press_Schechter.F90`

Modules used: `fgsl` `numerical_integration`

function: `generalizedpressschechterprobabilitybound`

Description: Return bounds onthe probability per unit change in $\delta_{\rm crit}$ that a halo of mass `haloMass` at time `deltaCritical` will undergo a branching to progenitors with mass greater than `massResolution`.

Code lines: 13

Contained by: file `merger_trees.branching_probability.generalized_Press_Schechter.F90`

function: `generalizedpressschechterprobabilityintegrand`

Description: Integrand for the branching probability.

Code lines: 9

Contained by: file `merger_trees.branching_probability.generalized_Press_Schechter.F90`

function: `generalizedpressschechterprogenitormassfunction`

Description: Progenitor mass function from Press-Schechter.

Code lines: 8

Contained by: file `merger_trees.branching_probability.generalized_Press_Schechter.F90`

function: `generalizedpressschechterstepmaximum`

Description: Return the maximum allowed step in $\delta_{\rm crit}$ that a halo of mass `haloMass` at time `deltaCritical` should be allowed to take.

Code lines: 10

Contained by: file `merger_trees.branching_probability.generalized_Press_Schechter.F90`

interface: `mergertreebranchingprobabilitygnrlzdprssschchtr`

Description: Constructors for the `generalizedPressSchechter` merger tree builder class.

Code lines: 4

Contained by: file `merger_trees.branching_probability.generalized_Press_Schechter.F90`

file: merger_trees.branching_probability.modifier.F90
Description: Contains a module which provides a class that implements core radii for cored cold mode hot halo mass distributions.
Code lines: 39

module: merger_tree_branching_modifiers
Description: Provides a module which provides a class that implements core radii for cored cold mode hot halo mass distributions.
Code lines: 17
Contained by: file merger_trees.branching_probability.modifier.F90
Used by: subroutine galacticus_function_classes_destroy; subroutine galacticus_state_retrieve; subroutine galacticus_state_store; file merger_trees.branching_probability.generalized_Press_Schechter.F90

file: merger_trees.branching_probability.modifier.Parkinson.F90
Description: Implements a merger tree branching probability rate modifier which uses the model of Parkinson et al. [2008].
Code lines: 109

interface: mergertreebranchingprobabilitymodifierparkinson2008
Description: Constructors for the parkinson2008 merger tree branching probability rate class.
Code lines: 4
Contained by: file merger_trees.branching_probability.modifier.Parkinson.F90

function: parkinson2008constructorinternal
Description: Default constructor for the parkinson2008 merger tree branching probability rate class.
Code lines: 12
Contained by: file merger_trees.branching_probability.modifier.Parkinson.F90
Modules used: input_parameters

function: parkinson2008constructorparameters
Description: A constructor for the parkinson2008 merger tree branching probability rate class which builds the object from a parameter set.
Code lines: 36
Contained by: file merger_trees.branching_probability.modifier.Parkinson.F90
Modules used: input_parameters

function: parkinson2008ratemodifier
Description: Returns a modifier for merger tree branching rates using the Parkinson et al. [2008] algorithm.
Code lines: 16
Contained by: file merger_trees.branching_probability.modifier.Parkinson.F90

file: merger_trees.branching_probability.modifier.identity.F90
Description: Implements a merger tree branching probability rate modifier which always returns the identity modifier.
Code lines: 62

function: `identityconstructorparameters`

Description: A constructor for the `identity` merger tree branching probability rate class which builds the object from a parameter set.
Code lines: 11
Contained by: file `merger_trees.branching_probability.modifier.identity.F90`
Modules used: `input_parameters`

function: `identityratemodifier`

Description: Returns a modifier for merger tree branching rates using the Parkinson et al. [2008] algorithm. Return the core radius of the hot halo mass distribution.
Code lines: 10
Contained by: file `merger_trees.branching_probability.modifier.identity.F90`

interface: `mergertreebranchingprobabilitymodifieridentity`

Description: Constructors for the `identity` merger tree branching probabiliy rate modifier class.
Code lines: 3
Contained by: file `merger_trees.branching_probability.modifier.identity.F90`

file: `merger_trees.construct.F90`

Description: Contains a module which constructs/destructs merger trees.
Code lines: 41

module: `merger_tree_construction`

Description: Constructs/destructs merger trees.
Code lines: 19
Contained by: file `merger_trees.construct.F90`
Modules used: `galacticus_nodes`, `iso_c_binding`
Used by: subroutine `galacticus_function_classes_destroy`, subroutine `galacticus_state_retrieve`, subroutine `galacticus_state_store`, file `tasks.evolve_forests.F90`

file: `merger_trees.construct.build.F90`

Description: Implements a merger tree constructor class which builds merger trees after drawing masses at random from a mass distribution.
Code lines: 314
Modules used: `cosmology_functions`, `cosmology_parameters`, `halo_mass_functions`, `merger_trees_build_masses`, `merger_trees_builders`, `output_times`

function: `buildconstruct`

Description: Build a merger tree.
Code lines: 81
Contained by: file `merger_trees.construct.build.F90`
Modules used: `functions_global`, `galacticus_nodes`, `kind_numbers`, `merger_tree_state_store`, `pseudo_random`, `string_handling`

subroutine: `buildconstructmasses`

Description: Construct the set of tree masses to be built.
Code lines: 42
Contained by: file merger_trees.construct.build.F90
Modules used: galacticus_error memory_management sort

function: buildconstructorinternal
Description: Initializes the merger tree building module.
Code lines: 31
Contained by: file merger_trees.construct.build.F90
Modules used: iso_c_binding numerical_comparison

function: buildconstructorparameters
Description: Constructor for the augment merger tree operator class which takes a parameter set as input.
Code lines: 65
Contained by: file merger_trees.construct.build.F90
Modules used: galacticus_error input_parameters memory_management

subroutine: builddestructor
Description: Destructor for the build merger tree constructor class.
Code lines: 12
Contained by: file merger_trees.construct.build.F90

interface: mergertreeconstructorbuild
Description: Constructors for the build merger tree constructor class.
Code lines: 4
Contained by: file merger_trees.construct.build.F90

file: merger_trees.construct.build.mass_resolution.F90
Description: Contains a module which provides a class of merger tree mass resolutions.
Code lines: 40

module: merger_trees_build_mass_resolution
Description: Provides a class of merger tree mass resolutions.
Code lines: 18
Contained by: file merger_trees.construct.build.mass_resolution.F90
Modules used: galacticus_nodes
Used by: subroutine galacticus_function_classes_destroy; subroutine galacticus_state_retrieve; subroutine galacticus_state_store; file merger_trees.construct.builder.Cole2000.F90

file: merger_trees.construct.build.mass_resolution.fixed.F90
Description: An implementation of a merger tree builder mass resolution which assumes a fixed resolution.
Code lines: 81

function: fixedconstructorinternal
Description: Internal constructor for the fixed merger tree building mass resolution class.

Code lines: 8
Contained by: file merger_trees.construct.build.mass_resolution.fixed.F90

function: fixedconstructorparameters
Description: Constructor for the fixed merger tree building mass resolution class which reads parameters from a provided parameter list.
Code lines: 19
Contained by: file merger_trees.construct.build.mass_resolution.fixed.F90

function: fixedresolution
Description: Returns a fixed mass resolution to use when building merger trees.
Code lines: 9
Contained by: file merger_trees.construct.build.mass_resolution.fixed.F90

interface: mergertreemassresolutionfixed
Description: Constructors for the fixed merger tree resolution class.
Code lines: 4
Contained by: file merger_trees.construct.build.mass_resolution.fixed.F90

file: merger_trees.construct.build.mass_resolution.scaled.F90
Description: An implementation of a merger tree builder mass resolution which assumes a resolution which scales with tree mass.
Code lines: 100

interface: mergertreemassresolutionscaled
Description: Constructors for the scaled merger tree resolution class.
Code lines: 4
Contained by: file merger_trees.construct.build.mass_resolution.scaled.F90

function: scaledconstructorinternal
Description: Internal constructor for the scaled merger tree building mass resolution class.
Code lines: 8
Contained by: file merger_trees.construct.build.mass_resolution.scaled.F90

function: scaledconstructorparameters
Description: Constructor for the scaled merger tree building mass resolution class which reads parameters from a provided parameter list.
Code lines: 36
Contained by: file merger_trees.construct.build.mass_resolution.scaled.F90

function: scaledresolution
Description: Returns a scaled mass resolution to use when building merger trees.
Code lines: 11
Contained by: file merger_trees.construct.build.mass_resolution.scaled.F90
Modules used: galacticus_nodes

file: merger_trees.construct.build.masses.F90
Description: Contains a module which implements a class for creating sets of tree masses to use when building merger trees.
Code lines: 40

module: merger_trees_build_masses
Description: Implements a class for creating sets of tree masses to use when building merger trees.
Code lines: 18
Contained by: file merger_trees.construct.build.masses.F90
Used by: subroutine galacticus_function_classes_destroy; subroutine galacticus_state_retrieve; subroutine galacticus_state_store; file merger_trees.construct.build.F90

file: merger_trees.construct.build.masses.distribution.F90
Description: Contains a module which implements a class providing mass distributions for merger trees to be built.
Code lines: 39

module: merger_trees_build_masses_distributions
Description: Implements a class providing mass distributions for merger trees to be built.
Code lines: 17
Contained by: file merger_trees.construct.build.masses.distribution.F90
Used by: subroutine galacticus_function_classes_destroy; subroutine galacticus_state_retrieve; subroutine galacticus_state_store; file merger_trees.construct.build.masses.sampled_distribution.F90

file: merger_trees.construct.build.masses.distribution.gaussian.F90
Description: Implementation of a merger tree halo mass function sampling class in which the sampling rate is given by a Gaussian distribution in halo mass.
Code lines: 91

function: gaussianconstructorinternal
Description: Internal constructor for the gaussian merger tree halo mass function sampling class.
Code lines: 8
Contained by: file merger_trees.construct.build.masses.distribution.gaussian.F90

function: gaussianconstructorparameters
Description: Constructor for the gaussian merger tree halo mass function sampling class which builds the object from a parameter set.
Code lines: 25
Contained by: file merger_trees.construct.build.masses.distribution.gaussian.F90
Modules used: input_parameters

function: gaussiansample
Description: Computes the halo mass function sampling rate using a volume-limited sampling.
Code lines: 13
Contained by: file merger_trees.construct.build.masses.distribution.gaussian.F90

interface: mergertreebuildmassdistributiongaussian
Description: Constructors for the gaussian merger tree halo mass function sampling class.
Code lines: 4

Contained by: file merger_trees.construct.build.masses.distribution.gaussian.F90

file: merger_trees.construct.build.masses.distribution.halo_mass_function.F90
Description: Implementation of a merger tree halo mass function sampling class in which the sampling rate is proportional to the halo mass function.
Code lines: 148
Modules used: cosmological_density_field halo_mass_functions

function: halomassfunctionconstructorinternal
Description: Internal constructor for the haloMassFunction merger tree halo mass function sampling class.
Code lines: 10
Contained by: file merger_trees.construct.build.masses.distribution.halo_mass_function.F90

function: halomassfunctionconstructorparameters
Description: Constructor for the haloMassFunction merger tree halo mass function sampling class which builds the object from a parameter set.
Code lines: 49
Contained by: file merger_trees.construct.build.masses.distribution.halo_mass_function.F90
Modules used: input_parameters

subroutine: halomassfunctiondestructor
Description: Destructor for the haloMassFunction merger tree halo mass sampling class.
Code lines: 8
Contained by: file merger_trees.construct.build.masses.distribution.halo_mass_function.F90

function: halomassfunctionsample
Description: Computes the halo mass function sampling rate using a volume-limited sampling.
Code lines: 28
Contained by: file merger_trees.construct.build.masses.distribution.halo_mass_function.F90
Modules used: galacticus_nodes

interface: mergertreebuildmassdistributionhalomassfunction

Contained by: file merger_trees.construct.build.masses.sampled_distribution.F90

file: merger_trees.construct.build.masses.sampled_distribution.pseudo_random.F90
Description: Implementation of a merger tree masses class which samples masses from a distribution using pseudo-random sampling.
Code lines: 88

interface: mergertreebuildmassessampleddistributionpseudorandom
Code lines: 3
Contained by: file merger_trees.construct.build.masses.sampled_distribution.pseudo_random.F90

function: sampleddistributionpseudorandomconstructorinternal
Description: Internal constructor for the sampledDistributionPseudoRandom merger tree masses class.
Code lines: 9
Contained by: file merger_trees.construct.build.masses.sampled_distribution.pseudo_random.F90

function: sampleddistributionpseudorandomconstructorparameters
Description: Constructor for the sampledDistributionPseudoRandom merger tree masses class which takes a parameter set as input.
Code lines: 10
Contained by: file merger_trees.construct.build.masses.sampled_distribution.pseudo_random.F90
Modules used: input_parameters

subroutine: sampleddistributionpseudorandomdestructor
Description: Destructor for the sampledDistributionPseudoRandom merger tree masses class.
Code lines: 7
Contained by: file merger_trees.construct.build.masses.sampled_distribution.pseudo_random.F90

subroutine: sampleddistributionpseudorandomsamplecmf
Description: Generate a pseudoRandom sample of points from the merger tree mass distribution.
Code lines: 16
Contained by: file merger_trees.construct.build.masses.sampled_distribution.pseudo_random.F90
Modules used: iso_c_binding pseudo_random

file: merger_trees.construct.build.masses.sampled_distribution.quasi_random.F90
Description: Implementation of a merger tree masses class which samples masses from a distribution using quasi-random sampling.
Code lines: 91

interface: mergertreebuildmassessampleddistributionquasirandom
Code lines: 3
Contained by: file merger_trees.construct.build.masses.sampled_distribution.quasi_random.F90

function: `sampleddistributionquasirandomconstructorinternal`
Description: Internal constructor for the `sampledDistributionQuasiRandom` merger tree masses class.
Code lines: 9
Contained by: file merger_trees.construct.build.masses.sampled_distribution.quasi_random.F90

function: `sampleddistributionquasirandomconstructorparameters`
Description: Constructor for the `sampledDistributionQuasiRandom` merger tree masses class which takes a parameter set as input.
Code lines: 10
Contained by: file merger_trees.construct.build.masses.sampled_distribution.quasi_random.F90
Modules used: input_parameters

subroutine: `sampleddistributionquasirandomdestructor`
Description: Destructor for the `sampledDistributionQuasiRandom` merger tree masses class.
Code lines: 7
Contained by: file merger_trees.construct.build.masses.sampled_distribution.quasi_random.F90

subroutine: `sampleddistributionquasirandomsamplecmf`
Description: Generate a quasiRandom sample of points from the merger tree mass distribution.
Code lines: 19
Contained by: file merger_trees.construct.build.masses.sampled_distribution.quasi_random.F90
Modules used: `fgsl` `iso_c_binding` quasi_random

file: `merger_trees.construct.build.masses.sampled_distribution.uniform.F90`
Description: Implementation of a merger tree masses class which samples masses from a distribution uniformly.
Code lines: 82

interface: `mergertreebuildmassessampleddistributionuniform`
Code lines: 3
Contained by: file merger_trees.construct.build.masses.sampled_distribution.uniform.F90

function: `sampleddistributionuniformconstructorinternal`
Description: Internal constructor for the `sampledDistributionUniform` merger tree masses class.
Code lines: 9
Contained by: file merger_trees.construct.build.masses.sampled_distribution.uniform.F90

function: `sampleddistributionuniformconstructorparameters`
Description: Constructor for the `sampledDistributionUniform` merger tree masses class which takes a parameter set as input.
Code lines: 10
Contained by: file merger_trees.construct.build.masses.sampled_distribution.uniform.F90
Modules used: input_parameters

subroutine: `sampleddistributionuniformdestructor`
Description: Destructor for the `sampledDistributionUniform` merger tree masses class.
Code lines: 7

Contained by: file merger_trees.construct.build.masses.sampled_distribution.uniform.F90

subroutine: sampleddistributionuniformsamplecmf
Description: Generate a uniform sample of points from the merger tree mass distribution.
Code lines: 10
Contained by: file merger_trees.construct.build.masses.sampled_distribution.uniform.F90
Modules used: numerical_ranges

file: merger_trees.construct.build.masses.union.F90
Description: Implementation of a merger tree masses class which constructs the union of other classes.
Code lines: 174

type: mergertreebuildmasseslist
Code lines: 3
Contained by: file merger_trees.construct.build.masses.union.F90

interface: mergertreebuildmassesunion
Code lines: 3
Contained by: file merger_trees.construct.build.masses.union.F90

subroutine: unionconstruct
Description: Construct a set of merger tree masses by sampling from a distribution.
Code lines: 75
Contained by: file merger_trees.construct.build.masses.union.F90
Modules used: galacticus_error, iso_c_binding, memory_management, sort, weight

function: unionconstructorinternal
Description: Internal constructor for the union merger tree masses class.
Code lines: 8
Contained by: file merger_trees.construct.build.masses.union.F90

function: unionconstructorparameters
Description: Constructor for the union merger tree masses class which takes a parameter set as input.
Code lines: 23
Contained by: file merger_trees.construct.build.masses.union.F90
Modules used: input_parameters

subroutine: uniondestructor
Description: Destructor for the merger tree mergerTreeBuildMasses function class.
Code lines: 16
Contained by: file merger_trees.construct.build.masses.union.F90

file: merger_trees.construct.builder.Cole2000.F90
Description: An implementation of a merger tree builder using the algorithm of Cole et al. [2000].
Code lines: 622
Modules used: cosmological_density_field, cosmology_functions, merger_tree_branching, merger_trees_build_mass_resolution

statistics_distributions

subroutine: cole2000build
Description: Build a merger tree.
Code lines: 351
Contained by: file merger_trees.construct.builder.Cole2000.F90
Modules used: galacticus_error, galacticus_nodes, iso_varying_string, kind_numbers, merger_tree_walkers, numerical_comparison, pseudo_random

function: cole2000constructorinternal
Description: Internal constructor for the Cole et al. [2000] merger tree building class.
Code lines: 19
Contained by: file merger_trees.construct.builder.Cole2000.F90
Modules used: galacticus_error

function: cole2000constructorparameters
Description: Constructor for the Cole et al. [2000] merger tree building class which reads parameters from a provided parameter list.
Code lines: 72
Contained by: file merger_trees.construct.builder.Cole2000.F90

subroutine: cole2000criticaloverdensityset
Description: Set the critical overdensity object for this tree builder.
Code lines: 11
Contained by: file merger_trees.construct.builder.Cole2000.F90

function: cole2000criticaloverdensityupdate
Description: Update the critical overdensity for a new node, given that of the parent,
Code lines: 19
Contained by: file merger_trees.construct.builder.Cole2000.F90
Modules used: galacticus_nodes

subroutine: cole2000destructor
Description: Destructor for the cole2000 merger tree builder class.
Code lines: 10
Contained by: file merger_trees.construct.builder.Cole2000.F90

function: cole2000shouldabort
Description: Return true if tree construction should be aborted. In the cole2000 tree builder we never abort.
Code lines: 10
Contained by: file merger_trees.construct.builder.Cole2000.F90

function: cole2000shouldfollowbranch
Description: Return true if tree construction should continue to follow the current branch. In the cole2000 tree builder we always continue.
Code lines: 12
Contained by: file merger_trees.construct.builder.Cole2000.F90
Modules used: galacticus_nodes

subroutine: `cole2000timeearliestset`
Description: Set the earliest time for the tree builder.
Code lines: 8
Contained by: file merger_trees.construct.builder.Cole2000.F90

interface: `mergertreebuildercole2000`
Description: Constructors for the `cole2000` merger tree builder class.
Code lines: 4
Contained by: file merger_trees.construct.builder.Cole2000.F90

file: `merger_trees.construct.builder.F90`
Description: Contains a module which provides a class of merger tree builders.
Code lines: 46

module: `merger_trees_builders`
Description: Provides a class of merger tree builders.
Code lines: 24
Contained by: file merger_trees.construct.builder.F90
Modules used: galacticus_nodes
Used by:

subroutine galacticus_function_-classes_destroy	subroutine galacticus_state_retrieve
subroutine galacticus_state_store	file merger_trees.construct.build.F90
file merger_trees.operators.augment.F90	function augmentaccepttree

file: `merger_trees.construct.fully_specified.F90`
Description: Implements a merger tree constructor class which constructs a merger tree given a full specification in XML.
Code lines: 275
Modules used: fox_dom

type: `documentcontainer`
Description: A container for XML docoment.
Code lines: 5
Contained by: file merger_trees.construct.fully_specified.F90

function: `fullyspecifiedconstruct`
Description: Construct a fully-specified merger tree.
Code lines: 156
Contained by: file merger_trees.construct.fully_specified.F90
Modules used:

fox_dom	galacticus_display
galacticus_error	galacticus_nodes
iso_c_binding	kind_numbers
memory_management	pseudo_random

function: `indexnode`
Description: Extract and return an index from a node definition as used when constructing fully-specified merger trees.
Code lines: 33
Contained by: function fullyspecifiedconstruct

Modules used: fox_dom galacticus_error kind_numbers

function: nodelookup
Description: Find the position of a node in the nodeArray array given its indexValue.
Code lines: 21
Contained by: function fullyspecifiedconstruct
Modules used: galacticus_error galacticus_nodes kind_numbers

function: fullyspecifiedconstructorinternal
Description: Internal constructor for the fullySpecified merger tree operator class.
Code lines: 22
Contained by: file merger_trees.construct.fully_specified.F90
Modules used: galacticus_error

function: fullyspecifiedconstructorparameters
Description: Constructor for the fullySpecified merger tree operator class which takes a parameter set as input.
Code lines: 18
Contained by: file merger_trees.construct.fully_specified.F90
Modules used: input_parameters

subroutine: fullyspecifieddestructor
Description: Destructor for the fullySpecified merger tree constructor class.
Code lines: 16
Contained by: file merger_trees.construct.fully_specified.F90

interface: mergertreeconstructorfullyspecified
Description: Constructors for the fullySpecified merger tree constructor class.
Code lines: 4
Contained by: file merger_trees.construct.fully_specified.F90

file: merger_trees.construct.read.F90
Description: Implements a merger tree constructor class which constructs trees by reading their definitions from file.
Code lines: 3681
Modules used: cosmology_functions dark_matter_halo_scales dark_matter_profile_scales dark_matter_profiles_concentration dark_matter_profiles_dmo galacticus_nodes halo_spin_distributions kind_numbers merger_tree_read_importers mpi_utilities output_times satellite_merging_timescales virial_orbits

interface: mergertreeconstructorread
Description: Constructors for the read merger tree constructor class.
Code lines: 4
Contained by: file merger_trees.construct.read.F90

type: `progenitoriterator`
Code lines: 44
Contained by: file `merger_trees.construct.read.F90`

function: `progenitoriteratorcurrent`
Description: Return a pointer to the current progenitor in a progenitor iterator object.
Code lines: 9
Contained by: file `merger_trees.construct.read.F90`

subroutine: `progenitoriteratordescendentset`
Description: Initialize a progenitor iterator object by storing the index of the taget `node` and finding the location of the first progenitor (if any).
Code lines: 26
Contained by: file `merger_trees.construct.read.F90`

function: `progenitoriteratorexist`
Description: Return true if progenitors exist, false otherwise.
Code lines: 7
Contained by: file `merger_trees.construct.read.F90`

function: `progenitoriteratorindex`
Description: Return the node index of the current progenitor in a progenitor iterator object.
Code lines: 9
Contained by: file `merger_trees.construct.read.F90`

function: `progenitoriteratornext`
Description: Move to the next progenitor using a progenitor iterator object, returning true if the next progenitor exists, false if it does not.
Code lines: 26
Contained by: file `merger_trees.construct.read.F90`

subroutine: `readassignhosttreepointers`
Description: After tree base nodes have been assigned, walk each tree and set the host tree pointer for each node.
Code lines: 18
Contained by: file `merger_trees.construct.read.F90`
Modules used: `merger_tree_walkers`

subroutine: `readassignisolatednodeindices`
Description: Assign to each node the number of the corresponding isolated node.
Code lines: 40
Contained by: file `merger_trees.construct.read.F90`

subroutine: `readassignmergers`
Description: Assign pointers to merge targets.
Code lines: 43
Contained by: file `merger_trees.construct.read.F90`
Modules used: `galacticus_error` `galacticus_nodes`

string_handling

subroutine: `readassignnamedproperties`
Description: Assign named properties to nodes.
Code lines: 37
Contained by: file merger_trees.construct.read.F90
Modules used: galacticus_error galacticus_nodes

subroutine: `readassignscaleradii`
Description: Assign scale radii to nodes.
Code lines: 112
Contained by: file merger_trees.construct.read.F90
Modules used: fallbackscalemethod galacticus_display galacticus_error galacticus_nodes input_parameters root_finder

subroutine: `readassignspinparameters`
Description: Assign spin parameters to nodes.
Code lines: 59
Contained by: file merger_trees.construct.read.F90
Modules used: galacticus_error galacticus_nodes numerical_constants_physical

function: `spinnormalization`
Description: Normalization for conversion of angular momentum to spin.
Code lines: 5
Contained by: subroutine readassignspinparameters

subroutine: `readassignsplitforestevents`
Description: Assign events to nodes if they jump between trees in a forest.
Code lines: 197
Contained by: file merger_trees.construct.read.F90
Modules used: galacticus_display galacticus_error galacticus_nodes node_events_inter_tree string_handling

subroutine: `readassignuniqueidstoclones`
Description: Assign new uniqueID values to any cloned nodes inserted into the trees.
Code lines: 13
Contained by: file merger_trees.construct.read.F90
Modules used: galacticus_nodes

subroutine: `readbuildchildandsiblinglinks`
Description: Build child and sibling links between nodes.
Code lines: 63
Contained by: file merger_trees.construct.read.F90
Modules used: galacticus_nodes memory_management

subroutine: `readbuilddescendentpointers`

Description: Builds pointers from each node to its descendent node.
Code lines: 46
Contained by: file `merger_trees.construct.read.F90`
Modules used: `galacticus_display` `galacticus_error` `string_handling`

subroutine: `readbuildisolatedparentpointers`

Description: Create parent pointer links between isolated nodes and assign times and masses to those nodes.
Code lines: 92
Contained by: file `merger_trees.construct.read.F90`
Modules used: `galacticus_error` `galacticus_nodes` `pseudo_random` `string_handling`

subroutine: `readbuildparentpointers`

Description: Build pointers to node parents.
Code lines: 42
Contained by: file `merger_trees.construct.read.F90`
Modules used: `galacticus_error` `string_handling`

subroutine: `readbuildsubhalomasshistories`

Description: Build and attached bound mass histories to subhalos.
Code lines: 134
Contained by: file `merger_trees.construct.read.F90`
Modules used: `galacticus_error` `galacticus_nodes` `histories` `string_handling`

function: `readconstruct`

Description: Construct a merger tree by reading its definition from file.
Code lines: 313
Contained by: file `merger_trees.construct.read.F90`
Modules used: `array_utilities` `arrays_search` `functions_global` `galacticus_error` `galacticus_nodes` `memory_management` `merger_tree_state_store` `numerical_comparison` `pseudo_random` `sort` `string_handling` `vectors`

function: `readconstructorinternal`

Description: Internal constructor for the `read` merger tree constructor class.
Code lines: 145
Contained by: file `merger_trees.construct.read.F90`
Modules used: `galacticus_display` `galacticus_error` `galacticus_nodes` `memory_management` `numerical_constants_astronomical` `numerical_constants_boolean`

function: `readconstructorparameters`

Description: Constructor for the `read` merger tree constructor class which takes a parameter set as input.
Code lines: 282
Contained by: file `merger_trees.construct.read.F90`
Modules used: `input_parameters`

subroutine: `readcreatebranchjumpevent`
Description: Create a matched-pair of branch jump events in the given nodes.
Code lines: 21
Contained by: file `merger_trees.construct.read.F90`
Modules used: `galacticus_nodes` `node_branch_jumps`

subroutine: `readcreatenodearray`
Description: Create an array of standard nodes and associated structures.
Code lines: 55
Contained by: file `merger_trees.construct.read.F90`
Modules used: `galacticus_nodes` `memory_management`

subroutine: `readcreatenodeindices`
Description: Create a sorted list of node indices with an index into the original array.
Code lines: 31
Contained by: file `merger_trees.construct.read.F90`
Modules used: `galacticus_error` `memory_management` `sort` `string_handling`

function: `readdescendentnodesortindex`
Description: Return the sort index of the given `descendentIndex`.
Code lines: 10
Contained by: file `merger_trees.construct.read.F90`
Modules used: `arrays_search`

subroutine: `readdestroynodeindices`
Description: Destroy the sorted list of node indices.
Code lines: 11
Contained by: file `merger_trees.construct.read.F90`
Modules used: `memory_management`

subroutine: `readdestructor`
Description: Destructor for the `read` merger tree constructor class.
Code lines: 20
Contained by: file `merger_trees.construct.read.F90`

subroutine: `readdumptree`
Description: Dumps the tree structure to a file in a format suitable for processing with DOT.
Code lines: 85
Contained by: file `merger_trees.construct.read.F90`

subroutine: `readenforcesubhalostatus`
Description: Ensure that any node which was once a subhalo remains a subhalo.
Code lines: 69

Contained by: file merger_trees.construct.read.F90
Modules used: galacticus_error string_handling

subroutine: readintertreemergetimeset
Description: Set the merging time for a node undergoing and inter-tree transfer.
Code lines: 79
Contained by: file merger_trees.construct.read.F90
Modules used: galacticus_error galacticus_nodes kepler_orbits string_handling

function: readisonpulllist
Description: Return true if the given node is on the current "pull-from" list of nodes for split forests.
Code lines: 12
Contained by: file merger_trees.construct.read.F90

function: readisonpushlist
Description: Return true if the given node is on the current "push-to" list of nodes for split forests.
Code lines: 12
Contained by: file merger_trees.construct.read.F90

function: readissubhalosubhalomerger
Description: Returns true if node undergoes a subhalo-subhalo merger.
Code lines: 25
Contained by: file merger_trees.construct.read.F90

function: readlasthostdescendent
Description: Return a pointer to the last descendent that can be reached from node when descending through hosts.
Code lines: 11
Contained by: file merger_trees.construct.read.F90

function: readnodelocation
Description: Return the location in the original array of the given nodeIndex.
Code lines: 16
Contained by: file merger_trees.construct.read.F90
Modules used: arrays_search

function: readorbitconstruct
Description: Construct a Keplerian orbit given body masses, positions, and relative velocities.
Code lines: 15
Contained by: file merger_trees.construct.read.F90
Modules used: kepler_orbits vectors

subroutine: readphasespacepositionrealize
Description: Modify relative positions and velocities to account for both any periodicity of the simulated volume, and for Hubble flow.
Code lines: 21
Contained by: file merger_trees.construct.read.F90
Modules used: cosmology_functions numerical_constants_boolean

function: `readpulllistcount`
Description: Return the number of the given node in the "pull-from" list of nodes for split forests.
Code lines: 13
Contained by: file `merger_trees.construct.read.F90`

function: `readpulllistindex`
Description: Return the index of the given node in the "pull-from" list of nodes for split forests.
Code lines: 21
Contained by: file `merger_trees.construct.read.F90`

function: `readpushlistindex`
Description: Return the index of the given node in the "push-to" list of nodes for split forests.
Code lines: 16
Contained by: file `merger_trees.construct.read.F90`

function: `readradiushalfmassroot`
Description: Function used to find scale radius of dark matter halos given their half-mass radius.
Code lines: 10
Contained by: file `merger_trees.construct.read.F90`

subroutine: `readrootnodeaffinitiesinitial`
Description: Find initial root node affinities for all nodes.
Code lines: 205
Contained by: file `merger_trees.construct.read.F90`
Modules used: `galacticus_display` `iso_varying_string` `memory_management` `sort` `string_handling`

subroutine: `readscanforbranchjumps`
Description: Search for subhalos which move between branches/trees.
Code lines: 169
Contained by: file `merger_trees.construct.read.F90`
Modules used: `galacticus_display` `galacticus_nodes` `iso_varying_string` `string_handling`

subroutine: `readscanformergers`
Description: Scan for and record mergers between nodes.
Code lines: 282
Contained by: file `merger_trees.construct.read.F90`
Modules used: `galacticus_error` `galacticus_nodes` `kepler_orbits` `string_handling` `vectors`

subroutine: `readscanforsubhalopromotions`
Description: Scan for cases where a subhalo stops being a subhalo and so must be promoted.
Code lines: 63
Contained by: file `merger_trees.construct.read.F90`
Modules used: `galacticus_nodes` `node_subhalo_promotions`

subroutine: `readtimeuntilmergingsubresolution`
Description: Compute the additional time until merging after a subhalo is lost from the tree (presumably due to limited resolution).
Code lines: 121
Contained by: file merger_trees.construct.read.F90
Modules used: galacticus_display, galacticus_error, galacticus_nodes, kepler_orbits, string_handling, vectors

subroutine: `readtimingrecord`
Description: Record timing data.
Code lines: 26
Contained by: file merger_trees.construct.read.F90

subroutine: `readtimingreport`
Description: Report on time taken in various steps of processing merger trees read from file.
Code lines: 20
Contained by: file merger_trees.construct.read.F90
Modules used: galacticus_display

subroutine: `readvalidateisolatedhalos`
Description: Ensure that nodes have valid primary progenitors.
Code lines: 46
Contained by: file merger_trees.construct.read.F90

file: `merger_trees.construct.read.importer.F90`
Description: Contains a module which provides an object that implements importing of merger trees from file.
Code lines: 377

module: `merger_tree_read_importers`
Description: Provides an object that implements importing of merger trees from file.
Code lines: 355
Contained by: file merger_trees.construct.read.importer.F90
Modules used: galacticus_nodes, iso_c_binding, iso_varying_string, kind_numbers, pseudo_random
Used by: subroutine galacticus_function_classes_destroy, subroutine galacticus_state_retrieve, subroutine galacticus_state_store, file merger_trees.construct.read.F90

interface: `importerunitconvert`
Description: Unit convertors for merger tree importers.
Code lines: 5
Contained by: module merger_tree_read_importers

function: `importerunitconvert1d`
Description: Convert a set of values for Galacticus internal units.

Code lines: 22
Contained by: module merger_tree_read_importers
Modules used: cosmology_functions cosmology_parameters galacticus_error

function: importerunitconvert2d
Description: Convert a set of values for GALACTICUS internal units.
Code lines: 23
Contained by: module merger_tree_read_importers
Modules used: cosmology_functions cosmology_parameters galacticus_error

function: importerunitconvertscalar
Description: Convert a set of values for GALACTICUS internal units.
Code lines: 19
Contained by: module merger_tree_read_importers
Modules used: cosmology_functions cosmology_parameters galacticus_error

type: importerunits
Code lines: 40
Contained by: module merger_tree_read_importers

function: importerunitsareequal
Description: Test whether two importerUnits objects are equal.
Code lines: 10
Contained by: module merger_tree_read_importers
Modules used: galacticus_error

function: importerunitsarenotequal
Description: Test whether two importerUnits objects are not equal.
Code lines: 8
Contained by: module merger_tree_read_importers

function: importerunitsexponentiate
Description: Exponentiate importerUnits objects.
Code lines: 12
Contained by: module merger_tree_read_importers

function: importerunitsmultiply
Description: Multiply to importerUnits objects.
Code lines: 12
Contained by: module merger_tree_read_importers

type: nodedata
Description: Structure used to store default raw data read from merger tree files.
Code lines: 10
Contained by: module merger_tree_read_importers

type: `nodedataminimal`
Description: Structure used to store minimal raw data read from merger tree files.
Code lines: 4
Contained by: module `merger_tree_read_importers`

file: `merger_trees.construct.read.importer.SussingMergerTrees.ASCII.F90`
Description: An implementation of the merger tree importer class for "Sussing Merger Trees" format merger tree files.
Code lines: 880

interface: `mergertreeimportersussingascii`
Description: Constructors for the `sussing` ASCII format merger tree importer class.
Code lines: 4
Contained by: file `merger_trees.construct.read.importer.SussingMergerTrees.ASCII.F90`

function: `sussingasciiconstructorinternal`
Description: Internal constructor for the "Sussing Merger Trees" ASCII format [Srisawat et al., 2013] merger tree importer.
Code lines: 16
Contained by: file `merger_trees.construct.read.importer.SussingMergerTrees.ASCII.F90`

function: `sussingasciiconstructorparameters`
Description: Constructor for the "Sussing Merger Trees" ASCII format [Srisawat et al., 2013] merger tree importer which takes a parameter set as input.
Code lines: 66
Contained by: file `merger_trees.construct.read.importer.SussingMergerTrees.ASCII.F90`
Modules used: `input_parameters`

subroutine: `sussingasciiload`
Description: Load a `sussing` ASCII format merger tree data.
Code lines: 544
Contained by: file `merger_trees.construct.read.importer.SussingMergerTrees.ASCII.F90`
Modules used:

`array_utilities`	`arrays_search`
`file_utilities`	`galacticus_display`
`galacticus_error`	`iso_c_binding`
`kind_numbers`	`memory_management`
`numerical_constants_astronomical`	`numerical_constants_prefixes`
`sort`	`string_handling`

subroutine: `sussingasciiopen`
Description: Validate a `sussing` ASCII format merger tree file.
Code lines: 117
Contained by: file `merger_trees.construct.read.importer.SussingMergerTrees.ASCII.F90`
Modules used:

`file_utilities`	`galacticus_display`
`galacticus_error`	`memory_management`
`numerical_comparison`	`numerical_constants_astronomical`
`regular_expressions`	`string_handling`

subroutine: `sussingasciireadhalo`
Description: Read an ASCII halo definition.
Code lines: 76
Contained by: file `merger_trees.construct.read.importer.SussingMergerTrees.ASCII.F90`
Modules used: `galacticus_error`

file: `merger_trees.construct.read.importer.SussingMergerTrees.F90`
Description: An implementation of the merger tree importer class for "Sussing Merger Trees" format merger tree files.
Code lines: 1033
Modules used: `cosmology_functions` `cosmology_parameters` `iso_varying_string` `pseudo_random` `stateful_types`

interface: `mergertreeimportersussing`
Code lines: 3
Contained by: file `merger_trees.construct.read.importer.SussingMergerTrees.F90`

function: `sussingangularmomenta3davailable`
Description: Return true if angular momenta vectors are available.
Code lines: 8
Contained by: file `merger_trees.construct.read.importer.SussingMergerTrees.F90`

function: `sussingangularmomentaavailable`
Description: Return true if angular momenta are available.
Code lines: 8
Contained by: file `merger_trees.construct.read.importer.SussingMergerTrees.F90`

function: `sussingangularmomentaincludesubhalos`
Description: Return a Boolean specifying whether or not the halo angular momenta include the contribution from subhalos.
Code lines: 9
Contained by: file `merger_trees.construct.read.importer.SussingMergerTrees.F90`
Modules used: `galacticus_error`

function: `sussingcanreadsubsets`
Description: Return false since this format does not permit reading of arbitrary subsets of halos from a forest.
Code lines: 8
Contained by: file `merger_trees.construct.read.importer.SussingMergerTrees.F90`

subroutine: `sussingclose`
Description: Close a `sussing` format merger tree file.
Code lines: 7
Contained by: file `merger_trees.construct.read.importer.SussingMergerTrees.F90`

function: `sussingconstructorinternal`
Description: Internal constructor for the "Sussing Merger Trees" format [Srisawat et al., 2013] merger tree importer class.

Code lines: 16
Contained by: file merger_trees.construct.read.importer.SussingMergerTrees.F90

function: sussingconstructorparameters
Description: Constructor for the "Sussing Merger Trees" format [Srisawat et al., 2013] merger tree importer which takes a parameter set as input.
Code lines: 95
Contained by: file merger_trees.construct.read.importer.SussingMergerTrees.F90
Modules used: input_parameters

function: sussingcubelength
Description: Return the length of the simulation cube.
Code lines: 12
Contained by: file merger_trees.construct.read.importer.SussingMergerTrees.F90
Modules used: numerical_constants_astronomical numerical_constants_boolean

subroutine: sussingdestructor
Code lines: 7
Contained by: file merger_trees.construct.read.importer.SussingMergerTrees.F90

subroutine: sussingimport
Description: Import the $i^{\rm th}$ merger tree.
Code lines: 31
Contained by: file merger_trees.construct.read.importer.SussingMergerTrees.F90
Modules used: galacticus_error memory_management

function: sussinginsubvolume
Description: Determine if a point lies within a subvolume of the simulation box (possibly with some buffering).
Code lines: 9
Contained by: file merger_trees.construct.read.importer.SussingMergerTrees.F90

function: sussinginsubvolume1d
Description: Determine if a point lies within the 1-D range of a subvolume of the simulation box (possibly with some buffering).
Code lines: 23
Contained by: file merger_trees.construct.read.importer.SussingMergerTrees.F90
Modules used: numerical_constants_astronomical

subroutine: sussingload
Description: Stub function for the load method of the sussing merger tree importer.
Code lines: 15
Contained by: file merger_trees.construct.read.importer.SussingMergerTrees.F90
Modules used: galacticus_error

function: sussingmassesincludesubhalos
Description: Return a Boolean specifying whether or not the halo masses include the contribution from subhalos.
Code lines: 9
Contained by: file merger_trees.construct.read.importer.SussingMergerTrees.F90

Modules used: galacticus_error

function: sussingnodecount
Description: Return a count of the number of nodes in the $i^{\rm th}$ tree.
Code lines: 10
Contained by: file merger_trees.construct.read.importer.SussingMergerTrees.F90

function: sussingparticlecountavailable
Description: Return true if particle counts are available.
Code lines: 8
Contained by: file merger_trees.construct.read.importer.SussingMergerTrees.F90

function: sussingperiodicseparation
Description: Determine the separation between two points in a periodic cube.
Code lines: 13
Contained by: file merger_trees.construct.read.importer.SussingMergerTrees.F90

function: sussingpositionsareperiodic
Description: Return a Boolean integer specifying whether or not positions are periodic.
Code lines: 9
Contained by: file merger_trees.construct.read.importer.SussingMergerTrees.F90
Modules used: numerical_constants_boolean

function: sussingpositionsavailable
Description: Return true if positions and/or velocities are available.
Code lines: 9
Contained by: file merger_trees.construct.read.importer.SussingMergerTrees.F90

function: sussingscaleradiiavailable
Description: Return true if scale radii are available.
Code lines: 8
Contained by: file merger_trees.construct.read.importer.SussingMergerTrees.F90

function: sussingspin3davailable
Description: Return true if spins vectors are available.
Code lines: 8
Contained by: file merger_trees.construct.read.importer.SussingMergerTrees.F90

function: sussingspinavailable
Description: Return true if spins are available.
Code lines: 8
Contained by: file merger_trees.construct.read.importer.SussingMergerTrees.F90

subroutine: sussingsubhalotrace
Description: Returns a trace of subhalo position/velocity.
Code lines: 12
Contained by: file merger_trees.construct.read.importer.SussingMergerTrees.F90
Modules used: galacticus_error

function: `sussingsubhalotracecount`
Description: Returns the length of a subhalo trace.
Code lines: 11
Contained by: file merger_trees.construct.read.importer.SussingMergerTrees.F90

function: `sussingtreecount`
Description: Return a count of the number of trees available.
Code lines: 8
Contained by: file merger_trees.construct.read.importer.SussingMergerTrees.F90

function: `sussingtreeindex`
Description: Return the index of the $i^{\rm th}$ tree.
Code lines: 9
Contained by: file merger_trees.construct.read.importer.SussingMergerTrees.F90

subroutine: `sussingtreeindicesread`
Description: Read the tree indices.
Code lines: 381
Contained by: file merger_trees.construct.read.importer.SussingMergerTrees.F90
Modules used:

array_utilities	arrays_search
galacticus_display	galacticus_error
iso_c_binding	kind_numbers
memory_management	numerical_constants_astronomical
numerical_constants_prefixes	sort
string_handling	

function: `sussingtreesareselfcontained`
Description: Return a Boolean integer specifying whether or not the trees are self-contained.
Code lines: 9
Contained by: file merger_trees.construct.read.importer.SussingMergerTrees.F90
Modules used: numerical_constants_boolean

function: `sussingtreeshavesubhalos`
Description: Return a Boolean integer specifying whether or not the trees have subhalos.
Code lines: 9
Contained by: file merger_trees.construct.read.importer.SussingMergerTrees.F90
Modules used: numerical_constants_boolean

function: `sussingtreeweight`
Description: Return the weight to assign to trees.
Code lines: 13
Contained by: file merger_trees.construct.read.importer.SussingMergerTrees.F90
Modules used:

galacticus_error	numerical_constants_astronomical
numerical_constants_boolean	

function: `sussingvalueisbad`
Description: Determine if a value in a “Sussing” merger tree file is bad
Code lines: 17

Contained by: file merger_trees.construct.read.importer.SussingMergerTrees.F90
Modules used: galacticus_error

function: sussingvelocitiesincludehubbleflow
Description: Return a Boolean integer specifying whether or not velocities include the Hubble flow.
Code lines: 9
Contained by: file merger_trees.construct.read.importer.SussingMergerTrees.F90
Modules used: numerical_constants_boolean

function: sussingvelocitydispersionavailable
Description: Return true if halo velocity dispersions are available.
Code lines: 8
Contained by: file merger_trees.construct.read.importer.SussingMergerTrees.F90

function: sussingvelocitymaximumavailable
Description: Return true if halo rotation curve velocity maxima are available.
Code lines: 8
Contained by: file merger_trees.construct.read.importer.SussingMergerTrees.F90

file: merger_trees.construct.read.importer.SussingMergerTrees.HDF5.F90
Description: An implementation of the merger tree importer class for "Sussing Merger Trees" format merger tree files.
Code lines: 474
Modules used: cosmological_density_field io_hdf5

interface: mergertreeimportersussinghdf5
Description: Constructors for the sussing HDF5 format merger tree importer class.
Code lines: 4
Contained by: file merger_trees.construct.read.importer.SussingMergerTrees.HDF5.F90

function: sussinghdf5constructorinternal
Description: Default constructor for the "Sussing Merger Trees" HDF5 format (Thomas et al.; in prep.) merger tree importer.
Code lines: 16
Contained by: file merger_trees.construct.read.importer.SussingMergerTrees.HDF5.F90
Modules used: input_parameters

function: sussinghdf5constructorparameters
Description: Default constructor for the "Sussing Merger Trees" HDF5 format (Thomas et al.; in prep.) merger tree importer.
Code lines: 12
Contained by: file merger_trees.construct.read.importer.SussingMergerTrees.HDF5.F90
Modules used: input_parameters

subroutine: sussinghdf5destructor
Description: Destructor for the sussing HDF5 format merger tree importer class.
Code lines: 12
Contained by: file merger_trees.construct.read.importer.SussingMergerTrees.HDF5.F90
Modules used: memory_management

subroutine: `sussinghdf5load`

Description: Load a `sussing` HDF5 format merger tree data.
Code lines: 270
Contained by: file merger_trees.construct.read.importer.SussingMergerTrees.HDF5.F90
Modules used: array_utilities, arrays_search, file_utilities, galacticus_display, galacticus_error, iso_c_binding, kind_numbers, memory_management, numerical_constants_astronomical, numerical_constants_prefixes, sort, string_handling

function: `decodeunits`

Description: Decode a textual unit definition and construct an importer units object from it.
Code lines: 34
Contained by: subroutine sussinghdf5load
Modules used: galacticus_display, galacticus_error

subroutine: `sussinghdf5open`

Description: Validate a `sussing` HDF5 format merger tree file.
Code lines: 109
Contained by: file merger_trees.construct.read.importer.SussingMergerTrees.HDF5.F90
Modules used: file_utilities, galacticus_display, galacticus_error, memory_management, numerical_comparison, numerical_constants_astronomical, string_handling

file: `merger_trees.construct.read.importer.galacticus.F90`

Description: An implementation of the merger tree importer class for Galacticus format merger tree files.
Code lines: 1224
Modules used: cosmological_density_field, cosmology_functions, cosmology_parameters, halo_mass_functions, io_hdf5, stateful_types

function: `galacticusangularmomenta3davailable`

Description: Return true if angular momenta vectors are available.
Code lines: 7
Contained by: file merger_trees.construct.read.importer.galacticus.F90

function: `galacticusangularmomentaavailable`

Description: Return true if angular momenta are available.
Code lines: 7
Contained by: file merger_trees.construct.read.importer.galacticus.F90

function: `galacticusangularmomentaincludesubhalos`

Description: Return a Boolean specifying whether or not the halo momenta include the contribution from subhalos.
Code lines: 24
Contained by: file merger_trees.construct.read.importer.galacticus.F90

Modules used: galacticus_error

function: galacticuscanreadsubsets
Description: Return true since this format does permit reading of arbitrary subsets of halos from a forest.
Code lines: 8
Contained by: file merger_trees.construct.read.importer.galacticus.F90

subroutine: galacticusclose
Description: Validate a Galacticus format merger tree file.
Code lines: 11
Contained by: file merger_trees.construct.read.importer.galacticus.F90

function: galacticusconstructorinternal
Description: Internal constructor for the Galacticus format merger tree importer.
Code lines: 19
Contained by: file merger_trees.construct.read.importer.galacticus.F90

function: galacticusconstructorparameters
Description: Constructor for the Galacticus format merger tree importer which takes a parameter set as input.
Code lines: 39
Contained by: file merger_trees.construct.read.importer.galacticus.F90
Modules used: input_parameters

function: galacticuscubelength
Description: Return the length of the simulation cube.
Code lines: 41
Contained by: file merger_trees.construct.read.importer.galacticus.F90
Modules used: galacticus_error numerical_constants_astronomical numerical_constants_boolean

subroutine: galacticusdestructor
Description: Destructor for the Galacticus format merger tree importer class.
Code lines: 14
Contained by: file merger_trees.construct.read.importer.galacticus.F90

subroutine: galacticusforestindicesread
Description: Read the tree indices.
Code lines: 109
Contained by: file merger_trees.construct.read.importer.galacticus.F90
Modules used: galacticus_error hdf5 numerical_constants_astronomical sort

subroutine: galacticusimport
Description: Import the $i^{\rm th}$ merger tree.
Code lines: 303
Contained by: file merger_trees.construct.read.importer.galacticus.F90
Modules used: galacticus_display galacticus_error hdf5 memory_management

nodesubset numerical_constants_astronomical
numerical_constants_prefixes vectors

function: galacticusmassesincludesubhalos
Description: Return a Boolean specifying whether or not the halo masses include the contribution from subhalos.
Code lines: 20
Contained by: file merger_trees.construct.read.importer.galacticus.F90
Modules used: galacticus_error

function: galacticusnodecount
Description: Return a count of the number of nodes in the $i^{\rm th}$ tree.
Code lines: 10
Contained by: file merger_trees.construct.read.importer.galacticus.F90

subroutine: galacticusopen
Description: Validate a Galacticus format merger tree file.
Code lines: 211
Contained by: file merger_trees.construct.read.importer.galacticus.F90
Modules used: galacticus_display galacticus_error
numerical_comparison

function: galacticusparticlecountavailable
Description: Return true if particle counts are available.
Code lines: 9
Contained by: file merger_trees.construct.read.importer.galacticus.F90

function: galacticuspositionsareperiodic
Description: Return a Boolean integer specifying whether or not positions are periodic.
Code lines: 18
Contained by: file merger_trees.construct.read.importer.galacticus.F90
Modules used: numerical_constants_boolean

function: galacticuspositionsavailable
Description: Return true if positions and/or velocities are available.
Code lines: 12
Contained by: file merger_trees.construct.read.importer.galacticus.F90

function: galacticusscaleradiiavailable
Description: Return true if scale radii are available.
Code lines: 9
Contained by: file merger_trees.construct.read.importer.galacticus.F90

function: galacticusspin3davailable
Description: Return true if spins vectors are available.
Code lines: 7
Contained by: file merger_trees.construct.read.importer.galacticus.F90

function: galacticusspinavailable

Description: Return true if spins are available.
Code lines: 7
Contained by: file merger_trees.construct.read.importer.galacticus.F90

subroutine: galacticussubhalotrace
Description: Returns a trace of subhalo position/velocity.
Code lines: 39
Contained by: file merger_trees.construct.read.importer.galacticus.F90
Modules used: galacticus_error numerical_constants_astronomical

function: galacticussubhalotracecount
Description: Returns the length of a subhalo trace.
Code lines: 17
Contained by: file merger_trees.construct.read.importer.galacticus.F90
Modules used: galacticus_error

function: galacticustreecount
Description: Return a count of the number of trees available.
Code lines: 9
Contained by: file merger_trees.construct.read.importer.galacticus.F90

function: galacticustreeindex
Description: Return the index of the $i^{\rm th}$ tree.
Code lines: 9
Contained by: file merger_trees.construct.read.importer.galacticus.F90

function: galacticustreesareselfcontained
Description: Return a Boolean integer specifying whether or not the trees are self-contained.
Code lines: 18
Contained by: file merger_trees.construct.read.importer.galacticus.F90
Modules used: numerical_constants_boolean

function: galacticustreeshavesubhalos
Description: Return a Boolean integer specifying whether or not the trees have subhalos.
Code lines: 18
Contained by: file merger_trees.construct.read.importer.galacticus.F90
Modules used: numerical_constants_boolean

function: galacticustreeweight
Description: Return the weight to assign to trees.
Code lines: 30
Contained by: file merger_trees.construct.read.importer.galacticus.F90
Modules used: galacticus_error numerical_constants_astronomical
numerical_constants_boolean

function: galacticusvelocitiesincludehubbleflow
Description: Return a Boolean integer specifying whether or not velocities include the Hubble flow.
Code lines: 18
Contained by: file merger_trees.construct.read.importer.galacticus.F90

Modules used: numerical_constants_boolean

function: galacticusvelocitydispersionavailable
Description: Return true if halo velocity dispersions are available.
Code lines: 9
Contained by: file merger_trees.construct.read.importer.galacticus.F90

function: galacticusvelocitymaximumavailable
Description: Return true if halo rotation curve velocity maxima are available.
Code lines: 9
Contained by: file merger_trees.construct.read.importer.galacticus.F90

interface: mergertreeimportergalacticus
Description: Constructors for the GALACTICUS format merger tree importer class.
Code lines: 4
Contained by: file merger_trees.construct.read.importer.galacticus.F90

type: nodedatagalacticus
Description: Extension of the nodeData class for GALACTICUS format merger trees. Stores particle indices and counts for nodes.
Code lines: 3
Contained by: file merger_trees.construct.read.importer.galacticus.F90

file: merger_trees.construct.smooth_accretion.F90
Description: Implements a merger tree constructor class which builds merger trees assuming smooth accretion.
Code lines: 192
Modules used: cosmology_functions dark_matter_halo_mass_accretion_histories

interface: mergertreeconstructorsmoothaccretion
Description: Constructors for the smoothAccretion merger tree constructor class.
Code lines: 4
Contained by: file merger_trees.construct.smooth_accretion.F90

function: smoothaccretionconstruct
Description: Build a merger tree with a smooth mass accretion history using the fitting function of Wechsler et al. [2002].
Code lines: 72
Contained by: file merger_trees.construct.smooth_accretion.F90
Modules used: galacticus_nodes iso_c_binding kind_numbers pseudo_random

function: smoothaccretionconstructorinternal
Description: Internal constructor for the augment merger tree operator class.
Code lines: 10
Contained by: file merger_trees.construct.smooth_accretion.F90

function: smoothaccretionconstructorparameters
Description: Constructor for the augment merger tree operator class which takes a parameter set as input.

Code lines: 49
Contained by: file merger_trees.construct.smooth_accretion.F90
Modules used: input_parameters

subroutine: smoothaccretiondestructor
Description: Destructor for the smoothAccretion merger tree constructor class.
Code lines: 8
Contained by: file merger_trees.construct.smooth_accretion.F90

file: merger_trees.construct.state_restore.F90
Description: Implements a merger tree constructor class which constructs a merger tree by restoring state from file.
Code lines: 378

interface: mergertreeconstructorstaterestored
Description: Constructors for the stateRestored merger tree constructor class.
Code lines: 4
Contained by: file merger_trees.construct.state_restore.F90

subroutine: mergertreestatefromfile
Description: Read the state of a merger tree from file.
Code lines: 142
Contained by: file merger_trees.construct.state_restore.F90
Modules used: galacticus_error, galacticus_nodes, kind_numbers, string_handling

function: nodepointer
Description: Return a pointer to a node, given its position in the array of nodes. Return a null pointer if the array index is -1.
Code lines: 13
Contained by: subroutine mergertreestatefromfile
Modules used: galacticus_nodes

subroutine: mergertreestatestore
Description: Store the complete internal state of a merger tree to file.
Code lines: 137
Contained by: file merger_trees.construct.state_restore.F90
Modules used: functions_global, galacticus_error, galacticus_nodes, iso_c_binding, kind_numbers, merger_tree_walkers

function: nodearrayposition
Description: Returns the position of a node in the output list given its index.
Code lines: 25
Contained by: subroutine mergertreestatestore
Modules used: galacticus_error, iso_varying_string, kind_numbers, string_handling

function: staterestoredconstruct

Description: Restores the state of a merger tree from file.
Code lines: 21
Contained by: file merger_trees.construct.state_restore.F90
Modules used: functions_global galacticus_nodes iso_c_binding

function: staterestoredconstructorinternal
Description: Internal constructor for the stateRestored merger tree operator class.
Code lines: 8
Contained by: file merger_trees.construct.state_restore.F90

function: staterestoredconstructorparameters
Description: Constructor for the stateRestored merger tree operator class which takes a parameter set as input.
Code lines: 19
Contained by: file merger_trees.construct.state_restore.F90
Modules used: input_parameters

file: merger_trees.dump_evolution.F90
Description: Contains a module which dumps the evolution of merger trees to XML.
Code lines: 103

module: merger_trees_dump_evolution
Description: Dumps the structure of entire merger trees.
Code lines: 81
Contained by: file merger_trees.dump_evolution.F90
Modules used: iso_varying_string
Used by: subroutine galacticus_output_close_file subroutine standardevolve

subroutine: merger_tree_dump_evolution
Description: Trim histories attached to the disk.
Code lines: 41
Contained by: module merger_trees_dump_evolution
Modules used: galacticus_nodes input_parameters

subroutine: merger_tree_dump_evolution_close
Description: Close the merger tree evolution dump file.
Code lines: 9
Contained by: module merger_trees_dump_evolution

file: merger_trees.dump_structure.F90
Description: Contains a module which dumps the structure of entire merger trees.
Code lines: 119

module: merger_tree_dump_structure
Description: Dumps the structure of entire merger trees.
Code lines: 97
Contained by: file merger_trees.dump_structure.F90
Modules used: iso_varying_string

Used by: subroutine evolveforestsperform

subroutine: merger_tree_structure_dump
Description: Output the structure of thisTree.
Code lines: 71
Contained by: module merger_tree_dump_structure
Modules used: galacticus_nodes input_parameters merger_trees_dump

file: merger_trees.evolve.deadlock_options.F90
Description: Contains a module which provides an enumeration for tree deadlock statuses.
Code lines: 34

module: merger_trees_evolve_deadlock_status
Description: Provides an enumeration for tree deadlock statuses.
Code lines: 12
Contained by: file merger_trees.evolve.deadlock_options.F90
Used by: function node_branch_jump; function node_pull_from_tree; function node_push_from_tree; function node_subhalo_promotion; subroutine satellitemergerprocess; subroutine standardevolve; subroutine standardnodeeventsperform

file: merger_trees.evolve.timesteps.F90
Description: Contains a module which implements a class for merger tree evolution timestepping.
Code lines: 58

module: merger_tree_timesteps
Description: Implements a class for merger tree evolution timestepping.
Code lines: 36
Contained by: file merger_trees.evolve.timesteps.F90
Modules used: galacticus_nodes
Used by: subroutine galacticus_function_-classes_destroy; subroutine galacticus_state_retrieve; subroutine galacticus_state_store; file merger_trees.evolver.standard.F90; subroutine standardevolve; function standardtimeevolveto

file: merger_trees.evolve.timesteps.history.F90
Description: Implements a merger tree evolution timestepping class which limits the step the next epoch at which to store global history.
Code lines: 334
Modules used: cosmology_functions fgsl

subroutine: historyautohook
Description: Create a hook to the HDF5 pre-close event to allow us to finalize and write out our data.
Code lines: 8
Contained by: file merger_trees.evolve.timesteps.history.F90
Modules used: events_hooks

function: `historyconstructorinternal`
Description: Constructor for the `history` merger tree evolution timestep class which takes a parameter set as input.
Code lines: 44
Contained by: file merger_trees.evolve.timesteps.history.F90
Modules used: galacticus_nodes, iso_c_binding, memory_management, numerical_ranges

function: `historyconstructorparameters`
Description: Constructor for the `history` merger tree evolution timestep class which takes a parameter set as input.
Code lines: 43
Contained by: file merger_trees.evolve.timesteps.history.F90
Modules used: input_parameters

subroutine: `historydestructor`
Description: Destructor for the `history` merger tree evolution timestep class.
Code lines: 7
Contained by: file merger_trees.evolve.timesteps.history.F90

subroutine: `historystore`
Description: Store various properties in global arrays.
Code lines: 60
Contained by: file merger_trees.evolve.timesteps.history.F90
Modules used: galactic_structure_enclosed_masses, galactic_structure_options, galacticus_error, galacticus_nodes, iso_c_binding, numerical_interpolation

function: `historytimeevolveto`
Description: Determine a suitable timestep for `node` using the history method.
Code lines: 36
Contained by: file merger_trees.evolve.timesteps.history.F90
Modules used: evolve_to_time_reports, galacticus_nodes, iso_c_binding, iso_varying_string, numerical_interpolation

subroutine: `historywrite`
Description: Store the global history data to the Galacticus output file.
Code lines: 73
Contained by: file merger_trees.evolve.timesteps.history.F90
Modules used: galacticus_error, galacticus_hdf5, numerical_constants_astronomical

interface: `mergertreeevolvetimestephistory`
Description: Constructors for the `history` merger tree evolution timestep class.
Code lines: 4
Contained by: file merger_trees.evolve.timesteps.history.F90

file: `merger_trees.evolve.timesteps.multi.F90`
Description: Implements a class for applying multiple different timestepping criteria.
Code lines: 174

interface: `mergertreeevolvetimestepmulti`
Description: Constructors for the `multi` mergerTreeEvolveTimestep.
Code lines: 4
Contained by: file `merger_trees.evolve.timesteps.multi.F90`

function: `multiconstructorinternal`
Description: Internal constructor for the `multi` merger tree evolution timestep class.
Code lines: 14
Contained by: file `merger_trees.evolve.timesteps.multi.F90`

function: `multiconstructorparameters`
Description: Constructor for the `multi` merger tree evolution timestep class which takes a parameter set as input.
Code lines: 22
Contained by: file `merger_trees.evolve.timesteps.multi.F90`
Modules used: `input_parameters`

subroutine: `multideepcopy`
Description: Perform a deep copy for the `multi` merger tree evolution timestep class.
Code lines: 31
Contained by: file `merger_trees.evolve.timesteps.multi.F90`
Modules used: `galacticus_error`

subroutine: `multidestructor`
Description: Destructor for the `multi` merger tree evolution timestep class.
Code lines: 16
Contained by: file `merger_trees.evolve.timesteps.multi.F90`

type: `multimergertreeevolvetimesteplist`
Code lines: 3
Contained by: file `merger_trees.evolve.timesteps.multi.F90`

function: `multitimeevolveto`
Description: Perform all mergerTreeEvolveTimesteps.
Code lines: 35
Contained by: file `merger_trees.evolve.timesteps.multi.F90`

file: `merger_trees.evolve.timesteps.record_evolution.F90`
Description: Implements a merger tree evolution timestepping class which limits the step to the next epoch at which to record evolution of the main branch galaxy.
Code lines: 287
Modules used: `cosmology_functions` `fgsl` `output_times`

interface: `mergertreeevolvetimesteprecordevolution`

Description: Constructors for the `recordEvolution` merger tree evolution timestep class.
Code lines: 4
Contained by: file `merger_trees.evolve.timesteps.record_evolution.F90`

subroutine: `recordevolutionautohook`
Description: Create a hook to the merger tree extra output event to allow us to write out our data.
Code lines: 8
Contained by: file `merger_trees.evolve.timesteps.record_evolution.F90`
Modules used: `events_hooks`

function: `recordevolutionconstructorinternal`
Description: Internal constructor for the `recordEvolution` merger tree evolution timestep class.
Code lines: 25
Contained by: file `merger_trees.evolve.timesteps.record_evolution.F90`
Modules used: `iso_c_binding` `memory_management` `numerical_ranges`

function: `recordevolutionconstructorparameters`
Description: Constructor for the `recordEvolution` merger tree evolution timestep class which takes a parameter set as input.
Code lines: 43
Contained by: file `merger_trees.evolve.timesteps.record_evolution.F90`
Modules used: `input_parameters`

subroutine: `recordevolutiondestructor`
Description: Destructor for the `recordEvolution` merger tree evolution timestep class.
Code lines: 8
Contained by: file `merger_trees.evolve.timesteps.record_evolution.F90`

subroutine: `recordevolutionoutput`
Description: Store main branch evolution to the output file.
Code lines: 45
Contained by: file `merger_trees.evolve.timesteps.record_evolution.F90`
Modules used: `galacticus_error` `galacticus_hdf5` `iso_c_binding` `iso_varying_string` `numerical_constants_astronomical` `string_handling`

subroutine: `recordevolutionreset`
Description: Resets recorded datasets to zero.
Code lines: 8
Contained by: file `merger_trees.evolve.timesteps.record_evolution.F90`

subroutine: `recordevolutionstore`
Description: Store properties of the main progenitor galaxy.
Code lines: 33
Contained by: file `merger_trees.evolve.timesteps.record_evolution.F90`
Modules used: `galactic_structure_enclosed_masses` `galactic_structure_options` `galacticus_error` `galacticus_nodes` `iso_c_binding` `numerical_interpolation`

function: `recordevolutiontimeevolveto`
Description: Determines the timestep to go to the next tabulation point for galaxy evolution storage.
Code lines: 38
Contained by: file `merger_trees.evolve.timesteps.record_evolution.F90`
Modules used: `evolve_to_time_reports` `galacticus_nodes` `iso_c_binding` `iso_varying_string` `numerical_interpolation`

file: `merger_trees.evolve.timesteps.report.F90`
Description: Contains a module which reports on timestepping criteria.
Code lines: 52

module: `evolve_to_time_reports`
Description: Contains functions which report on timestepping criteria.
Code lines: 30
Contained by: file `merger_trees.evolve.timesteps.report.F90`
Used by: function `historytimeevolveto` function `recordevolutiontimeevolveto` function `satellitetimeevolveto` function `simpletimeevolveto` function `standardtimeevolveto` function `standardtimeevolveto`

subroutine: `evolve_to_time_report`
Description: Display a report on evolution timestep criteria.
Code lines: 20
Contained by: module `evolve_to_time_reports`
Modules used: `galacticus_display` `iso_varying_string` `kind_numbers` `string_handling`

file: `merger_trees.evolve.timesteps.satellite.F90`
Code lines: 247

interface: `mergertreeevolvetimestepsatellite`
Description: Constructors for the `satellite` merger tree evolution timestep class.
Code lines: 4
Contained by: file `merger_trees.evolve.timesteps.satellite.F90`

function: `satelliteconstructorinternal`
Description: Constructor for the `satellite` merger tree evolution timestep class which takes a parameter set as input.
Code lines: 10
Contained by: file `merger_trees.evolve.timesteps.satellite.F90`
Modules used: `galacticus_nodes`

function: `satelliteconstructorparameters`
Description: Constructor for the `satellite` merger tree evolution timestep class which takes a parameter set as input.
Code lines: 29
Contained by: file `merger_trees.evolve.timesteps.satellite.F90`
Modules used: `input_parameters`

subroutine: `satellitemergerprocess`

Description: Process a satellite node which has undergone a merger with its host node.
Code lines: 103
Contained by: file merger_trees.evolve.timesteps.satellite.F90
Modules used: galacticus_display, iso_varying_string, merger_trees_evolve_deadlock_status, node_component_age_statistics_-standard, node_component_black_hole_simple, node_component_black_hole_standard, node_component_disk_standard, node_component_disk_very_simple, node_component_hot_halo_cold_mode, node_component_hot_halo_standard, node_component_hot_halo_very_simple, node_component_hot_halo_vs_delayed, node_component_inter_output_standard, node_component_merging_statistics_-major, node_component_merging_statistics_-standard, node_component_spheroid_standard, node_component_spheroid_very_simple, satellite_merging_remnant_properties, satellites_merging_output, string_handling

function: `satellitetimeevolveto`

Description: Determine a suitable timestep for `node` such that it does not exceed the time of the next satellite merger.
Code lines: 59
Contained by: file merger_trees.evolve.timesteps.satellite.F90
Modules used: evolve_to_time_reports, galacticus_nodes, iso_varying_string

file: `merger_trees.evolve.timesteps.simple.F90`

Code lines: 130
Modules used: cosmology_functions

interface: `mergertreeevolvetimestepsimple`

Description: Constructors for the `simple` merger tree evolution timestep class.
Code lines: 4
Contained by: file merger_trees.evolve.timesteps.simple.F90

function: `simpleconstructorinternal`

Description: Constructor for the `simple` merger tree evolution timestep class which takes a parameter set as input.
Code lines: 9
Contained by: file merger_trees.evolve.timesteps.simple.F90

function: `simpleconstructorparameters`

Description: Constructor for the `simple` merger tree evolution timestep class which takes a parameter set as input.
Code lines: 32
Contained by: file merger_trees.evolve.timesteps.simple.F90
Modules used: input_parameters

subroutine: `simpledestructor`
Description: Destructor for the `simple` merger tree evolution timestep class.
Code lines: 7
Contained by: file `merger_trees.evolve.timesteps.simple.F90`

function: `simpletimeevolveto`
Description: Determine a suitable timestep for `node` using the simple method. This simply selects the smaller of `timeStepAbsolute` and `timeStepRelative`$H^{-1}(t)$.
Code lines: 33
Contained by: file `merger_trees.evolve.timesteps.simple.F90`
Modules used: `evolve_to_time_reports` `galacticus_nodes` `iso_varying_string`

file: `merger_trees.evolve.timesteps.standard.F90`
Code lines: 124
Modules used: `cosmology_functions`

interface: `mergertreeevolvetimestepstandard`
Description: Constructors for the `standard` merger tree evolution timestep class.
Code lines: 4
Contained by: file `merger_trees.evolve.timesteps.standard.F90`

function: `standardconstructorinternal`
Description: Internal constructor for the `standard` merger tree evolution timestep class.
Code lines: 11
Contained by: file `merger_trees.evolve.timesteps.standard.F90`

function: `standardconstructorparameters`
Description: Constructor for the `standard` merger tree evolution timestep class which takes a parameter set as input.
Code lines: 14
Contained by: file `merger_trees.evolve.timesteps.standard.F90`
Modules used: `input_parameters`

subroutine: `standarddestructor`
Description: Destructor for the `standard` merger tree evolution timestep class.
Code lines: 8
Contained by: file `merger_trees.evolve.timesteps.standard.F90`

function: `standardtimeevolveto`
Description: Determine a suitable timestep for `node` by combining the `simple` and `satellite` timesteps.
Code lines: 35
Contained by: file `merger_trees.evolve.timesteps.standard.F90`
Modules used: `evolve_to_time_reports` `iso_varying_string`

file: `merger_trees.evolver.F90`
Description: Contains a module which provides a class that implements evolution of merger trees.
Code lines: 48

module: merger_trees_evolve
Description: Provides a class that implements evolution of merger trees.
Code lines: 26
Contained by: file merger_trees.evolver.F90
Modules used: galacticus_nodes, kind_numbers
Used by: subroutine galacticus_function_-classes_destroy, subroutine galacticus_state_retrieve, subroutine galacticus_state_store, file tasks.evolve_forests.F90

file: merger_trees.evolver.non_evolving.F90
Description: Implements a non-evolving class for evolving merger trees.
Code lines: 81

interface: mergertreeevolvernonevolving
Description: Constructors for the nonEvolving merger tree evolver.
Code lines: 3
Contained by: file merger_trees.evolver.non_evolving.F90

function: nonevolvingconstructorparameters
Description: Constructor for the nonEvolving merger tree evolver class which takes a parameter set as input.
Code lines: 10
Contained by: file merger_trees.evolver.non_evolving.F90
Modules used: input_parameters

subroutine: nonevolvingevolve
Description: Evolves all properties of a merger tree to the specified time.
Code lines: 30
Contained by: file merger_trees.evolver.non_evolving.F90
Modules used: galacticus_error, merger_trees_initialize

file: merger_trees.evolver.standard.F90
Description: Implements the standard class for evolving merger trees.
Code lines: 1029
Modules used: cosmology_functions, galactic_structure_solvers, galacticus_nodes, kind_numbers, merger_tree_timesteps, merger_trees_evolve_node

type: deadlocklist
Code lines: 5
Contained by: file merger_trees.evolver.standard.F90

interface: mergertreeevolverstandard
Description: Constructors for the standard merger tree evolver.
Code lines: 4
Contained by: file merger_trees.evolver.standard.F90

function: `standardconstructorinternal`
Description: Internal constructor for the `standard` merger tree evolver class.
Code lines: 14
Contained by: file `merger_trees.evolver.standard.F90`

function: `standardconstructorparameters`
Description: Constructor for the `standard` merger tree evolver class which takes a parameter set as input.
Code lines: 59
Contained by: file `merger_trees.evolver.standard.F90`
Modules used: `input_parameters`

subroutine: `standarddeadlockaddnode`
Description: Add a node to the deadlocked nodes list.
Code lines: 27
Contained by: file `merger_trees.evolver.standard.F90`

subroutine: `standarddeadlockoutputtree`
Description: Output the deadlocked nodes in `dot` format.
Code lines: 113
Contained by: file `merger_trees.evolver.standard.F90`
Modules used: `galacticus_nodes` `string_handling`

subroutine: `standarddestructor`
Description: Destructor for the `standard`m erger tree evolver class.
Code lines: 10
Contained by: file `merger_trees.evolver.standard.F90`

subroutine: `standardevolve`
Description: Evolves all properties of a merger tree to the specified time.
Code lines: 377
Contained by: file `merger_trees.evolver.standard.F90`
Modules used: `galacticus_display` `galacticus_error` `galacticus_nodes` `input_parameters` `merger_tree_timesteps` `merger_tree_walkers` `merger_trees_dump` `merger_trees_evolve_deadlock_status` `merger_trees_evolve_node` `merger_trees_initialize` `string_handling`

subroutine: `standardnodeeventsperform`
Description: Perform any events associated with `node`.
Code lines: 58
Contained by: file `merger_trees.evolver.standard.F90`
Modules used: `galacticus_nodes` `merger_trees_evolve_deadlock_status`

function: `standardtimeevolveto`
Description: Determine the time to which `node` should be evolved.
Code lines: 226
Contained by: file `merger_trees.evolver.standard.F90`

Modules used: evolve_to_time_reports, galacticus_display, galacticus_error, galacticus_nodes, input_parameters, merger_tree_timesteps, merger_trees_evolve_node, string_handling

subroutine: standardtreeeventsperform
Description: Perform any events associated with tree.
Code lines: 42
Contained by: file merger_trees.evolver.standard.F90
Modules used: galacticus_nodes

file: merger_trees.initialize.F90
Description: Contains a module which implements initialization of merger tree structures.
Code lines: 131

module: merger_trees_initialize
Description: Implements initialization of merger tree structures.
Code lines: 109
Contained by: file merger_trees.initialize.F90
Used by: subroutine nonevolvingevolve, subroutine standardevolve, subroutine evolveforestsperform

subroutine: merger_tree_initialize
Description: Walk through all nodes of a tree and call any routines that requested to perform initialization tasks.
Code lines: 99
Contained by: module merger_trees_initialize
Modules used: galacticus_nodes, merger_tree_walkers, node_component_basic_extended_tracking, node_component_basic_standard, node_component_basic_standard_extended, node_component_basic_standard_tracking, node_component_dark_matter_profile_scale, node_component_dark_matter_profile_scale_preset, node_component_dark_matter_profile_scale_shape, node_component_formation_times_cole2000, node_component_formation_times_mass_fraction, node_component_host_history_standard, node_component_hot_halo_cold_mode, node_component_hot_halo_standard, node_component_hot_halo_very_simple, node_component_hot_halo_vs_delayed, node_component_indices_standard, node_component_mass_flow_statistics_standard, node_component_merging_statistics_recent, node_component_merging_statistics_standard, node_component_position_trace_dark_matter, node_component_satellite_orbiting, node_component_satellite_standard, node_component_satellite_very_simple, node_component_spin_preset, node_component_spin_preset3d

node_component_spin_random node_component_spin_vitvitska

file: merger_trees.node_evolver.F90
Description: Contains a module which provides a class that implements evolution of nodes.
Code lines: 67

module: merger_trees_evolve_node
Description: Provides a class that implements evolution of nodes.
Code lines: 45
Contained by: file merger_trees.node_evolver.F90
Modules used: galactic_structure_solvers, galacticus_nodes
Used by: function node_subhalo_promotion, subroutine galacticus_function_classes_destroy, subroutine galacticus_state_retrieve, subroutine galacticus_state_store, file merger_trees.evolver.standard.F90, subroutine standardevolve, function standardtimeevolveto

file: merger_trees.node_evolver.standard.F90
Description: Implements the standard class for evolving nodes in merger trees.
Code lines: 1524
Modules used: fodeiv2, kind_numbers, merger_trees_merge_node

interface: mergertreenodeevolverstandard
Description: Constructors for the standard merger tree node evolver.
Code lines: 4
Contained by: file merger_trees.node_evolver.standard.F90

function: standardconstructorinternal
Description: Internal constructor for the standard merger tree node evolver class.
Code lines: 59
Contained by: file merger_trees.node_evolver.standard.F90
Modules used: fodeiv2, galacticus_error

function: standardconstructorparameters
Description: Constructor for the standard merger tree node evolver class which takes a parameter set as input.
Code lines: 95
Contained by: file merger_trees.node_evolver.standard.F90
Modules used: input_parameters

subroutine: standardderivativescompute
Description: Call routines to set alls derivatives for node.
Code lines: 110
Contained by: file merger_trees.node_evolver.standard.F90

subroutine: `augmentdestructor`
Description: Destructor for the augment merger tree operator function class.
Code lines: 8

Contained by: file merger_trees.operators.augment.F90

subroutine: augmentextendbyoverlap

Description: Conjoin two trees by overlapping the nodeTop of one tree with the chosen nodeBottom of the other. If keepTop is true, nodeTop replaces nodeBottom, otherwise, nodeBottom replaces nodeTop. If exchangeProperties is true, the mass and time information of the deleted node overwrites the mass and time of the retained node.
Code lines: 51
Contained by: file merger_trees.operators.augment.F90
Modules used: galacticus_nodes

subroutine: augmentextendnonoverlapnodes

Description: Extend any non-overlap nodes in an accepted tree by growing a new tree from each such node.
Code lines: 26
Contained by: file merger_trees.operators.augment.F90
Modules used: galacticus_error galacticus_nodes

subroutine: augmentfinalize

Description: Output augmentation histogram.
Code lines: 34
Contained by: file merger_trees.operators.augment.F90
Modules used: galacticus_hdf5 io_hdf5
iso_varying_string memory_management

function: augmentnodecomparison

Description: Compare the masses of an overlap node and the corresponding node in the original tree, testing if they agree to withing tolerance.
Code lines: 17
Contained by: file merger_trees.operators.augment.F90
Modules used: galacticus_nodes

subroutine: augmentnonoverlaplistadd

Description: Add the given node to a linked list of non-overlap nodes in the current trial tree.
Code lines: 32
Contained by: file merger_trees.operators.augment.F90
Modules used: galacticus_nodes

subroutine: augmentnonoverlapreinsert

Description: Reinsert non-overlap nodes into their tree.
Code lines: 23
Contained by: file merger_trees.operators.augment.F90
Modules used: galacticus_nodes

subroutine: augmentoperate

Description: Augment the resolution of a merger tree by inserting high resolution branches.
Code lines: 150
Contained by: file merger_trees.operators.augment.F90
Modules used: galacticus_display galacticus_nodes

subroutine: augmentsimpleinsert
Description: Insert a newly constructed tree into the original tree.
Code lines: 34
Contained by: file merger_trees.operators.augment.F90
Modules used: galacticus_nodes

subroutine: augmentsortchildren
Description: Sort the children of the given node such that they are in descending mass order.
Code lines: 50
Contained by: file merger_trees.operators.augment.F90
Modules used: galacticus_error galacticus_nodes

function: augmenttreestatistics
Description: Walks through tree and quietly collects information specified by desiredOutput input enumeration and returns that information.
Code lines: 31
Contained by: file merger_trees.operators.augment.F90
Modules used: galacticus_error galacticus_nodes
merger_tree_walkers

interface: mergertreeoperatoraugment
Description: Constructors for the augment merger tree operator class.
Code lines: 4
Contained by: file merger_trees.operators.augment.F90

file: merger_trees.operators.conditional_mass_function.F90
Description: Contains a module which implements a merger tree operator which accumulates conditional mass functions for trees.
Code lines: 1071
Modules used: cosmology_functions statistics_nbody_halo_mass_errors

function: conditionalmfbinweights
Description: Computes the weight that a given halo contributes to an array of bins.
Code lines: 33
Contained by: file merger_trees.operators.conditional_mass_function.F90
Modules used: galacticus_nodes

function: conditionalmfbinweights2d
Description: Computes the weight that a given halo contributes to a 2D array of bins.
Code lines: 102
Contained by: file merger_trees.operators.conditional_mass_function.F90
Modules used: fgsl galacticus_error
galacticus_nodes numerical_integration

function: conditionalmfbinweights2dintegrand

Description: Integrand used in finding the weight given to a bin in the space of parent mass vs. progenitor mass ratio.
Code lines: 26
Contained by: function conditionalmfbinweights2d
Modules used: galacticus_error numerical_constants_math

function: conditionalmfconstructorinternal
Description: Internal constructor for the conditional mass function merger tree operator class.
Code lines: 89
Contained by: file merger_trees.operators.conditional_mass_function.F90
Modules used: galacticus_error galacticus_nodes memory_management numerical_ranges

function: conditionalmfconstructorparameters
Description: Constructor for the conditional mass function merger tree operator class which takes a parameter set as input.
Code lines: 144
Contained by: file merger_trees.operators.conditional_mass_function.F90
Modules used: memory_management

subroutine: conditionalmfdestructor
Description: Destructor for the merger tree operator function class.
Code lines: 10
Contained by: file merger_trees.operators.conditional_mass_function.F90

subroutine: conditionalmffinalize
Description: Outputs conditional mass function.
Code lines: 220
Contained by: file merger_trees.operators.conditional_mass_function.F90
Modules used: galacticus_hdf5 io_hdf5 iso_varying_string memory_management numerical_constants_astronomical

subroutine: conditionalmfoperate
Description: Compute conditional mass function on tree.
Code lines: 264
Contained by: file merger_trees.operators.conditional_mass_function.F90
Modules used: galacticus_error galacticus_nodes input_parameters memory_management merger_tree_walkers numerical_comparison

interface: mergertreeoperatorconditionalmf
Description: Constructors for the conditional mass function merger tree operator class.

Contained by: file merger_trees.operators.conditional_mass_function.F90

file: merger_trees.operators.deforest.F90
Description: Contains a module which implements a deforestation operator on merger trees (i.e. removes all but the most massive tree in a forest).
Code lines: 109

function: `deforestconstructorparameters`
Description: Constructor for the deforestation merger tree operator class which takes a parameter set as input.
Code lines: 10
Contained by: file `merger_trees.operators.deforest.F90`
Modules used: `input_parameters`

subroutine: `deforestdestructor`
Description: Destructor for the deforestation merger tree operator function class.
Code lines: 8
Contained by: file `merger_trees.operators.deforest.F90`

subroutine: `deforestoperate`
Description: Perform a deforestation operation on a merger tree.
Code lines: 46
Contained by: file `merger_trees.operators.deforest.F90`
Modules used: `galacticus_nodes`

interface: `mergertreeoperatordeforest`
Description: Constructors for the deforestation merger tree operator class.
Code lines: 3
Contained by: file `merger_trees.operators.deforest.F90`

file: `merger_trees.operators.dump_to_GraphViz.F90`
Description: Contains a module which implements a dump to GraphViz operator on merger trees.
Code lines: 143

function: `dumptographvizconstructorinternal`
Description: Internal constructor for the dump-to-GraphViz merger tree operator class.
Code lines: 11
Contained by: file `merger_trees.operators.dump_to_GraphViz.F90`

function: `dumptographvizconstructorparameters`
Description: Constructor for the dump-to-GraphViz merger tree operator class which takes a parameter set as input.
Code lines: 54
Contained by: file `merger_trees.operators.dump_to_GraphViz.F90`
Modules used: `input_parameters`

subroutine: `dumptographvizdestructor`
Description: Destructor for the merger tree operator function class.
Code lines: 8
Contained by: file `merger_trees.operators.dump_to_GraphViz.F90`

subroutine: `dumptographvizoperate`
Description: Output the structure of `tree`.
Code lines: 20
Contained by: file `merger_trees.operators.dump_to_GraphViz.F90`

Modules used: galacticus_nodes merger_trees_dump

interface: mergertreeoperatordumptographviz
Description: Constructors for the dump to GraphViz merger tree operator class.
Code lines: 4
Contained by: file merger_trees.operators.dump_to_GraphViz.F90

file: merger_trees.operators.export.F90
Description: Contains a module which implements a merger tree operator which exports merger trees to file.
Code lines: 285
Modules used: cosmological_density_field cosmology_functions cosmology_parameters

function: exportconstructorinternal
Description: Internal constructor for the export merger tree operator class.
Code lines: 18
Contained by: file merger_trees.operators.export.F90
Modules used: galacticus_error merger_tree_data_structure

function: exportconstructorparameters
Description: Constructor for the export merger tree operator class which takes a parameter set as input.

Code lines: 11
Contained by: file merger_trees.operators.particulate.F90
Modules used: numerical_constants_physical

function: particulatesmoothingintegrandr
Description: The integrand over cylindrical coordinate z used in finding the smoothed density profile defined by Barnes [2012] to account for gravitational softening.
Code lines: 25
Contained by: file merger_trees.operators.particulate.F90

function: particulatesmoothingintegrandz
Description: The integrand over cylindrical coordinate z used in finding the smoothed density profile defined by Barnes [2012] to account for gravitational softening.

Code lines: 26
Contained by: file merger_trees.operators.particulate.F90
Modules used: fgsl numerical_integration

subroutine: particulatetabulateenergydistribution
Description: Construct the energy distribution function assuming a spherical dark matter halo with isotropic velocity dispersion. We solve Eddington's formula [Binney and Tremaine, 2008, eqn. 4.43a].

$$f(E) = \frac{1}{\sqrt{8}\pi^2} \frac{\mathrm{d}}{\mathrm{d}E} \int_E^0 \frac{\mathrm{d}\Phi}{\sqrt{\Phi - E}} \frac{\mathrm{d}\rho}{\mathrm{d}\Phi}. \tag{18.22}$$

In practice, we tabulate:

$$F(E) = \int_E^0 \frac{\mathrm{d}\Phi}{\sqrt{\Phi - E}} \frac{\mathrm{d}\rho}{\mathrm{d}\Phi}, \tag{18.23}$$

which we can then take the derivative of numerically to obtain the distribution function.
Code lines: 131
Contained by: file merger_trees.operators.particulate.F90
Modules used: fgsl galacticus_error numerical_integration table_labels

file: merger_trees.operators.perturb_masses.F90
Description: Contains a module which implements a merger tree operator which perturbs halo masses by some error model.
Code lines: 171
Modules used: statistics_distributions statistics_nbody_halo_mass_errors

interface: mergertreeoperatorperturbmasses
Description: Constructors for the mass perturbing merger tree operator class.

Description: Internal constructor for the information content merger tree operator class.
Code lines: 30
Contained by: file merger_trees.operators.profiler.F90
Modules used: memory_management, numerical_ranges

function: `profilerconstructorparameters`

Description: Constructor for the information content merger tree operator class which takes a parameter set as input.
Code lines: 63
Contained by: file merger_trees.operators.profiler.F90
Modules used: input_parameters

subroutine: `profilerdestructor`

Description: Destructor for the profiler merger tree operator function class.
Code lines: 7
Contained by: file merger_trees.operators.profiler.F90

subroutine: `profilerfinalize`

Description: Outputs tree information content function.
Code lines: 33
Contained by: file merger_trees.operators.profiler.F90
Modules used: galacticus_hdf5, io_hdf5

subroutine: `profileroperate`

Description: Perform a information content operation on a merger tree.
Code lines: 32
Contained by: file merger_trees.operators.profiler.F90

Modules used: galacticus_nodes merger_tree_walkers

file: merger_trees.operators.prune_baryons.F90
Description: Contains a module which implements a pruning operator on merger trees that removes all branches that can not contain any baryons.
Code lines: 158
Modules used: accretion_halos virial_density_contrast

interface: mergertreeoperatorprunebaryons
Description: Constructors for the pruning-by-mass merger tree operator class.
Code lines: 4
Contained by: file merger_trees.operators.prune_baryons.F90

function: prunebaryonsconstructorinternal
Description: Internal constructor for the prune-baryons merger tree operator class.
Code lines: 9
Contained by: file merger_trees.operators.prune_baryons.F90

function: prunebaryonsconstructorparameters
Description: Constructor for the prune-baryons merger tree operator class which takes a parameter set as input.
Code lines: 16
Contained by: file merger_trees.operators.prune_baryons.F90
Modules used: input_parameters

subroutine: prunebaryonsdestructor
Description: Destructor for the merger tree operator function class.
Code lines: 8
Contained by: file merger_trees.operators.prune_baryons.F90

subroutine: prunebaryonsoperate
Description: Prune branches from tree.
Code lines: 73
Contained by: file merger_trees.operators.prune_baryons.F90
Modules used: galacticus_nodes merger_tree_walkers merger_trees_pruning_utilities

file: merger_trees.operators.prune_branch_tips.F90
Description: Contains a module which implements a merger tree operator which prunes tips of branches (i.e. sections from the leaf node to the first node with a sibling).
Code lines: 82

interface: mergertreeoperatorprunebranchtips
Description: Constructors for the prune-branchTips merger tree operator class.
Code lines: 3
Contained by: file merger_trees.operators.prune_branch_tips.F90

function: prunebranchtipsconstructorparameters
Description: Constructor for the prune-branchTips merger tree operator class which takes a parameter set as input.

Code lines: 9
Contained by: file merger_trees.operators.prune_branch_tips.F90

subroutine: prunebranchtipsoperate
Description: Perform a prune-branchTips operation on a merger tree.
Code lines: 30
Contained by: file merger_trees.operators.prune_branch_tips.F90
Modules used: merger_tree_walkers merger_trees_pruning_utilities

file: merger_trees.operators.prune_by_mass.F90
Description: Contains a module which implements a pruning-by-mass operator on merger trees.
Code lines: 167

interface: mergertreeoperatorprunebymass
Description: Constructors for the pruning-by-mass merger tree operator class.
Code lines: 4
Contained by: file merger_trees.operators.prune_by_mass.F90

function: prunebymassconstructorinternal
Description: Internal constructor for the prune-by-mass merger tree operator class.
Code lines: 10
Contained by: file merger_trees.operators.prune_by_mass.F90

function: prunebymassconstructorparameters
Description: Constructor for the prune-by-mass merger tree operator class which takes a parameter set as input.
Code lines: 27
Contained by: file merger_trees.operators.prune_by_mass.F90
Modules used: input_parameters

subroutine: prunebymassdestructor
Description: Destructor for the merger tree operator function class.
Code lines: 8
Contained by: file merger_trees.operators.prune_by_mass.F90

subroutine: prunebymassoperate
Description: Perform a prune-by-mass operation on a merger tree.
Code lines: 73
Contained by: file merger_trees.operators.prune_by_mass.F90
Modules used: galacticus_nodes merger_tree_walkers merger_trees_pruning_utilities

file: merger_trees.operators.prune_by_time.F90
Description: Contains a module which implements a merger tree operator which prunes branches to end at a fixed time.
Code lines: 191

interface: mergertreeoperatorprunebytime
Description: Constructors for the prune-by-time merger tree operator class.

Code lines: 4
Contained by: file merger_trees.operators.prune_by_time.F90

function: prunebytimeconstructorinternal
Description: Internal constructor for the prune-by-time merger tree operator class.
Code lines: 10
Contained by: file merger_trees.operators.prune_by_time.F90

function: prunebytimeconstructorparameters
Description: Constructor for the prune-by-time merger tree operator class which takes a parameter set as input.
Code lines: 40
Contained by: file merger_trees.operators.prune_by_time.F90
Modules used: cosmology_functions

subroutine: prunebytimedestructor
Description: Destructor for the merger tree operator function class.
Code lines: 8
Contained by: file merger_trees.operators.prune_by_time.F90

subroutine: prunebytimeoperate
Description: Perform a prune-by-time operation on a merger tree.
Code lines: 85
Contained by: file merger_trees.operators.prune_by_time.F90
Modules used: galacticus_nodes merger_tree_walkers merger_trees_pruning_utilities

file: merger_trees.operators.prune_clones.F90
Description: Contains a module which implements a pruning-by-mass operator on merger trees.
Code lines: 97

interface: mergertreeoperatorpruneclones
Description: Constructors for the clone pruning merger tree operator class.
Code lines: 3
Contained by: file merger_trees.operators.prune_clones.F90

function: pruneclonesconstructorparameters
Description: Constructor for the clone pruning merger tree operator class which takes a parameter set as input.
Code lines: 10
Contained by: file merger_trees.operators.prune_clones.F90
Modules used: input_parameters

subroutine: pruneclonesdestructor
Description: Destructor for the merger tree operator function class.
Code lines: 8
Contained by: file merger_trees.operators.prune_clones.F90

subroutine: pruneclonesoperate

Description: Perform a clone pruning operation on a merger tree.
Code lines: 35
Contained by: file merger_trees.operators.prune_clones.F90
Modules used: galacticus_nodes, merger_tree_walkers, merger_trees_pruning_utilities, numerical_comparison

file: merger_trees.operators.prune_hierarchy.F90
Description: Contains a module which implements a merger tree operator which prunes branches below a given level in the substructure hierarchy.
Code lines: 155

interface: mergertreeoperatorprunehierarchy
Description: Constructors for the prune-hierarchy merger tree operator class.
Code lines: 4
Contained by: file merger_trees.operators.prune_hierarchy.F90

function: prunehierarchyconstructorinternal
Description: Internal constructor for the prune-hierarchy merger tree operator class.
Code lines: 10
Contained by: file merger_trees.operators.prune_hierarchy.F90
Modules used: galacticus_error

function: prunehierarchyconstructorparameters
Description: Constructor for the prune-hierarchy merger tree operator class which takes a parameter set as input.
Code lines: 18
Contained by: file merger_trees.operators.prune_hierarchy.F90

subroutine: prunehierarchydestructor
Description: Destructor for the merger tree operator function class.
Code lines: 8
Contained by: file merger_trees.operators.prune_hierarchy.F90

subroutine: prunehierarchyoperate
Description: Perform a prune-hierarchy operation on a merger tree.
Code lines: 60
Contained by: file merger_trees.operators.prune_hierarchy.F90
Modules used: merger_tree_walkers, merger_trees_pruning_utilities

file: merger_trees.operators.prune_lightcone.F90
Description: Contains a module which implements a prune-by-lightcone operator on merger trees.
Code lines: 205
Modules used: geometry_lightcones, satellite_oprhan_distributions

interface: mergertreeoperatorprunelightcone
Description: Constructors for the pruning-by-lightcone merger tree operator class.
Code lines: 4
Contained by: file merger_trees.operators.prune_lightcone.F90

function: `prunelightconeconstructorinternal`
Description: Internal constructor for the prune-by-lightcone merger tree operator class.
Code lines: 11
Contained by: file `merger_trees.operators.prune_lightcone.F90`

function: `prunelightconeconstructorparameters`
Description: Constructor for the prune-by-lightcone merger tree operator class which takes a parameter set as input.
Code lines: 26
Contained by: file `merger_trees.operators.prune_lightcone.F90`
Modules used: `input_parameters`

subroutine: `prunelightconedestructor`
Description: Destructor for the lightcone merger tree operator function class.
Code lines: 8
Contained by: file `merger_trees.operators.prune_lightcone.F90`

subroutine: `prunelightconeoperate`
Description: Perform a prune-by-lightcone operation on a merger tree.
Code lines: 89
Contained by: file `merger_trees.operators.prune_lightcone.F90`
Modules used: `galacticus_nodes` `histories` `merger_tree_walkers` `merger_trees_pruning_utilities`

subroutine: `prunelightconevalidate`
Description: Validate the lightcone pruning operator.
Code lines: 16
Contained by: file `merger_trees.operators.prune_lightcone.F90`
Modules used: `array_utilities` `galacticus_error` `galacticus_nodes`

file: `merger_trees.operators.prune_non_essential.F90`
Description: Contains a module which implements a merger tree operator which prunes all branches which do not contain an "essential" node.
Code lines: 158
Modules used: `kind_numbers`

interface: `mergertreeoperatorprunenonessential`
Description: Constructors for the prune-non-essential merger tree operator class.
Code lines: 4
Contained by: file `merger_trees.operators.prune_non_essential.F90`

function: `prunenonessentialconstructorinternal`
Description: Internal constructor for the prune-non-essential merger tree operator class.
Code lines: 11
Contained by: file `merger_trees.operators.prune_non_essential.F90`
Modules used: `galacticus_error`

function: `prunenonessentialconstructorparameters`
Description: Constructor for the prune-non-essential merger tree operator class which takes a parameter set as input.
Code lines: 24
Contained by: file `merger_trees.operators.prune_non_essential.F90`

subroutine: `prunenonessentialdestructor`
Description: Destructor for the merger tree operator function class.
Code lines: 8
Contained by: file `merger_trees.operators.prune_non_essential.F90`

subroutine: `prunenonessentialoperate`
Description: Perform a prune-non-essential operation on a merger tree.
Code lines: 59
Contained by: file `merger_trees.operators.prune_non_essential.F90`
Modules used: `galacticus_nodes` `merger_tree_walkers` `merger_trees_pruning_utilities`

file: `merger_trees.operators.regrid_times.F90`
Description: Contains a module which implements a merger tree operator which restructures the tree onto a fixed grid of timesteps.
Code lines: 499
Modules used: `cosmological_density_field` `cosmology_functions`

interface: `mergertreeoperatorregridtimes`
Description: Constructors for the regrid times merger tree operator class.
Code lines: 4
Contained by: file `merger_trees.operators.regrid_times.F90`

function: `regridtimesconstructorinternal`
Description: Internal constructor for the regrid times merger tree operator class.
Code lines: 59
Contained by: file `merger_trees.operators.regrid_times.F90`
Modules used: `galacticus_error` `memory_management` `numerical_ranges` `sort`

function: `regridtimesconstructorparameters`
Description: Constructor for the regrid times merger tree operator class which takes a parameter set as input.
Code lines: 89
Contained by: file `merger_trees.operators.regrid_times.F90`
Modules used: `galacticus_error`

subroutine: `regridtimesdestructor`
Description: Destructor for the merger tree operator function class.
Code lines: 8
Contained by: file `merger_trees.operators.regrid_times.F90`

subroutine: `regridtimesoperate`
Description: Perform a regrid times operation on a merger tree.
Code lines: 276
Contained by: file merger_trees.operators.regrid_times.F90
Modules used: fgsl, galacticus_error, galacticus_nodes, iso_c_binding, kind_numbers, merger_tree_walkers, merger_trees_dump, numerical_comparison, numerical_interpolation

file: `merger_trees.operators.select_within_range.F90`
Description: Contains a module which implements a select-within-range operator on the base nodes of merger trees.
Code lines: 125

interface: `mergertreeoperatorselectwithinrange`
Description: Constructors for the select-within-range merger tree operator class.
Code lines: 4
Contained by: file merger_trees.operators.select_within_range.F90

function: `selectwithinrangeconstructorinternal`
Description: Internal constructor for the select-within-range merger tree operator class.
Code lines: 9
Contained by: file merger_trees.operators.select_within_range.F90

function: `selectwithinrangeconstructorparameters`
Description: Constructor for the select-within-range merger tree operator class which takes a parameter set as input.
Code lines: 27
Contained by: file merger_trees.operators.select_within_range.F90
Modules used: input_parameters

subroutine: `selectwithinrangedestructor`
Description: Destructor for the merger tree operator function class.
Code lines: 8
Contained by: file merger_trees.operators.select_within_range.F90

subroutine: `selectwithinrangeoperate`
Description: Perform a select-within-range operation on a merger tree.
Code lines: 33
Contained by: file merger_trees.operators.select_within_range.F90
Modules used: galacticus_nodes, merger_trees_pruning_utilities

file: `merger_trees.operators.sequence.F90`
Description: Contains a module which implements a sequence of operators on merger trees.
Code lines: 168

interface: `mergertreeoperatorsequence`

Description: Constructors for the sequence merger tree operator class.
Code lines: 4
Contained by: file merger_trees.operators.sequence.F90

type: operatorlist
Code lines: 3
Contained by: file merger_trees.operators.sequence.F90

function: sequenceconstructorinternal
Description: Internal constructor for the sequence merger tree operator class.
Code lines: 14
Contained by: file merger_trees.operators.sequence.F90

function: sequenceconstructorparameters
Description: Constructor for the sequence merger tree operator class which takes a parameter set as input.
Code lines: 22
Contained by: file merger_trees.operators.sequence.F90
Modules used: input_parameters

subroutine: sequencedeepcopy
Description: Perform a deep copy for the sequence merger tree operator class.
Code lines: 31
Contained by: file merger_trees.operators.sequence.F90
Modules used: galacticus_error

subroutine: sequencedestructor
Description: Destructor for the merger tree operator function class.
Code lines: 16
Contained by: file merger_trees.operators.sequence.F90

subroutine: sequencefinalize
Description: Perform a finalization on a sequence of operators on a merger tree.
Code lines: 12
Contained by: file merger_trees.operators.sequence.F90

subroutine: sequenceoperate
Description: Perform a sequence operation on a merger tree.
Code lines: 13
Contained by: file merger_trees.operators.sequence.F90

file: merger_trees.output_structure.F90
Description: Contains a module which outputs the structure of entire merger trees.
Code lines: 287

module: merger_tree_output_structure
Description: Outputs the structure of entire merger trees.
Code lines: 265
Contained by: file merger_trees.output_structure.F90

Modules used: io_hdf5
Used by: subroutine galacticus_output_close_file subroutine evolveforestsperform

subroutine: merger_tree_structure_output
Description: Output the structure of tree.
Code lines: 228
Contained by: module merger_tree_output_structure
Modules used: dark_matter_halo_scales galacticus_hdf5 galacticus_nodes input_parameters iso_varying_string memory_management merger_tree_walkers node_component_dark_matter_profile_scale node_component_dark_matter_profile_scale_shape numerical_constants_astronomical string_handling

subroutine: merger_tree_structure_preclose
Description: Close the merger tree structure group.
Code lines: 6
Contained by: module merger_tree_output_structure

file: merger_trees.outputter.F90
Description: Contains a module which provides a class that implements evolution of merger trees.
Code lines: 58

module: merger_tree_outputters
Description: Provides a class that implements evolution of merger trees.
Code lines: 36
Contained by: file merger_trees.outputter.F90
Modules used: galacticus_nodes iso_c_binding
Used by: subroutine galacticus_function_classes_destroy subroutine galacticus_state_retrieve subroutine galacticus_state_store file tasks.evolve_forests.F90

file: merger_trees.outputter.analyzer.F90
Description: Implements a merger tree outputter class which performs analyzes on the trees.
Code lines: 140
Modules used: output_analyses

function: analyzerconstructorinternal
Description: Internal constructor for the analyzer merger tree outputter class.
Code lines: 8
Contained by: file merger_trees.outputter.analyzer.F90

function: analyzerconstructorparameters
Description: Constructor for the analyzer merger tree outputter class which takes a parameter set as input.
Code lines: 13
Contained by: file merger_trees.outputter.analyzer.F90

Modules used: input_parameters

subroutine: analyzerdestructor
Description: Destructor for the analyzer merger tree outputter class.
Code lines: 7
Contained by: file merger_trees.outputter.analyzer.F90

subroutine: analyzerfinalize
Description: Finalize merger tree output by finalizing analyses.
Code lines: 8
Contained by: file merger_trees.outputter.analyzer.F90
Modules used: galacticus_hdf5

subroutine: analyzeroutput
Description: Write properties of nodes in tree to the Galacticus output file.
Code lines: 34
Contained by: file merger_trees.outputter.analyzer.F90
Modules used: galacticus_calculations_resets galacticus_nodes merger_tree_walkers

subroutine: analyzerreduce
Description: Reduce over the outputter.
Code lines: 14
Contained by: file merger_trees.outputter.analyzer.F90
Modules used: galacticus_error

interface: mergertreeoutputteranalyzer
Description: Constructors for the analyzer merger tree outputter.
Code lines: 4
Contained by: file merger_trees.outputter.analyzer.F90

file: merger_trees.outputter.multi.F90
Description: Implements a merger trees outputter class which combines multiple other outputters.
Code lines: 194

interface: mergertreeoutputtermulti
Description: Constructors for the multi merger tree outputter.
Code lines: 4
Contained by: file merger_trees.outputter.multi.F90

function: multiconstructorinternal
Description: Internal constructor for the multi outputter class.
Code lines: 14
Contained by: file merger_trees.outputter.multi.F90

function: multiconstructorparameters
Description: Constructor for the multi merger tree outputter class which takes a parameter set as input.
Code lines: 22
Contained by: file merger_trees.outputter.multi.F90

Modules used: input_parameters

subroutine: multideepcopy
Description: Perform a deep copy for the multi outputter class.
Code lines: 31
Contained by: file merger_trees.outputter.multi.F90
Modules used: galacticus_error

subroutine: multidestructor
Description: Destructor for the multi outputter class.
Code lines: 16
Contained by: file merger_trees.outputter.multi.F90

subroutine: multifinalize
Description: Finalize all outputters.
Code lines: 12
Contained by: file merger_trees.outputter.multi.F90

subroutine: multioutput
Description: Output from all outputters.
Code lines: 16
Contained by: file merger_trees.outputter.multi.F90

type: multioutputterlist
Code lines: 3
Contained by: file merger_trees.outputter.multi.F90

subroutine: multireduce
Description: Reduce over the outputter.
Code lines: 21
Contained by: file merger_trees.outputter.multi.F90
Modules used: galacticus_error

file: merger_trees.outputter.null.F90
Description: Implements a merger trees outputter class which does no output.
Code lines: 72

interface: mergertreeoutputternull
Description: Constructors for the null merger tree outputter.
Code lines: 3
Contained by: file merger_trees.outputter.null.F90

function: nullconstructorparameters
Description: Constructor for the null merger tree outputter class which takes a parameter set as input.
Code lines: 10
Contained by: file merger_trees.outputter.null.F90
Modules used: input_parameters

subroutine: nullfinalize

Description: Finalize merger tree output.
Code lines: 7
Contained by: file merger_trees.outputter.null.F90

subroutine: nulloutput
Description: Perform no output.
Code lines: 11
Contained by: file merger_trees.outputter.null.F90

file: merger_trees.outputter.standard.F90
Description: Implements the standard class for outputting merger trees.
Code lines: 841
Modules used: cosmology_functions, galactic_filters, io_hdf5, kind_numbers, node_property_extractors

interface: mergertreeoutputterstandard
Description: Constructors for the standard merger tree outputter.
Code lines: 4
Contained by: file merger_trees.outputter.standard.F90

type: outputgroup
Description: Type used for output group information.
Code lines: 5
Contained by: file merger_trees.outputter.standard.F90

subroutine: standardbuffersallocate
Description: Allocate buffers for storage of properties.
Code lines: 36
Contained by: file merger_trees.outputter.standard.F90
Modules used: iso_c_binding, memory_management

function: standardconstructorinternal
Description: Internal constructor for the standard merger tree outputter class.
Code lines: 22
Contained by: file merger_trees.outputter.standard.F90

function: standardconstructorparameters
Description: Constructor for the standard merger tree outputter class which takes a parameter set as input.
Code lines: 37
Contained by: file merger_trees.outputter.standard.F90
Modules used: input_parameters

subroutine: standarddestructor
Description: Destructor for the standard merger tree outputter class.
Code lines: 10
Contained by: file merger_trees.outputter.standard.F90

subroutine: `standarddumpdoublebuffer`
Description: Dump the contents of the double precision properties buffer to the Galacticus output file.
Code lines: 23
Contained by: file merger_trees.outputter.standard.F90
Modules used: io_hdf5 iso_c_binding

subroutine: `standarddumpintegerbuffer`
Description: Dump the contents of the integer properties buffer to the Galacticus output file.
Code lines: 22
Contained by: file merger_trees.outputter.standard.F90
Modules used: io_hdf5

subroutine: `standardextenddoublebuffer`
Description: Extend the size of the double buffer.
Code lines: 15
Contained by: file merger_trees.outputter.standard.F90
Modules used: memory_management

subroutine: `standardextendintegerbuffer`
Description: Extend the size of the integer buffer.
Code lines: 15
Contained by: file merger_trees.outputter.standard.F90
Modules used: memory_management

subroutine: `standardfinalize`
Description: Finalize merger tree output by closing any open groups.
Code lines: 28
Contained by: file merger_trees.outputter.standard.F90
Modules used: io_hdf5

subroutine: `standardmakegroup`
Description: Make an group in the Galacticus file in which to store `tree`.
Code lines: 24
Contained by: file merger_trees.outputter.standard.F90
Modules used: galacticus_nodes iso_c_binding numerical_constants_astronomical string_handling

subroutine: `standardoutput`
Description: Write properties of nodes in `tree` to the Galacticus output file.
Code lines: 212
Contained by: file merger_trees.outputter.standard.F90
Modules used: events_hooks galacticus_calculations_resets galacticus_error galacticus_nodes input_parameters io_hdf5 iso_c_binding merger_tree_walkers multi_counters node_component_black_hole_simple node_component_black_hole_standard node_component_merging_statistics_recent

file: merger_trees.pruning.utilities.F90
Description: Contains a module which provides utility functions for pruning branches from merger trees.
Code lines: 119

module: merger_trees_pruning_utilities
Code lines: 97
Contained by: file merger_trees.pruning.utilities.F90
Used by: subroutine augmentoperate subroutine informationcontentoperate
subroutine prunebaryonsoperate subroutine prunebranchtipsoperate
subroutine prunebymassoperate subroutine prunebytimeoperate
subroutine pruneclonesoperate subroutine prunehierarchyoperate
subroutine prunelightconeoperate subroutine prunenonessentialoperate
subroutine selectwithinrangeoperate

subroutine: merger_tree_prune_clean_branch
Description: Cleans pointers in a branch about to be pruned to avoid dangling pointer problems during tree evolution.
Code lines: 27
Contained by: module merger_trees_pruning_utilities

Modules used: galacticus_nodes merger_tree_walkers

subroutine: merger_tree_prune_uniqueify_ids
Description: Ensure that nodes cloned during tree pruning have unique IDs.
Code lines: 15
Contained by: module merger_trees_pruning_utilities
Modules used: galacticus_nodes merger_tree_walkers

subroutine: merger_tree_prune_unlink_parent
Description: Unlink a parent node from a tree branch which is about to be pruned.
Code lines: 42
Contained by: module merger_trees_pruning_utilities
Modules used: galacticus_nodes

file: merger_trees.render.F90
Description: Contains a module which dumps information on merger tree structure useful for rendering 3D views of merger trees.
Code lines: 136

module: merger_trees_render
Description: Implements dumping of information on merger tree structure useful for rendering 3D views of merger trees.
Code lines: 114
Contained by: file merger_trees.render.F90
Modules used: kind_numbers

subroutine: merger_trees_render_dump
Description: Dumps information on merger tree structure useful for rendering 3D views of merger trees.
Code lines: 99
Contained by: module merger_trees_render
Modules used: cosmology_functions dark_matter_halo_scales
file_utilities galacticus_nodes
io_hdf5 memory_management

file: merger_trees.walkers.all_and_formation_nodes.F90
Description: Contains a module which implements a depth-first merger tree walker over all nodes including formation nodes.
Code lines: 104

function: allandformationnodesinternal
Description: Internal constructor for the allAndFormationNodes merger tree walker class.
Code lines: 9
Contained by: file merger_trees.walkers.all_and_formation_nodes.F90

function: allandformationnodesnext
Description: Walk nodes of a tree including formation nodes.
Code lines: 26
Contained by: file merger_trees.walkers.all_and_formation_nodes.F90

function: allandformationnodesparameters
Description: Constructor for the allAndFormationNodes merger tree walker class which takes a parameter set as input.
Code lines: 11
Contained by: file merger_trees.walkers.all_and_formation_nodes.F90
Modules used: galacticus_error input_parameters

subroutine: allandformationnodesprevious
Description: Step back to the previously visited node.
Code lines: 10
Contained by: file merger_trees.walkers.all_and_formation_nodes.F90
Modules used: galacticus_error

interface: mergertreewalkerallandformationnodes
Description: Constructors for the allAndFormationNodes merger tree walker class.
Code lines: 4
Contained by: file merger_trees.walkers.all_and_formation_nodes.F90

file: merger_trees.walkers.all_nodes.F90
Description: Contains a module which implements a depth-first merger tree walker over all all nodes.
Code lines: 246
Modules used: galacticus_nodes

subroutine: allnodesdescend
Description: Descend to the deepest progenitor (satellites and children) of the current branch.
Code lines: 14
Contained by: file merger_trees.walkers.all_nodes.F90

function: allnodesinternal
Description: Internal constructor for the allNodes merger tree walker class.
Code lines: 15

Contained by: file merger_trees.walkers.all_nodes.F90

function: allnodesnext
Description: This function will update to given node to the next node which should be visited in a tree to perform a depth-first walk, including satellite nodes. Once the entire tree has been walked, a null() pointer will be set, and a value of false returned indicating that there are no more nodes to walk. Each node will be visited once and once only if the tree is walked in this way. Note that it is important that the walk descends to satellites before descending to children: the routines that destroy merger tree branches rely on this since child nodes are used in testing whether a node is a satellite—if they are destroyed prior to the test being made then problems with dangling pointers will occur.
Code lines: 88
Contained by: file merger_trees.walkers.all_nodes.F90

function: allnodesnodesremain
Description: Returns true if more nodes remain to be walked to.
Code lines: 7
Contained by: file merger_trees.walkers.all_nodes.F90

function: allnodesparameters
Description: Constructor for the allNodes merger tree walker class which takes a parameter set as input.
Code lines: 11
Contained by: file merger_trees.walkers.all_nodes.F90
Modules used: galacticus_error input_parameters

subroutine: allnodesprevious
Description: Step back to the previously visited node.
Code lines: 17
Contained by: file merger_trees.walkers.all_nodes.F90
Modules used: galacticus_error

subroutine: allnodessetnode
Description: Returns true if more nodes remain to be walked to.
Code lines: 12
Contained by: file merger_trees.walkers.all_nodes.F90

interface: mergertreewalkerallnodes
Description: Constructors for the allNodes merger tree walker class.
Code lines: 4
Contained by: file merger_trees.walkers.all_nodes.F90

file: merger_trees.walkers.all_nodes.branch.F90
Description: Contains a module which implements a depth-first merger tree walker over all all nodes in a given branch.
Code lines: 153

subroutine: allnodesbranchdescend
Description: Descend to the deepest progenitor (satellites and children) of the current branch.
Code lines: 14

Contained by: file merger_trees.walkers.all_nodes.branch.F90

function: allnodesbranchinternal
Description: Internal constructor for the allNodesBranch merger tree walker class.
Code lines: 10
Contained by: file merger_trees.walkers.all_nodes.branch.F90

function: allnodesbranchnext
Description: This function will update the given node to the next node which should be visited in a tree branch to perform a depth-first walk. Once the entire branch has been walked, a null() pointer will be set, and a value of false returned indicating that there are no more nodes to walk. Each node will be visited once and once only if the branch is walked in this way.
Code lines: 49
Contained by: file merger_trees.walkers.all_nodes.branch.F90

function: allnodesbranchnodesremain
Description: Returns true if nodes remain to be visited in the branch.
Code lines: 7
Contained by: file merger_trees.walkers.all_nodes.branch.F90

function: allnodesbranchparameters
Description: Constructor for the allNodesBranch merger tree walker class which takes a parameter set as input.
Code lines: 11
Contained by: file merger_trees.walkers.all_nodes.branch.F90
Modules used: galacticus_error input_parameters

interface: mergertreewalkerallnodesbranch
Description: Constructors for the allNodesBranch merger tree walker class.
Code lines: 4
Contained by: file merger_trees.walkers.all_nodes.branch.F90

file: merger_trees.walkers.isolated_nodes.F90
Description: Contains a module which implements a depth-first merger tree walker over all isolated nodes.
Code lines: 134

function: isolatednodesinternal
Description: Internal constructor for the isolatedNodes merger tree walker class.
Code lines: 9
Contained by: file merger_trees.walkers.isolated_nodes.F90

function: isolatednodesnext
Description: This function will update to given node to the next node which should be visited in a tree to perform a depth-first walk. Once the entire tree has been walked, a null() pointer will be set, and a value of false returned indicating that there are no more nodes to walk. Each node will be visited once and once only if the tree is walked in this way.
Code lines: 70

Contained by: file merger_trees.walkers.tree_construction.F90

function: treeconstructionparameters
Description: Constructor for the treeConstruction merger tree walker class which takes a parameter set as input.
Code lines: 11
Contained by: file merger_trees.walkers.tree_construction.F90
Modules used: galacticus_error input_parameters

file: meta.tree_processing_times.F90
Description: Contains a module providing a class for calculations of the time taken to process merger trees.
Code lines: 40

module: meta_tree_compute_times
Description: Provides a class for calculations of the time taken to process merger trees.
Code lines: 18
Contained by: file meta.tree_processing_times.F90
Used by: subroutine galacticus_function_classes_destroy; subroutine galacticus_state_retrieve; subroutine galacticus_state_store; file merger_trees.construct.build.masses.distribution.stellar_mass_function.F90

file: meta.tree_processing_times.file.F90
Description: Contains a module which implements a merger tree processing time estimator using a polynomial relation read from file.
Code lines: 97

function: fileconstructorinternal
Description: Internal constructor for the “file” merger tree processing time estimator class.

Code lines: 19
Contained by: file meta.tree_processing_times.file.F90
Modules used: fox_dom galacticus_error io_xml

function: fileconstructorparameters
Description: Constructor for the "file" merger tree processing time estimator class which takes a parameter set as input.
Code lines: 17
Contained by: file meta.tree_processing_times.file.F90
Modules used: input_parameters

function: filetime
Description: Return the units of the file property in the SI system.
Code lines: 15
Contained by: file meta.tree_processing_times.file.F90

interface: metatreeprocessingtimefile
Description: Constructors for the "file" merger tree processing time estimator.
Code lines: 4
Contained by: file meta.tree_processing_times.file.F90

file: models.likelihoods.F90
Description: Contains a module which implements a likelihood class for posterior sampling simulations.
Code lines: 75

module: models_likelihoods
Description: Implements a likelihood class for posterior sampling simulations.
Code lines: 53
Contained by: file models.likelihoods.F90
Modules used: model_parameters posterior_sampling_convergence posterior_sampling_state
Used by: subroutine galacticus_function_classes_destroy; subroutine galacticus_state_retrieve; subroutine galacticus_state_store; file posterior_sampling.simulation.differential_evolution.F90; file posterior_sampling.simulation.particle_swarm.F90; module posterior_sampling_state_initialize

file: models.likelihoods.SED_fit.F90
Description: Implementation of a posterior sampling likelihood class which implements a likelihood for SED fitting.
Code lines: 471
Modules used: cosmology_functions stellar_population_selectors stellar_population_spectra_postprocess

interface: posteriorsamplelikelihoodsedfit

Description: Constructors for the `sedFit` posterior sampling convergence class.
Code lines: 4
Contained by: file models.likelihoods.SED_fit.F90

function: `sedfitconstructorinternal`
Description: Constructor for "sedFit" posterior sampling likelihood class.
Code lines: 44
Contained by: file models.likelihoods.SED_fit.F90
Modules used: galacticus_error, instruments_filters, iso_varying_string, memory_management

function: `sedfitconstructorparameters`
Description: Constructor for the `sedFit` posterior sampling convergence class which builds the object from a parameter set.
Code lines: 72
Contained by: file models.likelihoods.SED_fit.F90
Modules used: input_parameters

subroutine: `sedfitdestructor`
Description: Destructor for "sedFit" posterior sampling likelihood class.
Code lines: 9
Contained by: file models.likelihoods.SED_fit.F90

function: `sedfitevaluate`
Description: Return the log-likelihood for the SED fitting likelihood function.
Code lines: 251
Contained by: file models.likelihoods.SED_fit.F90
Modules used: abundances_structure, cosmology_functions, fgsl, galactic_structure_options, galacticus_error, galacticus_nodes, iso_c_binding, models_likelihoods_constants, numerical_integration, posterior_sampling_convergence, posterior_sampling_state, rapidevaluation, stellar_population_luminosities, stellar_populations, stellar_spectra_dust_attenuations

function: `luminosityintegrand`
Description: Star formation rate integrand.
Code lines: 31
Contained by: function sedfitevaluate
Modules used: numerical_constants_math, stellar_population_luminosities

subroutine: `sedfitfunctionchanged`
Description: Respond to possible changes in the likelihood function.
Code lines: 7
Contained by: file models.likelihoods.SED_fit.F90

file: `models.likelihoods.constants.F90`
Description: Contains a module which provides constants for use when constraining Galacticus.

Code lines: 30

module: `models_likelihoods_constants`
Description: Provides constants for use when constraining Galacticus.
Code lines: 8
Contained by: file models.likelihoods.constants.F90

file: `models.likelihoods.galaxy_population.F90`
Description: Implementation of a posterior sampling likelihood class which implements a likelihood for Galacticus models.
Code lines: 427
Modules used:

fox_dom	input_parameters
output_analyses	

function: `galaxypopulationconstructorinternal`
Description: Constructor for "galaxyPopulation" posterior sampling likelihood class.
Code lines: 11
Contained by: file models.likelihoods.galaxy_population.F90

function: `galaxypopulationconstructorparameters`
Description: Constructor for the `galaxyPopulation` posterior sampling likelihood class which builds the object from a parameter set.
Code lines: 58
Contained by: file models.likelihoods.galaxy_population.F90
Modules used:

galacticus_display	input_parameters

subroutine: `galaxypopulationdestructor`
Description: Destructor for the `galaxyPopulation` posterior sampling likelihood class.
Code lines: 8
Contained by: file models.likelihoods.galaxy_population.F90

function: `galaxypopulationevaluate`
Description: Return the log-likelihood for the Galacticus likelihood function.
Code lines: 255

Contained by: file models.likelihoods.galaxy_population.F90
Modules used: functions_global, galacticus_display, galacticus_error, kind_numbers, models_likelihoods_constants, mpi_utilities, posterior_sampling_convergence, posterior_sampling_state, string_handling

subroutine: galaxypopulationfunctionchanged
Description: Respond to possible changes in the likelihood function.
Code lines: 7
Contained by: file models.likelihoods.galaxy_population.F90

function: galaxypopulationwillevaluate
Description: Return true if the log-likelihood will be evaluated.
Code lines: 16
Contained by: file models.likelihoods.galaxy_population.F90
Modules used: models_likelihoods_constants, posterior_sampling_convergence, posterior_sampling_state

type: inputparameterlist
Description: Type used to maintain a list of pointers to parameters to be modified.
Code lines: 6
Contained by: file models.likelihoods.galaxy_population.F90

interface: posteriorsamplelikelihoodgalaxypopulation
Description: Constructors for the galaxyPopulation posterior sampling likelihood class.
Code lines: 4
Contained by: file models.likelihoods.galaxy_population.F90

file: models.likelihoods.gaussian_regression.F90
Description: Implementation of a posterior sampling likelihood class which implements a likelihood using Gaussian regression to emulate another likelihood.
Code lines: 1029
Modules used: fgsl

function: gaussianregressionconstructorinternal
Description: Constructor for "gaussianRegression" posterior sampling likelihood class.
Code lines: 24
Contained by: file models.likelihoods.gaussian_regression.F90
Modules used: file_utilities, galacticus_error

function: gaussianregressionconstructorparameters
Description: Constructor for the gaussianRegression posterior sampling likelihood class which builds the object from a parameter set.
Code lines: 90
Contained by: file models.likelihoods.gaussian_regression.F90
Modules used: input_parameters

function: gaussianregressioncorrelation

Description: Compute correlation of the variogram model.
Code lines: 8
Contained by: file models.likelihoods.gaussian_regression.F90

subroutine: gaussianregressiondestructor
Description: Destructor for Gaussian regression likelihood class.
Code lines: 9
Contained by: file models.likelihoods.gaussian_regression.F90

subroutine: gaussianregressionemulate
Description: Evaluate the model emulator.
Code lines: 48
Contained by: file models.likelihoods.gaussian_regression.F90
Modules used: fgsl

function: gaussianregressionevaluate
Description: Return the log-likelihood for a Gaussian regression likelihood function.
Code lines: 322
Contained by: file models.likelihoods.gaussian_regression.F90
Modules used:

posterior_sampling_convergence	posterior_sampling_state
string_handling	

function: gaussianregressionevaluatevariogram
Description: Compute the variogram at separation h.
Code lines: 14
Contained by: file models.likelihoods.gaussian_regression.F90

subroutine: gaussianregressionfitvariogram
Description: Compute best fit coefficients for the variogram model.
Code lines: 96
Contained by: file models.likelihoods.gaussian_regression.F90
Modules used:

fgsl	galacticus_error
iso_c_binding	sort

subroutine: gaussianregressionfunctionchanged
Description: Respond to possible changes in the likelihood function.
Code lines: 28
Contained by: file models.likelihoods.gaussian_regression.F90
Modules used: memory_management

subroutine: gaussianregressionrestore
Description: Process a previous state to restore likelihood function.
Code lines: 31
Contained by: file models.likelihoods.gaussian_regression.F90

Modules used: memory_management models_likelihoods_constants

function: gaussianregressionseparation
Description: Determine the separation between two state vectors.
Code lines: 8
Contained by: file models.likelihoods.gaussian_regression.F90

subroutine: gaussianregressionvariogrammodeld
Description: Derivatives of the function to be minimized when fitting the variogram.
Code lines: 27
Contained by: file models.likelihoods.gaussian_regression.F90
Modules used: fgsl iso_c_binding

function: gaussianregressionvariogrammodelf
Description: Function to be minimized when fitting the variogram.
Code lines: 21
Contained by: file models.likelihoods.gaussian_regression.F90
Modules used: fgsl iso_c_binding

subroutine: gaussianregressionvariogrammodelfd
Description: Computes both function and derivatives to be minimized when fitting the variogram.
Code lines: 10
Contained by: file models.likelihoods.gaussian_regression.F90
Modules used: iso_c_binding

function: gaussianregressionwillevaluate
Description: Return true if the log-likelihood will be evaluated.
Code lines: 47
Contained by: file models.likelihoods.gaussian_regression.F90
Modules used: galacticus_display iso_c_binding
models_likelihoods_constants posterior_sampling_convergence
posterior_sampling_state

function: polynomialcoefficientcount
Description: Return the number of coefficients at $\mathtt{n}^{\mathrm{th}}$ order in polynomial of dimension d.
Code lines: 12
Contained by: file models.likelihoods.gaussian_regression.F90
Modules used: factorials

interface: polynomialiterator
Code lines: 2
Contained by: file models.likelihoods.gaussian_regression.F90

function: polynomialiteratorconstructor
Description: Create a polynomial iterator for a poynomial of specified order and rank.
Code lines: 12
Contained by: file models.likelihoods.gaussian_regression.F90
Modules used: memory_management

function: `polynomialiteratorcounter`
Description: Return the current count of a polynomial iterator.
Code lines: 7
Contained by: file `models.likelihoods.gaussian_regression.F90`

function: `polynomialiteratorcurrentorder`
Description: Return the current order of a polynomial iterator.
Code lines: 7
Contained by: file `models.likelihoods.gaussian_regression.F90`

function: `polynomialiteratorindex`
Description: Return the requested index of a polynomial iterator.
Code lines: 8
Contained by: file `models.likelihoods.gaussian_regression.F90`

function: `polynomialiteratoriterate`
Description: Iterate over polynomial coefficients.
Code lines: 31
Contained by: file `models.likelihoods.gaussian_regression.F90`

subroutine: `polynomialiteratorreset`
Description: Reset a polynomial iterator.
Code lines: 10
Contained by: file `models.likelihoods.gaussian_regression.F90`

interface: `posteriorsamplelikelihoodgaussianregression`
Description: Constructors for the `gaussianRegression` posterior sampling likelihood class.
Code lines: 4
Contained by: file `models.likelihoods.gaussian_regression.F90`

file: `models.likelihoods.halo_mass_function.F90`
Description: Implementation of a posterior sampling likelihood class which implements a likelihood for halo mass functions.
Code lines: 428
Modules used: `cosmological_density_field` `cosmology_functions` `cosmology_parameters` `dark_matter_halo_scales` `dark_matter_profiles_dmo`

function: `halomassfunctionconstructorinternal`
Description: Constructor for "haloMassFunction" posterior sampling likelihood class.
Code lines: 104
Contained by: file `models.likelihoods.halo_mass_function.F90`
Modules used: `galacticus_display` `galacticus_error` `io_hdf5` `memory_management`

function: `halomassfunctionconstructorparameters`
Description: Constructor for the `haloMassFunction` posterior sampling convergence class which builds the object from a parameter set.
Code lines: 98

Contained by: file models.likelihoods.halo_mass_function.F90
Modules used: input_parameters

subroutine: halomassfunctiondestructor
Description: Destructor for "haloMassFunction" posterior sampling likelihood class.
Code lines: 15
Contained by: file models.likelihoods.halo_mass_function.F90

function: halomassfunctionevaluate
Description: Return the log-likelihood for the halo mass function likelihood function.
Code lines: 120
Contained by: file models.likelihoods.halo_mass_function.F90
Modules used: galacticus_error, halo_mass_functions, models_likelihoods_constants, mpi_utilities, posterior_sampling_convergence, posterior_sampling_state, statistics_nbody_halo_mass_errors

subroutine: halomassfunctionfunctionchanged
Description: Respond to possible changes in the likelihood function.
Code lines: 7
Contained by: file models.likelihoods.halo_mass_function.F90

interface: posteriorsamplelikelihoodhalomassfunction
Description: Constructors for the haloMassFunction posterior sampling convergence class.
Code lines: 4
Contained by: file models.likelihoods.halo_mass_function.F90

file: models.likelihoods.independent_likelihoods.F90
Description: Implementation of a model likelihood class which combines other likelihoods assumed to be independent.
Code lines: 227

function: independentlikelihoodsconstructorinternal
Description: Constructor for "independentLikelihoods" posterior sampling likelihood class.
Code lines: 8
Contained by: file models.likelihoods.independent_likelihoods.F90

function: independentlikelihoodsconstructorparameters
Description: Constructor for the independentLikelihoods posterior sampling convergence class which builds the object from a parameter set.
Code lines: 49
Contained by: file models.likelihoods.independent_likelihoods.F90
Modules used: galacticus_error, input_parameters, string_handling

subroutine: independentlikelihoodsdestructor
Description: Destructor for "independentLikelihoods" posterior sampling likelihood class.
Code lines: 22
Contained by: file models.likelihoods.independent_likelihoods.F90

function: `independentlikelihoodsevaluate`
Description: Return the log-likelihood for the halo mass function likelihood function.
Code lines: 75
Contained by: file `models.likelihoods.independent_likelihoods.F90`
Modules used: `galacticus_error`

subroutine: `independentlikelihoodsfunctionchanged`
Description: Respond to possible changes in the likelihood function.
Code lines: 12
Contained by: file `models.likelihoods.independent_likelihoods.F90`

interface: `posteriorsamplelikelihoodindependentlikelihoods`
Description: Constructors for the `independentLikelihoods` posterior sampling convergence class.
Code lines: 4
Contained by: file `models.likelihoods.independent_likelihoods.F90`

type: `posteriorsamplelikelihoodlist`
Code lines: 8
Contained by: file `models.likelihoods.independent_likelihoods.F90`

file: `models.likelihoods.independent_likelihoods.sequential.F90`
Description: Implementation of a model likelihood class which combines other likelihoods assumed to be independent.
Code lines: 306

function: `independentlikelihoodssequantialevaluate`
Description: Return the log-likelihood for the halo mass function likelihood function.
Code lines: 167
Contained by: file `models.likelihoods.independent_likelihoods.sequential.F90`
Modules used: `galacticus_display`, `galacticus_error`, `iso_varying_string`, `models_likelihoods_constants`, `mpi_utilities`, `string_handling`

function: `independentlikelihoodssequentialconstructorinternal`
Description: Constructor for "independentLikelihoods" posterior sampling likelihood class.
Code lines: 15
Contained by: file `models.likelihoods.independent_likelihoods.sequential.F90`

function: `independentlikelihoodssequentialconstructorparameters`
Description: Constructor for the `independentLikelihoods` posterior sampling convergence class which builds the object from a parameter set.
Code lines: 44
Contained by: file `models.likelihoods.independent_likelihoods.sequential.F90`
Modules used: `galacticus_error`, `input_parameters`

subroutine: `independentlikelihoodssequentialrestore`
Description: Process a previous state to restore progress state.
Code lines: 17

Contained by: file models.likelihoods.independent_likelihoods.sequential.F90

interface: posteriorsamplelikelihoodindpndntlklhdssqntl
Description: Constructors for the independentLikelihoods posterior sampling convergence class.
Code lines: 4
Contained by: file models.likelihoods.independent_likelihoods.sequential.F90

file: models.likelihoods.mass_function.F90
Description: Implementation of a posterior sampling likelihood class which implements a likelihood for mass functions.
Code lines: 366
Modules used: cosmology_functions, geometry_surveys, halo_mass_functions

function: massfunctionconstructorinternal
Description: Constructor for "massFunction" posterior sampling likelihood class.
Code lines: 67
Contained by: file models.likelihoods.mass_function.F90
Modules used: galacticus_display, galacticus_paths, io_hdf5, memory_management

function: massfunctionconstructorparameters
Description: Constructor for the massFunction posterior sampling convergence class which builds the object from a parameter set.
Code lines: 79
Contained by: file models.likelihoods.mass_function.F90
Modules used: input_parameters

subroutine: massfunctiondestructor
Description: Destructor for "massFunction" posterior sampling likelihood class.
Code lines: 9
Contained by: file models.likelihoods.mass_function.F90

function: massfunctionevaluate
Description: Return the log-likelihood for the mass function likelihood function.
Code lines: 140
Contained by: file models.likelihoods.mass_function.F90
Modules used: conditional_mass_functions, fgsl, galacticus_error, mass_function_incompletenesses, models_likelihoods_constants, numerical_integration, posterior_sampling_convergence, posterior_sampling_state

function: likelihoodmassfunctionhalomassintegrand
Description: Integral over halo mass function.
Code lines: 9
Contained by: function massfunctionevaluate

function: likelihoodmassfunctiontimeintegrand
Description: Integral over time.
Code lines: 38

Contained by: function massfunctionevaluate
Modules used: galacticus_error string_handling

function: likelihoodmassfunctiontimenormalizationintegrand
Description: Normalization integral over time.
Code lines: 7
Contained by: function massfunctionevaluate

subroutine: massfunctionfunctionchanged
Description: Respond to possible changes in the likelihood function.
Code lines: 7
Contained by: file models.likelihoods.mass_function.F90

interface: posteriorsamplelikelihoodmassfunction
Description: Constructors for the massFunction posterior sampling convergence class.
Code lines: 4
Contained by: file models.likelihoods.mass_function.F90

file: models.likelihoods.multivariate_normal.F90
Description: Implementation of a posterior sampling likelihood class which implements a multivariate normal likelihood.
Code lines: 127
Modules used: linear_algebra

function: multivariatenormalconstructorinternal
Description: Constructor for "multivariateNormal" convergence class.
Code lines: 10
Contained by: file models.likelihoods.multivariate_normal.F90

function: multivariatenormalconstructorparameters
Description: Constructor for the multivariateNormal posterior sampling convergence class which builds the object from a parameter set.
Code lines: 29
Contained by: file models.likelihoods.multivariate_normal.F90
Modules used: input_parameters

function: multivariatenormalevaluate
Description: Return the log-likelihood for a multivariate-normal likelihood function.
Code lines: 30
Contained by: file models.likelihoods.multivariate_normal.F90
Modules used: posterior_sampling_convergence posterior_sampling_state

subroutine: multivariatenormalfunctionchanged
Description: Respond to possible changes in the likelihood function.
Code lines: 7
Contained by: file models.likelihoods.multivariate_normal.F90

interface: posteriorsamplelikelihoodmultivariatenormal
Description: Constructors for the multivariateNormal posterior sampling convergence class.
Code lines: 4

Contained by: file models.likelihoods.multivariate_normal.F90

file: models.likelihoods.multivariate_normal.stochastic.F90
Description: Implementation of a posterior sampling likelihood class which implements a multivariate normal likelihood.
Code lines: 179
Modules used: pseudo_random

function: multivariatenormalstochasticconstructorinternal
Description: Constructor for "multivariateNormalStochastic" convergence class.
Code lines: 10
Contained by: file models.likelihoods.multivariate_normal.stochastic.F90

function: multivariatenormalstochasticconstructorparameters
Description: Constructor for the multivariateNormalStochastic posterior sampling convergence class which builds the object from a parameter set.
Code lines: 45
Contained by: file models.likelihoods.multivariate_normal.stochastic.F90
Modules used: input_parameters iso_varying_string

function: multivariatenormalstochasticevaluate
Description: Return the log-likelihood for a multivariate-normal likelihood function.
Code lines: 66
Contained by: file models.likelihoods.multivariate_normal.stochastic.F90
Modules used: numerical_constants_math posterior_sampling_convergence posterior_sampling_state

subroutine: multivariatenormalstochasticfunctionchanged
Description: Respond to possible changes in the likelihood function.
Code lines: 7
Contained by: file models.likelihoods.multivariate_normal.stochastic.F90

interface: posteriorsamplelikelihoodmltivrtnormalstochastic
Description: Constructors for the multivariateNormalStochastic posterior sampling convergence class.
Code lines: 4
Contained by: file models.likelihoods.multivariate_normal.stochastic.F90

file: models.likelihoods.posterior_as_prior.F90
Description: Implementation of a posterior sampling likelihood class which implements a likelihood using a given posterior distribution over the parameters in the form of a set of MCMC chains.
Code lines: 301
Modules used: nearest_neighbors

function: posterioraspriorconstructorinternal
Description: Constructor for "posteriorAsPrior" posterior sampling likelihood class.
Code lines: 87
Contained by: file models.likelihoods.posterior_as_prior.F90
Modules used: file_utilities iso_varying_string memory_management string_handling

function: posterioraspriorconstructorparameters
Description: Constructor for the posteriorAsPrior posterior sampling likelihood class which builds the object from a parameter set.
Code lines: 47
Contained by: file models.likelihoods.posterior_as_prior.F90
Modules used: input_parameters

subroutine: posterioraspriordestructor
Description: Destructor for "posterior as prior" posterior sampling likelihood class.
Code lines: 7
Contained by: file models.likelihoods.posterior_as_prior.F90

function: posterioraspriorevaluate
Description: Return the log-likelihood for a "posterior as prior" likelihood function.
Code lines: 35
Contained by: file models.likelihoods.posterior_as_prior.F90
Modules used: numerical_constants_math posterior_sampling_convergence posterior_sampling_state

subroutine: posteriorasprioriorfunctionchanged
Description: Respond to possible changes in the likelihood function.
Code lines: 7
Contained by: file models.likelihoods.posterior_as_prior.F90

subroutine: posterioraspriorinitialize
Description: Initialize a "posterior as prior" likelihood object.
Code lines: 43
Contained by: file models.likelihoods.posterior_as_prior.F90
Modules used: memory_management

interface: posteriorsamplelikelihoodposterioraspriorior
Description: Constructors for the posteriorAsPrior posterior sampling likelihood class.
Code lines: 4
Contained by: file models.likelihoods.posterior_as_prior.F90

file: models.likelihoods.projected_correlation_function.F90
Description: Implementation of a posterior sampling likelihood class which implements a likelihood for projected correlation functions.
Code lines: 269
Modules used: cosmology_functions dark_matter_halo_biases dark_matter_halo_scales dark_matter_profile_scales dark_matter_profiles_dmo geometry_surveys halo_mass_functions linear_algebra linear_growth power_spectra

interface: posteriorsamplelikelihoodprjctdcorrelationfunction
Description: Constructors for the projectedCorrelationFunction posterior sampling convergence class.
Code lines: 4

Contained by: file models.likelihoods.projected_correlation_function.F90

function: projectedcorrelationfunctionconstructorinternal
Description: Constructor for "projectedCorrelationFunction" posterior sampling likelihood class.
Code lines: 46
Contained by: file models.likelihoods.projected_correlation_function.F90
Modules used: galacticus_paths, io_hdf5, memory_management, node_component_dark_matter_profile_scale

function: projectedcorrelationfunctionconstructorparameters
Description: Constructor for the projectedCorrelationFunction posterior sampling convergence class which builds the object from a parameter set.
Code lines: 76
Contained by: file models.likelihoods.projected_correlation_function.F90
Modules used: input_parameters

subroutine: projectedcorrelationfunctiondestructor
Description: Destructor for the projectedCorrelationFunction class.
Code lines: 15
Contained by: file models.likelihoods.projected_correlation_function.F90

function: projectedcorrelationfunctionevaluate
Description: Return the log-likelihood for the projected correlation function likelihood function.
Code lines: 48
Contained by: file models.likelihoods.projected_correlation_function.F90
Modules used: conditional_mass_functions, galacticus_error, halo_model_projected_correlations, models_likelihoods_constants, posterior_sampling_convergence, posterior_sampling_state

subroutine: projectedcorrelationfunctionfunctionchanged
Description: Respond to possible changes in the likelihood function.
Code lines: 7
Contained by: file models.likelihoods.projected_correlation_function.F90

file: models.likelihoods.spin_distribution.F90
Description: Implementation of a posterior sampling likelihood class which implements a likelihood for halo spin distributions.
Code lines: 314
Modules used: cosmology_functions, dark_matter_halo_scales, dark_matter_profile_scales, dark_matter_profiles_dmo, halo_mass_functions, statistics_nbody_halo_mass_errors

interface: posteriorsamplelikelihoodspindistribution
Description: Constructors for the spinDistribution posterior sampling convergence class.
Code lines: 4
Contained by: file models.likelihoods.spin_distribution.F90

function: spindistributionconstructorinternal

Description: Constructor for "spinDistribution" posterior sampling likelihood class.
Code lines: 41
Contained by: file models.likelihoods.spin_distribution.F90
Modules used: cosmology_functions, galacticus_error, io_hdf5, memory_management

function: spindistributionconstructorparameters
Description: Constructor for the spinDistribution posterior sampling convergence class which builds the object from a parameter set.
Code lines: 81
Contained by: file models.likelihoods.spin_distribution.F90
Modules used: input_parameters

subroutine: spindistributiondestructor
Description: Destructor for "spinDistribution" posterior sampling likelihood class.
Code lines: 12
Contained by: file models.likelihoods.spin_distribution.F90

function: spindistributionevaluate
Description: Return the log-likelihood for the halo spin distribution likelihood function.
Code lines: 98
Contained by: file models.likelihoods.spin_distribution.F90
Modules used: fgsl, galacticus_error, galacticus_nodes, halo_spin_distributions, iso_c_binding, models_likelihoods_constants, mpi_utilities, numerical_integration, posterior_sampling_convergence, posterior_sampling_state

function: spindistributionintegrate
Description: Integrand function used to find cumulative spin distribution over a bin.
Code lines: 8
Contained by: function spindistributionevaluate

subroutine: spindistributionfunctionchanged
Description: Respond to possible changes in the likelihood function.
Code lines: 7
Contained by: file models.likelihoods.spin_distribution.F90

file: models.parameters.F90
Description: Contains a module that implements a class of parameter mapping functions.
Code lines: 115

module: model_parameters
Description: Implements a class of unary operators.
Code lines: 93
Contained by: file models.parameters.F90
Used by: subroutine galacticus_function_classes_destroy, subroutine galacticus_state_retrieve

subroutine galacticus_state_store
module posterior_sample_differential_-random_jump
file posterior_-sampling.simulation.particle_-swarm.F90
module models_likelihoods
file posterior_-sampling.simulation.differential_-evolution.F90
module posterior_sampling_state_-initialize

type: modelparameterlist
Description: Class used to construct lists of model parameters.
Code lines: 3
Contained by: module model_parameters

function: modelparameterlistlogprior
Description: Compute the log-prior of a list of parameters.
Code lines: 23
Contained by: module model_parameters
Modules used: models_likelihoods_constants posterior_sampling_state

file: models.parameters.active.F90
Description: Implementation of an active model parameter class.
Code lines: 198
Modules used: math_operators_unary statistics_distributions

function: activeconstructorinternal
Description: Internal constructor for the active model parameter class.
Code lines: 10
Contained by: file models.parameters.active.F90

function: activeconstructorparameters
Description: Constructor for the active model parameter class which builds the object from a parameter set.
Code lines: 27
Contained by: file models.parameters.active.F90
Modules used: input_parameters

subroutine: activedestructor
Description: Destructor for "active" model parameter class.
Code lines: 9
Contained by: file models.parameters.active.F90

function: activelogprior
Description: Return the log-prior on this parameter.
Code lines: 14
Contained by: file models.parameters.active.F90
Modules used: models_likelihoods_constants

function: activemap
Description: Map this parameter.

Code lines: 8
Contained by: file models.parameters.active.F90

function: activename
Description: Return the name of this parameter.
Code lines: 8
Contained by: file models.parameters.active.F90

function: activepriorinvert
Description: Invert the prior, returning the parameter value given the cumulative probability.
Code lines: 8
Contained by: file models.parameters.active.F90

function: activepriormaximum
Description: Return the maximum value for which the prior is non-zero.
Code lines: 7
Contained by: file models.parameters.active.F90

function: activepriorminimum
Description: Return the minimum value for which the prior is non-zero.
Code lines: 7
Contained by: file models.parameters.active.F90

function: activepriorsample
Description: Sample from the of this parameter.
Code lines: 7
Contained by: file models.parameters.active.F90

function: activerandomperturbation
Description: Return a random perturbation to this parameter.
Code lines: 7
Contained by: file models.parameters.active.F90

function: activeunmap
Description: Unmap this parameter.
Code lines: 8
Contained by: file models.parameters.active.F90

interface: modelparameteractive
Description: Constructors for the active 1D distribution function class.
Code lines: 4
Contained by: file models.parameters.active.F90

file: models.parameters.derived.F90
Description: Implementation of a model parameter class in which the parameter value is derived from other parameters.
Code lines: 96

function: derivedconstructorinternal

Description: Internal constructor for the `derived` model parameter class.
Code lines: 8
Contained by: file `models.parameters.derived.F90`

function: `derivedconstructorparameters`
Description: Constructor for the `derived` model parameter class which builds the object from a parameter set.
Code lines: 25
Contained by: file `models.parameters.derived.F90`
Modules used: `input_parameters`

function: `deriveddefinition`
Description: Return the definition of this parameter.
Code lines: 8
Contained by: file `models.parameters.derived.F90`

interface: `modelparameterderived`
Description: Constructors for the `derived` 1D distribution function class.
Code lines: 4
Contained by: file `models.parameters.derived.F90`

file: `models.parameters.inactive.F90`
Description: Implementation of an inactive model parameter class.
Code lines: 189

function: `inactiveconstructorinternal`
Description: Internal constructor for the `inactive` model parameter class.
Code lines: 8
Contained by: file `models.parameters.inactive.F90`

function: `inactiveconstructorparameters`
Description: Constructor for the `inactive` model parameter class which builds the object from a parameter set.
Code lines: 19
Contained by: file `models.parameters.inactive.F90`
Modules used: `input_parameters`

function: `inactivelogprior`
Description: Return the log-prior on this parameter.
Code lines: 11
Contained by: file `models.parameters.inactive.F90`
Modules used: `galacticus_error`

function: `inactivemap`
Description: Map this parameter.
Code lines: 11
Contained by: file `models.parameters.inactive.F90`
Modules used: `galacticus_error`

function: `inactivename`
Description: Return the name of this parameter.
Code lines: 8
Contained by: file `models.parameters.inactive.F90`

function: `inactivepriorinvert`
Description: Invert the prior, returning the parameter value given the cumulative probability.
Code lines: 11
Contained by: file `models.parameters.inactive.F90`
Modules used: `galacticus_error`

function: `inactivepriormaximum`
Description: Return the maximum value for which the prior is non-zero.
Code lines: 10
Contained by: file `models.parameters.inactive.F90`
Modules used: `galacticus_error`

function: `inactivepriorminimum`
Description: Return the minimum value for which the prior is non-zero.
Code lines: 10
Contained by: file `models.parameters.inactive.F90`
Modules used: `galacticus_error`

function: `inactivepriorsample`
Description: Sample from the of this parameter.
Code lines: 10
Contained by: file `models.parameters.inactive.F90`
Modules used: `galacticus_error`

function: `inactiverandomperturbation`
Description: Return a random perturbation to this parameter.
Code lines: 10
Contained by: file `models.parameters.inactive.F90`
Modules used: `galacticus_error`

function: `inactiveunmap`
Description: Unmap this parameter.
Code lines: 11
Contained by: file `models.parameters.inactive.F90`
Modules used: `galacticus_error`

interface: `modelparameterinactive`
Description: Constructors for the `inactive` 1D distribution function class.
Code lines: 4
Contained by: file `models.parameters.inactive.F90`

file: `nBody.import.F90`
Description: Contains a module which provides a class that implements importing of data from N-body simulations.

Code lines: 41

module: `nbody_importers`
Description: Provides a class that implements importing of data from N-body simulations.
Code lines: 19
Contained by: file `nBody.import.F90`
Modules used: `nbody_simulation_data`
Used by: subroutine `galacticus_function_-classes_destroy`; subroutine `galacticus_state_retrieve`; subroutine `galacticus_state_store`; file `tasks.nBody_analyze.F90`

file: `nBody.import.GadgetBinary.F90`
Description: Contains a module which implements an N-body data importer for Gadget binary files.
Code lines: 179
Modules used: `io_hdf5`; `iso_varying_string`

function: `gadgetbinaryconstructorinternal`
Description: Internal constructor for the "gadgetBinary" N-body importer class.
Code lines: 10
Contained by: file `nBody.import.GadgetBinary.F90`

function: `gadgetbinaryconstructorparameters`
Description: Constructor for the "gadgetBinary" N-body importer class which takes a parameter set as input.
Code lines: 62
Contained by: file `nBody.import.GadgetBinary.F90`
Modules used: `input_parameters`

function: `gadgetbinaryimport`
Description: Import data from a Gadget HDF5 file.
Code lines: 57
Contained by: file `nBody.import.GadgetBinary.F90`
Modules used: `galacticus_error`; `memory_management`; `numerical_constants_astronomical`; `numerical_constants_prefixes`

interface: `nbodyimportergadgetbinary`
Description: Constructors for the "gadgetBinary" N-body importer class.
Code lines: 4
Contained by: file `nBody.import.GadgetBinary.F90`

file: `nBody.import.GadgetHDF5.F90`
Description: Contains a module which implements an N-body data importer for Gadget HDF5 files.
Code lines: 171
Modules used: `io_hdf5`

function: `gadgethdf5constructorinternal`
Description: Internal constructor for the "gadgetHDF5" N-body importer class.
Code lines: 9
Contained by: file `nBody.import.GadgetHDF5.F90`

function: `gadgethdf5constructorparameters`
Description: Constructor for the "gadgetHDF5" N-body importer class which takes a parameter set as input.
Code lines: 47
Contained by: file `nBody.import.GadgetHDF5.F90`
Modules used: `input_parameters`

subroutine: `gadgethdf5destructor`
Description: Destructor for Gadget HF5 importer class.
Code lines: 7
Contained by: file `nBody.import.GadgetHDF5.F90`

function: `gadgethdf5import`
Description: Import data from a Gadget HDF5 file.
Code lines: 56
Contained by: file `nBody.import.GadgetHDF5.F90`
Modules used: `galacticus_error` `numerical_constants_astronomical` `numerical_constants_prefixes`

interface: `nbodyimportergadgethdf5`
Description: Constructors for the "gadgetHDF5" N-body importer class.
Code lines: 4
Contained by: file `nBody.import.GadgetHDF5.F90`

file: `nBody.operator.F90`
Description: Contains a module which provides a class that implements operators on data from N-body simulations.
Code lines: 40

module: `nbody_operators`
Description: Provides a class that implements operators on data from N-body simulations.
Code lines: 18
Contained by: file `nBody.operator.F90`
Modules used: `nbody_simulation_data`
Used by: subroutine `galacticus_function_-classes_destroy`; subroutine `galacticus_state_retrieve`; subroutine `galacticus_state_store`; file `tasks.nBody_analyze.F90`

file: `nBody.operator.environmental_overdensity.F90`
Description: Contains a module which implements an N-body data operator which determines the environmental overoverdensity around particles.
Code lines: 235
Modules used: `iso_c_binding`

function: `environmentaloverdensityconstructorinternal`
Description: Internal constructor for the "environmentalOverdensity" N-body operator class.
Code lines: 13
Contained by: file `nBody.operator.environmental_overdensity.F90`

Modules used: numerical_constants_math

function: environmentaloverdensityconstructorparameters
Description: Constructor for the "environmentalOverdensity" N-body operator class which takes a parameter set as input.
Code lines: 51
Contained by: file nBody.operator.environmental_overdensity.F90
Modules used: input_parameters

subroutine: environmentaloverdensityoperate
Description: Determine the mean position and velocity of N-body particles.
Code lines: 121
Contained by: file nBody.operator.environmental_overdensity.F90
Modules used: galacticus_display memory_management nearest_neighbors omp_lib

function: boundlower
Description: Compute lower bounds for particle inclusion in periodically replicated volumes.
Code lines: 18
Contained by: subroutine environmentaloverdensityoperate
Modules used: galacticus_error

function: boundupper
Description: Compute upper bounds for particle inclusion in periodically replicated volumes.
Code lines: 18
Contained by: subroutine environmentaloverdensityoperate
Modules used: galacticus_error

interface: nbodyoperatorenvironmentaloverdensity
Description: Constructors for the "environmentalOverdensity" N-body operator class.
Code lines: 4
Contained by: file nBody.operator.environmental_overdensity.F90

file: nBody.operator.mean_position.F90
Description: Contains a module which implements an N-body data operator which determines the mean position and velocity of particles.
Code lines: 137
Modules used: iso_c_binding

function: meanpositionconstructorinternal
Description: Internal constructor for the "meanPosition" N-body operator class.
Code lines: 10
Contained by: file nBody.operator.mean_position.F90
Modules used: input_parameters

function: meanpositionconstructorparameters
Description: Constructor for the "meanPosition" N-body operator class which takes a parameter set as input.
Code lines: 27
Contained by: file nBody.operator.mean_position.F90

Modules used: input_parameters

subroutine: meanpositionoperate
Description: Determine the mean position and velocity of N-body particles.
Code lines: 51
Contained by: file nBody.operator.mean_position.F90
Modules used: galacticus_error memory_management pseudo_random

interface: nbodyoperatormeanposition
Description: Constructors for the "meanPosition" N-body operator class.
Code lines: 4
Contained by: file nBody.operator.mean_position.F90

file: nBody.operator.null.F90
Description: Contains a module which implements a null N-body data operator.
Code lines: 60

interface: nbodyoperatornull
Description: Constructors for the "null" N-body operator class.
Code lines: 3
Contained by: file nBody.operator.null.F90

function: nullconstructorparameters
Description: Constructor for the "null" N-body operator class which takes a parameter set as input.
Code lines: 10
Contained by: file nBody.operator.null.F90
Modules used: input_parameters

subroutine: nulloperate
Description: Perform a null operation on N-body simulation data.
Code lines: 9
Contained by: file nBody.operator.null.F90

file: nBody.operator.pair_counts.F90
Description: Contains a module which implements an N-body data operator which computes pair counts in bins of separation.
Code lines: 172
Modules used: iso_c_binding

interface: nbodyoperatorpaircounts
Description: Constructors for the "pairCounts" N-body operator class.
Code lines: 4
Contained by: file nBody.operator.pair_counts.F90

function: paircountsconstructorinternal
Description: Internal constructor for the "pairCounts" N-body operator class.
Code lines: 9
Contained by: file nBody.operator.pair_counts.F90

function: `paircountsconstructorparameters`
Description: Constructor for the "pairCounts" N-body operator class which takes a parameter set as input.
Code lines: 49
Contained by: file `nBody.operator.pair_counts.F90`
Modules used: `input_parameters`

subroutine: `paircountsoperate`
Description: Determine the mean position and velocity of N-body particles.
Code lines: 65
Contained by: file `nBody.operator.pair_counts.F90`
Modules used: `galacticus_display` `memory_management` `nearest_neighbors` `numerical_ranges` `omp_lib` `pseudo_random`

file: `nBody.operator.rotation_curve.F90`
Description: Contains a module which implements an N-body data operator which computes the rotation curve at a set of given radii.
Code lines: 166
Modules used: `iso_c_binding`

interface: `nbodyoperatorrotationcurve`
Description: Constructors for the "rotationCurve" N-body operator class.
Code lines: 4
Contained by: file `nBody.operator.rotation_curve.F90`

function: `rotationcurveconstructorinternal`
Description: Internal constructor for the "rotationCurve" N-body operator class.
Code lines: 10
Contained by: file `nBody.operator.rotation_curve.F90`

function: `rotationcurveconstructorparameters`
Description: Constructor for the "rotationCurve" N-body operator class which takes a parameter set as input.
Code lines: 36
Contained by: file `nBody.operator.rotation_curve.F90`
Modules used: `input_parameters`

subroutine: `rotationcurveoperate`
Description: Determine the mean position and velocity of N-body particles.
Code lines: 70
Contained by: file `nBody.operator.rotation_curve.F90`
Modules used: `galacticus_error` `io_hdf5` `memory_management` `numerical_constants_physical` `pseudo_random`

file: `nBody.operator.self_bound.F90`
Description: Contains a module which implements an N-body data operator which determines the subset of particles that are self-bound.

Code lines: 492
Modules used: `iso_c_binding`

interface: `nbodyoperatorselfbound`
Description: Constructors for the "selfBound" N-body operator class.
Code lines: 4
Contained by: file `nBody.operator.self_bound.F90`

function: `selfboundconstructorinternal`
Description: Internal constructor for the "selfBound" N-body operator class
Code lines: 11
Contained by: file `nBody.operator.self_bound.F90`
Modules used: `input_parameters`

function: `selfboundconstructorparameters`
Description: Constructor for the "selfBound" N-body operator class which takes a parameter set as input.
Code lines: 52
Contained by: file `nBody.operator.self_bound.F90`
Modules used: `input_parameters`

subroutine: `selfboundoperate`
Description: Determine the subset of N-body particles which are self-bound.
Code lines: 360
Contained by: file `nBody.operator.self_bound.F90`
Modules used: `galacticus_display` `galacticus_error` `iso_varying_string` `memory_management` `numerical_constants_physical` `pseudo_random` `string_handling`

function: `selfboundpotential`
Description: Compute the potential for an array of particle separations. Currently assumes the functional form of the softening used by Gadget.
Code lines: 17
Contained by: file `nBody.operator.self_bound.F90`

file: `nBody.operator.sequence.F90`
Description: Contains a module which implements an N-body data operator which applies a sequence of other operators.
Code lines: 153

type: `nbodyoperatorlist`
Code lines: 3
Contained by: file `nBody.operator.sequence.F90`

interface: `nbodyoperatorsequence`
Description: Constructors for the "sequence" N-body operator class.
Code lines: 4
Contained by: file `nBody.operator.sequence.F90`

function: `sequenceconstructorinternal`
Description: Internal constructor for the "sequence" N-body operator class.
Code lines: 15
Contained by: file `nBody.operator.sequence.F90`
Modules used: `input_parameters`

function: `sequenceconstructorparameters`
Description: Constructor for the "sequence" N-body operator class which takes a parameter set as input.
Code lines: 22
Contained by: file `nBody.operator.sequence.F90`
Modules used: `input_parameters`

subroutine: `sequencedeepcopy`
Description: Perform a deep copy for the `sequence` N-body operator class.
Code lines: 31
Contained by: file `nBody.operator.sequence.F90`
Modules used: `galacticus_error`

subroutine: `sequencedestructor`
Description: Destructor for the sequence N-body operator class.
Code lines: 16
Contained by: file `nBody.operator.sequence.F90`

subroutine: `sequenceoperate`
Description: Apply a sequence of N-body simulation operators.
Code lines: 13
Contained by: file `nBody.operator.sequence.F90`

file: `nBody.operator.velocity_dispersion.F90`
Description: Contains a module which implements an N-body data operator which computes the velocity dispersion in a set of given spherical shells.
Code lines: 188
Modules used: `iso_c_binding`

interface: `nbodyoperatorvelocitydispersion`
Description: Constructors for the "velocityDispersion" N-body operator class.
Code lines: 4
Contained by: file `nBody.operator.velocity_dispersion.F90`

function: `velocitydispersionconstructorinternal`
Description: Internal constructor for the "velocityDispersion" N-body operator class.
Code lines: 12
Contained by: file `nBody.operator.velocity_dispersion.F90`
Modules used: `galacticus_error`

function: `velocitydispersionconstructorparameters`
Description: Constructor for the "velocityDispersion" N-body operator class which takes a parameter set as input.
Code lines: 44

Contained by: file nBody.operator.velocity_dispersion.F90
Modules used: input_parameters

file: nodes.property_extractor.ICM_SZ.F90

Description: Contains a module which implements an intracluster medium Sunyaev-Zeldovich property extractor class.
Code lines: 211
Modules used: chemical_states, cosmology_functions, dark_matter_halo_scales, hot_halo_mass_distributions, hot_halo_temperature_profiles

function: icmszconstructorinternal

Description: Internal constructor for the icmSZ property extractor class.
Code lines: 12
Contained by: file nodes.property_extractor.ICM_SZ.F90

function: icmszconstructorparameters

Description: Constructor for the icmSZ property extractor class which takes a parameter set as input.
Code lines: 25
Contained by: file nodes.property_extractor.ICM_SZ.F90
Modules used: input_parameters

function: icmszdescription

Description: Return a description of the intracluster medium Sunyaev-Zeldovich property.
Code lines: 9
Contained by: file nodes.property_extractor.ICM_SZ.F90

subroutine: icmszdestructor

Description: Destructor for the icmSZ property extractor class.
Code lines: 11
Contained by: file nodes.property_extractor.ICM_SZ.F90

function: icmszextract

Description: Implement a Sunyaev-Zeldovich effect property extractor.
Code lines: 57
Contained by: file nodes.property_extractor.ICM_SZ.F90
Modules used: fgsl, galacticus_nodes, numerical_constants_math, numerical_integration, radiation_fields

function: integrandcomptiony

Description: Integrand function used for computing ICM SZ properties.
Code lines: 27
Contained by: function icmszextract
Modules used: abundances_structure, numerical_constants_astronomical, numerical_constants_atomic, numerical_constants_physical, numerical_constants_prefixes

function: icmszname

Description: Return the name of the last isolated redshift property.
Code lines: 9
Contained by: file nodes.property_extractor.ICM_SZ.F90

function: icmsztype
Description: Return the type of the last isolated redshift property.
Code lines: 9
Contained by: file nodes.property_extractor.ICM_SZ.F90
Modules used: output_analyses_options

function: icmszunitsinsi
Description: Return the units of the last isolated redshift property in the SI system.
Code lines: 8
Contained by: file nodes.property_extractor.ICM_SZ.F90

interface: nodepropertyextractoricmsz
Description: Constructors for the "icmSZ" output analysis class.
Code lines: 4
Contained by: file nodes.property_extractor.ICM_SZ.F90

file: nodes.property_extractor.ICM_Xray_luminosity.F90
Description: Contains a module which implements an intracluster medium X-ray luminosity property extractor class.
Code lines: 271
Modules used: cooling_functions, cosmology_functions, dark_matter_halo_scales, hot_halo_mass_distributions, hot_halo_temperature_profiles

function: icmxrayluminosityconstructorinternal
Description: Internal constructor for the icmXRayLuminosity property extractor class.
Code lines: 12
Contained by: file nodes.property_extractor.ICM_Xray_luminosity.F90

function: icmxrayluminosityconstructorparameters
Description: Constructor for the icmXRayLuminosity property extractor class which takes a parameter set as input.
Code lines: 25
Contained by: file nodes.property_extractor.ICM_Xray_luminosity.F90
Modules used: input_parameters

function: icmxrayluminositydescriptions
Description: Return descriptions of the icmXRayLuminosity properties.
Code lines: 11
Contained by: file nodes.property_extractor.ICM_Xray_luminosity.F90

subroutine: icmxrayluminositydestructor
Description: Destructor for the icmXRayLuminosity property extractor class.
Code lines: 11
Contained by: file nodes.property_extractor.ICM_Xray_luminosity.F90

function: `icmxrayluminosityelementcount`
Description: Return the number of elements in the lightconeple property extractors.
Code lines: 9
Contained by: file nodes.property_extractor.ICM_Xray_luminosity.F90

function: `icmxrayluminosityextract`
Description: Implement an ICM X-ray properties extractor.
Code lines: 96
Contained by: file nodes.property_extractor.ICM_Xray_luminosity.F90
Modules used: `fgsl` galacticus_nodes numerical_constants_physical numerical_constants_prefixes numerical_constants_units numerical_integration radiation_fields

function: `integrandluminosityxray`
Description: Integrand function used for computing ICM X-ray luminosities.
Code lines: 40
Contained by: function icmxrayluminosityextract
Modules used: abundances_structure chemical_abundances_structure chemical_reaction_rates_utilities numerical_constants_astronomical numerical_constants_atomic numerical_constants_math numerical_constants_prefixes

function: `integrandtemperaturexray`
Description: Integrand function used for computing ICM X-ray luminosity-weighted temperatures.
Code lines: 7
Contained by: function icmxrayluminosityextract

function: `icmxrayluminositynames`
Description: Return the names of the `icmXRayLuminosity` properties.
Code lines: 11
Contained by: file nodes.property_extractor.ICM_Xray_luminosity.F90

function: `icmxrayluminositytype`
Description: Return the type of the `icmXRayLuminosity` properties.
Code lines: 9
Contained by: file nodes.property_extractor.ICM_Xray_luminosity.F90
Modules used: output_analyses_options

function: `icmxrayluminosityunitsinsi`
Description: Return the units of the `icmXRayLuminosity` properties in the SI system.
Code lines: 13
Contained by: file nodes.property_extractor.ICM_Xray_luminosity.F90
Modules used: numerical_constants_prefixes numerical_constants_units

interface: `nodepropertyextractoricmxrayluminosity`
Description: Constructors for the "icmXRayLuminosity" output analysis class.
Code lines: 4

Contained by: file nodes.property_extractor.ICM_Xray_luminosity.F90

file: nodes.property_extractor.cold_mode_infall_rate.F90
Description: Contains a module which implements a cold mode infall rate property extractor class.
Code lines: 138
Modules used: cooling_cold_mode_infall_rates

interface: nodepropertyextractorrateinfallcoldmode
Description: Constructors for the rateInfallColdMode output analysis class.
Code lines: 4
Contained by: file nodes.property_extractor.cold_mode_infall_rate.F90

function: rateinfallcoldmodeconstructorinternal
Description: Internal constructor for the rateInfallColdMode property extractor class.
Code lines: 8
Contained by: file nodes.property_extractor.cold_mode_infall_rate.F90

function: rateinfallcoldmodeconstructorparameters
Description: Constructor for the rateInfallColdMode property extractor class which takes a parameter set as input.
Code lines: 13
Contained by: file nodes.property_extractor.cold_mode_infall_rate.F90
Modules used: input_parameters

function: rateinfallcoldmodedescription
Description: Return a description of the rateInfallColdMode property.
Code lines: 9
Contained by: file nodes.property_extractor.cold_mode_infall_rate.F90

subroutine: rateinfallcoldmodedestructor
Description: Destructor for the rateInfallColdMode property extractor class.
Code lines: 7
Contained by: file nodes.property_extractor.cold_mode_infall_rate.F90

function: rateinfallcoldmodeextract
Description: Implement a rateInfallColdMode property extractor.
Code lines: 11
Contained by: file nodes.property_extractor.cold_mode_infall_rate.F90
Modules used: galacticus_nodes

function: rateinfallcoldmodename
Description: Return the name of the rateInfallColdMode property.
Code lines: 9
Contained by: file nodes.property_extractor.cold_mode_infall_rate.F90

function: rateinfallcoldmodetype
Description: Return the type of the rateInfallColdMode property.
Code lines: 9
Contained by: file nodes.property_extractor.cold_mode_infall_rate.F90

Modules used: output_analyses_options

function: rateinfallcoldmodeunitsinsi
Description: Return the units of the rateInfallColdMode property in the SI system.
Code lines: 9
Contained by: file nodes.property_extractor.cold_mode_infall_rate.F90
Modules used: numerical_constants_astronomical

file: nodes.property_extractor.concentration.F90
Description: Contains a module which implements a concentration output analysis property extractor class.
Code lines: 148
Modules used: virial_density_contrast

function: concentrationconstructorinternal
Description: Internal constructor for the "concentration" output analysis property extractor class.
Code lines: 9
Contained by: file nodes.property_extractor.concentration.F90
Modules used: input_parameters

function: concentrationconstructorparameters
Description: Constructor for the "concentration" output analysis property extractor class which takes a parameter set as input.
Code lines: 13
Contained by: file nodes.property_extractor.concentration.F90
Modules used: input_parameters

function: concentrationdescription
Description: Return a description of the concentration property.
Code lines: 9
Contained by: file nodes.property_extractor.concentration.F90

subroutine: concentrationdestructor
Description: Destructor for the concentration output analysis property extractor class.
Code lines: 7
Contained by: file nodes.property_extractor.concentration.F90

function: concentrationextract
Description: Implement a concentration output analysis.
Code lines: 18
Contained by: file nodes.property_extractor.concentration.F90
Modules used: dark_matter_profile_mass_definitions galacticus_nodes

function: concentrationname
Description: Return the name of the concentration property.
Code lines: 9
Contained by: file nodes.property_extractor.concentration.F90

function: concentrationtype
Description: Return the type of the concentration property.

Code lines: 9
Contained by: file nodes.property_extractor.concentration.F90
Modules used: output_analyses_options

function: concentrationunitsinsi
Description: Return the units of the concentration property in the SI system.
Code lines: 8
Contained by: file nodes.property_extractor.concentration.F90

interface: nodepropertyextractorconcentration
Description: Constructors for the "concentration" output analysis class.
Code lines: 4
Contained by: file nodes.property_extractor.concentration.F90

file: nodes.property_extractor.cooling_radius.F90
Description: Contains a module which implements a radiusCooling property extractor class.
Code lines: 137
Modules used: cooling_radii

interface: nodepropertyextractorradiuscooling
Description: Constructors for the "radiusCooling" output analysis class.
Code lines: 4
Contained by: file nodes.property_extractor.cooling_radius.F90

function: radiuscoolingconstructorinternal
Description: Internal constructor for the radiusCooling property extractor class.
Code lines: 8
Contained by: file nodes.property_extractor.cooling_radius.F90

function: radiuscoolingconstructorparameters
Description: Constructor for the radiusCooling property extractor class which takes a parameter set as input.
Code lines: 13
Contained by: file nodes.property_extractor.cooling_radius.F90
Modules used: input_parameters

function: radiuscoolingdescription
Description: Return a description of the cooling radius property.
Code lines: 9
Contained by: file nodes.property_extractor.cooling_radius.F90

subroutine: radiuscoolingdestructor
Description: Destructor for the radiusCooling property extractor class.
Code lines: 7
Contained by: file nodes.property_extractor.cooling_radius.F90

function: radiuscoolingextract
Description: Implement a cooling radius property extractor.
Code lines: 10

Contained by: file nodes.property_extractor.cooling_radius.F90

function: radiuscoolingname
Description: Return the name of the cooling radius property.
Code lines: 9
Contained by: file nodes.property_extractor.cooling_radius.F90

function: radiuscoolingtype
Description: Return the type of the last isolated redshift property.
Code lines: 9
Contained by: file nodes.property_extractor.cooling_radius.F90
Modules used: output_analyses_options

function: radiuscoolingunitsinsi
Description: Return the units of the cooling radius property in the SI system.
Code lines: 9
Contained by: file nodes.property_extractor.cooling_radius.F90
Modules used: numerical_constants_astronomical

file: nodes.property_extractor.cooling_rate.F90
Description: Contains a module which implements a cooling rate property extractor class.
Code lines: 138
Modules used: cooling_rates

interface: nodepropertyextractorratecooling
Description: Constructors for the "rateCooling" output analysis class.
Code lines: 4
Contained by: file nodes.property_extractor.cooling_rate.F90

function: ratecoolingconstructorinternal
Description: Internal constructor for the rateCooling property extractor class.
Code lines: 8
Contained by: file nodes.property_extractor.cooling_rate.F90

function: ratecoolingconstructorparameters
Description: Constructor for the rateCooling property extractor class which takes a parameter set as input.
Code lines: 13
Contained by: file nodes.property_extractor.cooling_rate.F90
Modules used: input_parameters

function: ratecoolingdescription
Description: Return a description of the rateCooling property.
Code lines: 9
Contained by: file nodes.property_extractor.cooling_rate.F90

subroutine: ratecoolingdestructor
Description: Destructor for the rateCooling property extractor class.
Code lines: 7

Contained by: file nodes.property_extractor.cooling_rate.F90

function: ratecoolingextract
Description: Implement a last isolated redshift output analysis.
Code lines: 11
Contained by: file nodes.property_extractor.cooling_rate.F90
Modules used: galacticus_nodes

function: ratecoolingname
Description: Return the name of the last isolated redshift property.
Code lines: 9
Contained by: file nodes.property_extractor.cooling_rate.F90

function: ratecoolingtype
Description: Return the type of the last isolated redshift property.
Code lines: 9
Contained by: file nodes.property_extractor.cooling_rate.F90
Modules used: output_analyses_options

function: ratecoolingunitsinsi
Description: Return the units of the last isolated redshift property in the SI system.
Code lines: 9
Contained by: file nodes.property_extractor.cooling_rate.F90
Modules used: numerical_constants_astronomical

file: nodes.property_extractor.density.F90
Description: Contains a module which implements a property extractor class for the density at a set of radii.
Code lines: 241
Modules used: dark_matter_halo_scales galactic_structure_radii_definitions

function: densityprofileconstructorinternal
Description: Internal constructor for the densityProfile property extractor class.
Code lines: 19
Contained by: file nodes.property_extractor.density.F90
Modules used: galactic_structure_radii_definitions

function: densityprofileconstructorparameters
Description: Constructor for the densityProfile property extractor class which takes a parameter set as input.
Code lines: 31
Contained by: file nodes.property_extractor.density.F90
Modules used: input_parameters

function: densityprofiledescriptions
Description: Return descriptions of the densityProfile property.
Code lines: 15
Contained by: file nodes.property_extractor.density.F90

subroutine: densityprofiledestructor
Description: Destructor for the densityProfile property extractor class.
Code lines: 7
Contained by: file nodes.property_extractor.density.F90

function: densityprofileelementcount
Description: Return the number of elements in the densityProfile property extractors.
Code lines: 9
Contained by: file nodes.property_extractor.density.F90

function: densityprofileextract
Description: Implement a densityProfile property extractor.
Code lines: 50
Contained by: file nodes.property_extractor.density.F90
Modules used: galactic_structure_densities, galactic_structure_enclosed_masses, galactic_structure_options, galactic_structure_radii_definitions, galacticus_nodes

function: densityprofilenames
Description: Return the names of the densityProfile properties.
Code lines: 15
Contained by: file nodes.property_extractor.density.F90

function: densityprofiletype
Description: Return the type of the densityProfile properties.
Code lines: 9
Contained by: file nodes.property_extractor.density.F90

Description: Constructors for the "densityContrasts" output analysis class.
Code lines: 4
Contained by: file nodes.property_extractor.density_contrasts.F90

file: nodes.property_extractor.descendents.F90
Description: Contains a module which implements an ISM mass output analysis property extractor class.
Code lines: 190
Modules used: output_times

function: descendentsconstructorinternal
Description: Internal constructor for the descendents node property extractor class.
Code lines: 8
Contained by: file nodes.property_extractor.descendents.F90

function: descendentsconstructorparameters
Description: Constructor for the descendents node property extractor class which takes a parameter set as input.
Code lines: 13
Contained by: file nodes.property_extractor.descendents.F90
Modules used: input_parameters

function: descendentsdescription
Description: Return a description of the descendents property.
Code lines: 9
Contained by: file nodes.property_extractor.descendents.F90

subroutine: descendentsdestructor
Description: Destructor for the descendents property extractor class.
Code lines: 7
Contained by: file nodes.property_extractor.descendents.F90

function: descendentsextract
Description: Implement a descendents node property extractor.
Code lines: 76
Contained by: file nodes.property_extractor.descendents.F90
Modules used: galacticus_nodes

function: descendentsname
Description: Return the name of the descendents property.

Code lines: 9
Contained by: file nodes.property_extractor.descendents.F90

function: descendentstype
Description: Return the type of the stellar mass property.
Code lines: 9
Contained by: file nodes.property_extractor.descendents.F90
Modules used: output_analyses_options

interface: nodepropertyextractordescendents
Description: Constructors for the "descendents" output analysis class.
Code lines: 4
Contained by: file nodes.property_extractor.descendents.F90

file: nodes.property_extractor.final_descendent.F90
Description: Contains a module which implements an ISM mass output analysis property extractor class.
Code lines: 111

function: finaldescendentconstructorparameters
Description: Constructor for the finalDescendent node property extractor class which takes a parameter set as input.
Code lines: 10
Contained by: file nodes.property_extractor.final_descendent.F90
Modules used: input_parameters

function: finaldescendentdescription
Description: Return a description of the finalDescendent property.
Code lines: 9
Contained by: file nodes.property_extractor.final_descendent.F90

function: finaldescendentextract
Description: Implement a finalDescendent node property extractor.
Code lines: 21
Contained by: file nodes.property_extractor.final_descendent.F90

function: finaldescendentname
Description: Return the name of the finalDescendent property.
Code lines: 9
Contained by: file nodes.property_extractor.final_descendent.F90

function: finaldescendenttype
Description: Return the type of the stellar mass property.
Code lines: 9
Contained by: file nodes.property_extractor.final_descendent.F90
Modules used: output_analyses_options

interface: nodepropertyextractorfinaldescendent
Description: Constructors for the "finalDescendent" output analysis class.
Code lines: 3

Contained by: file nodes.property_extractor.final_descendent.F90

file: nodes.property_extractor.half_light_properties.F90
Description: Contains a module which implements a half-light radii property extractor class.
Code lines: 157

interface: nodepropertyextractorradiihalflightproperties
Description: Constructors for the "radiiHalfLightProperties" output analysis class.
Code lines: 3
Contained by: file nodes.property_extractor.half_light_properties.F90

function: radiihalflightpropertiesconstructorparameters
Description: Constructor for the radiiHalfLightProperties property extractor class which takes a parameter set as input.
Code lines: 10
Contained by: file nodes.property_extractor.half_light_properties.F90
Modules used: input_parameters

function: radiihalflightpropertiesdescriptions
Description: Return descriptions of the radiiHalfLightProperties property extractor class.
Code lines: 15
Contained by: file nodes.property_extractor.half_light_properties.F90
Modules used: stellar_luminosities_structure

function: radiihalflightpropertieselementcount
Description: Return the number of elements in the radiiHalfLightProperties property extractor class.
Code lines: 10
Contained by: file nodes.property_extractor.half_light_properties.F90
Modules used: stellar_luminosities_structure

function: radiihalflightpropertiesextract
Description: Implement a radiiHalfLightProperties property extractor.
Code lines: 26
Contained by: file nodes.property_extractor.half_light_properties.F90
Modules used: galactic_structure_enclosed_masses galactic_structure_options stellar_luminosities_structure

function: radiihalflightpropertiesnames
Description: Return the names of the radiiHalfLightProperties properties.
Code lines: 15
Contained by: file nodes.property_extractor.half_light_properties.F90
Modules used: stellar_luminosities_structure

function: radiihalflightpropertiestype
Description: Return the type of the last isolated redshift property.
Code lines: 9
Contained by: file nodes.property_extractor.half_light_properties.F90
Modules used: output_analyses_options

function: `radiihalflightpropertiesunitsinsi`
Description: Return the units of the last isolated redshift property in the SI system.

Contained by: file `nodes.property_extractor.half_mass_radius.F90`

Modules used: numerical_constants_astronomical

file: nodes.property_extractor.halo_bias.F90
Description: Contains a module which implements an ISM mass output analysis property extractor class.
Code lines: 140
Modules used: dark_matter_halo_biases

function: halobiasconstructorinternal
Description: Internal constructor for the haloBias node property extractor class.
Code lines: 8
Contained by: file nodes.property_extractor.halo_bias.F90

function: halobiasconstructorparameters
Description: Constructor for the haloBias node property extractor class which takes a parameter set as input.
Code lines: 13
Contained by: file nodes.property_extractor.halo_bias.F90
Modules used: input_parameters

function: halobiasdescription
Description: Return a description of the haloBias property.
Code lines: 9
Contained by: file nodes.property_extractor.halo_bias.F90

subroutine: halobiasdestructor
Description: Destructor for the haloBias property extractor class.
Code lines: 7
Contained by: file nodes.property_extractor.halo_bias.F90

function: halobiasextract
Description: Implement a haloBias node property extractor.
Code lines: 15
Contained by: file nodes.property_extractor.halo_bias.F90

function: halobiasname
Description: Return the name of the haloBias property.
Code lines: 9
Contained by: file nodes.property_extractor.halo_bias.F90

function: halobiastype
Description: Return the type of the stellar mass property.
Code lines: 9
Contained by: file nodes.property_extractor.halo_bias.F90
Modules used: output_analyses_options

function: halobiasunitsinsi
Description: Return the units of the haloBias property in the SI system.
Code lines: 8
Contained by: file nodes.property_extractor.halo_bias.F90

interface: `nodepropertyextractorhalobias`
Description: Constructors for the "haloBias" output analysis class.
Code lines: 4
Contained by: file nodes.property_extractor.halo_bias.F90

file: `nodes.property_extractor.halo_environment.F90`
Description: Contains a module which implements a node property extractor class for halo environment.
Code lines: 157
Modules used: cosmological_density_field

function: `haloenvironmentconstructorinternal`
Description: Internal constructor for the `haloEnvironment` output analysis property extractor class.
Code lines: 8
Contained by: file nodes.property_extractor.halo_environment.F90

function: `haloenvironmentconstructorparameters`
Description: Constructor for the `haloEnvironment` node property extractor class which takes a parameter set as input.
Code lines: 13
Contained by: file nodes.property_extractor.halo_environment.F90
Modules used: input_parameters

function: `haloenvironmentdescriptions`
Description: Return a description of the `haloEnvironment` property.
Code lines: 11
Contained by: file nodes.property_extractor.halo_environment.F90

subroutine: `haloenvironmentdestructor`
Description: Destructor for the `haloEnvironment` output analysis property extractor class.
Code lines: 7
Contained by: file nodes.property_extractor.halo_environment.F90

function: `haloenvironmentelementcount`
Description: Return the number of elements in the `haloEnvironment` property extractor.
Code lines: 9
Contained by: file nodes.property_extractor.halo_environment.F90

function: `haloenvironmentextract`
Description: Implement extraction of halo environment properties.
Code lines: 13
Contained by: file nodes.property_extractor.halo_environment.F90

function: `haloenvironmentnames`
Description: Return the name of the `haloEnvironment` property.
Code lines: 11
Contained by: file nodes.property_extractor.halo_environment.F90

function: `haloenvironmenttype`
Description: Return the type of the `haloEnvironment` property.

Code lines: 9
Contained by: file nodes.property_extractor.halo_environment.F90
Modules used: output_analyses_options

function: haloenvironmentunitsinsi
Description: Return the units of the haloEnvironment property in the SI system.
Code lines: 11
Contained by: file nodes.property_extractor.halo_environment.F90

interface: nodepropertyextractorhaloenvironment
Description: Constructors for the "haloEnvironment" output analysis class.
Code lines: 4
Contained by: file nodes.property_extractor.halo_environment.F90

file: nodes.property_extractor.host_mass.F90
Description: Contains a module which implements a massHost property extractor class.
Code lines: 118

function: masshostconstructorparameters
Description: Constructor for the massHost property extractor class which takes a parameter set as input.
Code lines: 10
Contained by: file nodes.property_extractor.host_mass.F90
Modules used: input_parameters

function: masshostdescription
Description: Return a description of the host halo mass property.
Code lines: 9
Contained by: file nodes.property_extractor.host_mass.F90

function: masshostextract
Description: Implement a last isolated redshift output analysis.
Code lines: 19
Contained by: file nodes.property_extractor.host_mass.F90
Modules used: galacticus_nodes

function: masshostname
Description: Return the name of the host halo mass property.
Code lines: 9
Contained by: file nodes.property_extractor.host_mass.F90

function: masshosttype
Description: Return the type of the last isolated redshift property.
Code lines: 9
Contained by: file nodes.property_extractor.host_mass.F90
Modules used: output_analyses_options

function: masshostunitsinsi
Description: Return the units of the host halo mass in the SI system.
Code lines: 9

Contained by: file nodes.property_extractor.host_mass.F90
Modules used: numerical_constants_astronomical

interface: nodepropertyextractormasshost
Description: Constructors for the "massHost" output analysis class.
Code lines: 3
Contained by: file nodes.property_extractor.host_mass.F90

file: nodes.property_extractor.hosts.F90
Description: Contains a module which implements an ISM mass output analysis property extractor class.
Code lines: 132

function: indiceshostconstructorinternal
Description: Internal constructor for the indicesHost node property extractor class.
Code lines: 8
Contained by: file nodes.property_extractor.hosts.F90

function: indiceshostconstructorparameters
Description: Constructor for the indicesHost node property extractor class which takes a parameter set as input.
Code lines: 19
Contained by: file nodes.property_extractor.hosts.F90
Modules used: input_parameters

function: indiceshostdescription
Description: Return a description of the indicesHost property.
Code lines: 9
Contained by: file nodes.property_extractor.hosts.F90

function: indiceshostextract
Description: Implement a indicesHost node property extractor.
Code lines: 23
Contained by: file nodes.property_extractor.hosts.F90

function: indiceshostname
Description: Return the name of the indicesHost property.
Code lines: 9
Contained by: file nodes.property_extractor.hosts.F90

function: indiceshosttype
Description: Return the type of the stellar mass property.
Code lines: 9
Contained by: file nodes.property_extractor.hosts.F90
Modules used: output_analyses_options

interface: nodepropertyextractorindiceshost
Description: Constructors for the "indicesHost" output analysis class.
Code lines: 4
Contained by: file nodes.property_extractor.hosts.F90

file: `nodes.property_extractor.hot_mode_accretion_fraction.F90`
Description: Contains a module which implements a hot mode accretion fraction rate property extractor class.
Code lines: 144
Modules used: accretion_halos

function: `fractionaccretionhotmodeconstructorinternal`
Description: Internal constructor for the `fractionAccretionHotMode` property extractor class.
Code lines: 8
Contained by: file nodes.property_extractor.hot_mode_accretion_fraction.F90

function: `fractionaccretionhotmodeconstructorparameters`
Description: Constructor for the `fractionAccretionHotMode` property extractor class which takes a parameter set as input.
Code lines: 13
Contained by: file nodes.property_extractor.hot_mode_accretion_fraction.F90
Modules used: input_parameters

function: `fractionaccretionhotmodedescription`
Description: Return a description of the `fractionAccretionHotMode` property.
Code lines: 9
Contained by: file nodes.property_extractor.hot_mode_accretion_fraction.F90

subroutine: `fractionaccretionhotmodedestructor`
Description: Destructor for the `fractionAccretionHotMode` property extractor class.
Code lines: 7
Contained by: file nodes.property_extractor.hot_mode_accretion_fraction.F90

function: `fractionaccretionhotmodeextract`
Description: Implement a `fractionAccretionHotMode` property extractor.
Code lines: 18
Contained by: file nodes.property_extractor.hot_mode_accretion_fraction.F90
Modules used: accretion_halos

function: `fractionaccretionhotmodename`
Description: Return the name of the `fractionAccretionHotMode` property.
Code lines: 9
Contained by: file nodes.property_extractor.hot_mode_accretion_fraction.F90

function: `fractionaccretionhotmodetype`
Description: Return the type of the `fractionAccretionHotMode` property.
Code lines: 9
Contained by: file nodes.property_extractor.hot_mode_accretion_fraction.F90
Modules used: output_analyses_options

function: `fractionaccretionhotmodeunitsinsi`
Description: Return the units of the `fractionAccretionHotMode` property in the SI system.
Code lines: 8
Contained by: file nodes.property_extractor.hot_mode_accretion_fraction.F90

interface: `nodepropertyextractorfractionaccretionhotmode`
Description: Constructors for the `fractionAccretionHotMode` output analysis class.
Code lines: 4
Contained by: file nodes.property_extractor.hot_mode_accretion_fraction.F90

file: `nodes.property_extractor.integer_scalar.F90`
Code lines: 97
Modules used: kind_numbers

function: `integerscalarunitsinsi`
Description: Interface for integerScalar property units.
Code lines: 8
Contained by: file nodes.property_extractor.integer_scalar.F90

type: `nodepropertyextractorintegerscalar`
Description: A scalar integer node property extractor class.
Code lines: 39
Contained by: file nodes.property_extractor.integer_scalar.F90

file: `nodes.property_extractor.integer_tuple.F90`
Code lines: 113
Modules used: kind_numbers

type: `nodepropertyextractorintegertuple`
Description: A integerTuple property extractor.
Code lines: 47
Contained by: file nodes.property_extractor.integer_tuple.F90

file: `nodes.property_extractor.lightcone.F90`
Code lines: 281
Modules used: cosmology_functions geometry_lightcones iso_c_binding

subroutine: `lightconeaddinstances`
Description: Implement adding of instances to a lightcone property extractor.
Code lines: 25
Contained by: file nodes.property_extractor.lightcone.F90
Modules used: galacticus_error string_handling

function: `lightconeconstructorinternal`
Description: Internal constructor for the “lightcone” output extractor property extractor class.
Code lines: 61
Contained by: file nodes.property_extractor.lightcone.F90
Modules used: numerical_constants_astronomical numerical_constants_prefixes

function: `lightconeconstructorparameters`
Description: Constructor for the “lightcone” output extractor property extractor class which takes a parameter set as input.
Code lines: 33

Contained by: file nodes.property_extractor.lightcone.F90
Modules used: input_parameters

function: lightconedescriptions
Description: Return the descriptions of the lightconeple properties.
Code lines: 11
Contained by: file nodes.property_extractor.lightcone.F90

subroutine: lightconedestructor
Description: Destructor for the lightcone output extractor property extractor class.
Code lines: 8
Contained by: file nodes.property_extractor.lightcone.F90

function: lightconeelementcount
Description: Return the number of elements in the lightconeple property extractors.
Code lines: 9
Contained by: file nodes.property_extractor.lightcone.F90

function: lightconeextract
Description: Implement a lightcone output extractor.
Code lines: 29
Contained by: file nodes.property_extractor.lightcone.F90
Modules used: galacticus_error numerical_constants_astronomical numerical_constants_physical numerical_constants_prefixes vectors

function: lightconenames
Description: Return the names of the lightconeple properties.
Code lines: 11
Contained by: file nodes.property_extractor.lightcone.F90

function: lightconetype
Description: Return the type of the lightcone property.
Code lines: 9
Contained by: file nodes.property_extractor.lightcone.F90
Modules used: output_analyses_options

function: lightconeunitsinsi
Description: Return the units of the lightconeple properties in the SI system.
Code lines: 11
Contained by: file nodes.property_extractor.lightcone.F90

interface: nodepropertyextractorlightcone
Description: Constructors for the "lightcone" output extractor class.
Code lines: 4
Contained by: file nodes.property_extractor.lightcone.F90

file: nodes.property_extractor.luminosity_emission_line.F90
Description: Contains a module which implements a stellar mass output analysis property extractor class.

Code lines: 472
Modules used: fgsl, iso_varying_string, output_times, stellar_spectra_dust_attenuations

function: lmnstyemssnlineconstructorinternal
Description: Internal constructor for the "lmnstyEmssnLine" output analysis property extractor class.
Code lines: 76
Contained by: file nodes.property_extractor.luminosity_emission_line.F90
Modules used: galacticus_error, galacticus_paths, instruments_filters, io_hdf5, iso_c_binding, memory_management, output_times, stellar_luminosities_structure, string_handling

function: lmnstyemssnlineconstructorparameters
Description: Constructor for the "lmnstyEmssnLine" output analysis property extractor class which takes a parameter set as input.
Code lines: 34
Contained by: file nodes.property_extractor.luminosity_emission_line.F90
Modules used: input_parameters

function: lmnstyemssnlinedescription
Description: Return a description of the lmnstyEmssnLine property.
Code lines: 8
Contained by: file nodes.property_extractor.luminosity_emission_line.F90

subroutine: lmnstyemssnlinedestructor
Description: Destructor for the "lmnstyEmssnLine" output analysis property extractor class.
Code lines: 14
Contained by: file nodes.property_extractor.luminosity_emission_line.F90
Modules used: numerical_interpolation

function: lmnstyemssnlineextract
Description: Implement an emission line output analysis property extractor.
Code lines: 198
Contained by: file nodes.property_extractor.luminosity_emission_line.F90
Modules used: abundances_structure, galacticus_nodes, iso_c_binding, numerical_constants_astronomical, numerical_constants_atomic, numerical_constants_physical, numerical_constants_prefixes, numerical_interpolation, stellar_luminosities_structure

function: lmnstyemssnlinename
Description: Return the name of the lmnstyEmssnLine property.
Code lines: 8
Contained by: file nodes.property_extractor.luminosity_emission_line.F90

function: lmnstyemssnlinequantity
Description: Return the class of the emission line luminosity property.

Code lines: 9
Contained by: file nodes.property_extractor.luminosity_emission_line.F90
Modules used: output_analyses_options

function: lmnstyemssnlinetype
Description: Return the type of the emission line luminosity property.
Code lines: 9
Contained by: file nodes.property_extractor.luminosity_emission_line.F90
Modules used: output_analyses_options

function: lmnstyemssnlineunitsinsi
Description: Return the units of the lmnstyEmssnLine property in the SI system.
Code lines: 9
Contained by: file nodes.property_extractor.luminosity_emission_line.F90
Modules used: numerical_constants_units

interface: nodepropertyextractorlmnstyemssnline
Description: Constructors for the "lmnstyEmssnLine" output analysis class.
Code lines: 4
Contained by: file nodes.property_extractor.luminosity_emission_line.F90

file: nodes.property_extractor.luminosity_stellar.F90
Description: Contains a module which implements a stellar mass output analysis property extractor class.
Code lines: 236
Modules used: iso_varying_string output_times

function: luminositystellarconstructorinternal
Description: Internal constructor for the "luminosityStellar" output analysis property extractor class.
Code lines: 36
Contained by: file nodes.property_extractor.luminosity_stellar.F90
Modules used: iso_c_binding memory_management
stellar_luminosities_structure

function: luminositystellarconstructorparameters
Description: Constructor for the "luminosityStellar" output analysis property extractor class which takes a parameter set as input.
Code lines: 62
Contained by: file nodes.property_extractor.luminosity_stellar.F90
Modules used: input_parameters

function: luminositystellardescription
Description: Return a description of the luminosityStellar property.
Code lines: 8
Contained by: file nodes.property_extractor.luminosity_stellar.F90

subroutine: luminositystellardestructor
Description: Destructor for the "luminosityStellar" output analysis property extractor class.
Code lines: 8
Contained by: file nodes.property_extractor.luminosity_stellar.F90

Modules used: memory_management

function: luminositystellarextract
Description: Implement a stellar luminosity output analysis property extractor.
Code lines: 18
Contained by: file nodes.property_extractor.luminosity_stellar.F90
Modules used: galactic_structure_enclosed_masses galactic_structure_options galacticus_nodes iso_c_binding

function: luminositystellarname
Description: Return the name of the luminosityStellar property.
Code lines: 8
Contained by: file nodes.property_extractor.luminosity_stellar.F90

function: luminositystellarquantity
Description: Return the class of the stellar luminosity property.
Code lines: 9
Contained by: file nodes.property_extractor.luminosity_stellar.F90
Modules used: output_analyses_options

function: luminositystellartype
Description: Return the type of the stellar luminosity property.
Code lines: 9
Contained by: file nodes.property_extractor.luminosity_stellar.F90
Modules used: output_analyses_options

function: luminositystellarunitsinsi
Description: Return the units of the luminosityStellar property in the SI system.
Code lines: 9
Contained by: file nodes.property_extractor.luminosity_stellar.F90
Modules used: numerical_constants_astronomical

interface: nodepropertyextractorluminositystellar
Description: Constructors for the "luminosityStellar" output analysis class.
Code lines: 4
Contained by: file nodes.property_extractor.luminosity_stellar.F90

file: nodes.property_extractor.luminosity_stellar.dust.CharlotFall2000.F90
Description: Contains a module which implements a stellar luminosity output analysis property extractor class which applies the dust model of Charlot and Fall [2000].
Code lines: 292
Modules used: iso_varying_string output_times

function: lmnstystllrcf2000description
Description: Return a description of the lmnstyStllrCF2000 property.
Code lines: 8
Contained by: file nodes.property_extractor.luminosity_stellar.dust.CharlotFall2000.F90

function: lmnstystllrcf2000name

Description: Return the name of the lmnstyStllrCF2000 property.
Code lines: 8
Contained by: file nodes.property_extractor.luminosity_stellar.dust.CharlotFall2000.F90

function: `lmnstystllrcf2000unitsinsi`
Description: Return the units of the lmnstyStllrCF2000 property in the SI system.
Code lines: 9
Contained by: file nodes.property_extractor.luminosity_stellar.dust.CharlotFall2000.F90
Modules used: numerical_constants_astronomical

function: `lmnstystllrchrltfll2000constructorinternal`
Description: Internal constructor for the "lmnstyStllrChrltFll2000" output analysis property extractor class.
Code lines: 39
Contained by: file nodes.property_extractor.luminosity_stellar.dust.CharlotFall2000.F90
Modules used: instruments_filters, iso_c_binding, memory_management, stellar_luminosities_structure

function: `lmnstystllrchrltfll2000constructorparameters`
Description: Constructor for the "lmnstyStllrChrltFll2000" output analysis property extractor class which takes a parameter set as input.
Code lines: 68
Contained by: file nodes.property_extractor.luminosity_stellar.dust.CharlotFall2000.F90
Modules used: input_parameters

subroutine: `lmnstystllrchrltfll2000destructor`
Description: Destructor for the `lmnstyStllrChrltFll2000` output analysis property extractor class.
Code lines: 7
Contained by: file nodes.property_extractor.luminosity_stellar.dust.CharlotFall2000.F90

function: `lmnstystllrchrltfll2000extract`
Description: Implement a stellar luminosity output analysis property extractor.
Code lines: 66
Contained by: file nodes.property_extractor.luminosity_stellar.dust.CharlotFall2000.F90
Modules used: abundances_structure, galacticus_nodes, iso_c_binding, numerical_constants_astronomical, numerical_constants_atomic, numerical_constants_math, numerical_constants_prefixes, stellar_luminosities_structure

function: `lmnstystllrchrltfll2000quantity`
Description: Return the class of the stellar luminosity property.
Code lines: 9
Contained by: file nodes.property_extractor.luminosity_stellar.dust.CharlotFall2000.F90
Modules used: output_analyses_options

function: `lmnstystllrchrltfll2000type`
Description: Return the type of the stellar luminosity property.
Code lines: 9
Contained by: file nodes.property_extractor.luminosity_stellar.dust.CharlotFall2000.F90

Modules used: output_analyses_options

interface: nodepropertyextractorlmnstystllrcf2000
Description: Constructors for the "lmnstyStllrChrltFll2000" output analysis class.
Code lines: 4
Contained by: file nodes.property_extractor.luminosity_stellar.dust.CharlotFall2000.F90

file: nodes.property_extractor.main_branch.F90
Description: Contains a module which implements an ISM mass output analysis property extractor class.
Code lines: 103

function: mainbranchstatusconstructorparameters
Description: Constructor for the mainBranchStatus node property extractor class which takes a parameter set as input.
Code lines: 10
Contained by: file nodes.property_extractor.main_branch.F90
Modules used: input_parameters

function: mainbranchstatusdescription
Description: Return a description of the mainBranchStatus property.
Code lines: 9
Contained by: file nodes.property_extractor.main_branch.F90

function: mainbranchstatusextract
Description: Implement a mainBranchStatus node property extractor.
Code lines: 16
Contained by: file nodes.property_extractor.main_branch.F90

function: mainbranchstatusname
Description: Return the name of the mainBranchStatus property.
Code lines: 9
Contained by: file nodes.property_extractor.main_branch.F90

function: mainbranchstatustype
Description: Return the type of the stellar mass property.
Code lines: 9
Contained by: file nodes.property_extractor.main_branch.F90
Modules used: output_analyses_options

interface: nodepropertyextractormainbranchstatus
Description: Constructors for the "mainBranchStatus" output analysis class.
Code lines: 3
Contained by: file nodes.property_extractor.main_branch.F90

file: nodes.property_extractor.mass_ISM.F90
Description: Contains a module which implements an ISM mass output analysis property extractor class.
Code lines: 123

function: massismconstructorparameters

Description: Constructor for the "massISM" output analysis property extractor class which takes a parameter set as input.
Code lines: 10
Contained by: file nodes.property_extractor.mass_ISM.F90
Modules used: input_parameters

function: massismdescription
Description: Return a description of the massISM property.
Code lines: 9
Contained by: file nodes.property_extractor.mass_ISM.F90

function: massismextract
Description: Implement a massISM output analysis.
Code lines: 12
Contained by: file nodes.property_extractor.mass_ISM.F90
Modules used: galactic_structure_enclosed_masses galactic_structure_options

function: massismname
Description: Return the name of the massISM property.
Code lines: 9
Contained by: file nodes.property_extractor.mass_ISM.F90

function: massismquantity
Description: Return the class of the stellar luminosity property.
Code lines: 9
Contained by: file nodes.property_extractor.mass_ISM.F90
Modules used: output_analyses_options

function: massismtype
Description: Return the type of the stellar mass property.
Code lines: 9
Contained by: file nodes.property_extractor.mass_ISM.F90
Modules used: output_analyses_options

function: massismunitsinsi
Description: Return the units of the massISM property in the SI system.
Code lines: 9
Contained by: file nodes.property_extractor.mass_ISM.F90
Modules used: numerical_constants_astronomical

interface: nodepropertyextractormassism
Description: Constructors for the "massISM" output analysis class.
Code lines: 3
Contained by: file nodes.property_extractor.mass_ISM.F90

file: nodes.property_extractor.mass_black_hole.F90
Description: Contains a module which implements a black hole mass output analysis property extractor class.
Code lines: 126

function: `massblackholeconstructorparameters`
Description: Constructor for the "massBlackHole" output analysis property extractor class which takes a parameter set as input.
Code lines: 10
Contained by: file `nodes.property_extractor.mass_black_hole.F90`
Modules used: `input_parameters`

function: `massblackholedescription`
Description: Return a description of the massBlackHole property.
Code lines: 9
Contained by: file `nodes.property_extractor.mass_black_hole.F90`

function: `massblackholeextract`
Description: Implement a massBlackHole output analysis.
Code lines: 15
Contained by: file `nodes.property_extractor.mass_black_hole.F90`
Modules used: `galactic_structure_enclosed_masses` `galactic_structure_options` `galacticus_nodes`

function: `massblackholename`
Description: Return the name of the massBlackHole property.
Code lines: 9
Contained by: file `nodes.property_extractor.mass_black_hole.F90`

function: `massblackholequantity`
Description: Return the class of the stellar luminosity property.
Code lines: 9
Contained by: file `nodes.property_extractor.mass_black_hole.F90`
Modules used: `output_analyses_options`

function: `massblackholetype`
Description: Return the type of the stellar mass property.
Code lines: 9
Contained by: file `nodes.property_extractor.mass_black_hole.F90`
Modules used: `output_analyses_options`

function: `massblackholeunitsinsi`
Description: Return the units of the massBlackHole property in the SI system.
Code lines: 9
Contained by: file `nodes.property_extractor.mass_black_hole.F90`
Modules used: `numerical_constants_astronomical`

interface: `nodepropertyextractormassblackhole`
Description: Constructors for the "massBlackHole" output analysis class.
Code lines: 3
Contained by: file `nodes.property_extractor.mass_black_hole.F90`

file: `nodes.property_extractor.mass_halo.F90`

Description: Contains a module which implements a halo mass output analysis property extractor class.
Code lines: 144
Modules used: virial_density_contrast

function: masshaloconstructorinternal
Description: Internal constructor for the "massHalo" output analysis property extractor class.
Code lines: 9
Contained by: file nodes.property_extractor.mass_halo.F90
Modules used: input_parameters

function: masshaloconstructorparameters
Description: Constructor for the "massHalo" output analysis property extractor class which takes a parameter set as input.
Code lines: 13
Contained by: file nodes.property_extractor.mass_halo.F90
Modules used: input_parameters

function: masshalodescription
Description: Return a description of the massHalo property.
Code lines: 9
Contained by: file nodes.property_extractor.mass_halo.F90

subroutine: masshalodestructor
Description: Destructor for the mass output analysis property extractor class.
Code lines: 7
Contained by: file nodes.property_extractor.mass_halo.F90

function: masshaloextract
Description: Implement a massHalo output analysis.
Code lines: 14
Contained by: file nodes.property_extractor.mass_halo.F90
Modules used: dark_matter_profile_mass_definitions galacticus_nodes

function: masshaloname
Description: Return the name of the massHalo property.
Code lines: 9
Contained by: file nodes.property_extractor.mass_halo.F90

function: masshalotype
Description: Return the type of the halo mass property.
Code lines: 9
Contained by: file nodes.property_extractor.mass_halo.F90
Modules used: output_analyses_options

function: masshalounitsinsi
Description: Return the units of the massHalo property in the SI system.
Code lines: 9
Contained by: file nodes.property_extractor.mass_halo.F90
Modules used: numerical_constants_astronomical

interface: `nodepropertyextractormasshalo`
Description: Constructors for the "massHalo" output analysis class.
Code lines: 4
Contained by: file `nodes.property_extractor.mass_halo.F90`

file: `nodes.property_extractor.mass_profile.F90`
Description: Contains a module which implements a property extractor class for the mass enclosed by a set of radii.
Code lines: 173

function: `massprofileconstructorinternal`
Description: Internal constructor for the `massProfile` property extractor class.
Code lines: 10
Contained by: file `nodes.property_extractor.mass_profile.F90`
Modules used: `galactic_structure_options`

function: `massprofileconstructorparameters`
Description: Constructor for the `massProfile` property extractor class which takes a parameter set as input.
Code lines: 19
Contained by: file `nodes.property_extractor.mass_profile.F90`
Modules used: `input_parameters`

function: `massprofiledescriptions`
Description: Return descriptions of the `massProfile` property.
Code lines: 16
Contained by: file `nodes.property_extractor.mass_profile.F90`

function: `massprofileelementcount`
Description: Return the number of elements in the `massProfile` property extractors.
Code lines: 9
Contained by: file `nodes.property_extractor.mass_profile.F90`

function: `massprofileextract`
Description: Implement a last isolated redshift output analysis.
Code lines: 18
Contained by: file `nodes.property_extractor.mass_profile.F90`
Modules used: `galactic_structure_enclosed_masses` `galactic_structure_options`

function: `massprofilenames`
Description: Return the names of the `massProfile` properties.
Code lines: 16
Contained by: file `nodes.property_extractor.mass_profile.F90`

function: `massprofiletype`
Description: Return the type of the `massProfile` properties.
Code lines: 9
Contained by: file `nodes.property_extractor.mass_profile.F90`

Modules used: output_analyses_options

function: massprofileunitsinsi
Description: Return the units of the massProfile properties in the SI system.
Code lines: 15
Contained by: file nodes.property_extractor.mass_profile.F90
Modules used: numerical_constants_astronomical

interface: nodepropertyextractormassprofile
Description: Constructors for the "massProfile" output analysis class.
Code lines: 4
Contained by: file nodes.property_extractor.mass_profile.F90

file: nodes.property_extractor.mass_stellar.F90
Description: Contains a module which implements a stellar mass output analysis property extractor class.
Code lines: 123

function: massstellarconstructorparameters
Description: Constructor for the "massStellar" output analysis property extractor class which takes a parameter set as input.
Code lines: 10
Contained by: file nodes.property_extractor.mass_stellar.F90
Modules used: input_parameters

function: massstellardescription
Description: Return a description of the massStellar property.
Code lines: 9
Contained by: file nodes.property_extractor.mass_stellar.F90

function: massstellarextract
Description: Implement a massStellar output analysis.
Code lines: 12
Contained by: file nodes.property_extractor.mass_stellar.F90
Modules used: galactic_structure_enclosed_masses galactic_structure_options

function: massstellarname
Description: Return the name of the massStellar property.
Code lines: 9
Contained by: file nodes.property_extractor.mass_stellar.F90

function: massstellarquantity
Description: Return the class of the stellar luminosity property.
Code lines: 9
Contained by: file nodes.property_extractor.mass_stellar.F90
Modules used: output_analyses_options

function: massstellartype
Description: Return the type of the stellar mass property.
Code lines: 9

Contained by: file nodes.property_extractor.mass_stellar.F90
Modules used: output_analyses_options

function: massstellarunitsinsi
Description: Return the units of the massStellar property in the SI system.
Code lines: 9
Contained by: file nodes.property_extractor.mass_stellar.F90
Modules used: numerical_constants_astronomical

interface: nodepropertyextractormassstellar
Description: Constructors for the "massStellar" output analysis class.
Code lines: 3
Contained by: file nodes.property_extractor.mass_stellar.F90

file: nodes.property_extractor.mass_stellar_morphology.F90
Description: Contains a module which implements a stellar mass-weighted morphology output analysis property extractor class.
Code lines: 117

function: massstellarmorphologyconstructorparameters
Description: Constructor for the "massStellarMorphology" output analysis property extractor class which takes a parameter set as input.
Code lines: 10
Contained by: file nodes.property_extractor.mass_stellar_morphology.F90
Modules used: input_parameters

function: massstellarmorphologydescription
Description: Return a description of the massStellarMorphology property.
Code lines: 9
Contained by: file nodes.property_extractor.mass_stellar_morphology.F90

function: massstellarmorphologyextract
Description: Implement a stellar mass-weighted morphology output analysis.
Code lines: 19
Contained by: file nodes.property_extractor.mass_stellar_morphology.F90
Modules used: galactic_structure_enclosed_masses galactic_structure_options

function: massstellarmorphologyname
Description: Return the name of the massStellarMorphology property.
Code lines: 9
Contained by: file nodes.property_extractor.mass_stellar_morphology.F90

function: massstellarmorphologytype
Description: Return the type of the stellar mass-weighted morphology property.
Code lines: 9
Contained by: file nodes.property_extractor.mass_stellar_morphology.F90
Modules used: output_analyses_options

function: massstellarmorphologyunitsinsi

Description: Return the units of the massStellarMorphology property in the SI system.
Code lines: 8
Contained by: file nodes.property_extractor.mass_stellar_morphology.F90

interface: `nodepropertyextractormassstellarmorphology`
Description: Constructors for the "massStellarMorphology" output analysis class.
Code lines: 3
Contained by: file nodes.property_extractor.mass_stellar_morphology.F90

file: `nodes.property_extractor.mass_stellar_spheroid.F90`
Description: Contains a module which implements a spheroid stellar mass output analysis property extractor class.
Code lines: 123

function: `massstellarspheroidconstructorparameters`
Description: Constructor for the "massStellarSpheroid" output analysis property extractor class which takes a parameter set as input.
Code lines: 10
Contained by: file nodes.property_extractor.mass_stellar_spheroid.F90
Modules used: input_parameters

function: `massstellarspheroiddescription`
Description: Return a description of the massStellarSpheroid property.
Code lines: 9
Contained by: file nodes.property_extractor.mass_stellar_spheroid.F90

function: `massstellarspheroidextract`
Description: Implement a stellar mass-weighted morphology output analysis.
Code lines: 12
Contained by: file nodes.property_extractor.mass_stellar_spheroid.F90
Modules used: galactic_structure_enclosed_masses galactic_structure_options

function: `massstellarspheroidname`
Description: Return the name of the massStellarSpheroid property.
Code lines: 9
Contained by: file nodes.property_extractor.mass_stellar_spheroid.F90

function: `massstellarspheroidquantity`
Description: Return the class of the stellar luminosity property.
Code lines: 9
Contained by: file nodes.property_extractor.mass_stellar_spheroid.F90
Modules used: output_analyses_options

function: `massstellarspheroidtype`
Description: Return the type of the stellar mass-weighted morphology property.
Code lines: 9
Contained by: file nodes.property_extractor.mass_stellar_spheroid.F90
Modules used: output_analyses_options

function: `massstellarspheroidunitsinsi`
Description: Return the units of the massStellarSpheroid property in the SI system.
Code lines: 9
Contained by: file `nodes.property_extractor.mass_stellar_spheroid.F90`
Modules used: `numerical_constants_astronomical`

interface: `nodepropertyextractormassstellarspheroid`
Description: Constructors for the "massStellarSpheroid" output analysis class.
Code lines: 3
Contained by: file `nodes.property_extractor.mass_stellar_spheroid.F90`

file: `nodes.property_extractor.metallicity_ISM.F90`
Description: Contains a module which implements an ISM metallicity output analysis property extractor class.
Code lines: 153

function: `metallicityismconstructorinternal`
Description: Internal constructor for the "metallicityISM" output analysis property extractor class.
Code lines: 8
Contained by: file `nodes.property_extractor.metallicity_ISM.F90`

function: `metallicityismconstructorparameters`
Description: Constructor for the "metallicityISM" output analysis property extractor class which takes a parameter set as input.
Code lines: 21
Contained by: file `nodes.property_extractor.metallicity_ISM.F90`
Modules used: `abundances_structure` `input_parameters`

function: `metallicityismdescription`
Description: Return a description of the metallicityISM property.
Code lines: 10
Contained by: file `nodes.property_extractor.metallicity_ISM.F90`
Modules used: `abundances_structure`

function: `metallicityismextract`
Description: Extracts the metallicity (defined as the mass ratio of a specified element to hydrogen) in the ISM.
Code lines: 30
Contained by: file `nodes.property_extractor.metallicity_ISM.F90`
Modules used: `abundances_structure` `galacticus_nodes`

function: `metallicityismname`
Description: Return the name of the metallicityISM property.
Code lines: 10
Contained by: file `nodes.property_extractor.metallicity_ISM.F90`
Modules used: `abundances_structure`

function: `metallicityismtype`

Description: Return the type of the stellar mass property.
Code lines: 9
Contained by: file nodes.property_extractor.metallicity_ISM.F90
Modules used: output_analyses_options

function: metallicityismunitsinsi
Description: Return the units of the metallicityISM property in the SI system.
Code lines: 8
Contained by: file nodes.property_extractor.metallicity_ISM.F90

interface: nodepropertyextractormetallicityism
Description: Constructors for the "metallicityISM" output analysis class.
Code lines: 4
Contained by: file nodes.property_extractor.metallicity_ISM.F90

file: nodes.property_extractor.most_massive_progenitor.F90
Description: Contains a module which implements an ISM mass output analysis property extractor class.
Code lines: 144

function: mostmassiveprogenitorconstructorinternal
Description: Internal constructor for the mostMassiveProgenitor node property extractor class.
Code lines: 9
Contained by: file nodes.property_extractor.most_massive_progenitor.F90

function: mostmassiveprogenitorconstructorparameters
Description: Constructor for the mostMassiveProgenitor node property extractor class which takes a parameter set as input.
Code lines: 10
Contained by: file nodes.property_extractor.most_massive_progenitor.F90
Modules used: input_parameters

function: mostmassiveprogenitordescription
Description: Return a description of the mostMassiveProgenitor property.
Code lines: 9
Contained by: file nodes.property_extractor.most_massive_progenitor.F90

function: mostmassiveprogenitorextract
Description: Implement a mostMassiveProgenitor node property extractor.
Code lines: 43
Contained by: file nodes.property_extractor.most_massive_progenitor.F90
Modules used: galacticus_nodes merger_tree_walkers

function: mostmassiveprogenitorname
Description: Return the name of the mostMassiveProgenitor property.
Code lines: 9
Contained by: file nodes.property_extractor.most_massive_progenitor.F90

function: mostmassiveprogenitortype
Description: Return the type of the stellar mass property.

Code lines: 9
Contained by: file nodes.property_extractor.most_massive_progenitor.F90
Modules used: output_analyses_options

interface: nodepropertyextractormostmassiveprogenitor
Description: Constructors for the "mostMassiveProgenitor" output analysis class.
Code lines: 4
Contained by: file nodes.property_extractor.most_massive_progenitor.F90

file: nodes.property_extractor.multi.F90
Description: Contains a module which implements a multi node property extractor class.
Code lines: 474

subroutine: multiaddinstances
Description: Implement adding of instances to a multi output extractor.
Code lines: 14
Contained by: file nodes.property_extractor.multi.F90

function: multiconstructorinternal
Description: Internal constructor for the "multi" output extractor property extractor class.
Code lines: 14
Contained by: file nodes.property_extractor.multi.F90

function: multiconstructorparameters
Description: Constructor for the "multi" output extractor property extractor class which takes a parameter set as input.
Code lines: 22
Contained by: file nodes.property_extractor.multi.F90
Modules used: input_parameters

subroutine: multideepcopy
Description: Perform a deep copy for the multi extractor class.
Code lines: 32
Contained by: file nodes.property_extractor.multi.F90
Modules used: galacticus_error

function: multidescriptions
Description: Return the descriptions of the multiple properties.
Code lines: 44
Contained by: file nodes.property_extractor.multi.F90
Modules used: galacticus_error

subroutine: multidestructor
Description: Destructor for the multi output extractor property extractor class.
Code lines: 16
Contained by: file nodes.property_extractor.multi.F90

function: multielementcount
Description: Return the number of elements in the multiple property extractors.

Code lines: 27
Contained by: file nodes.property_extractor.multi.F90
Modules used: galacticus_error

function: multiextractdouble
Description: Implement a multi output extractor.
Code lines: 35
Contained by: file nodes.property_extractor.multi.F90
Modules used: galacticus_error

function: multiextractinteger
Description: Implement a multi output extractor.
Code lines: 35
Contained by: file nodes.property_extractor.multi.F90
Modules used: galacticus_error

type: multiextractorlist
Code lines: 3
Contained by: file nodes.property_extractor.multi.F90

function: multinames
Description: Return the names of the multiple properties.
Code lines: 44
Contained by: file nodes.property_extractor.multi.F90
Modules used: galacticus_error

function: multitype
Description: Return the type of the multi property.
Code lines: 9
Contained by: file nodes.property_extractor.multi.F90
Modules used: output_analyses_options

function: multiunitsinsi
Description: Return the units of the multiple properties in the SI system.
Code lines: 44
Contained by: file nodes.property_extractor.multi.F90
Modules used: galacticus_error

interface: nodepropertyextractormulti
Description: Constructors for the "multi" output extractor class.
Code lines: 4
Contained by: file nodes.property_extractor.multi.F90

file: nodes.property_extractor.node_indices.F90
Description: Contains a module which implements a property extractor for basic node indices.
Code lines: 136

function: nodeindicesconstructorparameters
Description: Constructor for the nodeIndices property extractor class which takes a parameter set as input.

Code lines: 10
Contained by: file nodes.property_extractor.node_indices.F90
Modules used: input_parameters

function: nodeindicesdescriptions
Description: Return descriptions of the nodeIndices properties.
Code lines: 11
Contained by: file nodes.property_extractor.node_indices.F90

function: nodeindiceselementcount
Description: Return the number of elements in the nodeIndices property extractors.
Code lines: 9
Contained by: file nodes.property_extractor.node_indices.F90

function: nodeindicesextract
Description: Implement a nodeIndices property extractor.
Code lines: 19
Contained by: file nodes.property_extractor.node_indices.F90

function: nodeindicesnames
Description: Return the names of the nodeIndices properties.
Code lines: 11
Contained by: file nodes.property_extractor.node_indices.F90

function: nodeindicestype
Description: Return the type of the last isolated redshift property.
Code lines: 9
Contained by: file nodes.property_extractor.node_indices.F90
Modules used: output_analyses_options

function: nodeindicesunitsinsi
Description: Return the units of the last isolated redshift property in the SI system.
Code lines: 11
Contained by: file nodes.property_extractor.node_indices.F90

interface: nodepropertyextractornodeindices
Description: Constructors for the "nodeIndices" output analysis class.
Code lines: 3
Contained by: file nodes.property_extractor.node_indices.F90

file: nodes.property_extractor.null.F90
Description: Contains a module which implements a null output analysis class.
Code lines: 60

interface: nodepropertyextractornull
Description: Constructors for the "null" output analysis class.
Code lines: 3
Contained by: file nodes.property_extractor.null.F90

function: `nullconstructorparameters`
Description: Constructor for the "null" output analysis property extractor class which takes a parameter set as input.
Code lines: 10
Contained by: file `nodes.property_extractor.null.F90`
Modules used: `input_parameters`

function: `nulltype`
Description: Return the type of the null property.
Code lines: 9
Contained by: file `nodes.property_extractor.null.F90`
Modules used: `output_analyses_options`

file: `nodes.property_extractor.projected_density.F90`
Description: Contains a module which implements a property extractor class for the projected density at a set of radii.
Code lines: 268
Modules used: `dark_matter_halo_scales` `galactic_structure_radii_definitions`

interface: `nodepropertyextractorprojecteddensity`
Description: Constructors for the "projectedDensity" output analysis class.
Code lines: 4
Contained by: file `nodes.property_extractor.projected_density.F90`

function: `projecteddensityconstructorinternal`
Description: Internal constructor for the `projectedDensity` property extractor class.
Code lines: 19
Contained by: file `nodes.property_extractor.projected_density.F90`
Modules used: `galactic_structure_radii_definitions`

function: `projecteddensityconstructorparameters`
Description: Constructor for the `projectedDensity` property extractor class which takes a parameter set as input.
Code lines: 31
Contained by: file `nodes.property_extractor.projected_density.F90`
Modules used: `input_parameters`

function: `projecteddensitydescriptions`
Description: Return descriptions of the `projectedDensity` property.
Code lines: 15
Contained by: file `nodes.property_extractor.projected_density.F90`

subroutine: `projecteddensitydestructor`
Description: Destructor for the `projectedDensity` property extractor class.
Code lines: 7
Contained by: file `nodes.property_extractor.projected_density.F90`

function: `projecteddensityelementcount`

Description: Return the number of elements in the `projectedDensity` property extractors.
Code lines: 9
Contained by: file nodes.property_extractor.projected_density.F90

function: `projecteddensityextract`
Description: Implement a `projectedDensity` property extractor.
Code lines: 73
Contained by: file nodes.property_extractor.projected_density.F90
Modules used: fgsl, galactic_structure_densities, galactic_structure_enclosed_masses, galactic_structure_options, galactic_structure_radii_definitions, galacticus_nodes, numerical_integration

function: `projecteddensityintegrand`
Description: Integrand function used for computing projected densities.
Code lines: 12
Contained by: function projecteddensityextract
Modules used: galactic_structure_densities

function: `projecteddensitynames`
Description: Return the names of the `projectedDensity` properties.
Code lines: 15
Contained by: file nodes.property_extractor.projected_density.F90

function: `projecteddensitytype`
Description: Return the type of the `projectedDensity` properties.
Code lines: 9
Contained by: file nodes.property_extractor.projected_density.F90
Modules used: output_analyses_options

function: `projecteddensityunitsinsi`
Description: Return the units of the `projectedDensity` properties in the SI system.
Code lines: 16
Contained by: file nodes.property_extractor.projected_density.F90
Modules used: numerical_constants_astronomical

file: `nodes.property_extractor.radius_half_mass.F90`
Description: Contains a module which implements a half-stellar mass radius output analysis property extractor class.
Code lines: 113

function: `halfmassradiusconstructorparameters`
Description: Constructor for the "halfMassRadius" output analysis property extractor class which takes a parameter set as input.
Code lines: 11
Contained by: file nodes.property_extractor.radius_half_mass.F90
Modules used: input_parameters

function: `halfmassradiusdescription`

Description: Return a description of the halfMassRadius property.
Code lines: 9
Contained by: file nodes.property_extractor.radius_half_mass.F90

function: halfmassradiusextract
Description: Implement a half-mass output analysis.
Code lines: 12
Contained by: file nodes.property_extractor.radius_half_mass.F90
Modules used: galactic_structure_enclosed_masses galactic_structure_options

function: halfmassradiusname
Description: Return the name of the halfMassRadius property.
Code lines: 9
Contained by: file nodes.property_extractor.radius_half_mass.F90

function: halfmassradiustype
Description: Return the type of the half-mass radius property.
Code lines: 9
Contained by: file nodes.property_extractor.radius_half_mass.F90
Modules used: output_analyses_options

function: halfmassradiusunitsinsi
Description: Return the units of the halfMassRadius property in the SI system.
Code lines: 9
Contained by: file nodes.property_extractor.radius_half_mass.F90
Modules used: numerical_constants_astronomical

interface: nodepropertyextractorhalfmassradius
Description: Constructors for the "halfMassRadius" output analysis class.
Code lines: 3
Contained by: file nodes.property_extractor.radius_half_mass.F90

file: nodes.property_extractor.ratio.F90
Description: Contains a module which implements a ratio output analysis property extractor class.
Code lines: 185

interface: nodepropertyextractorratio
Description: Constructors for the "ratio" output analysis class.
Code lines: 4
Contained by: file nodes.property_extractor.ratio.F90

function: ratioconstructorinternal
Description: Internal constructor for the "ratio" output analysis property extractor class.
Code lines: 24
Contained by: file nodes.property_extractor.ratio.F90
Modules used: galacticus_error

function: ratioconstructorparameters
Description: Constructor for the "ratio" output analysis property extractor class which takes a parameter set as input.
Code lines: 30

Contained by: file nodes.property_extractor.ratio.F90
Modules used: input_parameters

function: ratiodescription
Description: Return the description of this property.
Code lines: 8
Contained by: file nodes.property_extractor.ratio.F90

subroutine: ratiodestructor
Description: Destructor for the "ratio" output analysis property extractor class.
Code lines: 8
Contained by: file nodes.property_extractor.ratio.F90

function: ratioextract
Description: Implement a ratio output analysis.
Code lines: 29
Contained by: file nodes.property_extractor.ratio.F90
Modules used: galacticus_error

function: rationame
Description: Return the name of this property.
Code lines: 8
Contained by: file nodes.property_extractor.ratio.F90

function: ratiotype
Description: Return the type of the ratio property.
Code lines: 9
Contained by: file nodes.property_extractor.ratio.F90
Modules used: output_analyses_options

function: ratiounitsinsi
Description: Return the description of this property.
Code lines: 7
Contained by: file nodes.property_extractor.ratio.F90

file: nodes.property_extractor.redshift.F90
Description: Contains a module which implements a redshiftLastIsolated property extractor class.
Code lines: 138
Modules used: cosmology_functions

interface: nodepropertyextractorredshiftlastisolated
Description: Constructors for the "redshiftLastIsolated" output analysis class.
Code lines: 4
Contained by: file nodes.property_extractor.redshift.F90

function: redshiftlastisolatedconstructorinternal
Description: Internal constructor for the redshiftLastIsolated property extractor class.
Code lines: 8
Contained by: file nodes.property_extractor.redshift.F90

function: `redshiftlastisolatedconstructorparameters`
Description: Constructor for the `redshiftLastIsolated` property extractor class which takes a parameter set as input.
Code lines: 13
Contained by: file `nodes.property_extractor.redshift.F90`
Modules used: `input_parameters`

function: `redshiftlastisolateddescription`
Description: Return a description of the redshiftLastIsolated property.
Code lines: 9
Contained by: file `nodes.property_extractor.redshift.F90`

subroutine: `redshiftlastisolateddestructor`
Description: Destructor for the `redshiftLastIsolated` property extractor class.
Code lines: 7
Contained by: file `nodes.property_extractor.redshift.F90`

function: `redshiftlastisolatedextract`
Description: Implement a last isolated redshift output analysis.
Code lines: 13
Contained by: file `nodes.property_extractor.redshift.F90`
Modules used: `galacticus_nodes`

function: `redshiftlastisolatedname`
Description: Return the name of the last isolated redshift property.
Code lines: 9
Contained by: file `nodes.property_extractor.redshift.F90`

function: `redshiftlastisolatedtype`
Description: Return the type of the last isolated redshift property.
Code lines: 9
Contained by: file `nodes.property_extractor.redshift.F90`
Modules used: `output_analyses_options`

function: `redshiftlastisolatedunitsinsi`
Description: Return the units of the last isolated redshift property in the SI system.
Code lines: 8
Contained by: file `nodes.property_extractor.redshift.F90`

file: `nodes.property_extractor.rotation_curve.F90`
Description: Contains a module which implements a property extractor class for the rotation curve at a set of radii.
Code lines: 242
Modules used: `dark_matter_halo_scales` `galactic_structure_radii_definitions`

interface: `nodepropertyextractorrotationcurve`
Description: Constructors for the "rotationCurve" output analysis class.
Code lines: 4
Contained by: file `nodes.property_extractor.rotation_curve.F90`

function: `rotationcurveconstructorinternal`
Description: Internal constructor for the `rotationCurve` property extractor class.
Code lines: 19
Contained by: file nodes.property_extractor.rotation_curve.F90
Modules used: galactic_structure_radii_definitions

function: `rotationcurveconstructorparameters`
Description: Constructor for the `rotationCurve` property extractor class which takes a parameter set as input.
Code lines: 31
Contained by: file nodes.property_extractor.rotation_curve.F90
Modules used: input_parameters

function: `rotationcurvedescriptions`
Description: Return descriptions of the `rotationCurve` property.
Code lines: 15
Contained by: file nodes.property_extractor.rotation_curve.F90

subroutine: `rotationcurvedestructor`
Description: Destructor for the `rotationCurve` property extractor class.
Code lines: 7
Contained by: file nodes.property_extractor.rotation_curve.F90

function: `rotationcurveelementcount`
Description: Return the number of elements in the `rotationCurve` property extractors.
Code lines: 9
Contained by: file nodes.property_extractor.rotation_curve.F90

function: `rotationcurveextract`
Description: Implement a `rotationCurve` property extractor.
Code lines: 50
Contained by: file nodes.property_extractor.rotation_curve.F90
Modules used: galactic_structure_enclosed_masses galactic_structure_options galactic_structure_radii_definitions galactic_structure_rotation_curves galacticus_nodes

function: `rotationcurvenames`
Description: Return the names of the `rotationCurve` properties.
Code lines: 15
Contained by: file nodes.property_extractor.rotation_curve.F90

function: `rotationcurvetype`
Description: Return the type of the `rotationCurve` properties.
Code lines: 9
Contained by: file nodes.property_extractor.rotation_curve.F90
Modules used: output_analyses_options

function: `rotationcurveunitsinsi`
Description: Return the units of the `rotationCurve` properties in the SI system.

Code lines: 17
Contained by: file nodes.property_extractor.rotation_curve.F90
Modules used: numerical_constants_astronomical numerical_constants_prefixes

file: nodes.property_extractor.satellite_orbital_extrema.F90
Description: Contains a module which implements satellite orbital extrema property extractor class.
Code lines: 206

interface: nodepropertyextractorsatelliteorbitalextrema
Description: Constructors for the "satelliteOrbitalExtrema" output analysis class.
Code lines: 4
Contained by: file nodes.property_extractor.satellite_orbital_extrema.F90

function: satelliteorbitalextremaconstructorinternal
Description: Internal constructor for the satelliteOrbitalExtrema property extractor class.
Code lines: 19
Contained by: file nodes.property_extractor.satellite_orbital_extrema.F90
Modules used: galacticus_error

function: satelliteorbitalextremaconstructorparameters
Description: Constructor for the satelliteOrbitalExtrema property extractor class which takes a parameter set as input.
Code lines: 27
Contained by: file nodes.property_extractor.satellite_orbital_extrema.F90
Modules used: input_parameters

function: satelliteorbitalextremadescriptions
Description: Return a description of the satelliteOrbitalExtrema property.
Code lines: 12
Contained by: file nodes.property_extractor.satellite_orbital_extrema.F90

function: satelliteorbitalextremaelementcount
Description: Return the number of elements in the satelliteOrbitalExtrema property extractor class.
Code lines: 9
Contained by: file nodes.property_extractor.satellite_orbital_extrema.F90

function: satelliteorbitalextremaextract
Description: Implement a satelliteOrbitalExtrema property extractor
Code lines: 43
Contained by: file nodes.property_extractor.satellite_orbital_extrema.F90
Modules used: galacticus_nodes kepler_orbits satellite_orbits

function: satelliteorbitalextremanames
Description: Return the name of the satelliteOrbitalExtrema property.
Code lines: 12
Contained by: file nodes.property_extractor.satellite_orbital_extrema.F90

function: satelliteorbitalextrematype
Description: Return the type of the satelliteOrbitalExtrema property.

Code lines: 9
Contained by: file nodes.property_extractor.satellite_orbital_extrema.F90
Modules used: output_analyses_options

function: satelliteorbitalextremaunitsinsi
Description: Return the units of the satelliteOrbitalExtrema property in the SI system.
Code lines: 14
Contained by: file nodes.property_extractor.satellite_orbital_extrema.F90
Modules used: numerical_constants_astronomical numerical_constants_prefixes

file: nodes.property_extractor.satellite_status.F90
Description: Contains a module which implements an ISM mass output analysis property extractor class.
Code lines: 170

interface: nodepropertyextractorsatellitestatus
Description: Constructors for the "satelliteStatus" output analysis class.
Code lines: 4
Contained by: file nodes.property_extractor.satellite_status.F90

function: satellitestatusconstructorinternal
Description: Internal constructor for the satelliteStatus node property extractor class.
Code lines: 16
Contained by: file nodes.property_extractor.satellite_status.F90
Modules used: galacticus_error galacticus_nodes

function: satellitestatusconstructorparameters
Description: Constructor for the satelliteStatus node property extractor class which takes a parameter set as input.
Code lines: 19
Contained by: file nodes.property_extractor.satellite_status.F90
Modules used: input_parameters

function: satellitestatusdescription
Description: Return a description of the satelliteStatus property.
Code lines: 9
Contained by: file nodes.property_extractor.satellite_status.F90

function: satellitestatusextract
Description: Implement a satelliteStatus node property extractor.
Code lines: 43
Contained by: file nodes.property_extractor.satellite_status.F90
Modules used: galacticus_nodes histories

function: satellitestatusname
Description: Return the name of the satelliteStatus property.
Code lines: 9
Contained by: file nodes.property_extractor.satellite_status.F90

function: satellitestatustype
Description: Return the type of the stellar mass property.

Code lines: 9
Contained by: file nodes.property_extractor.satellite_status.F90
Modules used: output_analyses_options

file: nodes.property_extractor.scalar.F90
Code lines: 89

type: nodepropertyextractorscalar
Description: A scalar output analysis class.
Code lines: 39
Contained by: file nodes.property_extractor.scalar.F90

file: nodes.property_extractor.spin_Bullock.F90
Description: Contains a module which implements a node property extractor class for the Bullock et al. [2001] definition of spin parameter.
Code lines: 188
Modules used: dark_matter_halo_scales dark_matter_profiles_dmo

interface: nodepropertyextractorspinbullock
Description: Constructors for the "spinBullock" output analysis class.
Code lines: 4
Contained by: file nodes.property_extractor.spin_Bullock.F90

function: spinbullockconstructorinternal
Description: Internal constructor for the spinBullock output analysis property extractor class.
Code lines: 16
Contained by: file nodes.property_extractor.spin_Bullock.F90
Modules used: galacticus_nodes

function: spinbullockconstructorparameters
Description: Constructor for the y output analysis property extractor class which takes a parameter set as input.
Code lines: 16
Contained by: file nodes.property_extractor.spin_Bullock.F90
Modules used: input_parameters

function: spinbullockdescriptions
Description: Return a description of the spinBullock property.
Code lines: 12
Contained by: file nodes.property_extractor.spin_Bullock.F90

subroutine: spinbullockdestructor
Description: Destructor for the spinBullock output analysis property extractor class.
Code lines: 8
Contained by: file nodes.property_extractor.spin_Bullock.F90

function: spinbullockelementcount
Description: Return the number of elements in the spinBullock property extractor.
Code lines: 9

Contained by: file nodes.property_extractor.spin_Bullock.F90

function: spinbullockextract
Description: Implement extraction of the spin parameter under the Bullock et al. [2001] defintiion.
Code lines: 26
Contained by: file nodes.property_extractor.spin_Bullock.F90
Modules used: dark_matter_halo_spins galacticus_nodes

function: spinbullocknames
Description: Return the name of the spinBullock property.
Code lines: 12
Contained by: file nodes.property_extractor.spin_Bullock.F90

function: spinbullocktype
Description: Return the type of the spinBullock property.
Code lines: 9
Contained by: file nodes.property_extractor.spin_Bullock.F90
Modules used: output_analyses_options

function: spinbullockunitsinsi
Description: Return the units of the spinBullock property in the SI system.
Code lines: 11
Contained by: file nodes.property_extractor.spin_Bullock.F90

file: nodes.property_extractor.spin_parameter.F90
Description: Contains a module which implements a spin parameter output analysis property extractor class.
Code lines: 112

interface: nodepropertyextractorspin
Description: Constructors for the "spin" output property extractor class.
Code lines: 3
Contained by: file nodes.property_extractor.spin_parameter.F90

function: spinconstructorparameters
Description: Constructor for the "spin" output analysis property extractor class which takes a parameter set as input.
Code lines: 11
Contained by: file nodes.property_extractor.spin_parameter.F90
Modules used: input_parameters

function: spindescription
Description: Return a description of the spin property.
Code lines: 9
Contained by: file nodes.property_extractor.spin_parameter.F90

function: spinextract
Description: Implement a spin output property extractor.
Code lines: 13

Contained by: file nodes.property_extractor.spin_parameter.F90
Modules used: galacticus_nodes

function: spinname
Description: Return the name of the spin property.
Code lines: 9
Contained by: file nodes.property_extractor.spin_parameter.F90

function: spintype
Description: Return the type of the spin parameter property.
Code lines: 9
Contained by: file nodes.property_extractor.spin_parameter.F90
Modules used: output_analyses_options

function: spinunitsinsi
Description: Return the units of the spin property in the SI system.
Code lines: 8
Contained by: file nodes.property_extractor.spin_parameter.F90

file: nodes.property_extractor.tree_indices.F90
Description: Contains a module which implements an ISM mass output analysis property extractor class.
Code lines: 100

function: indicestreeconstructorparameters
Description: Constructor for the indicesTree node property extractor class which takes a parameter set as input.
Code lines: 10
Contained by: file nodes.property_extractor.tree_indices.F90
Modules used: input_parameters

function: indicestreedescription
Description: Return a description of the indicesTree property.
Code lines: 9
Contained by: file nodes.property_extractor.tree_indices.F90

function: indicestreeextract
Description: Implement a indicesTree node property extractor.
Code lines: 12
Contained by: file nodes.property_extractor.tree_indices.F90

function: indicestreename
Description: Return the name of the indicesTree property.
Code lines: 9
Contained by: file nodes.property_extractor.tree_indices.F90

function: indicestreetype
Description: Return the type of the stellar mass property.
Code lines: 9
Contained by: file nodes.property_extractor.tree_indices.F90

Modules used: output_analyses_options

interface: nodepropertyextractorindicestree
Description: Constructors for the "indicesTree" output analysis class.
Code lines: 3
Contained by: file nodes.property_extractor.tree_indices.F90

file: nodes.property_extractor.tree_weight.F90
Description: Contains a module which implements a merger tree weight property extractor class.
Code lines: 109

interface: nodepropertyextractortreeweight
Description: Constructors for the "treeWeight" output analysis class.
Code lines: 3
Contained by: file nodes.property_extractor.tree_weight.F90

function: treeweightconstructorparameters
Description: Constructor for the treeWeight property extractor class which takes a parameter set as input.
Code lines: 10
Contained by: file nodes.property_extractor.tree_weight.F90
Modules used: input_parameters

function: treeweightdescription
Description: Return a description of the treeWeight property.
Code lines: 9
Contained by: file nodes.property_extractor.tree_weight.F90

function: treeweightextract
Description: Implement a last isolated redshift output analysis.
Code lines: 10
Contained by: file nodes.property_extractor.tree_weight.F90

function: treeweightname
Description: Return the name of the last isolated redshift property.
Code lines: 9
Contained by: file nodes.property_extractor.tree_weight.F90

function: treeweighttype
Description: Return the type of the last isolated redshift property.
Code lines: 9
Contained by: file nodes.property_extractor.tree_weight.F90
Modules used: output_analyses_options

function: treeweightunitsinsi
Description: Return the units of the last isolated redshift property in the SI system.
Code lines: 9
Contained by: file nodes.property_extractor.tree_weight.F90
Modules used: numerical_constants_astronomical

file: `nodes.property_extractor.tuple.F90`
Code lines: 111

type: `nodepropertyextractortuple`
Description: A tuple property extractor.
Code lines: 47
Contained by: file `nodes.property_extractor.tuple.F90`

file: `nodes.property_extractor.velocity_dispersion.F90`
Description: Contains a module which implements a property extractor class for the velocity dispersion at a set of radii.
Code lines: 543
Modules used: `dark_matter_halo_scales` `galactic_structure_radii_definitions`

interface: `nodepropertyextractorvelocitydispersion`
Description: Constructors for the "velocityDispersion" output analysis class.
Code lines: 4
Contained by: file `nodes.property_extractor.velocity_dispersion.F90`

function: `velocitydispersionconstructorinternal`
Description: Internal constructor for the `velocityDispersion` property extractor class.
Code lines: 19
Contained by: file `nodes.property_extractor.velocity_dispersion.F90`
Modules used: `galactic_structure_radii_definitions`

function: `velocitydispersionconstructorparameters`
Description: Constructor for the `velocityDispersion` property extractor class which takes a parameter set as input.
Code lines: 31
Contained by: file `nodes.property_extractor.velocity_dispersion.F90`
Modules used: `input_parameters`

function: `velocitydispersiondensityintegrand`
Description: Integrand function used for computing line-of-sight velocity dispersions.
Code lines: 12
Contained by: file `nodes.property_extractor.velocity_dispersion.F90`
Modules used: `galactic_structure_densities`

function: `velocitydispersiondescriptions`
Description: Return descriptions of the `velocityDispersion` property.
Code lines: 15
Contained by: file `nodes.property_extractor.velocity_dispersion.F90`

subroutine: `velocitydispersiondestructor`
Description: Destructor for the `velocityDispersion` property extractor class.
Code lines: 7
Contained by: file `nodes.property_extractor.velocity_dispersion.F90`

function: `velocitydispersionelementcount`

Description: Return the number of elements in the `velocityDispersion` property extractors.
Code lines: 9
Contained by: file `nodes.property_extractor.velocity_dispersion.F90`

function: `velocitydispersionextract`

Description: Implement a `velocityDispersion` property extractor.
Code lines: 133
Contained by: file `nodes.property_extractor.velocity_dispersion.F90`
Modules used: `fgsl`, `galactic_structure_enclosed_masses`, `galactic_structure_options`, `galactic_structure_radii_definitions`, `galactic_structure_velocity_dispersions`, `galacticus_nodes`, `numerical_integration`

function: `velocitydispersionlambdarintegrand1`

Description: Integrand function used for integrating the λ_R statistic of Cappellari et al. [2007]. In this case we want to evaluate

$$\int_0^r 2\pi r' \Sigma(r') \sqrt{\sigma^2(r') + V^2(r')} \mathrm{d}r', \tag{18.24}$$

where $\Sigma(r)$ is the projected surface density (in mass or light) of the galaxy at radius r, $\sigma^2(r)$ is the measured velocity dispersion and $V(r)$ the measured rotation speed. Assuming that the selected component is purely dispersion dominated with velocity dispersion $\sigma_\mathrm{s}(r)$, and that rotation is present in only the disk component with rotation curve $V_\mathrm{d}(r)$ then we can model the velocity distribution, $P(V)$, at r as the sum of a Gaussian of width $\sigma_\mathrm{s}(r)$ and normalized area $\Sigma_\mathrm{s}(r)$, and a delta function at $V_\mathrm{d}(r)$ with normalized area $\Sigma_\mathrm{d}(r)$. The measured rotation speed is then:

$$V(r) = \int_{-\infty}^{+\infty} P(V) V \mathrm{d}V \Big/ \int_{-\infty}^{+\infty} P(V) \mathrm{d}V = \frac{\Sigma_\mathrm{d}(r) V_\mathrm{d}(r)}{[\Sigma_\mathrm{d}(r) + \Sigma_\mathrm{s}(r)]}, \tag{18.25}$$

and the measured velocity dispersion is:

$$\sigma^2(r) = \int_{-\infty}^{+\infty} P(V) [V - V(r)]^2 \mathrm{d}V \Big/ \int_{-\infty}^{+\infty} P(V) \mathrm{d}V = \frac{\Sigma_\mathrm{s}(r) [\sigma_\mathrm{s}^2(r)] + \Sigma_\mathrm{d}(r) [V_\mathrm{d}(r) - V(r)]^2}{[\Sigma_\mathrm{d}(r) + \Sigma_\mathrm{s}(r)]}. \tag{18.26}$$

Code lines: 54
Contained by: file `nodes.property_extractor.velocity_dispersion.F90`
Modules used: `fgsl`, `galactic_structure_options`, `galactic_structure_rotation_curves`, `galactic_structure_surface_densities`, `numerical_constants_math`, `numerical_integration`

function: `velocitydispersionlambdarintegrand2`

Description: Integrand function used for integrating the $\lambda_{\rm R}$ statistic of Cappellari et al. [2007]. In this case we want to evaluate

$$\int_0^r 2\pi r' \Sigma(r') V(r') \mathrm{d}r', \tag{18.27}$$

where $\Sigma(r)$ is the projected surface density (in mass or light) of the galaxy at radius r, and $V(r)$ the measured rotation speed. Assuming that the selected component is purely dispersion dominated with velocity dispersion $\sigma_{\rm s}(r)$, and that rotation is present in only the disk component with rotation curve $V_{\rm d}(r)$ then we can model the velocity distribution, $P(V)$, at r as the sum of a Gaussian of width $\sigma_{\rm s}(r)$ and normalized area $\Sigma_{\rm s}(r)$, and a delta function at $V_{\rm d}(r)$ with normalized area $\Sigma_{\rm d}(r)$. The measured rotation speed is then:

$$V(r) = \int_{-\infty}^{+\infty} P(V) V \mathrm{d}V \Big/ \int_{-\infty}^{+\infty} P(V) \mathrm{d}V = \frac{\Sigma_{\rm d}(r) V_{\rm d}(r)}{[\Sigma_{\rm d}(r) + \Sigma_{\rm s}(r)]}. \tag{18.28}$$

Code lines: 17
Contained by: file nodes.property_extractor.velocity_dispersion.F90
Modules used: numerical_constants_astronomical numerical_constants_prefixes

function: velocitydispersionvelocitydensityintegrand

Description: Integrand function used for computing line-of-sight velocity dispersions. Specifically, we wish to evaluate the integral:

$$\int_{r_\mathrm{i}}^{r_\mathrm{o}} \sigma^2(r)\rho(r)\frac{r}{\sqrt{r^2-r_\mathrm{i}^2}}\mathrm{d}r, \tag{18.29}$$

where r_i is the impact parameter, r_o is an outer radius at which we assume $\rho(r_\mathrm{o})\sigma^2(r_\mathrm{o}) = 0$ (i.e. it is the radius at which we begin integrating the Jeans equation), $\rho(r)$ is density, and $\sigma(r)$ is the velocity dispersion at radius r. Assuming spherical symmetry and isotropic velocity dispersion, the Jeans equation tells us

$$\rho(r)\sigma^2(r) = \int_r^{r_\mathrm{o}} \frac{\mathrm{G}M(<r')}{r'^2}\rho(r')\mathrm{d}r', \tag{18.30}$$

where G is the gravitational constant, and $M(<r)$ is the total mass contained within radius r. Equation (18.29) can then be simplified using integration by parts to give:

$$\left[\sigma^2(r)\rho(r)\sqrt{r^2-r_\mathrm{i}^2}\right]_{r_\mathrm{i}}^{r_\mathrm{o}} + \int_{r_\mathrm{i}}^{r_\mathrm{o}} \frac{\mathrm{d}}{\mathrm{d}r}\left[\sigma^2(r)\rho(r)\right]\sqrt{r^2-r_\mathrm{i}^2}\mathrm{d}r. \tag{18.31}$$

The first term is zero at both limits (due to the constraint $\rho(r_\mathrm{o})\sigma^2(r_\mathrm{o}) = 0$ at r_o and due to $sqrtr^2 - r_\mathrm{i}^2 = 0$ at r_i), and the second term can be simplified using eqn. (18.30) to give

$$\int_{r_\mathrm{i}}^{r_\mathrm{o}} \frac{\mathrm{G}M(<r)}{r^2}\rho(r)\sqrt{r^2-r_\mathrm{i}^2}\mathrm{d}r. \tag{18.32}$$

function: triangular_shaped_cloud_integral
Description: Return the integral over a triangular shaped cloud given the fraction of the cloud length in a cell.
Code lines: 11
Contained by: module meshes

file: numerical.nearest_neighbors.F90
Description: Contains a module which wraps the ANN (Approximate Nearest Neighbor) library.
Code lines: 241

module: nearest_neighbors
Description: Wraps the ANN (Approximate Nearest Neighbor) library.
Code lines: 216
Contained by: file numerical.nearest_neighbors.F90
Modules used: iso_c_binding
Used by: file models.likelihoods.posterior_as_prior.F90; subroutine environmentaloverdensityoperate; subroutine paircountsoperate; subroutine statistics_points_correlation

interface: nearestneighbors
Code lines: 2
Contained by: module nearest_neighbors

subroutine: nearestneighborsclose
Description: Closes the ANN (Approximate Nearest Neighbor) library.
Code lines: 13
Contained by: module nearest_neighbors
Modules used: galacticus_error

function: nearestneighborsconstructor
Description: Constructs a nearest neighor search object.
Code lines: 18
Contained by: module nearest_neighbors
Modules used: galacticus_error; iso_c_binding

subroutine: nearestneighborsdestructor

Description: Destroys a nearest neighbor search object.
Code lines: 15
Contained by: module nearest_neighbors
Modules used: galacticus_error

subroutine: nearestneighborssearch
Description: Return indices and distances to the (approximate) nearest neighbors.
Code lines: 25
Contained by: module nearest_neighbors
Modules used: galacticus_error

subroutine: nearestneighborssearchfixedradius
Description: Return indices and distances to all neighbors within a given radius.
Code lines: 44
Contained by: module nearest_neighbors
Modules used: galacticus_error memory_management

file: numerical.points.F90
Description: Contains a module which provides tools for working with sets of points.
Code lines: 172

module: points
Description: Provide tools for working with sets of points.
Code lines: 150
Contained by: file numerical.points.F90
Used by: subroutine catalogprojectedcorrelationfunctionperform

subroutine: points_prune
Description: Prune a set of points.
Code lines: 21
Contained by: module points
Modules used: memory_management

subroutine: points_replicate
Description: Apply a simple translation to a set of points.
Code lines: 27
Contained by: module points
Modules used: memory_management

subroutine: points_rotate
Description: Apply a rotation to a set of points.
Code lines: 23
Contained by: module points
Modules used: vectors

subroutine: points_survey_geometry
Description: Select a set of points that lie within a given survey geometry
Code lines: 38

Contained by: module points
Modules used: galacticus_display geometry_surveys memory_management

subroutine: points_translate
Description: Apply a simple translation to a set of points.
Code lines: 24
Contained by: module points

file: numerical.random.F90
Description: Contains a module which implements pseudo-random numbers.
Code lines: 269

module: pseudo_random
Description: Implements pseudo-random numbers.
Code lines: 247
Contained by: file numerical.random.F90

file: `numerical.sort.topological.F90`
Description: Contains a module which implements topological sorting.
Code lines: 85

module: `sorting_topological`
Description: Implements topological sorting.
Code lines: 63
Contained by: file `numerical.sort.topological.F90`
Used by: program `test_sort_topological`

subroutine: `sort_topological`
Description: Topological sorting function. Based on the example from Rosetta Code. Arguments are:

`countObjects`→ the number of objects to be sorted;

`countDependencies`→ the number of dependencies;

`dependencies`→ an array of dependencies, such that `dependencies(:,1)` depends on `dependencies(:,2)`;

`order`← an array giving the order of the objects after sorting;

`countOrdered`← a count of the objects which were ordered by the sort, such that `order(1:countOrdered)` contains the ordered objects, while the remainder of `order()` contains objects that were unordered (i.e. had no dependencies).

The unordered objects are those for which no solution is available—i.e. the graph is not acyclic. So, if `order<countObjects` then one or more circular dependencies existed in the graph.

interface: abs

Code lines: 2

Contained by: module abundances_structure

interface: `abundances`
Description: Constructors for the `abundances` class.
Code lines: 3
Contained by: module `abundances_structure`

function: `abundances_abs`
Description: Return an element-by-element `abs()` on an abundances objects.
Code lines: 9
Contained by: module `abundances_structure`

function: `abundances_add`
Description: Add two abundances objects.
Code lines: 17
Contained by: module `abundances_structure`

subroutine: `abundances_allocate_elemental_values`
Description: Ensure that the `elementalValue` array in an `abundances` is allocated.
Code lines: 8
Contained by: module `abundances_structure`
Modules used: `memory_management`

function: `abundances_atomic_index`
Description: Return the atomic index for the specified entry in the abundances structure.
Code lines: 24
Contained by: module `abundances_structure`
Modules used: `galacticus_error`

subroutine: `abundances_builder`
Description: Build a `abundances` object from the given XML `abundancesDefinition`.
Code lines: 29
Contained by: module `abundances_structure`
Modules used: `fox_dom` `galacticus_error`

subroutine: `abundances_deserialize`
Description: Pack abundances from an array into an abundances structure.
Code lines: 17
Contained by: module `abundances_structure`

subroutine: `abundances_destroy`
Description: Destroy an abundances object.
Code lines: 8
Contained by: module `abundances_structure`
Modules used: `memory_management`

function: `abundances_divide`
Description: Divide an abundances object by a scalar.
Code lines: 12
Contained by: module `abundances_structure`

subroutine: `abundances_dump`
Description: Reset an abundances object.
Code lines: 23
Contained by: module `abundances_structure`
Modules used: `galacticus_display`

subroutine: `abundances_dump_raw`
Description: Dump an abundances object to binary.
Code lines: 12
Contained by: module `abundances_structure`

function: `abundances_get_metallicity`
Description: Return the metallicity of the `self` structure.
Code lines: 36
Contained by: module `abundances_structure`
Modules used: `galacticus_error`

function: `abundances_helium_mass_fraction`
Description: Returns the mass fraction of helium.
Code lines: 10
Contained by: module `abundances_structure`

function: `abundances_helium_number_fraction`
Description: Returns the mass fraction of helium.
Code lines: 13
Contained by: module `abundances_structure`

function: `abundances_hydrogen_mass_fraction`
Description: Returns the mass fraction of hydrogen.
Code lines: 11
Contained by: module `abundances_structure`

function: `abundances_hydrogen_number_fraction`
Description: Returns the number fraction of hydrogen.
Code lines: 13
Contained by: module `abundances_structure`

subroutine: `abundances_increment`
Description: Increment an abundances object.
Code lines: 12
Contained by: module `abundances_structure`

function: `abundances_index_from_name`
Description: Return the index of an element in the elements array given its name.
Code lines: 14
Contained by: module `abundances_structure`

subroutine: `abundances_initialize`

Description: Initialize the `abundanceStructure` object module. Determines which abundances are to be tracked.
Code lines: 45
Contained by: module abundances_structure
Modules used: atomic_data input_parameters memory_management

function: `abundances_is_zero`
Description: Test whether an abundances object is zero.
Code lines: 15
Contained by: module abundances_structure

subroutine: `abundances_mass_to_mass_fraction`
Description: Convert abundance masses to mass fractions by dividing by `mass` while ensuring that the fractions remain within the range 0–1.
Code lines: 15
Contained by: module abundances_structure

subroutine: `abundances_mass_to_mass_fraction_packed`
Description: Convert abundance masses to mass fractions by dividing by `mass` while ensuring that the fractions remain within the range 0–1.
Code lines: 29
Contained by: module abundances_structure

function: `abundances_max`
Description: Return an element-by-element `max()` on two abundances objects.
Code lines: 9
Contained by: module abundances_structure

function: `abundances_multiply`
Description: Multiply an abundances object by a scalar.
Code lines: 12
Contained by: module abundances_structure

function: `abundances_multiply_switched`
Description: Multiply a scalar by an abundances object.
Code lines: 9
Contained by: module abundances_structure

function: `abundances_names`
Description: Return a name for the specified entry in the abundances structure.
Code lines: 24
Contained by: module abundances_structure
Modules used: galacticus_error

function: `abundances_non_static_size_of`
Description: Return the size of any non-static components of the object.
Code lines: 13
Contained by: module abundances_structure
Modules used: iso_c_binding

subroutine: `abundances_output`
Description: Store an abundances object in the output buffers.
Code lines: 19
Contained by: module `abundances_structure`
Modules used: `multi_counters`

subroutine: `abundances_output_count`
Description: Increment the output count to account for an abundances object.
Code lines: 10
Contained by: module `abundances_structure`

subroutine: `abundances_output_names`
Description: Assign names to output buffers for an abundances object.
Code lines: 26
Contained by: module `abundances_structure`

subroutine: `abundances_post_output`
Description: Perform post-output processing of abundances objects.
Code lines: 9
Contained by: module `abundances_structure`
Modules used: `multi_counters`

function: `abundances_property_count`
Description: Return the number of properties required to track abundances. This is equal to the number of elements tracked, `elementsCount`, plus one since we always track a total metallicity.
Code lines: 10
Contained by: module `abundances_structure`

subroutine: `abundances_read_raw`
Description: Read an abundances object from binary.
Code lines: 12
Contained by: module `abundances_structure`

subroutine: `abundances_reset`
Description: Reset an abundances object.
Code lines: 11
Contained by: module `abundances_structure`

subroutine: `abundances_serialize`
Description: Pack abundances from an array into an abundances structure.
Code lines: 20
Contained by: module `abundances_structure`

subroutine: `abundances_set_metallicity`
Description: Set the metallicity of the `self` structure to `metallicity`.
Code lines: 69
Contained by: module `abundances_structure`
Modules used: `atomic_data` `galacticus_error`

subroutine: `abundances_set_to_unity`
Description: Set an abundances object to unity.
Code lines: 13
Contained by: module `abundances_structure`

function: `abundances_subtract`
Description: Subtract two abundances objects.
Code lines: 17
Contained by: module `abundances_structure`

function: `abundancesconstructorzero`
Description: A constructor for `abundances` objects which sets all content to zero.
Code lines: 8
Contained by: module `abundances_structure`

interface: `max`
Code lines: 2
Contained by: module `abundances_structure`

interface: `operator(*)`
Code lines: 2
Contained by: module `abundances_structure`

file: `objects.chemical_abundances.F90`
Description: Contains a module which defines the structure used for describing chemical abundances in Galacticus.
Code lines: 694

module: `chemical_abundances_structure`
Description: Defines the structure used for describing chemical abundances in Galacticus.
Code lines: 672

Contained by: module coordinates

type: `coordinatecylindrical`
Description: A cylindrical coordinate object class.
Code lines: 50
Contained by: module coordinates

subroutine: `coordinates_assign`
Description: Assign one coordinate object to another, automatically handling the conversion between coordinate systems.
Code lines: 16
Contained by: module coordinates

subroutine: `coordinates_assign_from`
Description: Return a 3-component vector from a `coordinate` object.
Code lines: 8
Contained by: module coordinates

subroutine: `coordinates_assign_to`
Description: Assign a 3-component vector to a `coordinate` object.
Code lines: 8
Contained by: module coordinates

subroutine: `coordinates_cartesian_from_cartesian`
Description: Create a Cartesian `coordinate` object from a Cartesian vector.
Code lines: 8
Contained by: module coordinates

subroutine: `coordinates_cartesian_set_x`
Description: Return the x-component of a Cartesian `coordinate` object.
Code lines: 8
Contained by: module coordinates

subroutine: `coordinates_cartesian_set_y`
Description: Return the y-component of a Cartesian `coordinate` object.
Code lines: 8
Contained by: module coordinates

subroutine: `coordinates_cartesian_set_z`
Description: Return the z-component of a Cartesian `coordinate` object.
Code lines: 8
Contained by: module coordinates

function: `coordinates_cartesian_to_cartesian`

Description: Return a Cartesian vector from a Cartesian `coordinate` object.
Code lines: 8
Contained by: module `coordinates`

function: `coordinates_cartesian_x`
Description: Return the x-component of a Cartesian `coordinate` object.
Code lines: 7
Contained by: module `coordinates`

function: `coordinates_cartesian_y`
Description: Return the y-component of a Cartesian `coordinate` object.
Code lines: 7
Contained by: module `coordinates`

function: `coordinates_cartesian_z`
Description: Return the z-component of a Cartesian `coordinate` object.
Code lines: 7
Contained by: module `coordinates`

subroutine: `coordinates_cylindrical_from_cartesian`
Description: Create a cylindrical `coordinate` object from a Cartesian vector.
Code lines: 12
Contained by: module `coordinates`

function: `coordinates_cylindrical_phi`
Description: Return the ϕ-component of a Cylindrical `coordinate` object.
Code lines: 7
Contained by: module `coordinates`

function: `coordinates_cylindrical_r`
Description: Return the r-component of a Cylindrical `coordinate` object.
Code lines: 7
Contained by: module `coordinates`

subroutine: `coordinates_cylindrical_set_phi`
Description: Return the ϕ-component of a Cylindrical `coordinate` object.
Code lines: 8
Contained by: module `coordinates`

subroutine: `coordinates_cylindrical_set_r`
Description: Return the r-component of a Cylindrical `coordinate` object.
Code lines: 8
Contained by: module `coordinates`

subroutine: `coordinates_cylindrical_set_z`
Description: Return the z-component of a Cylindrical `coordinate` object.
Code lines: 8
Contained by: module `coordinates`

function: `coordinates_cylindrical_to_cartesian`
Description: Return a Cartesian vector from a cylindrical `coordinate` object.
Code lines: 12
Contained by: module `coordinates`

function: `coordinates_cylindrical_z`
Description: Return the z-component of a Cylindrical `coordinate` object.
Code lines: 7
Contained by: module `coordinates`

subroutine: `coordinates_null_from`
Description: Set generic coordinate object from Cartesian point. Simply quits with an error.
Code lines: 10
Contained by: module `coordinates`
Modules used: `galacticus_error`

function: `coordinates_null_to`
Description: Convert generic coordinate object to Cartesian point. Simply quits with an error.

module stellar_population_properties

type: `history`
Description: The history object type.
Code lines: 197
Contained by: module histories

function: `history_add`
Description: Add two history objects.
Code lines: 22
Contained by: module histories
Modules used: galacticus_error

subroutine: `history_append_epoch`
Description: Append a history to a long integer history.
Code lines: 34

Contained by: module histories
Modules used: galacticus_error memory_management

subroutine: history_append_history
Description: Append a history to a long integer history.
Code lines: 31
Contained by: module histories
Modules used: galacticus_error memory_management

subroutine: history_builder
Description: Build a history object from the given XML historyDefinition.
Code lines: 11
Contained by: module histories
Modules used: fox_dom galacticus_error

subroutine: history_clone
Description: Clone a history object.
Code lines: 19
Contained by: module histories
Modules used: memory_management

subroutine: history_create
Description: Create a history object.
Code lines: 36
Contained by: module histories
Modules used: galacticus_error memory_management numerical_ranges

subroutine: history_deserialize
Description: Pack history from an array into a history structure.
Code lines: 14
Contained by: module histories
Modules used: galacticus_error

subroutine: history_destroy
Description: Destroy a history.
Code lines: 19
Contained by: module histories
Modules used: memory_management

function: history_divide
Description: Divides history data by a double precision divisor.
Code lines: 13
Contained by: module histories

subroutine: history_dump
Description: Dumps a history object.
Code lines: 24
Contained by: module histories

Modules used: galacticus_display iso_varying_string

subroutine: history_dump_raw
Description: Dumps a history object in binary.
Code lines: 14
Contained by: module histories

function: history_exists
Description: Returns true if the history has been created.
Code lines: 7
Contained by: module histories

subroutine: history_extend
Description: Extends a history to encompass the given time range.
Code lines: 123
Contained by: module histories
Modules used: galacticus_error iso_varying_string
numerical_ranges range
string_handling

subroutine: history_increment
Description: Combines the data in addHistory with that in thisHistory. This function is designed for histories that track integrated quantities (such as total mass of stars formed in a time interval for example). thisHistory will be extended if necessary to span the range of addHistory. Then, the data from addHistory will be added to that in thisHistory by finding the fraction of each timestep in addHistory that overlaps with each timestep in thisHistory and assuming that the corresponding fraction of the data value should be added to thisHistory.
Code lines: 85
Contained by: module histories
Modules used: arrays_search galacticus_error
iso_c_binding numerical_ranges

subroutine: history_interpolated_increment
Description: Adds the data in addHistory to that in thisHistory. This function is designed for histories that track instantaneous rates. The rates in addHistory are interpolated to the times in thisHistory and added to the rates in thisHistory.
Code lines: 59
Contained by: module histories
Modules used: galacticus_error iso_c_binding
numerical_interpolation

function: history_is_zero
Description: Test whether a history object is all zero.
Code lines: 10
Contained by: module histories

subroutine: history_long_integer_append_epoch
Description: Append a history to a long integer history.

Code lines: 34
Contained by: module histories

subroutine: history_long_integer_create
Description: Create a history object.
Code lines: 36
Contained by: module histories
Modules used: galacticus_error memory_management numerical_ranges

subroutine: history_long_integer_destroy
Description: Destroy a history.
Code lines: 19
Contained by: module histories
Modules used: memory_management

subroutine: history_long_integer_dump
Description: Dumps a history object.
Code lines: 24
Contained by: module histories
Modules used: galacticus_display iso_varying_string

subroutine: history_long_integer_dump_raw
Description: Dumps a history object in binary.
Code lines: 14
Contained by: module histories

function: history_long_integer_exists
Description: Returns true if the history has been created.
Code lines: 7

Contained by: module histories

function: history_long_integer_non_static_size_of
Description: Return the size of any non-static components of the object.
Code lines: 13
Contained by: module histories
Modules used: iso_c_binding

subroutine: history_long_integer_read_raw
Description: Read a history object in binary.
Code lines: 19
Contained by: module histories
Modules used: memory_management

subroutine: history_long_integer_reset
Description: Reset a history by zeroing all elements, but leaving the structure (and times) intact.
Code lines: 7
Contained by: module histories

subroutine: history_long_integer_trim
Description: Removes outdated information from "future histories" (i.e. histories that store data for future reference). Removes all but one entry prior to the given currentTime (this allows for interpolation of the history to the current time). Optionally, the remove is done only if it will remove more than minimumPointsToRemove entries (since the removal can be slow this allows for some optimization).
Code lines: 61
Contained by: module histories
Modules used: galacticus_error iso_c_binding memory_management

subroutine: history_long_integer_trim_forward
Description: Removes all points in a history after the given time. Optionally, the removed history can be returned as removedHistory.
Code lines: 44
Contained by: module histories
Modules used: arrays_search iso_c_binding memory_management

function: history_multiply
Description: Multiplies history data by a double precision multiplier.
Code lines: 13
Contained by: module histories

function: history_multiply_switched
Description: Multiply a scalar by an history object.
Code lines: 9
Contained by: module histories

function: history_non_static_size_of

Description: Return the size of any non-static components of the object.
Code lines: 13
Contained by: module histories
Modules used: iso_c_binding

subroutine: history_read_raw
Description: Read a history object in binary.
Code lines: 19
Contained by: module histories
Modules used: memory_management

subroutine: history_reset
Description: Reset a history by zeroing all elements, but leaving the structure (and times) intact.
Code lines: 7
Contained by: module histories

subroutine: history_serialize
Description: Pack history from an array into an history structure.
Code lines: 9
Contained by: module histories

function: history_serialize_count
Description: Return the number of properties required to track a history.
Code lines: 11
Contained by: module histories

subroutine: history_set_to_unity
Description: Reset a history by zeroing all elements, but leaving the structure (and times) intact.
Code lines: 7
Contained by: module histories

function: history_subtract
Description: Subtract two history objects.
Code lines: 24
Contained by: module histories
Modules used: galacticus_error

subroutine: history_timesteps
Description: Return an array of time intervals in thisHistory.
Code lines: 26
Contained by: module histories
Modules used: memory_management numerical_ranges

subroutine: history_trim

Description: Removes outdated information from "future histories" (i.e. histories that store data for future reference). Removes all but one entry prior to the given `currentTime` (this allows for interpolation of the history to the current time). Optionally, the remove is done only if it will remove more than `minimumPointsToRemove` entries (since the removal can be slow this allows for some optimization).

program tests_kepler_orbits

function: `kepler_orbits_angular_momentum`
Description: Return the angular momentum for this orbit.
Code lines: 11
Contained by: module kepler_orbits

subroutine: `kepler_orbits_angular_momentum_set`
Description: Sets the tangential velocity to the specified value.
Code lines: 10
Contained by: module kepler_orbits

function: `kepler_orbits_apocenter_radius`
Description: Return the apocenter radius for this orbit.
Code lines: 18
Contained by: module kepler_orbits

subroutine: `kepler_orbits_apocenter_radius_set`
Description: Sets the apocenter radius to the specified value.
Code lines: 10
Contained by: module kepler_orbits

subroutine: `kepler_orbits_assert_is_defined`
Description: Assert that an orbit is defined - quit with an error if it is not.
Code lines: 8
Contained by: module kepler_orbits
Modules used: galacticus_error

subroutine: `kepler_orbits_builder`
Description: Build a `keplerOrbit` object from the given XML `keplerOrbitDefinition`.
Code lines: 43
Contained by: module kepler_orbits
Modules used: fox_dom galacticus_error

subroutine: `kepler_orbits_destroy`
Description: Destroy an orbit.
Code lines: 8
Contained by: module kepler_orbits

subroutine: `kepler_orbits_dump`
Description: Reset an orbit to a null state.
Code lines: 63
Contained by: module kepler_orbits
Modules used: galacticus_display iso_varying_string

subroutine: `kepler_orbits_dump_raw`
Description: Dump a `keplerOrbit` object in binary.
Code lines: 18

Contained by: module kepler_orbits

function: kepler_orbits_eccentricity
Description: Return the eccentricity for this orbit.
Code lines: 14
Contained by: module kepler_orbits

subroutine: kepler_orbits_eccentricity_set
Description: Sets the tangential velocity to the specified value.
Code lines: 10
Contained by: module kepler_orbits

function: kepler_orbits_energy
Description: Return the energy for this orbit.
Code lines: 16
Contained by: module kepler_orbits
Modules used: numerical_constants_physical

subroutine: kepler_orbits_energy_set
Description: Sets the tangential velocity to the specified value.
Code lines: 10
Contained by: module kepler_orbits

function: kepler_orbits_epsilon
Description: Return the angle ϵ for this orbit.
Code lines: 9
Contained by: module kepler_orbits
Modules used: galacticus_error

subroutine: kepler_orbits_epsilon_set
Description: Sets the ϵ to the specified value.
Code lines: 10
Contained by: module kepler_orbits

function: kepler_orbits_host_mass
Description: Return the host mass for this orbit.
Code lines: 9
Contained by: module kepler_orbits
Modules used: galacticus_error

function: kepler_orbits_is_bound
Description: Returns true if the orbit is bound.
Code lines: 10
Contained by: module kepler_orbits

function: kepler_orbits_is_defined

Description: Returns true if the orbit is fully defined. For the orbits consider here, in which we don't care about the orientation of the orbital plane or the argument of pericenter, this requires that three orbital parameter be set (in addition to the masses of the orbitting bodies).
Code lines: 27
Contained by: module `kepler_orbits`

subroutine: `kepler_orbits_masses_set`
Description: Sets the masses of the two orbitting objects in a `keplerOrbit` object.
Code lines: 11
Contained by: module `kepler_orbits`

function: `kepler_orbits_non_static_size_of`
Description: Return the size of any non-static components of the object.
Code lines: 10
Contained by: module `kepler_orbits`
Modules used: `iso_c_binding`

subroutine: `kepler_orbits_output`
Description: Store a `keplerOrbit` object in the output buffers.
Code lines: 23
Contained by: module `kepler_orbits`
Modules used: `kind_numbers` `multi_counters`

subroutine: `kepler_orbits_output_count`
Description: Increment the output count to account for a `keplerOrbit` object.
Code lines: 10
Contained by: module `kepler_orbits`

subroutine: `kepler_orbits_output_names`
Description: Assign names to output buffers for a `keplerOrbit` object.
Code lines: 30
Contained by: module `kepler_orbits`
Modules used: `numerical_constants_astronomical`

function: `kepler_orbits_pericenter_radius`
Description: Return the pericenter radius for this orbit.
Code lines: 14
Contained by: module `kepler_orbits`

subroutine: `kepler_orbits_pericenter_radius_set`
Description: Sets the pericenter radius to the specified value.
Code lines: 10
Contained by: module `kepler_orbits`

function: `kepler_orbits_phi`
Description: Return the angle ϕ for this orbit.
Code lines: 9
Contained by: module `kepler_orbits`
Modules used: `galacticus_error`

subroutine: `kepler_orbits_phi_set`
Description: Sets the angle ϕ to the specified value.
Code lines: 10
Contained by: module `kepler_orbits`

function: `kepler_orbits_position`
Description: Return the position of the orbit in Cartesian coordinates.
Code lines: 9
Contained by: module `kepler_orbits`
Modules used: `coordinates`

subroutine: `kepler_orbits_post_output`
Description: Perform post-output processing of a `keplerOrbit` object.
Code lines: 8
Contained by: module `kepler_orbits`

subroutine: `kepler_orbits_propagate`
Description: Propagate an orbit along its path.
Code lines: 33
Contained by: module `kepler_orbits`

subroutine: `kepler_orbits_radius_set`
Description: Sets the radius to the specified value.
Code lines: 10
Contained by: module `kepler_orbits`

subroutine: `kepler_orbits_read_raw`
Description: Read a `keplerOrbit` object in binary.
Code lines: 18
Contained by: module `kepler_orbits`

subroutine: `kepler_orbits_reset`
Description: Reset an orbit to a null state.
Code lines: 17
Contained by: module `kepler_orbits`

function: `kepler_orbits_semi_major_axis`
Description: Return the semi-major axis for this orbit.
Code lines: 14
Contained by: module `kepler_orbits`

subroutine: `kepler_orbits_semi_major_axis_set`
Description: Sets the semi-major axis to the specified value.
Code lines: 10
Contained by: module `kepler_orbits`

function: `kepler_orbits_specific_reduced_mass`
Description: Return the specific reduced mass for this orbit.
Code lines: 9
Contained by: module `kepler_orbits`
Modules used: `galacticus_error`

function: `kepler_orbits_theta`
Description: Return the angle θ for this orbit.
Code lines: 9
Contained by: module `kepler_orbits`
Modules used: `galacticus_error`

subroutine: `kepler_orbits_theta_set`
Description: Sets the angle θ to the specified value.
Code lines: 10
Contained by: module `kepler_orbits`

function: `kepler_orbits_velocity`
Description: Return the position of the orbit in Cartesian coordinates.
Code lines: 18
Contained by: module `kepler_orbits`
Modules used: `coordinates` `vectors`

function: `kepler_orbits_velocity_radial`
Description: Return the radial velocity for this orbit.
Code lines: 19
Contained by: module `kepler_orbits`
Modules used: `galacticus_error`

subroutine: `kepler_orbits_velocity_radial_set`
Description: Sets the radial velocity to the specified value.
Code lines: 10
Contained by: module `kepler_orbits`

function: `kepler_orbits_velocity_scale`
Description: Return the velocity scale for the orbit.
Code lines: 12
Contained by: module `kepler_orbits`
Modules used: `galacticus_error` `numerical_constants_physical`

function: `kepler_orbits_velocity_tangential`
Description: Return the tangential velocity for this orbit.
Code lines: 24
Contained by: module `kepler_orbits`
Modules used: `galacticus_error`

subroutine: `kepler_orbits_velocity_tangential_set`

Description: Sets the tangential velocity to the specified value.
Code lines: 10
Contained by: module kepler_orbits

interface: keplerorbit
Description: Constructors for Kepler orbits.
Code lines: 3
Contained by: module kepler_orbits

Description:	Contains a module which implements an object hierarchy for nodes in merger trees and all of their constituent physical components.
Code lines:	101345

module: `galacticus_nodes`

Description: Implements an object hierarchy for nodes in merger trees and all of their constituent physical components. Defines an object class for merger trees. Defines an object class for the simulation universe. Contains custom functions for the standard basic component. Contains custom functions for the standard basic component. Contains custom functions for the simple black hole component. Contains custom functions for the standard black hole component. Contains custom functions for the standard disk component. Contains custom functions for the very simple disk component. Contains custom functions for the very simple size disk component. Contains custom functions for the bars dynamics statistics component. Contains custom functions for the Cole2000 formation times component. Contains custom functions for the cold mode hot halo component. Contains custom functions for the outflow tracking hot halo component. Contains custom functions for the standard hot halo component. Contains custom functions for the preset position component. Contains custom functions for the preset+orphans position component. Contains custom functions for the orbiting satellite component. Contains custom functions for the prest satellite component. Contains custom functions for the standard satellite component. Contains custom functions for the very simple satellite component. Contains custom functions for the standard spheroid component. Contains custom functions for the very simple spheroid component. Defines functions bound to the merger tree object class. Defines functions bound to the universe class.

subroutine: agestatisticscreatebyinterrupt

Description: Create the ageStatistics component of self via an interrupt.
Code lines: 10
Contained by: module galacticus_nodes

function: agestatisticsdiskintegratedsfr

Description: Returns the default value for the diskIntegratedSFR property for the ageStatistics component class.
Code lines: 17
Contained by: module galacticus_nodes

function: agestatisticsdiskintegratedsfrattributematch

Description: Return a text list of component implementations in the ageStatistics class that have the desired attributes for the diskIntegratedSFR property
Code lines: 28
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: agestatisticsdiskintegratedsfrisgettable

Description: Returns true if the diskIntegratedSFR property is gettable for the ageStatistics component class.

Code lines: 9
Contained by: module galacticus_nodes

subroutine: agestatisticsdiskintegratedsfrrate
Description: Accept a rate set for the diskIntegratedSFR property of the ageStatistics component class. Trigger an interrupt to create the component.
Code lines: 21
Contained by: module galacticus_nodes
Modules used: galacticus_error

function: agestatisticsdiskintegratedsfrrateget
Description: Returns a zero rate for the diskIntegratedSFR property for the ageStatistics component class.
Code lines: 13
Contained by: module galacticus_nodes

function: agestatisticsdisktimeweightedintegratedsfr
Description: Returns the default value for the diskTimeWeightedIntegratedSFR property for the ageStatistics component class.
Code lines: 17
Contained by: module galacticus_nodes

function: agestatisticsdisktimeweightedintegratedsfrattributematch
Description: Return a text list of component implementations in the ageStatistics class that have the desired attributes for the diskTimeWeightedIntegratedSFR property
Code lines: 28
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: agestatisticsdisktimeweightedintegratedsfrisgettable
Description: Returns true if the diskTimeWeightedIntegratedSFR property is gettable for the ageStatistics component class.
Code lines: 9
Contained by: module galacticus_nodes

subroutine: agestatisticsdisktimeweightedintegratedsfrrate
Description: Accept a rate set for the diskTimeWeightedIntegratedSFR property of the ageStatistics component class. Trigger an interrupt to create the component.
Code lines: 21
Contained by: module galacticus_nodes
Modules used: galacticus_error

function: agestatisticsdisktimeweightedintegratedsfrrateget
Description: Returns a zero rate for the diskTimeWeightedIntegratedSFR property for the ageStatistics component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: agestatisticsnulloutputcount
Description: Increment the count of properties to output for a null implementation of the ageStatistics component.

Code lines: 22
Contained by: module galacticus_nodes

subroutine: agestatisticsnulloutputnames
Description: Return the names of properties to output for a null implementation of the ageStatistics component.
Code lines: 39
Contained by: module galacticus_nodes

subroutine: agestatisticsoutput
Description: Populate output buffers with properties to output for a ageStatistics component.
Code lines: 40
Contained by: module galacticus_nodes
Modules used: multi_counters

subroutine: agestatisticsoutputcount
Description: Increment the count of properties to output for a generic ageStatistics component.
Code lines: 15
Contained by: module galacticus_nodes

subroutine: agestatisticsoutputnames
Description: Establish the names of properties to output for a generic ageStatistics component.
Code lines: 20
Contained by: module galacticus_nodes

subroutine: agestatisticspostoutput
Description: Perform post-output processing of a ageStatistics component.
Code lines: 14
Contained by: module galacticus_nodes

function: agestatisticsspheroidintegratedsfr
Description: Returns the default value for the spheroidIntegratedSFR property for the ageStatistics component class.
Code lines: 17
Contained by: module galacticus_nodes

function: agestatisticsspheroidintegratedsfrattributematch
Description: Return a text list of component implementations in the ageStatistics class that have the desired attributes for the spheroidIntegratedSFR property
Code lines: 28
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: agestatisticsspheroidintegratedsfrisgettable
Description: Returns true if the spheroidIntegratedSFR property is gettable for the ageStatistics component class.
Code lines: 9
Contained by: module galacticus_nodes

subroutine: agestatisticsspheroidintegratedsfrrate

Description: Accept a rate set for the `spheroidIntegratedSFR` property of the `ageStatistics` component class. Trigger an interrupt to create the component.
Code lines: 21
Contained by: module galacticus_nodes
Modules used: galacticus_error

function: `agestatisticsspheroidintegratedsfrrateget`
Description: Returns a zero rate for the `spheroidIntegratedSFR` property for the `ageStatistics` component class.
Code lines: 13
Contained by: module galacticus_nodes

function: `agestatisticsspheroidtimeweightedintegratedsfr`
Description: Returns the default value for the `spheroidTimeWeightedIntegratedSFR` property for the `ageStatistics` component class.
Code lines: 17
Contained by: module galacticus_nodes

function: `agestatisticsspheroidtimeweightedintegratedsfrattributematch`
Description: Return a text list of component implementations in the `ageStatistics` class that have the desired attributes for the `spheroidTimeWeightedIntegratedSFR` property
Code lines: 28
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: `agestatisticsspheroidtimeweightedintegratedsfrisgettable`
Description: Returns true if the `spheroidTimeWeightedIntegratedSFR` property is gettable for the `ageStatistics` component class.
Code lines: 9
Contained by: module galacticus_nodes

subroutine: `agestatisticsspheroidtimeweightedintegratedsfrrate`
Description: Accept a rate set for the `spheroidTimeWeightedIntegratedSFR` property of the `ageStatistics` component class. Trigger an interrupt to create the component.
Code lines: 21
Contained by: module galacticus_nodes
Modules used: galacticus_error

function: `agestatisticsspheroidtimeweightedintegratedsfrrateget`
Description: Returns a zero rate for the `spheroidTimeWeightedIntegratedSFR` property for the `ageStatistics` component class.
Code lines: 13
Contained by: module galacticus_nodes

function: `agestatisticsstandarddiskintegratedsfrcount`
Description: Return a count of the number of scalar properties in the `diskIntegratedSFR` property of an `standard` implementation of the `ageStatistics` component class.
Code lines: 12
Contained by: module galacticus_nodes

function: `agestatisticsstandarddiskintegratedsfrget`
Description: Get the `diskIntegratedSFR` property of an `standard` implementation of the `ageStatistics` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `agestatisticsstandarddiskintegratedsfrjcbnzr`
Description: Indicate that the `diskIntegratedSFR` property of an `standard` implementation of the `ageStatistics` component class is inactive for differential equation solving.
Code lines: 12
Contained by: module `galacticus_nodes`

subroutine: `agestatisticsstandarddiskintegratedsfrrate`
Description: Accumulate to the rate of change of the `diskIntegratedSFR` property of an `standard` implementation of the `ageStatistics` component class.
Code lines: 31
Contained by: module `galacticus_nodes`

function: `agestatisticsstandarddiskintegratedsfrrateget`
Description: Get the rate of change of the `diskIntegratedSFR` property of an `standard` implementation of the `ageStatistics` component class.
Code lines: 23
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

subroutine: `agestatisticsstandarddiskintegratedsfrscale`
Description: Set the absolute scale of the `diskIntegratedSFR` property of an `standard` implementation of the `ageStatistics` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

subroutine: `agestatisticsstandarddiskintegratedsfrset`
Description: Set the `diskIntegratedSFR` property of an `standard` implementation of the `ageStatistics` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `agestatisticsstandarddisktimeweightedintegratedsfrcount`
Description: Return a count of the number of scalar properties in the `diskTimeWeightedIntegratedSFR` property of an `standard` implementation of the `ageStatistics` component class.
Code lines: 12
Contained by: module `galacticus_nodes`

function: `agestatisticsstandarddisktimeweightedintegratedsfrget`
Description: Get the `diskTimeWeightedIntegratedSFR` property of an `standard` implementation of the `ageStatistics` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: agestatisticsstandarddisktimeweightedintegratedsfrjcbnzr
Description: Indicate that the diskTimeWeightedIntegratedSFR property of an standard implementation of the ageStatistics component class is inactive for differential equation solving.
Code lines: 12
Contained by: module galacticus_nodes

subroutine: agestatisticsstandarddisktimeweightedintegratedsfrrate
Description: Accumulate to the rate of change of the diskTimeWeightedIntegratedSFR property of an standard implementation of the ageStatistics component class.
Code lines: 31
Contained by: module galacticus_nodes

function: agestatisticsstandarddisktimeweightedintegratedsfrrateget
Description: Get the rate of change of the diskTimeWeightedIntegratedSFR property of an standard implementation of the ageStatistics component class.
Code lines: 23
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: agestatisticsstandarddisktimeweightedintegratedsfrscale
Description: Set the absolute scale of the diskTimeWeightedIntegratedSFR property of an standard implementation of the ageStatistics component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: agestatisticsstandarddisktimeweightedintegratedsfrset
Description: Set the diskTimeWeightedIntegratedSFR property of an standard implementation of the ageStatistics component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: agestatisticsstandardoutputcount
Description: Increment the count of properties to output for a standard implementation of the ageStatistics component.
Code lines: 21
Contained by: module galacticus_nodes

subroutine: agestatisticsstandardoutputnames
Description: Return the names of properties to output for a standard implementation of the ageStatistics component.
Code lines: 55
Contained by: module galacticus_nodes

function: agestatisticsstandardspheroidintegratedsfrcount
Description: Return a count of the number of scalar properties in the spheroidIntegratedSFR property of an standard implementation of the ageStatistics component class.
Code lines: 12
Contained by: module galacticus_nodes

function: `agestatisticsstandardspheroidintegratedsfrget`
Description: Get the `spheroidIntegratedSFR` property of an `standard` implementation of the `ageStatistics` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `agestatisticsstandardspheroidintegratedsfrjcbnzr`
Description: Indicate that the `spheroidIntegratedSFR` property of an `standard` implementation of the `ageStatistics` component class is inactive for differential equation solving.
Code lines: 12
Contained by: module `galacticus_nodes`

subroutine: `agestatisticsstandardspheroidintegratedsfrrate`
Description: Accumulate to the rate of change of the `spheroidIntegratedSFR` property of an `standard` implementation of the `ageStatistics` component class.
Code lines: 31
Contained by: module `galacticus_nodes`

function: `agestatisticsstandardspheroidintegratedsfrrateget`
Description: Get the rate of change of the `spheroidIntegratedSFR` property of an `standard` implementation of the `ageStatistics` component class.
Code lines: 23
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

subroutine: `agestatisticsstandardspheroidintegratedsfrscale`
Description: Set the absolute scale of the `spheroidIntegratedSFR` property of an `standard` implementation of the `ageStatistics` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

subroutine: `agestatisticsstandardspheroidintegratedsfrset`
Description: Set the `spheroidIntegratedSFR` property of an `standard` implementation of the `ageStatistics` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `agestatisticsstandardspheroidtimeweightedintegratedsfrcount`
Description: Return a count of the number of scalar properties in the `spheroidTimeWeightedIntegratedSFR` property of an `standard` implementation of the `ageStatistics` component class.
Code lines: 12
Contained by: module `galacticus_nodes`

function: `agestatisticsstandardspheroidtimeweightedintegratedsfrget`
Description: Get the `spheroidTimeWeightedIntegratedSFR` property of an `standard` implementation of the `ageStatistics` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: agestatisticsstandardspheroidtimeweightedintegratedsfrjcbnzr
Description: Indicate that the spheroidTimeWeightedIntegratedSFR property of an standard implementation of the ageStatistics component class is inactive for differential equation solving.
Code lines: 12
Contained by: module galacticus_nodes

subroutine: agestatisticsstandardspheroidtimeweightedintegratedsfrrate
Description: Accumulate to the rate of change of the spheroidTimeWeightedIntegratedSFR property of an standard implementation of the ageStatistics component class.
Code lines: 31
Contained by: module galacticus_nodes

function: agestatisticsstandardspheroidtimeweightedintegratedsfrrateget
Description: Get the rate of change of the spheroidTimeWeightedIntegratedSFR property of an standard implementation of the ageStatistics component class.
Code lines: 23
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: agestatisticsstandardspheroidtimeweightedintegratedsfrscale
Description: Set the absolute scale of the spheroidTimeWeightedIntegratedSFR property of an standard implementation of the ageStatistics component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: agestatisticsstandardspheroidtimeweightedintegratedsfrset
Description: Set the spheroidTimeWeightedIntegratedSFR property of an standard implementation of the ageStatistics component class.
Code lines: 10
Contained by: module galacticus_nodes

function: basicaccretionrate
Description: Returns the default value for the accretionRate property for the basic component class.
Code lines: 13
Contained by: module galacticus_nodes

function: basicaccretionrateattributematch
Description: Return a text list of component implementations in the basic class that have the desired attributes for the accretionRate property
Code lines: 63
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: basicaccretionratebertschinger
Description: Returns the default value for the accretionRateBertschinger property for the basic component class.
Code lines: 13
Contained by: module galacticus_nodes

function: `basicaccretionratebertschingerattributematch`
Description: Return a text list of component implementations in the `basic` class that have the desired attributes for the `accretionRateBertschinger` property
Code lines: 41
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

function: `basicaccretionratebertschingerisgettable`
Description: Returns true if the `accretionRateBertschinger` property is gettable for the `basic` component class.
Code lines: 8
Contained by: module `galacticus_nodes`

function: `basicaccretionratebertschingerrateget`
Description: Returns a zero rate for the `accretionRateBertschinger` property for the `basic` component class.
Code lines: 13

function: `basicmassisgettable`
Description: Returns true if the `mass` property is gettable for the `basic` component class.
Code lines: 8
Contained by: module `galacticus_nodes`

function: `basicmassmaximum`
Description: Returns the default value for the `massMaximum` property for the `basic` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `basicmassmaximumattributematch`
Description: Return a text list of component implementations in the `basic` class that have the desired attributes for the `massMaximum` property
Code lines: 41
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

function: `basicmassmaximumisgettable`
Description: Returns true if the `massMaximum` property is gettable for the `basic` component class.
Code lines: 8
Contained by: module `galacticus_nodes`

function: `basicmassmaximumrateget`
Description: Returns a zero rate for the `massMaximum` property for the `basic` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `basicmassrateget`
Description: Returns a zero rate for the `mass` property for the `basic` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `basicmasstarget`
Description: Returns the default value for the `massTarget` property for the `basic` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `basicmasstargetattributematch`
Description: Return a text list of component implementations in the `basic` class that have the desired attributes for the `massTarget` property
Code lines: 63
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

function: `basicmasstargetisgettable`
Description: Returns true if the `massTarget` property is gettable for the `basic` component class.
Code lines: 8
Contained by: module `galacticus_nodes`

function: `basicmasstargetrateget`
Description: Returns a zero rate for the `massTarget` property for the `basic` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `basicnonevolvingmassget`
Description: Get the `mass` property of an `nonEvolving` implementation of the `basic` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `basicnonevolvingmassset`
Description: Set the `mass` property of an `nonEvolving` implementation of the `basic` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `basicnonevolvingoutputcount`
Description: Increment the count of properties to output for a `nonEvolving` implementation of the `basic` component.
Code lines: 21
Contained by: module `galacticus_nodes`

subroutine: `basicnonevolvingoutputnames`
Description: Return the names of properties to output for a `nonEvolving` implementation of the `basic` component.
Code lines: 43
Contained by: module `galacticus_nodes`

function: `basicnonevolvingtimecount`
Description: Return a count of the number of scalar properties in the `time` property of an `nonEvolving` implementation of the `basic` component class.
Code lines: 12
Contained by: module `galacticus_nodes`

function: `basicnonevolvingtimeget`
Description: Get the `time` property of an `nonEvolving` implementation of the `basic` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `basicnonevolvingtimejcbnzr`
Description: Indicate that the `time` property of an `nonEvolving` implementation of the `basic` component class is inactive for differential equation solving.
Code lines: 12
Contained by: module `galacticus_nodes`

function: `basicnonevolvingtimelastisolated`
Description: Return the `timeLastIsolated` property of the `Basic` component class.
Code lines: 16
Contained by: module `galacticus_nodes`

subroutine: `basicnonevolvingtimelastisolatedset`
Description: Set the `timeLastIsolated` property of an `nonEvolving` implementation of the `basic` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `basicnonevolvingtimerate`
Description: Accumulate to the rate of change of the `time` property of an `nonEvolving` implementation of the `basic` component class.
Code lines: 31
Contained by: module `galacticus_nodes`

function: `basicnonevolvingtimerateget`
Description: Get the rate of change of the `time` property of an `nonEvolving` implementation of the `basic` component class.
Code lines: 23
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

subroutine: `basicnonevolvingtimescale`
Description: Set the absolute scale of the `time` property of an `nonEvolving` implementation of the `basic` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

subroutine: `basicnonevolvingtimeset`
Description: Set the `time` property of an `nonEvolving` implementation of the `basic` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `basicnulloutputcount`
Description: Increment the count of properties to output for a `null` implementation of the `basic` component.
Code lines: 22
Contained by: module `galacticus_nodes`

subroutine: `basicnulloutputnames`
Description: Return the names of properties to output for a `null` implementation of the `basic` component.
Code lines: 39
Contained by: module `galacticus_nodes`

subroutine: `basicoutput`
Description: Populate output buffers with properties to output for a `basic` component.
Code lines: 46
Contained by: module `galacticus_nodes`
Modules used: `multi_counters`

subroutine: `basicoutputcount`
Description: Increment the count of properties to output for a generic `basic` component.
Code lines: 15
Contained by: module `galacticus_nodes`

subroutine: `basicoutputnames`
Description: Establish the names of properties to output for a generic `basic` component.

Code lines: 20
Contained by: module galacticus_nodes

subroutine: basicpostoutput
Description: Perform post-output processing of a basic component.
Code lines: 14
Contained by: module galacticus_nodes

function: basicradiusturnaround
Description: Returns the default value for the radiusTurnaround property for the basic component class.
Code lines: 17
Contained by: module galacticus_nodes

function: basicradiusturnaroundattributematch
Description: Return a text list of component implementations in the basic class that have the desired attributes for the radiusTurnaround property
Code lines: 37
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: basicradiusturnaroundgrowthrate
Description: Returns the default value for the radiusTurnaroundGrowthRate property for the basic component class.
Code lines: 17
Contained by: module galacticus_nodes

function: basicradiusturnaroundgrowthrateattributematch
Description: Return a text list of component implementations in the basic class that have the desired attributes for the radiusTurnaroundGrowthRate property
Code lines: 41
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: basicradiusturnaroundgrowthrateisgettable
Description: Returns true if the radiusTurnaroundGrowthRate property is gettable for the basic component class.
Code lines: 9
Contained by: module galacticus_nodes

function: basicradiusturnaroundgrowthraterateget
Description: Returns a zero rate for the radiusTurnaroundGrowthRate property for the basic component class.
Code lines: 13
Contained by: module galacticus_nodes

function: basicradiusturnaroundisgettable
Description: Returns true if the radiusTurnaround property is gettable for the basic component class.
Code lines: 9
Contained by: module galacticus_nodes

function: `basicradiusturnaroundrateget`
Description: Returns a zero rate for the `radiusTurnaround` property for the `basic` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `basicstandardaccretionrateget`
Description: Get the `accretionRate` property of an `standard` implementation of the `basic` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `basicstandardaccretionrateset`
Description: Set the `accretionRate` property of an `standard` implementation of the `basic` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `basicstandardextendedaccretionratebertschingerget`
Description: Get the `accretionRateBertschinger` property of an `standardExtended` implementation of the `basic` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `basicstandardextendedaccretionratebertschingerset`
Description: Set the `accretionRateBertschinger` property of an `standardExtended` implementation of the `basic` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `basicstandardextendedmassbertschingercount`
Description: Return a count of the number of scalar properties in the `massBertschinger` property of an `standardExtended` implementation of the `basic` component class.
Code lines: 12
Contained by: module `galacticus_nodes`

function: `basicstandardextendedmassbertschingerget`
Description: Get the value of the `massBertschinger` property of the `standardExtended` implementation of the `basic` component using a deferred function.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `basicstandardextendedmassbertschingergetfunction`
Description: Set the function to be used for the `get` method of the `massBertschinger` property of the `BasicStandardExtended` component.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `basicstandardextendedmassbertschingergetisattached`
Description: Return true if the deferred function used to get the `massBertschinger` property of the `BasicStandardExtended` component class has been attached.

Code lines: 8
Contained by: module galacticus_nodes

function: basicstandardextendedmassbertschingergetvalue
Description: Get the massBertschinger property of an standardExtended implementation of the basic component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: basicstandardextendedmassbertschingerjcbnzr
Description: Indicate that the massBertschinger property of an standardExtended implementation of the basic component class is inactive for differential equation solving.
Code lines: 12
Contained by: module galacticus_nodes

subroutine: basicstandardextendedmassbertschingerrate
Description: Accumulate to the rate of change of the massBertschinger property of an standardExtended implementation of the basic component class.
Code lines: 31
Contained by: module galacticus_nodes

function: basicstandardextendedmassbertschingerrateget
Description: Get the rate of change of the massBertschinger property of an standardExtended implementation of the basic component class.
Code lines: 23
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: basicstandardextendedmassbertschingerscale
Description: Set the absolute scale of the massBertschinger property of an standardExtended implementation of the basic component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: basicstandardextendedmassbertschingerset
Description: Set the massBertschinger property of an standardExtended implementation of the basic component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: basicstandardextendedoutputcount
Description: Increment the count of properties to output for a standardExtended implementation of the basic component.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: basicstandardextendedoutputnames
Description: Return the names of properties to output for a standardExtended implementation of the basic component.
Code lines: 23
Contained by: module galacticus_nodes

subroutine: `basicstandardextendedpostoutput`
Description: Perform post-output processing for a `standardExtended` implementation of the `basic` component.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `basicstandardextendedradiusturnaroundcount`
Description: Return a count of the number of scalar properties in the `radiusTurnaround` property of an `standardExtended` implementation of the `basic` component class.
Code lines: 12
Contained by: module `galacticus_nodes`

function: `basicstandardextendedradiusturnaroundget`
Description: Get the value of the `radiusTurnaround` property of the `standardExtended` implementation of the `basic` component using a deferred function.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `basicstandardextendedradiusturnaroundgetfunction`
Description: Set the function to be used for the `get` method of the `radiusTurnaround` property of the `BasicStandardExtended` component.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `basicstandardextendedradiusturnaroundgetisattached`
Description: Return true if the deferred function used to get the `radiusTurnaround` property of the `BasicStandardExtended` component class has been attached.
Code lines: 8
Contained by: module `galacticus_nodes`

function: `basicstandardextendedradiusturnaroundgetvalue`
Description: Get the `radiusTurnaround` property of an `standardExtended` implementation of the `basic` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `basicstandardextendedradiusturnaroundgrowthrateget`
Description: Get the `radiusTurnaroundGrowthRate` property of an `standardExtended` implementation of the `basic` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `basicstandardextendedradiusturnaroundgrowthrateset`
Description: Set the `radiusTurnaroundGrowthRate` property of an `standardExtended` implementation of the `basic` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `basicstandardextendedradiusturnaroundjcbnzr`

Description: Indicate that the `radiusTurnaround` property of an `standardExtended` implementation of the `basic` component class is inactive for differential equation solving.
Code lines: 12
Contained by: module galacticus_nodes

subroutine: `basicstandardextendedradiusturnaroundrate`
Description: Accumulate to the rate of change of the `radiusTurnaround` property of an `standardExtended` implementation of the `basic` component class.
Code lines: 31
Contained by: module galacticus_nodes

function: `basicstandardextendedradiusturnaroundrateget`
Description: Get the rate of change of the `radiusTurnaround` property of an `standardExtended` implementation of the `basic` component class.
Code lines: 23
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: `basicstandardextendedradiusturnaroundscale`
Description: Set the absolute scale of the `radiusTurnaround` property of an `standardExtended` implementation of the `basic` component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: `basicstandardextendedradiusturnaroundset`
Description: Set the `radiusTurnaround` property of an `standardExtended` implementation of the `basic` component class.
Code lines: 10
Contained by: module galacticus_nodes

function: `basicstandardmasscount`
Description: Return a count of the number of scalar properties in the `mass` property of an `standard` implementation of the `basic` component class.
Code lines: 12
Contained by: module galacticus_nodes

function: `basicstandardmassget`
Description: Get the `mass` property of an `standard` implementation of the `basic` component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: `basicstandardmassjcbnzr`
Description: Indicate that the `mass` property of an `standard` implementation of the `basic` component class is inactive for differential equation solving.
Code lines: 12
Contained by: module galacticus_nodes

subroutine: `basicstandardmassrate`
Description: Accumulate to the rate of change of the `mass` property of an `standard` implementation of the `basic` component class.
Code lines: 31

Contained by: module galacticus_nodes

function: basicstandardmassrateget
Description: Get the rate of change of the mass property of an standard implementation of the basic component class.
Code lines: 23
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: basicstandardmassscale
Description: Set the absolute scale of the mass property of an standard implementation of the basic component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: basicstandardmassset
Description: Set the mass property of an standard implementation of the basic component class.
Code lines: 10
Contained by: module galacticus_nodes

function: basicstandardmasstargetget
Description: Get the massTarget property of an standard implementation of the basic component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: basicstandardmasstargetset
Description: Set the massTarget property of an standard implementation of the basic component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: basicstandardoutputcount
Description: Increment the count of properties to output for a standard implementation of the basic component.
Code lines: 21
Contained by: module galacticus_nodes

subroutine: basicstandardoutputnames
Description: Return the names of properties to output for a standard implementation of the basic component.
Code lines: 43
Contained by: module galacticus_nodes

function: basicstandardtimecount
Description: Return a count of the number of scalar properties in the time property of an standard implementation of the basic component class.
Code lines: 12
Contained by: module galacticus_nodes

function: basicstandardtimeget
Description: Get the time property of an standard implementation of the basic component class.

Code lines: 10
Contained by: module galacticus_nodes

subroutine: basicstandardtimejcbnzr
Description: Indicate that the time property of an standard implementation of the basic component class is inactive for differential equation solving.
Code lines: 12
Contained by: module galacticus_nodes

function: basicstandardtimelastisolated
Description: Return the timeLastIsolated property of the Basic component class.
Code lines: 16
Contained by: module galacticus_nodes

subroutine: basicstandardtimelastisolatedset
Description: Set the timeLastIsolated property of an standard implementation of the basic component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: basicstandardtimerate
Description: Accumulate to the rate of change of the time property of an standard implementation of the basic component class.
Code lines: 31
Contained by: module galacticus_nodes

function: basicstandardtimerateget
Description: Get the rate of change of the time property of an standard implementation of the basic component class.
Code lines: 23
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: basicstandardtimescale
Description: Set the absolute scale of the time property of an standard implementation of the basic component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: basicstandardtimeset
Description: Set the time property of an standard implementation of the basic component class.
Code lines: 10
Contained by: module galacticus_nodes

function: basicstandardtrackingmassmaximumget
Description: Get the massMaximum property of an standardTracking implementation of the basic component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: basicstandardtrackingmassmaximumset

Description: Set the `massMaximum` property of an `standardTracking` implementation of the `basic` component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: `basicstandardtrackingoutputcount`
Description: Increment the count of properties to output for a `standardTracking` implementation of the `basic` component.
Code lines: 12
Contained by: module galacticus_nodes

subroutine: `basicstandardtrackingoutputnames`
Description: Return the names of properties to output for a `standardTracking` implementation of the `basic` component.
Code lines: 17
Contained by: module galacticus_nodes

subroutine: `basicstandardtrackingpostoutput`
Description: Perform post-output processing for a `standardTracking` implementation of the `basic` component.
Code lines: 10
Contained by: module galacticus_nodes

function: `basictime`
Description: Returns the default value for the `time` property for the `basic` component class.
Code lines: 13
Contained by: module galacticus_nodes

function: `basictimeattributematch`
Description: Return a text list of component implementations in the `basic` class that have the desired attributes for the `time` property
Code lines: 64
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: `basictimeisgettable`
Description: Returns true if the `time` property is gettable for the `basic` component class.
Code lines: 8
Contained by: module galacticus_nodes

function: `basictimelastisolated`
Description: Returns the default value for the `timeLastIsolated` property for the `basic` component class.
Code lines: 13
Contained by: module galacticus_nodes

function: `basictimelastisolatedattributematch`
Description: Return a text list of component implementations in the `basic` class that have the desired attributes for the `timeLastIsolated` property
Code lines: 74
Contained by: module galacticus_nodes

Modules used: iso_varying_string

function: basictimelastisolatedisgettable
Description: Returns true if the timeLastIsolated property is gettable for the basic component class.
Code lines: 8
Contained by: module galacticus_nodes

function: basictimelastisolatedrateget
Description: Returns a zero rate for the timeLastIsolated property for the basic component class.
Code lines: 13
Contained by: module galacticus_nodes

function: basictimerateget
Description: Returns a zero rate for the time property for the basic component class.
Code lines: 13
Contained by: module galacticus_nodes

function: blackholeaccretionrate
Description: Returns the default value for the accretionRate property for the blackHole component class.
Code lines: 13
Contained by: module galacticus_nodes

function: blackholeaccretionrateattributematch
Description: Return a text list of component implementations in the blackHole class that have the desired attributes for the accretionRate property
Code lines: 41
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: blackholeaccretionrateisgettable
Description: Returns true if the accretionRate property is gettable for the blackHole component class.
Code lines: 8
Contained by: module galacticus_nodes

function: blackholeaccretionraterateget
Description: Returns a zero rate for the accretionRate property for the blackHole component class.
Code lines: 13
Contained by: module galacticus_nodes

function: blackholemass
Description: Returns the default value for the mass property for the blackHole component class.
Code lines: 21
Contained by: module galacticus_nodes

function: blackholemassattributematch
Description: Return a text list of component implementations in the blackHole class that have the desired attributes for the mass property
Code lines: 46
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: `blackholemassisgettable`
Description: Returns true if the `mass` property is gettable for the `blackHole` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `blackholemassrateget`
Description: Returns a zero rate for the `mass` property for the `blackHole` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `blackholemassseed`
Description: Returns the default value for the `massSeed` property for the `blackHole` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `blackholemassseedattributematch`
Description: Return a text list of component implementations in the `blackHole` class that have the desired attributes for the `massSeed` property
Code lines: 52
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

function: `blackholemassseedisgettable`
Description: Returns true if the `massSeed` property is gettable for the `blackHole` component class.
Code lines: 8
Contained by: module `galacticus_nodes`

function: `blackholemassseedrateget`
Description: Returns a zero rate for the `massSeed` property for the `blackHole` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

subroutine: `blackholenoncentraloutputcount`
Description: Increment the count of properties to output for a `nonCentral` implementation of the `blackHole` component.
Code lines: 13
Contained by: module `galacticus_nodes`

subroutine: `blackholenoncentraloutputnames`
Description: Return the names of properties to output for a `nonCentral` implementation of the `blackHole` component.
Code lines: 18
Contained by: module `galacticus_nodes`

subroutine: `blackholenoncentralpostoutput`
Description: Perform post-output processing for a `nonCentral` implementation of the `blackHole` component.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `blackholenoncentralradialpositioncount`
Description: Return a count of the number of scalar properties in the `radialPosition` property of an `nonCentral` implementation of the `blackHole` component class.
Code lines: 12
Contained by: module `galacticus_nodes`

function: `blackholenoncentralradialpositionget`
Description: Get the `radialPosition` property of an `nonCentral` implementation of the `blackHole` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `blackholenoncentralradialpositionjcbnzr`
Description: Indicate that the `radialPosition` property of an `nonCentral` implementation of the `blackHole` component class is inactive for differential equation solving.
Code lines: 12
Contained by: module `galacticus_nodes`

subroutine: `blackholenoncentralradialpositionrate`
Description: Accumulate to the rate of change of the `radialPosition` property of an `nonCentral` implementation of the `blackHole` component class.
Code lines: 31
Contained by: module `galacticus_nodes`

function: `blackholenoncentralradialpositionrateget`
Description: Get the rate of change of the `radialPosition` property of an `nonCentral` implementation of the `blackHole` component class.
Code lines: 23
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

subroutine: `blackholenoncentralradialpositionscale`
Description: Set the absolute scale of the `radialPosition` property of an `nonCentral` implementation of the `blackHole` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

subroutine: `blackholenoncentralradialpositionset`
Description: Set the `radialPosition` property of an `nonCentral` implementation of the `blackHole` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `blackholenulloutputcount`
Description: Increment the count of properties to output for a `null` implementation of the `blackHole` component.
Code lines: 22
Contained by: module `galacticus_nodes`

subroutine: `blackholenulloutputnames`
Description: Return the names of properties to output for a `null` implementation of the `blackHole` component.
Code lines: 39
Contained by: module `galacticus_nodes`

subroutine: `blackholeoutput`
Description: Populate output buffers with properties to output for a `blackHole` component.
Code lines: 38
Contained by: module `galacticus_nodes`
Modules used: `multi_counters`

subroutine: `blackholeoutputcount`
Description: Increment the count of properties to output for a generic `blackHole` component.
Code lines: 15
Contained by: module `galacticus_nodes`

subroutine: `blackholeoutputnames`
Description: Establish the names of properties to output for a generic `blackHole` component.
Code lines: 20
Contained by: module `galacticus_nodes`

subroutine: `blackholepostoutput`
Description: Perform post-output processing of a `blackHole` component.
Code lines: 14
Contained by: module `galacticus_nodes`

function: `blackholeradialposition`
Description: Returns the default value for the `radialPosition` property for the `blackHole` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `blackholeradialpositionattributematch`
Description: Return a text list of component implementations in the `blackHole` class that have the desired attributes for the `radialPosition` property
Code lines: 41
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

function: `blackholeradialpositionisgettable`
Description: Returns true if the `radialPosition` property is gettable for the `blackHole` component class.
Code lines: 8
Contained by: module `galacticus_nodes`

function: `blackholeradialpositionrateget`
Description: Returns a zero rate for the `radialPosition` property for the `blackHole` component class.
Code lines: 13

Contained by: module galacticus_nodes

function: blackholeradiativeefficiency
Description: Returns the default value for the radiativeEfficiency property for the blackHole component class.
Code lines: 13
Contained by: module galacticus_nodes

function: blackholeradiativeefficiencyattributematch
Description: Return a text list of component implementations in the blackHole class that have the desired attributes for the radiativeEfficiency property
Code lines: 41
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: blackholeradiativeefficiencyisgettable
Description: Returns true if the radiativeEfficiency property is gettable for the blackHole component class.
Code lines: 8
Contained by: module galacticus_nodes

function: blackholeradiativeefficiencyrateget
Description: Returns a zero rate for the radiativeEfficiency property for the blackHole component class.
Code lines: 13
Contained by: module galacticus_nodes

function: blackholesimplemasscount
Description: Return a count of the number of scalar properties in the mass property of an simple implementation of the blackHole component class.
Code lines: 12
Contained by: module galacticus_nodes

function: blackholesimplemassget
Description: Get the mass property of an simple implementation of the blackHole component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: blackholesimplemassjcbnzr
Description: Indicate that the mass property of an simple implementation of the blackHole component class is inactive for differential equation solving.
Code lines: 12
Contained by: module galacticus_nodes

subroutine: blackholesimplemassrate
Description: Accumulate to the rate of change of the mass property of an simple implementation of the blackHole component class.
Code lines: 31
Contained by: module galacticus_nodes

function: blackholesimplemassrateget

Description: Get the rate of change of the `mass` property of an `simple` implementation of the `blackHole` component class.
Code lines: 23
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

subroutine: `blackholesimplemassscale`
Description: Set the absolute scale of the `mass` property of an `simple` implementation of the `blackHole` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

subroutine: `blackholesimplemassset`
Description: Set the `mass` property of an `simple` implementation of the `blackHole` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `blackholesimpleoutputcount`
Description: Increment the count of properties to output for a `simple` implementation of the `blackHole` component.
Code lines: 21
Contained by: module `galacticus_nodes`

subroutine: `blackholesimpleoutputnames`
Description: Return the names of properties to output for a `simple` implementation of the `blackHole` component.
Code lines: 37
Contained by: module `galacticus_nodes`

function: `blackholespin`
Description: Returns the default value for the `spin` property for the `blackHole` component class.
Code lines: 17
Contained by: module `galacticus_nodes`

function: `blackholespinattributematch`
Description: Return a text list of component implementations in the `blackHole` class that have the desired attributes for the `spin` property
Code lines: 37
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

function: `blackholespinisgettable`
Description: Returns true if the `spin` property is gettable for the `blackHole` component class.
Code lines: 9
Contained by: module `galacticus_nodes`

function: `blackholespinrateget`
Description: Returns a zero rate for the `spin` property for the `blackHole` component class.
Code lines: 13

Contained by: module galacticus_nodes

function: blackholespinseed
Description: Returns the default value for the spinSeed property for the blackHole component class.
Code lines: 13
Contained by: module galacticus_nodes

function: blackholespinseedattributematch
Description: Return a text list of component implementations in the blackHole class that have the desired attributes for the spinSeed property
Code lines: 41
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: blackholespinseedisgettable
Description: Returns true if the spinSeed property is gettable for the blackHole component class.
Code lines: 8
Contained by: module galacticus_nodes

function: blackholespinseedrateget
Description: Returns a zero rate for the spinSeed property for the blackHole component class.
Code lines: 13
Contained by: module galacticus_nodes

function: blackholestandardaccretionrateget
Description: Get the value of the accretionRate property of the standard implementation of the blackHole component using a deferred function.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: blackholestandardaccretionrategetfunction
Description: Set the function to be used for the get method of the accretionRate property of the BlackHoleStandard component.
Code lines: 10
Contained by: module galacticus_nodes

function: blackholestandardaccretionrategetisattached
Description: Return true if the deferred function used to get the accretionRate property of the BlackHoleStandard component class has been attached.
Code lines: 8
Contained by: module galacticus_nodes

function: blackholestandardmasscount
Description: Return a count of the number of scalar properties in the mass property of an standard implementation of the blackHole component class.
Code lines: 12
Contained by: module galacticus_nodes

function: blackholestandardmassget

Description: Get the `mass` property of an `standard` implementation of the `blackHole` component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: `blackholestandardmassjcbnzr`
Description: Indicate that the `mass` property of an `standard` implementation of the `blackHole` component class is inactive for differential equation solving.
Code lines: 12
Contained by: module galacticus_nodes

subroutine: `blackholestandardmassrate`
Description: Accumulate to the rate of change of the `mass` property of an `standard` implementation of the `blackHole` component class.
Code lines: 31
Contained by: module galacticus_nodes

function: `blackholestandardmassrateget`
Description: Get the rate of change of the `mass` property of an `standard` implementation of the `blackHole` component class.
Code lines: 23
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: `blackholestandardmassscale`
Description: Set the absolute scale of the `mass` property of an `standard` implementation of the `blackHole` component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: `blackholestandardmassset`
Description: Set the `mass` property of an `standard` implementation of the `blackHole` component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: `blackholestandardoutputcount`
Description: Increment the count of properties to output for a `standard` implementation of the `blackHole` component.
Code lines: 20
Contained by: module galacticus_nodes

subroutine: `blackholestandardoutputnames`
Description: Return the names of properties to output for a `standard` implementation of the `blackHole` component.
Code lines: 42
Contained by: module galacticus_nodes

function: `blackholestandardradialpositionget`
Description: Get the `radialPosition` property of an `standard` implementation of the `blackHole` component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: `blackholestandardradialpositionset`
Description: Set the `radialPosition` property of an `standard` implementation of the `blackHole` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `blackholestandardradiativeefficiencyget`
Description: Get the value of the `radiativeEfficiency` property of the `standard` implementation of the `blackHole` component using a deferred function.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `blackholestandardradiativeefficiencygetfunction`
Description: Set the function to be used for the `get` method of the `radiativeEfficiency` property of the `BlackHoleStandard` component.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `blackholestandardradiativeefficiencygetisattached`
Description: Return true if the deferred function used to get the `radiativeEfficiency` property of the `BlackHoleStandard` component class has been attached.
Code lines: 8
Contained by: module `galacticus_nodes`

function: `blackholestandardspincount`
Description: Return a count of the number of scalar properties in the `spin` property of an `standard` implementation of the `blackHole` component class.
Code lines: 12
Contained by: module `galacticus_nodes`

subroutine: `blackholestandardspinjcbnzr`
Description: Indicate that the `spin` property of an `standard` implementation of the `blackHole` component class is inactive for differential equation solving.
Code lines: 12
Contained by: module `galacticus_nodes`

subroutine: `blackholestandardspinrate`
Description: Accumulate to the rate of change of the `spin` property of an `standard` implementation of the `blackHole` component class.
Code lines: 31
Contained by: module `galacticus_nodes`

function: `blackholestandardspinrateget`
Description: Get the rate of change of the `spin` property of an `standard` implementation of the `blackHole` component class.
Code lines: 23
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

subroutine: `blackholestandardspinscale`
Description: Set the absolute scale of the `spin` property of an `standard` implementation of the `blackHole` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

subroutine: `blackholestandardspinset`
Description: Set the `spin` property of an `standard` implementation of the `blackHole` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `blackholestandardtripleinteractiontimeget`
Description: Get the `tripleInteractionTime` property of an `standard` implementation of the `blackHole` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `blackholestandardtripleinteractiontimeset`
Description: Set the `tripleInteractionTime` property of an `standard` implementation of the `blackHole` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `blackholetripleinteractiontime`
Description: Returns the default value for the `tripleInteractionTime` property for the `blackHole` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `blackholetripleinteractiontimeattributematch`
Description: Return a text list of component implementations in the `blackHole` class that have the desired attributes for the `tripleInteractionTime` property
Code lines: 41
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

function: `blackholetripleinteractiontimeisgettable`
Description: Returns true if the `tripleInteractionTime` property is gettable for the `blackHole` component class.
Code lines: 8
Contained by: module `galacticus_nodes`

function: `blackholetripleinteractiontimerateget`
Description: Returns a zero rate for the `tripleInteractionTime` property for the `blackHole` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `boolean_false`

Description: Returns Boolean false always.
Code lines: 6
Contained by: module galacticus_nodes

function: boolean_true
Description: Returns Boolean true always.
Code lines: 6
Contained by: module galacticus_nodes

subroutine: darkmatterprofilenulloutputcount
Description: Increment the count of properties to output for a null implementation of the darkMatterProfile component.
Code lines: 22
Contained by: module galacticus_nodes

subroutine: darkmatterprofilenulloutputnames
Description: Return the names of properties to output for a null implementation of the darkMatterProfile component.
Code lines: 39
Contained by: module galacticus_nodes

subroutine: darkmatterprofileoutput
Description: Populate output buffers with properties to output for a darkMatterProfile component.
Code lines: 42
Contained by: module galacticus_nodes
Modules used: multi_counters

subroutine: darkmatterprofileoutputcount
Description: Increment the count of properties to output for a generic darkMatterProfile component.
Code lines: 15
Contained by: module galacticus_nodes

subroutine: darkmatterprofileoutputnames
Description: Establish the names of properties to output for a generic darkMatterProfile component.
Code lines: 20
Contained by: module galacticus_nodes

subroutine: darkmatterprofilepostoutput
Description: Perform post-output processing of a darkMatterProfile component.
Code lines: 14
Contained by: module galacticus_nodes

function: darkmatterprofilescale
Description: Returns the default value for the scale property for the darkMatterProfile component class.
Code lines: 21
Contained by: module galacticus_nodes

function: darkmatterprofilescaleattributematch

Description: Return a text list of component implementations in the `darkMatterProfile` class that have the desired attributes for the `scale` property
Code lines: 46
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

function: `darkmatterprofilescalegrowthrate`
Description: Returns the default value for the `scaleGrowthRate` property for the `darkMatterProfile` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `darkmatterprofilescalegrowthrateattributematch`
Description: Return a text list of component implementations in the `darkMatterProfile` class that have the desired attributes for the `scaleGrowthRate` property
Code lines: 52
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

function: `darkmatterprofilescalegrowthrateisgettable`
Description: Returns true if the `scaleGrowthRate` property is gettable for the `darkMatterProfile` component class.
Code lines: 8
Contained by: module `galacticus_nodes`

function: `darkmatterprofilescalegrowthraterateget`
Description: Returns a zero rate for the `scaleGrowthRate` property for the `darkMatterProfile` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `darkmatterprofilescaleisgettable`
Description: Returns true if the `scale` property is gettable for the `darkMatterProfile` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `darkmatterprofilescaleislimited`
Description: Returns the default value for the `scaleIsLimited` property for the `darkMatterProfile` component class.
Code lines: 17
Contained by: module `galacticus_nodes`

function: `darkmatterprofilescaleislimitedattributematch`
Description: Return a text list of component implementations in the `darkMatterProfile` class that have the desired attributes for the `scaleIsLimited` property
Code lines: 41
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

function: `darkmatterprofilescaleislimitedisgettable`

Description: Returns true if the `scaleIsLimited` property is gettable for the `darkMatterProfile` component class.
Code lines: 9
Contained by: module `galacticus_nodes`

function: `darkmatterprofilescaleislimitedrateget`
Description: Returns a zero rate for the `scaleIsLimited` property for the `darkMatterProfile` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

subroutine: `darkmatterprofilescaleoutputcount`
Description: Increment the count of properties to output for a `scale` implementation of the `darkMatterProfile` component.
Code lines: 21
Contained by: module `galacticus_nodes`

subroutine: `darkmatterprofilescaleoutputnames`
Description: Return the names of properties to output for a `scale` implementation of the `darkMatterProfile` component.
Code lines: 37
Contained by: module `galacticus_nodes`

subroutine: `darkmatterprofilescalepresetoutputcount`
Description: Increment the count of properties to output for a `scalePreset` implementation of the `darkMatterProfile` component.
Code lines: 21
Contained by: module `galacticus_nodes`

subroutine: `darkmatterprofilescalepresetoutputnames`
Description: Return the names of properties to output for a `scalePreset` implementation of the `darkMatterProfile` component.
Code lines: 37
Contained by: module `galacticus_nodes`

function: `darkmatterprofilescalepresetscalecount`
Description: Return a count of the number of scalar properties in the `scale` property of an `scalePreset` implementation of the `darkMatterProfile` component class.
Code lines: 12
Contained by: module `galacticus_nodes`

function: `darkmatterprofilescalepresetscaleget`
Description: Get the `scale` property of an `scalePreset` implementation of the `darkMatterProfile` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `darkmatterprofilescalepresetscalegrowthrateget`
Description: Get the `scaleGrowthRate` property of an `scalePreset` implementation of the `darkMatterProfile` component class.
Code lines: 10

Contained by: module galacticus_nodes

subroutine: darkmatterprofilescalepresetscalegrowthrateset
Description: Set the scaleGrowthRate property of an scalePreset implementation of the darkMatterProfile component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: darkmatterprofilescalepresetscalejcbnzr
Description: Indicate that the scale property of an scalePreset implementation of the darkMatterProfile component class is inactive for differential equation solving.
Code lines: 12
Contained by: module galacticus_nodes

subroutine: darkmatterprofilescalepresetscalerate
Description: Accumulate to the rate of change of the scale property of an scalePreset implementation of the darkMatterProfile component class.
Code lines: 31
Contained by: module galacticus_nodes

function: darkmatterprofilescalepresetscalerateget
Description: Get the rate of change of the scale property of an scalePreset implementation of the darkMatterProfile component class.
Code lines: 23
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: darkmatterprofilescalepresetscalescale
Description: Set the absolute scale of the scale property of an scalePreset implementation of the darkMatterProfile component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: darkmatterprofilescalepresetscaleset
Description: Set the scale property of an scalePreset implementation of the darkMatterProfile component class.
Code lines: 10
Contained by: module galacticus_nodes

function: darkmatterprofilescalerateget
Description: Returns a zero rate for the scale property for the darkMatterProfile component class.
Code lines: 13
Contained by: module galacticus_nodes

function: darkmatterprofilescalescalecount
Description: Return a count of the number of scalar properties in the scale property of an scale implementation of the darkMatterProfile component class.
Code lines: 12
Contained by: module galacticus_nodes

function: `darkmatterprofilescalescaleget`
Description: Get the value of the `scale` property of the `scale` implementation of the `darkMatterProfile` component using a deferred function.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `darkmatterprofilescalescalegetfunction`
Description: Set the function to be used for the `get` method of the `scale` property of the `DarkMatterProfileScale` component.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `darkmatterprofilescalescalegetisattached`
Description: Return true if the deferred function used to get the `scale` property of the `DarkMatterProfileScale` component class has been attached.
Code lines: 8
Contained by: module `galacticus_nodes`

function: `darkmatterprofilescalescalegetvalue`
Description: Get the `scale` property of an `scale` implementation of the `darkMatterProfile` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `darkmatterprofilescalescalegrowthrateget`
Description: Get the `scaleGrowthRate` property of an `scale` implementation of the `darkMatterProfile` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `darkmatterprofilescalescalegrowthrateset`
Description: Set the `scaleGrowthRate` property of an `scale` implementation of the `darkMatterProfile` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `darkmatterprofilescalescaleislimitedget`
Description: Get the `scaleIsLimited` property of an `scale` implementation of the `darkMatterProfile` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `darkmatterprofilescalescaleislimitedset`
Description: Set the `scaleIsLimited` property of an `scale` implementation of the `darkMatterProfile` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `darkmatterprofilescalescalejcbnzr`

Description: Indicate that the `scale` property of an `scale` implementation of the `darkMatterProfile` component class is inactive for differential equation solving.
Code lines: 12
Contained by: module `galacticus_nodes`

subroutine: `darkmatterprofilescalescalerate`
Description: Accumulate to the rate of change of the `scale` property of an `scale` implementation of the `darkMatterProfile` component class.
Code lines: 31
Contained by: module `galacticus_nodes`

function: `darkmatterprofilescalescalerateget`
Description: Get the rate of change of the `scale` property of an `scale` implementation of the `darkMatterProfile` component class.
Code lines: 23
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

subroutine: `darkmatterprofilescalescalescale`
Description: Set the absolute scale of the `scale` property of an `scale` implementation of the `darkMatterProfile` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

subroutine: `darkmatterprofilescalescaleset`
Description: Set the `scale` property of an `scale` implementation of the `darkMatterProfile` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `darkmatterprofilescaleshapeoutputcount`
Description: Increment the count of properties to output for a `scaleShape` implementation of the `darkMatterProfile` component.
Code lines: 13
Contained by: module `galacticus_nodes`

subroutine: `darkmatterprofilescaleshapeoutputnames`
Description: Return the names of properties to output for a `scaleShape` implementation of the `darkMatterProfile` component.
Code lines: 23
Contained by: module `galacticus_nodes`

subroutine: `darkmatterprofilescaleshapepostoutput`
Description: Perform post-output processing for a `scaleShape` implementation of the `darkMatterProfile` component.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `darkmatterprofilescaleshapeshapecount`
Description: Return a count of the number of scalar properties in the `shape` property of an `scaleShape` implementation of the `darkMatterProfile` component class.

Code lines: 12
Contained by: module galacticus_nodes

function: darkmatterprofilescaleshapeshapeget
Description: Get the value of the shape property of the scaleShape implementation of the darkMatterProfile component using a deferred function.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: darkmatterprofilescaleshapeshapegetfunction
Description: Set the function to be used for the get method of the shape property of the DarkMatterProfileScaleShape component.
Code lines: 10
Contained by: module galacticus_nodes

function: darkmatterprofilescaleshapeshapegetisattached
Description: Return true if the deferred function used to get the shape property of the DarkMatterProfileScaleShape component class has been attached.
Code lines: 8
Contained by: module galacticus_nodes

function: darkmatterprofilescaleshapeshapegetvalue
Description: Get the shape property of an scaleShape implementation of the darkMatterProfile component class.
Code lines: 10
Contained by: module galacticus_nodes

function: darkmatterprofilescaleshapeshapegrowthrateget
Description: Get the shapeGrowthRate property of an scaleShape implementation of the darkMatterProfile component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: darkmatterprofilescaleshapeshapegrowthrateset
Description: Set the shapeGrowthRate property of an scaleShape implementation of the darkMatterProfile component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: darkmatterprofilescaleshapeshapejcbnzr
Description: Indicate that the shape property of an scaleShape implementation of the darkMatterProfile component class is inactive for differential equation solving.
Code lines: 12
Contained by: module galacticus_nodes

subroutine: darkmatterprofilescaleshapeshaperate
Description: Accumulate to the rate of change of the shape property of an scaleShape implementation of the darkMatterProfile component class.
Code lines: 31
Contained by: module galacticus_nodes

function: `darkmatterprofilescaleshapeshaperateget`
Description: Get the rate of change of the `shape` property of an `scaleShape` implementation of the `darkMatterProfile` component class.
Code lines: 23
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

subroutine: `darkmatterprofilescaleshapeshapescale`
Description: Set the absolute scale of the `shape` property of an `scaleShape` implementation of the `darkMatterProfile` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

subroutine: `darkmatterprofilescaleshapeshapeset`
Description: Set the `shape` property of an `scaleShape` implementation of the `darkMatterProfile` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `darkmatterprofileshape`
Description: Returns the default value for the `shape` property for the `darkMatterProfile` component class.
Code lines: 17
Contained by: module `galacticus_nodes`

function: `darkmatterprofileshapeattributematch`
Description: Return a text list of component implementations in the `darkMatterProfile` class that have the desired attributes for the `shape` property
Code lines: 28
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

function: `darkmatterprofileshapegrowthrate`
Description: Returns the default value for the `shapeGrowthRate` property for the `darkMatterProfile` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `darkmatterprofileshapegrowthrateattributematch`
Description: Return a text list of component implementations in the `darkMatterProfile` class that have the desired attributes for the `shapeGrowthRate` property
Code lines: 30
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

function: `darkmatterprofileshapegrowthrateisgettable`
Description: Returns true if the `shapeGrowthRate` property is gettable for the `darkMatterProfile` component class.
Code lines: 8
Contained by: module `galacticus_nodes`

function: `darkmatterprofileshapegrowthraterateget`
Description: Returns a zero rate for the `shapeGrowthRate` property for the `darkMatterProfile` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `darkmatterprofileshapeisgettable`
Description: Returns true if the `shape` property is gettable for the `darkMatterProfile` component class.
Code lines: 9
Contained by: module `galacticus_nodes`

function: `darkmatterprofileshaperateget`
Description: Returns a zero rate for the `shape` property for the `darkMatterProfile` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `diskabundancesgas`
Description: Returns the default value for the `abundancesGas` property for the `disk` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `diskabundancesgasattributematch`
Description: Return a text list of component implementations in the `disk` class that have the desired attributes for the `abundancesGas` property
Code lines: 46
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

function: `diskabundancesgasisgettable`
Description: Returns true if the `abundancesGas` property is gettable for the `disk` component class.
Code lines: 8
Contained by: module `galacticus_nodes`

subroutine: `diskabundancesgasrate`
Description: Accept a rate set for the `abundancesGas` property of the `disk` component class. Trigger an interrupt to create the component.
Code lines: 21
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

function: `diskabundancesgasrateget`
Description: Returns a zero rate for the `abundancesGas` property for the `disk` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `diskabundancesstellar`
Description: Returns the default value for the `abundancesStellar` property for the `disk` component class.
Code lines: 13

Contained by: module galacticus_nodes

function: diskabundancesstellarattributematch
Description: Return a text list of component implementations in the disk class that have the desired attributes for the abundancesStellar property
Code lines: 46
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: diskabundancesstellarisgettable
Description: Returns true if the abundancesStellar property is gettable for the disk component class.
Code lines: 8
Contained by: module galacticus_nodes

function: diskabundancesstellarrateget
Description: Returns a zero rate for the abundancesStellar property for the disk component class.
Code lines: 13
Contained by: module galacticus_nodes

function: diskangularmomentum
Description: Returns the default value for the angularMomentum property for the disk component class.
Code lines: 13
Contained by: module galacticus_nodes

function: diskangularmomentumattributematch
Description: Return a text list of component implementations in the disk class that have the desired attributes for the angularMomentum property
Code lines: 28
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: diskangularmomentumisgettable
Description: Returns true if the angularMomentum property is gettable for the disk component class.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: diskangularmomentumrate
Description: Accept a rate set for the angularMomentum property of the disk component class. Trigger an interrupt to create the component.
Code lines: 21
Contained by: module galacticus_nodes
Modules used: galacticus_error

function: diskangularmomentumrateget
Description: Returns a zero rate for the angularMomentum property for the disk component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: diskcreatebyinterrupt

Description: Create the `disk` component of `self` via an interrupt.
Code lines: 10
Contained by: module galacticus_nodes

function: `diskfractionmassretained`
Description: Returns the default value for the `fractionMassRetained` property for the `disk` component class.
Code lines: 13
Contained by: module galacticus_nodes

function: `diskfractionmassretainedattributematch`
Description: Return a text list of component implementations in the `disk` class that have the desired attributes for the `fractionMassRetained` property
Code lines: 28
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: `diskfractionmassretainedisgettable`
Description: Returns true if the `fractionMassRetained` property is gettable for the `disk` component class.
Code lines: 8
Contained by: module galacticus_nodes

function: `diskfractionmassretainedrateget`
Description: Returns a zero rate for the `fractionMassRetained` property for the `disk` component class.
Code lines: 13
Contained by: module galacticus_nodes

function: `diskhalfmassradius`
Description: Returns the default value for the `halfMassRadius` property for the `disk` component class.
Code lines: 13
Contained by: module galacticus_nodes

function: `diskhalfmassradiusattributematch`
Description: Return a text list of component implementations in the `disk` class that have the desired attributes for the `halfMassRadius` property
Code lines: 41
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: `diskhalfmassradiusisgettable`
Description: Returns true if the `halfMassRadius` property is gettable for the `disk` component class.
Code lines: 8
Contained by: module galacticus_nodes

function: `diskhalfmassradiusrateget`
Description: Returns a zero rate for the `halfMassRadius` property for the `disk` component class.
Code lines: 13
Contained by: module galacticus_nodes

function: `diskisinitialized`
Description: Returns the default value for the `isInitialized` property for the `disk` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `diskisinitializedattributematch`
Description: Return a text list of component implementations in the `disk` class that have the desired attributes for the `isInitialized` property
Code lines: 52
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

function: `diskisinitializedisgettable`
Description: Returns true if the `isInitialized` property is gettable for the `disk` component class.
Code lines: 8
Contained by: module `galacticus_nodes`

function: `diskisinitializedrateget`
Description: Returns a zero rate for the `isInitialized` property for the `disk` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `diskluminositiesstellar`
Description: Returns the default value for the `luminositiesStellar` property for the `disk` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `diskluminositiesstellarattributematch`
Description: Return a text list of component implementations in the `disk` class that have the desired attributes for the `luminositiesStellar` property
Code lines: 46
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

function: `diskluminositiesstellarisgettable`
Description: Returns true if the `luminositiesStellar` property is gettable for the `disk` component class.
Code lines: 8
Contained by: module `galacticus_nodes`

function: `diskluminositiesstellarrateget`
Description: Returns a zero rate for the `luminositiesStellar` property for the `disk` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `diskmassgas`
Description: Returns the default value for the `massGas` property for the `disk` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `diskmassgasattributematch`
Description: Return a text list of component implementations in the `disk` class that have the desired attributes for the `massGas` property
Code lines: 46
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

function: `diskmassgasisgettable`
Description: Returns true if the `massGas` property is gettable for the `disk` component class.
Code lines: 8
Contained by: module `galacticus_nodes`

subroutine: `diskmassgasrate`
Description: Accept a rate set for the `massGas` property of the `disk` component class. Trigger an interrupt to create the component.
Code lines: 21
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

function: `diskmassgasrateget`
Description: Returns a zero rate for the `massGas` property for the `disk` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `diskmassstellar`
Description: Returns the default value for the `massStellar` property for the `disk` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `diskmassstellarattributematch`
Description: Return a text list of component implementations in the `disk` class that have the desired attributes for the `massStellar` property
Code lines: 46
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

function: `diskmassstellarformed`
Description: Returns the default value for the `massStellarFormed` property for the `disk` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `diskmassstellarformedattributematch`
Description: Return a text list of component implementations in the `disk` class that have the desired attributes for the `massStellarFormed` property
Code lines: 28
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

function: `diskmassstellarformedisgettable`
Description: Returns true if the `massStellarFormed` property is gettable for the `disk` component class.
Code lines: 8
Contained by: module `galacticus_nodes`

function: `diskmassstellarformedrateget`
Description: Returns a zero rate for the `massStellarFormed` property for the `disk` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `diskmassstellarisgettable`
Description: Returns true if the `massStellar` property is gettable for the `disk` component class.
Code lines: 8
Contained by: module `galacticus_nodes`

function: `diskmassstellarrateget`
Description: Returns a zero rate for the `massStellar` property for the `disk` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

subroutine: `diskknulloutputcount`
Description: Increment the count of properties to output for a `null` implementation of the `disk` component.
Code lines: 22
Contained by: module `galacticus_nodes`

subroutine: `diskknulloutputnames`
Description: Return the names of properties to output for a `null` implementation of the `disk` component.
Code lines: 39
Contained by: module `galacticus_nodes`

subroutine: `diskoutput`
Description: Populate output buffers with properties to output for a `disk` component.
Code lines: 74
Contained by: module `galacticus_nodes`
Modules used: `multi_counters`

subroutine: `diskoutputcount`
Description: Increment the count of properties to output for a generic `disk` component.
Code lines: 15
Contained by: module `galacticus_nodes`

subroutine: `diskoutputnames`
Description: Establish the names of properties to output for a generic `disk` component.
Code lines: 20
Contained by: module `galacticus_nodes`

subroutine: `diskpostoutput`

Description: Perform post-output processing of a `disk` component.
Code lines: 14
Contained by: module galacticus_nodes

function: `diskradius`
Description: Returns the default value for the `radius` property for the `disk` component class.
Code lines: 13
Contained by: module galacticus_nodes

function: `diskradiusattributematch`
Description: Return a text list of component implementations in the `disk` class that have the desired attributes for the `radius` property
Code lines: 41
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: `diskradiusisgettable`
Description: Returns true if the `radius` property is gettable for the `disk` component class.
Code lines: 8
Contained by: module galacticus_nodes

function: `diskradiusrateget`
Description: Returns a zero rate for the `radius` property for the `disk` component class.
Code lines: 13
Contained by: module galacticus_nodes

function: `diskstandardabundancesgascount`
Description: Return a count of the number of scalar properties in the `abundancesGas` property of an `standard` implementation of the `disk` component class.
Code lines: 12
Contained by: module galacticus_nodes

function: `diskstandardabundancesgasget`
Description: Get the `abundancesGas` property of an `standard` implementation of the `disk` component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: `diskstandardabundancesgasjcbnzr`
Description: Indicate that the `abundancesGas` property of an `standard` implementation of the `disk` component class is inactive for differential equation solving.
Code lines: 14
Contained by: module galacticus_nodes

subroutine: `diskstandardabundancesgasrate`
Description: Accumulate to the rate of change of the `abundancesGas` property of an `standard` implementation of the `disk` component class.
Code lines: 38
Contained by: module galacticus_nodes

subroutine: `diskstandardabundancesgasrategeneric`

Description: Set the rate of the `abundancesGas` property of the `abundancesGas` property of an `standard` implementation of the `disk` component class via a generic `nodeComponent`.
Code lines: 27
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

function: `diskstandardabundancesgasrateget`
Description: Get the rate of change of the `abundancesGas` property of an `standard` implementation of the `disk` component class.
Code lines: 26
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

subroutine: `diskstandardabundancesgasscale`
Description: Set the absolute scale of the `abundancesGas` property of an `standard` implementation of the `disk` component class.
Code lines: 15
Contained by: module `galacticus_nodes`

subroutine: `diskstandardabundancesgasset`
Description: Set the `abundancesGas` property of an `standard` implementation of the `disk` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `diskstandardabundancesstellarcount`
Description: Return a count of the number of scalar properties in the `abundancesStellar` property of an `standard` implementation of the `disk` component class.
Code lines: 12
Contained by: module `galacticus_nodes`

function: `diskstandardabundancesstellarget`
Description: Get the `abundancesStellar` property of an `standard` implementation of the `disk` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `diskstandardabundancesstellarjcbnzr`
Description: Indicate that the `abundancesStellar` property of an `standard` implementation of the `disk` component class is inactive for differential equation solving.
Code lines: 14
Contained by: module `galacticus_nodes`

subroutine: `diskstandardabundancesstellarrate`
Description: Accumulate to the rate of change of the `abundancesStellar` property of an `standard` implementation of the `disk` component class.
Code lines: 38
Contained by: module `galacticus_nodes`

function: `diskstandardabundancesstellarrateget`

Description: Get the rate of change of the `abundancesStellar` property of an `standard` implementation of the `disk` component class.
Code lines: 26
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: `diskstandardabundancesstellarscale`
Description: Set the absolute scale of the `abundancesStellar` property of an `standard` implementation of the `disk` component class.
Code lines: 15
Contained by: module galacticus_nodes

subroutine: `diskstandardabundancesstellarset`
Description: Set the `abundancesStellar` property of an `standard` implementation of the `disk` component class.
Code lines: 10
Contained by: module galacticus_nodes

function: `diskstandardangularmomentumcount`
Description: Return a count of the number of scalar properties in the `angularMomentum` property of an `standard` implementation of the `disk` component class.
Code lines: 12
Contained by: module galacticus_nodes

function: `diskstandardangularmomentumget`
Description: Get the `angularMomentum` property of an `standard` implementation of the `disk` component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: `diskstandardangularmomentumjcbnzr`
Description: Indicate that the `angularMomentum` property of an `standard` implementation of the `disk` component class is inactive for differential equation solving.
Code lines: 12
Contained by: module galacticus_nodes

subroutine: `diskstandardangularmomentumrate`
Description: Accumulate to the rate of change of the `angularMomentum` property of an `standard` implementation of the `disk` component class.
Code lines: 31
Contained by: module galacticus_nodes

subroutine: `diskstandardangularmomentumrategeneric`
Description: Set the rate of the `angularMomentum` property of the `angularMomentum` property of an `standard` implementation of the `disk` component class via a generic `nodeComponent`.
Code lines: 27
Contained by: module galacticus_nodes
Modules used: galacticus_error

function: `diskstandardangularmomentumrateget`

Description: Get the rate of change of the `angularMomentum` property of an `standard` implementation of the `disk` component class.
Code lines: 23
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

subroutine: `diskstandardangularmomentumscale`
Description: Set the absolute scale of the `angularMomentum` property of an `standard` implementation of the `disk` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

subroutine: `diskstandardangularmomentumset`
Description: Set the `angularMomentum` property of an `standard` implementation of the `disk` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `diskstandardfractionmassretainedcount`
Description: Return a count of the number of scalar properties in the `fractionMassRetained` property of an `standard` implementation of the `disk` component class.
Code lines: 12
Contained by: module `galacticus_nodes`

function: `diskstandardfractionmassretainedget`
Description: Get the `fractionMassRetained` property of an `standard` implementation of the `disk` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `diskstandardfractionmassretainedjcbnzr`
Description: Indicate that the `fractionMassRetained` property of an `standard` implementation of the `disk` component class is inactive for differential equation solving.
Code lines: 12
Contained by: module `galacticus_nodes`

subroutine: `diskstandardfractionmassretainedrate`
Description: Accumulate to the rate of change of the `fractionMassRetained` property of an `standard` implementation of the `disk` component class.
Code lines: 31
Contained by: module `galacticus_nodes`

function: `diskstandardfractionmassretainedrateget`
Description: Get the rate of change of the `fractionMassRetained` property of an `standard` implementation of the `disk` component class.
Code lines: 23
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

subroutine: `diskstandardfractionmassretainedscale`

Description: Set the absolute scale of the `fractionMassRetained` property of an `standard` implementation of the `disk` component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: `diskstandardfractionmassretainedset`
Description: Set the `fractionMassRetained` property of an `standard` implementation of the `disk` component class.
Code lines: 10
Contained by: module galacticus_nodes

function: `diskstandardisinitializedget`
Description: Get the `isInitialized` property of an `standard` implementation of the `disk` component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: `diskstandardisinitializedset`
Description: Set the `isInitialized` property of an `standard` implementation of the `disk` component class.
Code lines: 10
Contained by: module galacticus_nodes

function: `diskstandardluminositiesstellarcount`
Description: Return a count of the number of scalar properties in the `luminositiesStellar` property of an `standard` implementation of the `disk` component class.
Code lines: 12
Contained by: module galacticus_nodes

function: `diskstandardluminositiesstellarget`
Description: Get the `luminositiesStellar` property of an `standard` implementation of the `disk` component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: `diskstandardluminositiesstellarjcbnzr`
Description: Indicate that the `luminositiesStellar` property of an `standard` implementation of the `disk` component class is inactive for differential equation solving.
Code lines: 14
Contained by: module galacticus_nodes

subroutine: `diskstandardluminositiesstellarrate`
Description: Accumulate to the rate of change of the `luminositiesStellar` property of an `standard` implementation of the `disk` component class.
Code lines: 38
Contained by: module galacticus_nodes

function: `diskstandardluminositiesstellarrateget`
Description: Get the rate of change of the `luminositiesStellar` property of an `standard` implementation of the `disk` component class.
Code lines: 26
Contained by: module galacticus_nodes

Modules used: galacticus_error

subroutine: diskstandardluminositiesstellarscale
Description: Set the absolute scale of the luminositiesStellar property of an standard implementation of the disk component class.
Code lines: 15
Contained by: module galacticus_nodes

subroutine: diskstandardluminositiesstellarset
Description: Set the luminositiesStellar property of an standard implementation of the disk component class.
Code lines: 10
Contained by: module galacticus_nodes

function: diskstandardmassgascount
Description: Return a count of the number of scalar properties in the massGas property of an standard implementation of the disk component class.
Code lines: 12
Contained by: module galacticus_nodes

function: diskstandardmassgasget
Description: Get the massGas property of an standard implementation of the disk component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: diskstandardmassgasjcbnzr
Description: Indicate that the massGas property of an standard implementation of the disk component class is inactive for differential equation solving.
Code lines: 12
Contained by: module galacticus_nodes

subroutine: diskstandardmassgasrate
Description: Accumulate to the rate of change of the massGas property of an standard implementation of the disk component class.
Code lines: 31
Contained by: module galacticus_nodes

subroutine: diskstandardmassgasrategeneric
Description: Set the rate of the massGas property of the massGas property of an standard implementation of the disk component class via a generic nodeComponent.
Code lines: 27
Contained by: module galacticus_nodes
Modules used: galacticus_error

function: diskstandardmassgasrateget
Description: Get the rate of change of the massGas property of an standard implementation of the disk component class.
Code lines: 23
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: `diskstandardmassgasscale`
Description: Set the absolute scale of the `massGas` property of an `standard` implementation of the `disk` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

subroutine: `diskstandardmassgasset`
Description: Set the `massGas` property of an `standard` implementation of the `disk` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `diskstandardmassstellarcount`
Description: Return a count of the number of scalar properties in the `massStellar` property of an `standard` implementation of the `disk` component class.
Code lines: 12
Contained by: module `galacticus_nodes`

function: `diskstandardmassstellarformedcount`
Description: Return a count of the number of scalar properties in the `massStellarFormed` property of an `standard` implementation of the `disk` component class.
Code lines: 12
Contained by: module `galacticus_nodes`

function: `diskstandardmassstellarformedget`
Description: Get the `massStellarFormed` property of an `standard` implementation of the `disk` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `diskstandardmassstellarformedjcbnzr`
Description: Indicate that the `massStellarFormed` property of an `standard` implementation of the `disk` component class is inactive for differential equation solving.
Code lines: 12
Contained by: module `galacticus_nodes`

subroutine: `diskstandardmassstellarformedrate`
Description: Accumulate to the rate of change of the `massStellarFormed` property of an `standard` implementation of the `disk` component class.
Code lines: 31
Contained by: module `galacticus_nodes`

function: `diskstandardmassstellarformedrateget`
Description: Get the rate of change of the `massStellarFormed` property of an `standard` implementation of the `disk` component class.
Code lines: 23
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

subroutine: `diskstandardmassstellarformedscale`

Description: Set the absolute scale of the `massStellarFormed` property of an `standard` implementation of the `disk` component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: `diskstandardmassstellarformedset`
Description: Set the `massStellarFormed` property of an `standard` implementation of the `disk` component class.
Code lines: 10
Contained by: module galacticus_nodes

function: `diskstandardmassstellarget`
Description: Get the `massStellar` property of an `standard` implementation of the `disk` component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: `diskstandardmassstellarjcbnzr`
Description: Indicate that the `massStellar` property of an `standard` implementation of the `disk` component class is inactive for differential equation solving.
Code lines: 12
Contained by: module galacticus_nodes

subroutine: `diskstandardmassstellarrate`
Description: Accumulate to the rate of change of the `massStellar` property of an `standard` implementation of the `disk` component class.
Code lines: 31
Contained by: module galacticus_nodes

function: `diskstandardmassstellarrateget`
Description: Get the rate of change of the `massStellar` property of an `standard` implementation of the `disk` component class.
Code lines: 23
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: `diskstandardmassstellarscale`
Description: Set the absolute scale of the `massStellar` property of an `standard` implementation of the `disk` component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: `diskstandardmassstellarset`
Description: Set the `massStellar` property of an `standard` implementation of the `disk` component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: `diskstandardoutputcount`
Description: Increment the count of properties to output for a `standard` implementation of the `disk` component.
Code lines: 24
Contained by: module galacticus_nodes

subroutine: `diskstandardoutputnames`
Description: Return the names of properties to output for a `standard` implementation of the `disk` component.
Code lines: 71
Contained by: module `galacticus_nodes`

subroutine: `diskstandardpostoutput`
Description: Perform post-output processing for a `standard` implementation of the `disk` component.
Code lines: 12
Contained by: module `galacticus_nodes`

function: `diskstandardradiusget`
Description: Get the `radius` property of an `standard` implementation of the `disk` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `diskstandardradiusset`
Description: Set the `radius` property of an `standard` implementation of the `disk` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `diskstandardstarformationhistorycount`
Description: Return a count of the number of scalar properties in the `starFormationHistory` property of an `standard` implementation of the `disk` component class.
Code lines: 12
Contained by: module `galacticus_nodes`

function: `diskstandardstarformationhistoryget`
Description: Get the `starFormationHistory` property of an `standard` implementation of the `disk` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `diskstandardstarformationhistoryjcbnzr`
Description: Indicate that the `starFormationHistory` property of an `standard` implementation of the `disk` component class is inactive for differential equation solving.
Code lines: 14
Contained by: module `galacticus_nodes`

subroutine: `diskstandardstarformationhistoryrate`
Description: Accumulate to the rate of change of the `starFormationHistory` property of an `standard` implementation of the `disk` component class.
Code lines: 38
Contained by: module `galacticus_nodes`

function: `diskstandardstarformationhistoryrateget`
Description: Get the rate of change of the `starFormationHistory` property of an `standard` implementation of the `disk` component class.
Code lines: 26

Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: diskstandardstarformationhistoryscale
Description: Set the absolute scale of the starFormationHistory property of an standard implementation of the disk component class.
Code lines: 15
Contained by: module galacticus_nodes

subroutine: diskstandardstarformationhistoryset
Description: Set the starFormationHistory property of an standard implementation of the disk component class.
Code lines: 10
Contained by: module galacticus_nodes

function: diskstandardstarformationrateget
Description: Get the value of the starFormationRate property of the standard implementation of the disk component using a deferred function.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: diskstandardstarformationrategetfunction
Description: Set the function to be used for the get method of the starFormationRate property of the DiskStandard component.
Code lines: 10
Contained by: module galacticus_nodes

function: diskstandardstarformationrategetisattached
Description: Return true if the deferred function used to get the starFormationRate property of the DiskStandard component class has been attached.
Code lines: 8
Contained by: module galacticus_nodes

function: diskstandardstellarpropertieshistorycount
Description: Return a count of the number of scalar properties in the stellarPropertiesHistory property of an standard implementation of the disk component class.
Code lines: 12
Contained by: module galacticus_nodes

function: diskstandardstellarpropertieshistoryget
Description: Get the stellarPropertiesHistory property of an standard implementation of the disk component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: diskstandardstellarpropertieshistoryjcbnzr
Description: Indicate that the stellarPropertiesHistory property of an standard implementation of the disk component class is inactive for differential equation solving.
Code lines: 14
Contained by: module galacticus_nodes

subroutine: `diskstandardstellarpropertieshistoryrate`
Description: Accumulate to the rate of change of the `stellarPropertiesHistory` property of an `standard` implementation of the `disk` component class.
Code lines: 38
Contained by: module galacticus_nodes

function: `diskstandardstellarpropertieshistoryrateget`
Description: Get the rate of change of the `stellarPropertiesHistory` property of an `standard` implementation of the `disk` component class.
Code lines: 26
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: `diskstandardstellarpropertieshistoryscale`
Description: Set the absolute scale of the `stellarPropertiesHistory` property of an `standard` implementation of the `disk` component class.
Code lines: 15
Contained by: module galacticus_nodes

subroutine: `diskstandardstellarpropertieshistoryset`
Description: Set the `stellarPropertiesHistory` property of an `standard` implementation of the `disk` component class.
Code lines: 10
Contained by: module galacticus_nodes

function: `diskstandardvelocityget`
Description: Get the `velocity` property of an `standard` implementation of the `disk` component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: `diskstandardvelocityset`
Description: Set the `velocity` property of an `standard` implementation of the `disk` component class.
Code lines: 10
Contained by: module galacticus_nodes

function: `diskstarformationhistory`
Description: Returns the default value for the `starFormationHistory` property for the `disk` component class.
Code lines: 13
Contained by: module galacticus_nodes

function: `diskstarformationhistoryattributematch`
Description: Return a text list of component implementations in the `disk` class that have the desired attributes for the `starFormationHistory` property
Code lines: 28
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: `diskstarformationhistoryisgettable`

Description: Returns true if the `starFormationHistory` property is gettable for the `disk` component class.
Code lines: 8
Contained by: module `galacticus_nodes`

function: `diskstarformationhistoryrateget`
Description: Returns a zero rate for the `starFormationHistory` property for the `disk` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `diskstarformationrate`
Description: Returns the default value for the `starFormationRate` property for the `disk` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `diskstarformationrateattributematch`
Description: Return a text list of component implementations in the `disk` class that have the desired attributes for the `starFormationRate` property
Code lines: 52
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

function: `diskstarformationrateisgettable`
Description: Returns true if the `starFormationRate` property is gettable for the `disk` component class.
Code lines: 8
Contained by: module `galacticus_nodes`

Contained by: module `galacticus_nodes`

function: `diskverysimpleabundancesgascount`
Description: Return a count of the number of scalar properties in the `abundancesGas` property of an `verySimple` implementation of the `disk` component class.
Code lines: 12
Contained by: module `galacticus_nodes`

function: `diskverysimpleabundancesgasget`
Description: Get the `abundancesGas` property of an `verySimple` implementation of the `disk` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `diskverysimpleabundancesgasjcbnzr`
Description: Indicate that the `abundancesGas` property of an `verySimple` implementation of the `disk` component class is inactive for differential equation solving.
Code lines: 14
Contained by: module `galacticus_nodes`

subroutine: `diskverysimpleabundancesgasrate`
Description: Accumulate to the rate of change of the `abundancesGas` property of an `verySimple` implementation of the `disk` component class.
Code lines: 38

Contained by: module galacticus_nodes

subroutine: diskverysimpleabundancesgasrategeneric
Description: Set the rate of the abundancesGas property of the abundancesGas property of an verySimple implementation of the disk component class via a generic nodeComponent.
Code lines: 27
Contained by: module galacticus_nodes
Modules used: galacticus_error

function: diskverysimpleabundancesgasrateget
Description: Get the rate of change of the abundancesGas property of an verySimple implementation of the disk component class.
Code lines: 26
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: diskverysimpleabundancesgasscale
Description: Set the absolute scale of the abundancesGas property of an verySimple implementation of the disk component class.
Code lines: 15
Contained by: module galacticus_nodes

subroutine: diskverysimpleabundancesgasset
Description: Set the abundancesGas property of an verySimple implementation of the disk component class.
Code lines: 10
Contained by: module galacticus_nodes

function: diskverysimpleabundancesstellarcount
Description: Return a count of the number of scalar properties in the abundancesStellar property of an verySimple implementation of the disk component class.
Code lines: 12
Contained by: module galacticus_nodes

function: diskverysimpleabundancesstellarget
Description: Get the abundancesStellar property of an verySimple implementation of the disk component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: diskverysimpleabundancesstellarjcbnzr
Description: Indicate that the abundancesStellar property of an verySimple implementation of the disk component class is inactive for differential equation solving.
Code lines: 14
Contained by: module galacticus_nodes

subroutine: diskverysimpleabundancesstellarrate
Description: Accumulate to the rate of change of the abundancesStellar property of an verySimple implementation of the disk component class.
Code lines: 38
Contained by: module galacticus_nodes

function: `diskverysimpleabundancesstellarrateget`
Description: Get the rate of change of the `abundancesStellar` property of an `verySimple` implementation of the `disk` component class.
Code lines: 26
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

subroutine: `diskverysimpleabundancesstellarscale`
Description: Set the absolute scale of the `abundancesStellar` property of an `verySimple` implementation of the `disk` component class.
Code lines: 15
Contained by: module `galacticus_nodes`

subroutine: `diskverysimpleabundancesstellarset`
Description: Set the `abundancesStellar` property of an `verySimple` implementation of the `disk` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `diskverysimpleisinitializedget`
Description: Get the `isInitialized` property of an `verySimple` implementation of the `disk` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `diskverysimpleisinitializedset`
Description: Set the `isInitialized` property of an `verySimple` implementation of the `disk` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `diskverysimpleluminositiesstellarcount`
Description: Return a count of the number of scalar properties in the `luminositiesStellar` property of an `verySimple` implementation of the `disk` component class.
Code lines: 12
Contained by: module `galacticus_nodes`

function: `diskverysimpleluminositiesstellarget`
Description: Get the `luminositiesStellar` property of an `verySimple` implementation of the `disk` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `diskverysimpleluminositiesstellarjcbnzr`
Description: Indicate that the `luminositiesStellar` property of an `verySimple` implementation of the `disk` component class is inactive for differential equation solving.
Code lines: 14
Contained by: module `galacticus_nodes`

subroutine: `diskverysimpleluminositiesstellarrate`

Description: Accumulate to the rate of change of the `luminositiesStellar` property of an `verySimple` implementation of the `disk` component class.
Code lines: 38
Contained by: module `galacticus_nodes`

function: `diskverysimpleluminositiesstellarrateget`
Description: Get the rate of change of the `luminositiesStellar` property of an `verySimple` implementation of the `disk` component class.
Code lines: 26
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

subroutine: `diskverysimpleluminositiesstellarscale`
Description: Set the absolute scale of the `luminositiesStellar` property of an `verySimple` implementation of the `disk` component class.
Code lines: 15
Contained by: module `galacticus_nodes`

subroutine: `diskverysimpleluminositiesstellarset`
Description: Set the `luminositiesStellar` property of an `verySimple` implementation of the `disk` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `diskverysimplemassgascount`
Description: Return a count of the number of scalar properties in the `massGas` property of an `verySimple` implementation of the `disk` component class.
Code lines: 12
Contained by: module `galacticus_nodes`

function: `diskverysimplemassgasget`
Description: Get the `massGas` property of an `verySimple` implementation of the `disk` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `diskverysimplemassgasjcbnzr`
Description: Indicate that the `massGas` property of an `verySimple` implementation of the `disk` component class is inactive for differential equation solving.
Code lines: 12
Contained by: module `galacticus_nodes`

subroutine: `diskverysimplemassgasrate`
Description: Accumulate to the rate of change of the `massGas` property of an `verySimple` implementation of the `disk` component class.
Code lines: 31
Contained by: module `galacticus_nodes`

subroutine: `diskverysimplemassgasrategeneric`
Description: Set the rate of the `massGas` property of the `massGas` property of an `verySimple` implementation of the `disk` component class via a generic `nodeComponent`.
Code lines: 27

Contained by: module galacticus_nodes
Modules used: galacticus_error

function: diskverysimplemassgasrateget
Description: Get the rate of change of the massGas property of an verySimple implementation of the disk component class.
Code lines: 23
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: diskverysimplemassgasscale
Description: Set the absolute scale of the massGas property of an verySimple implementation of the disk component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: diskverysimplemassgasset
Description: Set the massGas property of an verySimple implementation of the disk component class.
Code lines: 10
Contained by: module galacticus_nodes

function: diskverysimplemassstellarcount
Description: Return a count of the number of scalar properties in the massStellar property of an verySimple implementation of the disk component class.
Code lines: 12
Contained by: module galacticus_nodes

function: diskverysimplemassstellarget
Description: Get the massStellar property of an verySimple implementation of the disk component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: diskverysimplemassstellarjcbnzr
Description: Indicate that the massStellar property of an verySimple implementation of the disk component class is inactive for differential equation solving.
Code lines: 12
Contained by: module galacticus_nodes

subroutine: diskverysimplemassstellarrate
Description: Accumulate to the rate of change of the massStellar property of an verySimple implementation of the disk component class.
Code lines: 31
Contained by: module galacticus_nodes

function: diskverysimplemassstellarrateget
Description: Get the rate of change of the massStellar property of an verySimple implementation of the disk component class.
Code lines: 23
Contained by: module galacticus_nodes

Modules used: galacticus_error

subroutine: diskverysimplemassstellarscale
Description: Set the absolute scale of the massStellar property of an verySimple implementation of the disk component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: diskverysimplemassstellarset
Description: Set the massStellar property of an verySimple implementation of the disk component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: diskverysimpleoutputcount
Description: Increment the count of properties to output for a verySimple implementation of the disk component.
Code lines: 24
Contained by: module galacticus_nodes

subroutine: diskverysimpleoutputnames
Description: Return the names of properties to output for a verySimple implementation of the disk component.
Code lines: 53
Contained by: module galacticus_nodes

subroutine: diskverysimplepostoutput
Description: Perform post-output processing for a verySimple implementation of the disk component.
Code lines: 12
Contained by: module galacticus_nodes

subroutine: diskverysimplesizeoutputcount
Description: Increment the count of properties to output for a verySimpleSize implementation of the disk component.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: diskverysimplesizeoutputnames
Description: Return the names of properties to output for a verySimpleSize implementation of the disk component.
Code lines: 29
Contained by: module galacticus_nodes

subroutine: diskverysimplesizepostoutput
Description: Perform post-output processing for a verySimpleSize implementation of the disk component.
Code lines: 10
Contained by: module galacticus_nodes

function: diskverysimplesizeradiusget

Description: Get the `radius` property of an `verySimpleSize` implementation of the `disk` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `diskverysimplesizeradiusset`
Description: Set the `radius` property of an `verySimpleSize` implementation of the `disk` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `diskverysimplesizevelocityget`
Description: Get the `velocity` property of an `verySimpleSize` implementation of the `disk` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `diskverysimplesizevelocityset`
Description: Set the `velocity` property of an `verySimpleSize` implementation of the `disk` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `diskverysimplestarformationrateget`
Description: Get the value of the `starFormationRate` property of the `verySimple` implementation of the `disk` component using a deferred function.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `diskverysimplestarformationrategetfunction`
Description: Set the function to be used for the `get` method of the `starFormationRate` property of the `DiskVerySimple` component.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `diskverysimplestarformationrategetisattached`
Description: Return true if the deferred function used to get the `starFormationRate` property of the `DiskVerySimple` component class has been attached.
Code lines: 8
Contained by: module `galacticus_nodes`

function: `diskverysimplestellarpropertieshistorycount`
Description: Return a count of the number of scalar properties in the `stellarPropertiesHistory` property of an `verySimple` implementation of the `disk` component class.
Code lines: 12
Contained by: module `galacticus_nodes`

function: `diskverysimplestellarpropertieshistoryget`
Description: Get the `stellarPropertiesHistory` property of an `verySimple` implementation of the `disk` component class.
Code lines: 10

Contained by: module galacticus_nodes

subroutine: diskverysimplestellarpropertieshistoryjcbnzr
Description: Indicate that the stellarPropertiesHistory property of an verySimple implementation of the disk component class is inactive for differential equation solving.
Code lines: 14
Contained by: module galacticus_nodes

subroutine: diskverysimplestellarpropertieshistoryrate
Description: Accumulate to the rate of change of the stellarPropertiesHistory property of an verySimple implementation of the disk component class.
Code lines: 38
Contained by: module galacticus_nodes

function: diskverysimplestellarpropertieshistoryrateget
Description: Get the rate of change of the stellarPropertiesHistory property of an verySimple implementation of the disk component class.
Code lines: 26
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: diskverysimplestellarpropertieshistoryscale
Description: Set the absolute scale of the stellarPropertiesHistory property of an verySimple implementation of the disk component class.
Code lines: 15
Contained by: module galacticus_nodes

subroutine: diskverysimplestellarpropertieshistoryset
Description: Set the stellarPropertiesHistory property of an verySimple implementation of the disk component class.
Code lines: 10
Contained by: module galacticus_nodes

function: dynamicsstatisticsadiabaticratio
Description: Returns the default value for the adiabaticRatio property for the dynamicsStatistics component class.
Code lines: 13
Contained by: module galacticus_nodes

function: dynamicsstatisticsadiabaticratioattributematch
Description: Return a text list of component implementations in the dynamicsStatistics class that have the desired attributes for the adiabaticRatio property
Code lines: 30
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: dynamicsstatisticsadiabaticratioisgettable
Description: Returns true if the adiabaticRatio property is gettable for the dynamicsStatistics component class.
Code lines: 8
Contained by: module galacticus_nodes

function: `dynamicsstatisticsadiabaticratiorateget`
Description: Returns a zero rate for the `adiabaticRatio` property for the `dynamicsStatistics` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `dynamicsstatisticsbarinstabilitytimescale`
Description: Returns the default value for the `barInstabilityTimescale` property for the `dynamicsStatistics` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `dynamicsstatisticsbarinstabilitytimescaleattributematch`
Description: Return a text list of component implementations in the `dynamicsStatistics` class that have the desired attributes for the `barInstabilityTimescale` property
Code lines: 30
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

function: `dynamicsstatisticsbarinstabilitytimescaleisgettable`
Description: Returns true if the `barInstabilityTimescale` property is gettable for the `dynamicsStatistics` component class.
Code lines: 8
Contained by: module `galacticus_nodes`

function: `dynamicsstatisticsbarinstabilitytimescalerateget`
Description: Returns a zero rate for the `barInstabilityTimescale` property for the `dynamicsStatistics` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `dynamicsstatisticsbarsadiabaticratioget`
Description: Get the `adiabaticRatio` property of an `bars` implementation of the `dynamicsStatistics` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `dynamicsstatisticsbarsadiabaticratioset`
Description: Set the `adiabaticRatio` property of an `bars` implementation of the `dynamicsStatistics` component class.
Code lines: 20
Contained by: module `galacticus_nodes`
Modules used: `memory_management`

function: `dynamicsstatisticsbarsbarinstabilitytimescaleget`
Description: Get the `barInstabilityTimescale` property of an `bars` implementation of the `dynamicsStatistics` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `dynamicsstatisticsbarsbarinstabilitytimescaleset`
Description: Set the `barInstabilityTimescale` property of an `bars` implementation of the `dynamicsStatistics` component class.
Code lines: 20
Contained by: module `galacticus_nodes`
Modules used: `memory_management`

subroutine: `dynamicsstatisticsbarsoutputcount`
Description: Increment the count of properties to output for a `bars` implementation of the `dynamicsStatistics` component.
Code lines: 22
Contained by: module `galacticus_nodes`

subroutine: `dynamicsstatisticsbarsoutputnames`
Description: Return the names of properties to output for a `bars` implementation of the `dynamicsStatistics` component.
Code lines: 39
Contained by: module `galacticus_nodes`

function: `dynamicsstatisticsbarstimeget`
Description: Get the `time` property of an `bars` implementation of the `dynamicsStatistics` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `dynamicsstatisticsbarstimeset`
Description: Set the `time` property of an `bars` implementation of the `dynamicsStatistics` component class.
Code lines: 20
Contained by: module `galacticus_nodes`
Modules used: `memory_management`

subroutine: `dynamicsstatisticsnulloutputcount`
Description: Increment the count of properties to output for a `null` implementation of the `dynamicsStatistics` component.
Code lines: 22
Contained by: module `galacticus_nodes`

subroutine: `dynamicsstatisticsnulloutputnames`
Description: Return the names of properties to output for a `null` implementation of the `dynamicsStatistics` component.
Code lines: 39
Contained by: module `galacticus_nodes`

subroutine: `dynamicsstatisticsoutput`
Description: Populate output buffers with properties to output for a `dynamicsStatistics` component.
Code lines: 38
Contained by: module `galacticus_nodes`
Modules used: `multi_counters`

subroutine: `dynamicsstatisticsoutputcount`
Description: Increment the count of properties to output for a generic `dynamicsStatistics` component.
Code lines: 15
Contained by: module `galacticus_nodes`

subroutine: `dynamicsstatisticsoutputnames`
Description: Establish the names of properties to output for a generic `dynamicsStatistics` component.
Code lines: 20
Contained by: module `galacticus_nodes`

subroutine: `dynamicsstatisticspostoutput`
Description: Perform post-output processing of a `dynamicsStatistics` component.
Code lines: 14
Contained by: module `galacticus_nodes`

function: `dynamicsstatisticstime`
Description: Returns the default value for the `time` property for the `dynamicsStatistics` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `dynamicsstatisticstimeattributematch`
Description: Return a text list of component implementations in the `dynamicsStatistics` class that have the desired attributes for the `time` property
Code lines: 30
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

function: `dynamicsstatisticstimeisgettable`
Description: Returns true if the `time` property is gettable for the `dynamicsStatistics` component class.
Code lines: 8
Contained by: module `galacticus_nodes`

function: `dynamicsstatisticstimerateget`
Description: Returns a zero rate for the `time` property for the `dynamicsStatistics` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `formationtimecole2000formationtime`
Description: Return the `formationTime` property of the `formationTime` component class.
Code lines: 25
Contained by: module `galacticus_nodes`

subroutine: `formationtimecole2000outputcount`
Description: Increment the count of properties to output for a `Cole2000` implementation of the `formationTime` component.
Code lines: 22
Contained by: module `galacticus_nodes`

subroutine: `formationtimecole2000outputnames`
Description: Return the names of properties to output for a `Cole2000` implementation of the `formationTime` component.
Code lines: 39
Contained by: module galacticus_nodes

function: `formationtimeformationtime`
Description: Returns the default value for the `formationTime` property for the `formationTime` component class.
Code lines: 13
Contained by: module galacticus_nodes

function: `formationtimeformationtimeattributematch`
Description: Return a text list of component implementations in the `formationTime` class that have the desired attributes for the `formationTime` property
Code lines: 41
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: `formationtimeformationtimeisgettable`
Description: Returns true if the `formationTime` property is gettable for the `formationTime` component class.
Code lines: 8
Contained by: module galacticus_nodes

function: `formationtimeformationtimerateget`
Description: Returns a zero rate for the `formationTime` property for the `formationTime` component class.
Code lines: 13
Contained by: module galacticus_nodes

function: `formationtimemassfractionformationtimeget`
Description: Get the `formationTime` property of an `massFraction` implementation of the `formationTime` component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: `formationtimemassfractionformationtimeset`
Description: Set the `formationTime` property of an `massFraction` implementation of the `formationTime` component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: `formationtimemassfractionoutputcount`
Description: Increment the count of properties to output for a `massFraction` implementation of the `formationTime` component.
Code lines: 21
Contained by: module galacticus_nodes

subroutine: `formationtimemassfractionoutputnames`

Description: Return the names of properties to output for a `massFraction` implementation of the `formationTime` component.
Code lines: 37
Contained by: module galacticus_nodes

subroutine: `formationtimenulloutputcount`
Description: Increment the count of properties to output for a `null` implementation of the `formationTime` component.
Code lines: 22
Contained by: module galacticus_nodes

subroutine: `formationtimenulloutputnames`
Description: Return the names of properties to output for a `null` implementation of the `formationTime` component.
Code lines: 39
Contained by: module galacticus_nodes

subroutine: `formationtimeoutput`
Description: Populate output buffers with properties to output for a `formationTime` component.
Code lines: 34
Contained by: module galacticus_nodes
Modules used: multi_counters

subroutine: `formationtimeoutputcount`
Description: Increment the count of properties to output for a generic `formationTime` component.
Code lines: 15
Contained by: module galacticus_nodes

subroutine: `formationtimeoutputnames`
Description: Establish the names of properties to output for a generic `formationTime` component.
Code lines: 20
Contained by: module galacticus_nodes

subroutine: `formationtimepostoutput`
Description: Perform post-output processing of a `formationTime` component.
Code lines: 14
Contained by: module galacticus_nodes

subroutine: `galacticus_nodes_unique_id_set`
Description: Resets the global unique ID number.
Code lines: 7
Contained by: module galacticus_nodes

function: `hosthistoryhostmassmaximum`
Description: Returns the default value for the `hostMassMaximum` property for the `hostHistory` component class.
Code lines: 17
Contained by: module galacticus_nodes

function: `hosthistoryhostmassmaximumattributematch`

Description: Return a text list of component implementations in the `hostHistory` class that have the desired attributes for the `hostMassMaximum` property
Code lines: 30
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

function: `hosthistoryhostmassmaximumisgettable`
Description: Returns true if the `hostMassMaximum` property is gettable for the `hostHistory` component class.
Code lines: 9
Contained by: module `galacticus_nodes`

function: `hosthistoryhostmassmaximumrateget`
Description: Returns a zero rate for the `hostMassMaximum` property for the `hostHistory` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

subroutine: `hosthistorynulloutputcount`
Description: Increment the count of properties to output for a `null` implementation of the `hostHistory` component.
Code lines: 22
Contained by: module `galacticus_nodes`

subroutine: `hosthistorynulloutputnames`
Description: Return the names of properties to output for a `null` implementation of the `hostHistory` component.
Code lines: 39
Contained by: module `galacticus_nodes`

subroutine: `hosthistoryoutput`
Description: Populate output buffers with properties to output for a `hostHistory` component.
Code lines: 34
Contained by: module `galacticus_nodes`
Modules used: `multi_counters`

subroutine: `hosthistoryoutputcount`
Description: Increment the count of properties to output for a generic `hostHistory` component.
Code lines: 15
Contained by: module `galacticus_nodes`

subroutine: `hosthistoryoutputnames`
Description: Establish the names of properties to output for a generic `hostHistory` component.
Code lines: 20
Contained by: module `galacticus_nodes`

subroutine: `hosthistorypostoutput`
Description: Perform post-output processing of a `hostHistory` component.
Code lines: 14
Contained by: module `galacticus_nodes`

function: `hosthistorystandardhostmassmaximumget`
Description: Get the `hostMassMaximum` property of an `standard` implementation of the `hostHistory` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `hosthistorystandardhostmassmaximumset`
Description: Set the `hostMassMaximum` property of an `standard` implementation of the `hostHistory` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `hosthistorystandardoutputcount`
Description: Increment the count of properties to output for a `standard` implementation of the `hostHistory` component.
Code lines: 21
Contained by: module `galacticus_nodes`

subroutine: `hosthistorystandardoutputnames`
Description: Return the names of properties to output for a `standard` implementation of the `hostHistory` component.
Code lines: 37
Contained by: module `galacticus_nodes`

function: `hothaloabundances`
Description: Returns the default value for the `abundances` property for the `hotHalo` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `hothaloabundancesattributematch`
Description: Return a text list of component implementations in the `hotHalo` class that have the desired attributes for the `abundances` property
Code lines: 64
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

function: `hothaloabundancescold`
Description: Returns the default value for the `abundancesCold` property for the `hotHalo` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `hothaloabundancescoldattributematch`
Description: Return a text list of component implementations in the `hotHalo` class that have the desired attributes for the `abundancesCold` property
Code lines: 28
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

function: `hothaloabundancescoldisgettable`

Description: Returns true if the `abundancesCold` property is gettable for the `hotHalo` component class.
Code lines: 8
Contained by: module `galacticus_nodes`

subroutine: `hothaloabundancescoldrate`
Description: Accept a rate set for the `abundancesCold` property of the `hotHalo` component class. Trigger an interrupt to create the component.
Code lines: 21
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

function: `hothaloabundancescoldrateget`
Description: Returns a zero rate for the `abundancesCold` property for the `hotHalo` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `hothaloabundancesisgettable`
Description: Returns true if the `abundances` property is gettable for the `hotHalo` component class.
Code lines: 8
Contained by: module `galacticus_nodes`

subroutine: `hothaloabundancesrate`
Description: Accept a rate set for the `abundances` property of the `hotHalo` component class. Trigger an interrupt to create the component.
Code lines: 21
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

function: `hothaloabundancesrateget`
Description: Returns a zero rate for the `abundances` property for the `hotHalo` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `hothaloangularmomentum`
Description: Returns the default value for the `angularMomentum` property for the `hotHalo` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `hothaloangularmomentumattributematch`
Description: Return a text list of component implementations in the `hotHalo` class that have the desired attributes for the `angularMomentum` property
Code lines: 46
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

function: `hothaloangularmomentumcold`
Description: Returns the default value for the `angularMomentumCold` property for the `hotHalo` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `hothaloangularmomentumcoldattributematch`
Description: Return a text list of component implementations in the `hotHalo` class that have the desired attributes for the `angularMomentumCold` property
Code lines: 28
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

function: `hothaloangularmomentumcoldisgettable`
Description: Returns true if the `angularMomentumCold` property is gettable for the `hotHalo` component class.
Code lines: 8
Contained by: module `galacticus_nodes`

subroutine: `hothaloangularmomentumcoldrate`
Description: Accept a rate set for the `angularMomentumCold` property of the `hotHalo` component class. Trigger an interrupt to create the component.
Code lines: 21
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

function: `hothaloangularmomentumcoldrateget`
Description: Returns a zero rate for the `angularMomentumCold` property for the `hotHalo` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `hothaloangularmomentumisgettable`
Description: Returns true if the `angularMomentum` property is gettable for the `hotHalo` component class.
Code lines: 8
Contained by: module `galacticus_nodes`

subroutine: `hothaloangularmomentumrate`
Description: Accept a rate set for the `angularMomentum` property of the `hotHalo` component class. Trigger an interrupt to create the component.
Code lines: 21
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

function: `hothaloangularmomentumrateget`
Description: Returns a zero rate for the `angularMomentum` property for the `hotHalo` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `hothalochemicals`
Description: Returns the default value for the `chemicals` property for the `hotHalo` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `hothalochemicalsattributematch`
Description: Return a text list of component implementations in the `hotHalo` class that have the desired attributes for the `chemicals` property
Code lines: 46
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

function: `hothalochemicalsisgettable`
Description: Returns true if the `chemicals` property is gettable for the `hotHalo` component class.
Code lines: 8
Contained by: module `galacticus_nodes`

subroutine: `hothalochemicalsrate`
Description: Accept a rate set for the `chemicals` property of the `hotHalo` component class. Trigger an interrupt to create the component.
Code lines: 21
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

function: `hothalochemicalsrateget`
Description: Returns a zero rate for the `chemicals` property for the `hotHalo` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `hothalocoldmodeabundancescoldcount`
Description: Return a count of the number of scalar properties in the `abundancesCold` property of an `coldMode` implementation of the `hotHalo` component class.
Code lines: 12
Contained by: module `galacticus_nodes`

function: `hothalocoldmodeabundancescoldget`
Description: Get the `abundancesCold` property of an `coldMode` implementation of the `hotHalo` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `hothalocoldmodeabundancescoldjcbnzr`
Description: Indicate that the `abundancesCold` property of an `coldMode` implementation of the `hotHalo` component class is inactive for differential equation solving.
Code lines: 14
Contained by: module `galacticus_nodes`

subroutine: `hothalocoldmodeabundancescoldrate`
Description: Accumulate to the rate of change of the `abundancesCold` property of an `coldMode` implementation of the `hotHalo` component class.
Code lines: 38
Contained by: module `galacticus_nodes`

function: `hothalocoldmodeabundancescoldrateget`

Description: Get the rate of change of the `abundancesCold` property of an `coldMode` implementation of the `hotHalo` component class.
Code lines: 26
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: `hothalocoldmodeabundancescoldscale`
Description: Set the absolute scale of the `abundancesCold` property of an `coldMode` implementation of the `hotHalo` component class.
Code lines: 15
Contained by: module galacticus_nodes

subroutine: `hothalocoldmodeabundancescoldset`
Description: Set the `abundancesCold` property of an `coldMode` implementation of the `hotHalo` component class.
Code lines: 10
Contained by: module galacticus_nodes

function: `hothalocoldmodeangularmomentumcoldcount`
Description: Return a count of the number of scalar properties in the `angularMomentumCold` property of an `coldMode` implementation of the `hotHalo` component class.
Code lines: 12
Contained by: module galacticus_nodes

function: `hothalocoldmodeangularmomentumcoldget`
Description: Get the `angularMomentumCold` property of an `coldMode` implementation of the `hotHalo` component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: `hothalocoldmodeangularmomentumcoldjcbnzr`
Description: Indicate that the `angularMomentumCold` property of an `coldMode` implementation of the `hotHalo` component class is inactive for differential equation solving.
Code lines: 12
Contained by: module galacticus_nodes

subroutine: `hothalocoldmodeangularmomentumcoldrate`
Description: Accumulate to the rate of change of the `angularMomentumCold` property of an `coldMode` implementation of the `hotHalo` component class.
Code lines: 31
Contained by: module galacticus_nodes

function: `hothalocoldmodeangularmomentumcoldrateget`
Description: Get the rate of change of the `angularMomentumCold` property of an `coldMode` implementation of the `hotHalo` component class.
Code lines: 23
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: `hothalocoldmodeangularmomentumcoldscale`

Description: Set the absolute scale of the `angularMomentumCold` property of an `coldMode` implementation of the `hotHalo` component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: `hothalocoldmodeangularmomentumcoldset`
Description: Set the `angularMomentumCold` property of an `coldMode` implementation of the `hotHalo` component class.
Code lines: 10
Contained by: module galacticus_nodes

function: `hothalocoldmodemasscoldcount`
Description: Return a count of the number of scalar properties in the `massCold` property of an `coldMode` implementation of the `hotHalo` component class.
Code lines: 12
Contained by: module galacticus_nodes

function: `hothalocoldmodemasscoldget`
Description: Get the `massCold` property of an `coldMode` implementation of the `hotHalo` component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: `hothalocoldmodemasscoldjcbnzr`
Description: Indicate that the `massCold` property of an `coldMode` implementation of the `hotHalo` component class is inactive for differential equation solving.
Code lines: 12
Contained by: module galacticus_nodes

subroutine: `hothalocoldmodemasscoldrate`
Description: Accumulate to the rate of change of the `massCold` property of an `coldMode` implementation of the `hotHalo` component class.
Code lines: 31
Contained by: module galacticus_nodes

function: `hothalocoldmodemasscoldrateget`
Description: Get the rate of change of the `massCold` property of an `coldMode` implementation of the `hotHalo` component class.
Code lines: 23
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: `hothalocoldmodemasscoldscale`
Description: Set the absolute scale of the `massCold` property of an `coldMode` implementation of the `hotHalo` component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: `hothalocoldmodemasscoldset`
Description: Set the `massCold` property of an `coldMode` implementation of the `hotHalo` component class.
Code lines: 10

Contained by: module galacticus_nodes

function: hothalocoldmodeouterradiusgrowthrate
Description: Call the deferred function for the outerRadiusGrowthRate method of the hotHalo component class if it has been set.
Code lines: 21
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: hothalocoldmodeouterradiusgrowthratedeferredfunctionset
Description: Set the function to be used for the outerRadiusGrowthRate method of the coldMode implementation of the hotHalo component class.
Code lines: 10
Contained by: module galacticus_nodes

function: hothalocoldmodeouterradiusgrowthratedfrrdfnctnisset
Description: Return true if the deferred function for the outerRadiusGrowthRate method of the coldMode implementation of the hotHalo component class has been set.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: hothalocoldmodeoutflowreturn
Description: Call the deferred function for the outflowReturn method of the hotHalo component class if it has been set.
Code lines: 22
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: hothalocoldmodeoutflowreturndeferredfunctionset
Description: Set the function to be used for the outflowReturn method of the coldMode implementation of the hotHalo component class.
Code lines: 10
Contained by: module galacticus_nodes

function: hothalocoldmodeoutflowreturndfrrdfnctnisset
Description: Return true if the deferred function for the outflowReturn method of the coldMode implementation of the hotHalo component class has been set.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: hothalocoldmodeoutputcount
Description: Increment the count of properties to output for a coldMode implementation of the hotHalo component.
Code lines: 16
Contained by: module galacticus_nodes

subroutine: hothalocoldmodeoutputnames
Description: Return the names of properties to output for a coldMode implementation of the hotHalo component.
Code lines: 34
Contained by: module galacticus_nodes

subroutine: `hothalocoldmodepostoutput`
Description: Perform post-output processing for a `coldMode` implementation of the `hotHalo` component.
Code lines: 11
Contained by: module galacticus_nodes

subroutine: `hothalocreatebyinterrupt`
Description: Create the `hotHalo` component of `self` via an interrupt.
Code lines: 14
Contained by: module galacticus_nodes

function: `hothaloheatsource`
Description: Returns the default value for the `heatSource` property for the `hotHalo` component class.
Code lines: 13
Contained by: module galacticus_nodes

function: `hothaloheatsourceattributematch`
Description: Return a text list of component implementations in the `hotHalo` class that have the desired attributes for the `heatSource` property
Code lines: 52
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: `hothaloheatsourceisgettable`
Description: Returns true if the `heatSource` property is gettable for the `hotHalo` component class.
Code lines: 8
Contained by: module galacticus_nodes

function: `hothaloheatsourcerateget`
Description: Returns a zero rate for the `heatSource` property for the `hotHalo` component class.
Code lines: 13
Contained by: module galacticus_nodes

function: `hothalohothalocoolingabundances`
Description: Returns the default value for the `hotHaloCoolingAbundances` property for the `hotHalo` component class.
Code lines: 13
Contained by: module galacticus_nodes

function: `hothalohothalocoolingabundancesattributematch`
Description: Return a text list of component implementations in the `hotHalo` class that have the desired attributes for the `hotHaloCoolingAbundances` property
Code lines: 74
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: `hothalohothalocoolingabundancesisgettable`
Description: Returns true if the `hotHaloCoolingAbundances` property is gettable for the `hotHalo` component class.
Code lines: 8

Contained by: module galacticus_nodes

subroutine: hothalohothalocoolingabundancesratefunction
Description: Set the function to be used for the rate method of the hotHaloCoolingAbundances property of the hotHalo component.
Code lines: 10
Contained by: module galacticus_nodes

function: hothalohothalocoolingabundancesrateget
Description: Returns a zero rate for the hotHaloCoolingAbundances property for the hotHalo component class.
Code lines: 13
Contained by: module galacticus_nodes

function: hothalohothalocoolingabundancesrateisattached
Description: Return true if the deferred function used to rate the hotHaloCoolingAbundances property of the hotHalo component class has been attached.
Code lines: 8
Contained by: module galacticus_nodes

function: hothalohothalocoolingangularmomentum
Description: Returns the default value for the hotHaloCoolingAngularMomentum property for the hotHalo component class.
Code lines: 13
Contained by: module galacticus_nodes

function: hothalohothalocoolingangularmomentumattributematch
Description: Return a text list of component implementations in the hotHalo class that have the desired attributes for the hotHaloCoolingAngularMomentum property
Code lines: 52
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: hothalohothalocoolingangularmomentumisgettable
Description: Returns true if the hotHaloCoolingAngularMomentum property is gettable for the hotHalo component class.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: hothalohothalocoolingangularmomentumratefunction
Description: Set the function to be used for the rate method of the hotHaloCoolingAngularMomentum property of the hotHalo component.
Code lines: 10
Contained by: module galacticus_nodes

function: hothalohothalocoolingangularmomentumrateget
Description: Returns a zero rate for the hotHaloCoolingAngularMomentum property for the hotHalo component class.
Code lines: 13
Contained by: module galacticus_nodes

function: `hothalohothalocoolingangularmomentumrateisattached`
Description: Return true if the deferred function used to rate the `hotHaloCoolingAngularMomentum` property of the `hotHalo` component class has been attached.
Code lines: 8
Contained by: module `galacticus_nodes`

function: `hothalohothalocoolingmass`
Description: Returns the default value for the `hotHaloCoolingMass` property for the `hotHalo` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `hothalohothalocoolingmassattributematch`
Description: Return a text list of component implementations in the `hotHalo` class that have the desired attributes for the `hotHaloCoolingMass` property
Code lines: 74
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

function: `hothalohothalocoolingmassisgettable`
Description: Returns true if the `hotHaloCoolingMass` property is gettable for the `hotHalo` component class.
Code lines: 8
Contained by: module `galacticus_nodes`

subroutine: `hothalohothalocoolingmassratefunction`
Description: Set the function to be used for the `rate` method of the `hotHaloCoolingMass` property of the `hotHalo` component.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `hothalohothalocoolingmassrateget`
Description: Returns a zero rate for the `hotHaloCoolingMass` property for the `hotHalo` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `hothalohothalocoolingmassrateisattached`
Description: Return true if the deferred function used to rate the `hotHaloCoolingMass` property of the `hotHalo` component class has been attached.
Code lines: 8
Contained by: module `galacticus_nodes`

function: `hothaloisinitialized`
Description: Returns the default value for the `isInitialized` property for the `hotHalo` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `hothaloisinitializedattributematch`
Description: Return a text list of component implementations in the `hotHalo` class that have the desired attributes for the `isInitialized` property

Code lines: 52
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: hothaloisinitializedisgettable
Description: Returns true if the isInitialized property is gettable for the hotHalo component class.
Code lines: 8
Contained by: module galacticus_nodes

function: hothaloisinitializedrateget
Description: Returns a zero rate for the isInitialized property for the hotHalo component class.
Code lines: 13
Contained by: module galacticus_nodes

function: hothalomass
Description: Returns the default value for the mass property for the hotHalo component class.
Code lines: 13
Contained by: module galacticus_nodes

function: hothalomassattributematch
Description: Return a text list of component implementations in the hotHalo class that have the desired attributes for the mass property
Code lines: 64
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: hothalomasscold
Description: Returns the default value for the massCold property for the hotHalo component class.
Code lines: 13
Contained by: module galacticus_nodes

function: hothalomasscoldattributematch
Description: Return a text list of component implementations in the hotHalo class that have the desired attributes for the massCold property
Code lines: 28
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: hothalomasscoldisgettable
Description: Returns true if the massCold property is gettable for the hotHalo component class.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: hothalomasscoldrate
Description: Accept a rate set for the massCold property of the hotHalo component class. Trigger an interrupt to create the component.
Code lines: 21
Contained by: module galacticus_nodes
Modules used: galacticus_error

function: `hothalomasscoldrateget`
Description: Returns a zero rate for the `massCold` property for the `hotHalo` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `hothalomassisgettable`
Description: Returns true if the `mass` property is gettable for the `hotHalo` component class.
Code lines: 8
Contained by: module `galacticus_nodes`

subroutine: `hothalomassrate`
Description: Accept a rate set for the `mass` property of the `hotHalo` component class. Trigger an interrupt to create the component.
Code lines: 21
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

function: `hothalomassrateget`
Description: Returns a zero rate for the `mass` property for the `hotHalo` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `hothalomasssink`
Description: Returns the default value for the `massSink` property for the `hotHalo` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `hothalomasssinkattributematch`
Description: Return a text list of component implementations in the `hotHalo` class that have the desired attributes for the `massSink` property
Code lines: 52
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

function: `hothalomasssinkisgettable`
Description: Returns true if the `massSink` property is gettable for the `hotHalo` component class.
Code lines: 8
Contained by: module `galacticus_nodes`

function: `hothalomasssinkrateget`
Description: Returns a zero rate for the `massSink` property for the `hotHalo` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `hothalomasstotal`
Description: Returns the default value for the `massTotal` property for the `hotHalo` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `hothalomasstotalattributematch`
Description: Return a text list of component implementations in the `hotHalo` class that have the desired attributes for the `massTotal` property
Code lines: 52
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

function: `hothalomasstotalisgettable`
Description: Returns true if the `massTotal` property is gettable for the `hotHalo` component class.
Code lines: 8
Contained by: module `galacticus_nodes`

function: `hothalomasstotalrateget`
Description: Returns a zero rate for the `massTotal` property for the `hotHalo` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

subroutine: `hothalonulloutputcount`
Description: Increment the count of properties to output for a `null` implementation of the `hotHalo` component.
Code lines: 22
Contained by: module `galacticus_nodes`

subroutine: `hothalonulloutputnames`
Description: Return the names of properties to output for a `null` implementation of the `hotHalo` component.
Code lines: 39
Contained by: module `galacticus_nodes`

function: `hothaloouterradius`
Description: Returns the default value for the `outerRadius` property for the `hotHalo` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `hothaloouterradiusattributematch`
Description: Return a text list of component implementations in the `hotHalo` class that have the desired attributes for the `outerRadius` property
Code lines: 68
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

function: `hothaloouterradiusisgettable`
Description: Returns true if the `outerRadius` property is gettable for the `hotHalo` component class.
Code lines: 8
Contained by: module `galacticus_nodes`

function: `hothaloouterradiusrateget`
Description: Returns a zero rate for the `outerRadius` property for the `hotHalo` component class.
Code lines: 13

Contained by: module galacticus_nodes

function: hothalooutflowedabundances
Description: Returns the default value for the outflowedAbundances property for the hotHalo component class.
Code lines: 13
Contained by: module galacticus_nodes

function: hothalooutflowedabundancesattributematch
Description: Return a text list of component implementations in the hotHalo class that have the desired attributes for the outflowedAbundances property
Code lines: 55
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: hothalooutflowedabundancesisgettable
Description: Returns true if the outflowedAbundances property is gettable for the hotHalo component class.
Code lines: 8
Contained by: module galacticus_nodes

function: hothalooutflowedabundancesrateget
Description: Returns a zero rate for the outflowedAbundances property for the hotHalo component class.
Code lines: 13
Contained by: module galacticus_nodes

function: hothalooutflowedangularmomentum
Description: Returns the default value for the outflowedAngularMomentum property for the hotHalo component class.
Code lines: 13
Contained by: module galacticus_nodes

function: hothalooutflowedangularmomentumattributematch
Description: Return a text list of component implementations in the hotHalo class that have the desired attributes for the outflowedAngularMomentum property
Code lines: 46
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: hothalooutflowedangularmomentumisgettable
Description: Returns true if the outflowedAngularMomentum property is gettable for the hotHalo component class.
Code lines: 8
Contained by: module galacticus_nodes

function: hothalooutflowedangularmomentumrateget
Description: Returns a zero rate for the outflowedAngularMomentum property for the hotHalo component class.
Code lines: 13
Contained by: module galacticus_nodes

function: `hothalooutflowedmass`
Description: Returns the default value for the `outflowedMass` property for the `hotHalo` component class.
Code lines: 13
Contained by: module galacticus_nodes

function: `hothalooutflowedmassattributematch`
Description: Return a text list of component implementations in the `hotHalo` class that have the desired attributes for the `outflowedMass` property
Code lines: 55
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: `hothalooutflowedmassisgettable`
Description: Returns true if the `outflowedMass` property is gettable for the `hotHalo` component class.
Code lines: 8
Contained by: module galacticus_nodes

function: `hothalooutflowedmassrateget`
Description: Returns a zero rate for the `outflowedMass` property for the `hotHalo` component class.
Code lines: 13
Contained by: module galacticus_nodes

function: `hothalooutflowingabundances`
Description: Returns the default value for the `outflowingAbundances` property for the `hotHalo` component class.
Code lines: 13
Contained by: module galacticus_nodes

function: `hothalooutflowingabundancesattributematch`
Description: Return a text list of component implementations in the `hotHalo` class that have the desired attributes for the `outflowingAbundances` property
Code lines: 74
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: `hothalooutflowingabundancesisgettable`
Description: Returns true if the `outflowingAbundances` property is gettable for the `hotHalo` component class.
Code lines: 8
Contained by: module galacticus_nodes

function: `hothalooutflowingabundancesrateget`
Description: Returns a zero rate for the `outflowingAbundances` property for the `hotHalo` component class.
Code lines: 13
Contained by: module galacticus_nodes

function: `hothalooutflowingangularmomentum`
Description: Returns the default value for the `outflowingAngularMomentum` property for the `hotHalo` component class.

Code lines: 13
Contained by: module galacticus_nodes

function: hothalooutflowingangularmomentumattributematch
Description: Return a text list of component implementations in the hotHalo class that have the desired attributes for the outflowingAngularMomentum property
Code lines: 52
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: hothalooutflowingangularmomentumisgettable
Description: Returns true if the outflowingAngularMomentum property is gettable for the hotHalo component class.
Code lines: 8
Contained by: module galacticus_nodes

function: hothalooutflowingangularmomentumrateget
Description: Returns a zero rate for the outflowingAngularMomentum property for the hotHalo component class.
Code lines: 13
Contained by: module galacticus_nodes

function: hothalooutflowingmass
Description: Returns the default value for the outflowingMass property for the hotHalo component class.
Code lines: 13
Contained by: module galacticus_nodes

function: hothalooutflowingmassattributematch
Description: Return a text list of component implementations in the hotHalo class that have the desired attributes for the outflowingMass property
Code lines: 74
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: hothalooutflowingmassisgettable
Description: Returns true if the outflowingMass property is gettable for the hotHalo component class.
Code lines: 8
Contained by: module galacticus_nodes

function: hothalooutflowingmassrateget
Description: Returns a zero rate for the outflowingMass property for the hotHalo component class.
Code lines: 13
Contained by: module galacticus_nodes

function: hothalooutflowtrackingouterradiusgrowthrate
Description: Call the deferred function for the outerRadiusGrowthRate method of the hotHalo component class if it has been set.
Code lines: 21
Contained by: module galacticus_nodes

Modules used: galacticus_error

subroutine: hothalooutflowtrackingouterradiusgrowthratedeferredfunctionset
Description: Set the function to be used for the outerRadiusGrowthRate method of the outflowTracking implementation of the hotHalo component class.
Code lines: 10
Contained by: module galacticus_nodes

function: hothalooutflowtrackingouterradiusgrowthratedfrrdfnctnisset
Description: Return true if the deferred function for the outerRadiusGrowthRate method of the outflowTracking implementation of the hotHalo component class has been set.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: hothalooutflowtrackingoutflowreturn
Description: Call the deferred function for the outflowReturn method of the hotHalo component class if it has been set.
Code lines: 22
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: hothalooutflowtrackingoutflowreturndeferredfunctionset
Description: Set the function to be used for the outflowReturn method of the outflowTracking implementation of the hotHalo component class.
Code lines: 10
Contained by: module galacticus_nodes

function: hothalooutflowtrackingoutflowreturndfrrdfnctnisset
Description: Return true if the deferred function for the outflowReturn method of the outflowTracking implementation of the hotHalo component class has been set.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: hothalooutflowtrackingoutputcount
Description: Increment the count of properties to output for a outflowTracking implementation of the hotHalo component.
Code lines: 16
Contained by: module galacticus_nodes

subroutine: hothalooutflowtrackingoutputnames
Description: Return the names of properties to output for a outflowTracking implementation of the hotHalo component.
Code lines: 28
Contained by: module galacticus_nodes

subroutine: hothalooutflowtrackingpostoutput
Description: Perform post-output processing for a outflowTracking implementation of the hotHalo component.
Code lines: 11
Contained by: module galacticus_nodes

function: `hothalooutflowtrackingtrackedoutflowabundancescount`
Description: Return a count of the number of scalar properties in the `trackedOutflowAbundances` property of an `outflowTracking` implementation of the `hotHalo` component class.
Code lines: 12
Contained by: module galacticus_nodes

function: `hothalooutflowtrackingtrackedoutflowabundancesget`
Description: Get the `trackedOutflowAbundances` property of an `outflowTracking` implementation of the `hotHalo` component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: `hothalooutflowtrackingtrackedoutflowabundancesjcbnzr`
Description: Indicate that the `trackedOutflowAbundances` property of an `outflowTracking` implementation of the `hotHalo` component class is inactive for differential equation solving.
Code lines: 14
Contained by: module galacticus_nodes

subroutine: `hothalooutflowtrackingtrackedoutflowabundancesrate`
Description: Accumulate to the rate of change of the `trackedOutflowAbundances` property of an `outflowTracking` implementation of the `hotHalo` component class.
Code lines: 38
Contained by: module galacticus_nodes

function: `hothalooutflowtrackingtrackedoutflowabundancesrateget`
Description: Get the rate of change of the `trackedOutflowAbundances` property of an `outflowTracking` implementation of the `hotHalo` component class.
Code lines: 26
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: `hothalooutflowtrackingtrackedoutflowabundancesscale`
Description: Set the absolute scale of the `trackedOutflowAbundances` property of an `outflowTracking` implementation of the `hotHalo` component class.
Code lines: 15
Contained by: module galacticus_nodes

subroutine: `hothalooutflowtrackingtrackedoutflowabundancesset`
Description: Set the `trackedOutflowAbundances` property of an `outflowTracking` implementation of the `hotHalo` component class.
Code lines: 10
Contained by: module galacticus_nodes

function: `hothalooutflowtrackingtrackedoutflowmasscount`
Description: Return a count of the number of scalar properties in the `trackedOutflowMass` property of an `outflowTracking` implementation of the `hotHalo` component class.
Code lines: 12
Contained by: module galacticus_nodes

function: `hothalooutflowtrackingtrackedoutflowmassget`
Description: Get the `trackedOutflowMass` property of an `outflowTracking` implementation of the `hotHalo` component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: `hothalooutflowtrackingtrackedoutflowmassjcbnzr`
Description: Indicate that the `trackedOutflowMass` property of an `outflowTracking` implementation of the `hotHalo` component class is inactive for differential equation solving.
Code lines: 12
Contained by: module galacticus_nodes

subroutine: `hothalooutflowtrackingtrackedoutflowmassrate`
Description: Accumulate to the rate of change of the `trackedOutflowMass` property of an `outflowTracking` implementation of the `hotHalo` component class.
Code lines: 31
Contained by: module galacticus_nodes

function: `hothalooutflowtrackingtrackedoutflowmassrateget`
Description: Get the rate of change of the `trackedOutflowMass` property of an `outflowTracking` implementation of the `hotHalo` component class.
Code lines: 23
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: `hothalooutflowtrackingtrackedoutflowmassscale`
Description: Set the absolute scale of the `trackedOutflowMass` property of an `outflowTracking` implementation of the `hotHalo` component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: `hothalooutflowtrackingtrackedoutflowmassset`
Description: Set the `trackedOutflowMass` property of an `outflowTracking` implementation of the `hotHalo` component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: `hothalooutput`
Description: Populate output buffers with properties to output for a `hotHalo` component.
Code lines: 75
Contained by: module galacticus_nodes
Modules used: multi_counters

subroutine: `hothalooutputcount`
Description: Increment the count of properties to output for a generic `hotHalo` component.
Code lines: 15
Contained by: module galacticus_nodes

subroutine: `hothalooutputnames`
Description: Establish the names of properties to output for a generic `hotHalo` component.
Code lines: 20
Contained by: module `galacticus_nodes`

subroutine: `hothalopostoutput`
Description: Perform post-output processing of a `hotHalo` component.
Code lines: 14
Contained by: module `galacticus_nodes`

function: `hothalostandardabundancescount`
Description: Return a count of the number of scalar properties in the `abundances` property of an `standard` implementation of the `hotHalo` component class.
Code lines: 12
Contained by: module `galacticus_nodes`

function: `hothalostandardabundancesget`
Description: Get the `abundances` property of an `standard` implementation of the `hotHalo` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `hothalostandardabundancesjcbnzr`
Description: Indicate that the `abundances` property of an `standard` implementation of the `hotHalo` component class is inactive for differential equation solving.
Code lines: 14
Contained by: module `galacticus_nodes`

subroutine: `hothalostandardabundancesrate`
Description: Accumulate to the rate of change of the `abundances` property of an `standard` implementation of the `hotHalo` component class.
Code lines: 38
Contained by: module `galacticus_nodes`

function: `hothalostandardabundancesrateget`
Description: Get the rate of change of the `abundances` property of an `standard` implementation of the `hotHalo` component class.
Code lines: 26
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

subroutine: `hothalostandardabundancesscale`
Description: Set the absolute scale of the `abundances` property of an `standard` implementation of the `hotHalo` component class.
Code lines: 15
Contained by: module `galacticus_nodes`

subroutine: `hothalostandardabundancesset`
Description: Set the `abundances` property of an `standard` implementation of the `hotHalo` component class.

Code lines: 10
Contained by: module galacticus_nodes

function: hothalostandardangularmomentumcount
Description: Return a count of the number of scalar properties in the angularMomentum property of an standard implementation of the hotHalo component class.
Code lines: 12
Contained by: module galacticus_nodes

function: hothalostandardangularmomentumget
Description: Get the angularMomentum property of an standard implementation of the hotHalo component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: hothalostandardangularmomentumjcbnzr
Description: Indicate that the angularMomentum property of an standard implementation of the hotHalo component class is inactive for differential equation solving.
Code lines: 12
Contained by: module galacticus_nodes

subroutine: hothalostandardangularmomentumrate
Description: Accumulate to the rate of change of the angularMomentum property of an standard implementation of the hotHalo component class.
Code lines: 31
Contained by: module galacticus_nodes

function: hothalostandardangularmomentumrateget
Description: Get the rate of change of the angularMomentum property of an standard implementation of the hotHalo component class.
Code lines: 23
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: hothalostandardangularmomentumscale
Description: Set the absolute scale of the angularMomentum property of an standard implementation of the hotHalo component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: hothalostandardangularmomentumset
Description: Set the angularMomentum property of an standard implementation of the hotHalo component class.
Code lines: 10
Contained by: module galacticus_nodes

function: hothalostandardchemicalscount
Description: Return a count of the number of scalar properties in the chemicals property of an standard implementation of the hotHalo component class.
Code lines: 12
Contained by: module galacticus_nodes

function: `hothalostandardchemicalsget`
Description: Get the `chemicals` property of an `standard` implementation of the `hotHalo` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `hothalostandardchemicalsjcbnzr`
Description: Indicate that the `chemicals` property of an `standard` implementation of the `hotHalo` component class is inactive for differential equation solving.
Code lines: 14
Contained by: module `galacticus_nodes`

subroutine: `hothalostandardchemicalsrate`
Description: Accumulate to the rate of change of the `chemicals` property of an `standard` implementation of the `hotHalo` component class.
Code lines: 38
Contained by: module `galacticus_nodes`

function: `hothalostandardchemicalsrateget`
Description: Get the rate of change of the `chemicals` property of an `standard` implementation of the `hotHalo` component class.
Code lines: 26
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

subroutine: `hothalostandardchemicalsscale`
Description: Set the absolute scale of the `chemicals` property of an `standard` implementation of the `hotHalo` component class.
Code lines: 15
Contained by: module `galacticus_nodes`

subroutine: `hothalostandardchemicalsset`
Description: Set the `chemicals` property of an `standard` implementation of the `hotHalo` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `hothalostandardcreatefunctionset`
Description: Set the create function for the `standard` implementation of the `hotHalo` component class.
Code lines: 9
Contained by: module `galacticus_nodes`

subroutine: `hothalostandardheatsourcerate`
Description: Accumulate the rate of change of the `heatSource` property of the `standard` implementation of the `hotHalo` component using a deferred function.
Code lines: 12
Contained by: module `galacticus_nodes`

subroutine: `hothalostandardheatsourceratefunction`
Description: Set the function to be used for the `rate` method of the `heatSource` property of the `HotHaloStandard` component.

Code lines: 10
Contained by: module galacticus_nodes

function: hothalostandardheatsourcerateisattached
Description: Return true if the deferred function used to rate the heatSource property of the HotHaloStandard component class has been attached.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: hothalostandardhothalocoolingabundancesrate
Description: Accumulate the rate of change of the hotHaloCoolingAbundances property of the standard implementation of the hotHalo component using a deferred function.
Code lines: 12
Contained by: module galacticus_nodes

subroutine: hothalostandardhothalocoolingangularmomentumrate
Description: Accumulate the rate of change of the hotHaloCoolingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.
Code lines: 12
Contained by: module galacticus_nodes

subroutine: hothalostandardhothalocoolingmassrate
Description: Accumulate the rate of change of the hotHaloCoolingMass property of the standard implementation of the hotHalo component using a deferred function.
Code lines: 12
Contained by: module galacticus_nodes

function: hothalostandardisinitializedget
Description: Get the isInitialized property of an standard implementation of the hotHalo component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: hothalostandardisinitializedset
Description: Set the isInitialized property of an standard implementation of the hotHalo component class.
Code lines: 10
Contained by: module galacticus_nodes

function: hothalostandardmasscount
Description: Return a count of the number of scalar properties in the mass property of an standard implementation of the hotHalo component class.
Code lines: 12
Contained by: module galacticus_nodes

function: hothalostandardmassget
Description: Get the mass property of an standard implementation of the hotHalo component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: `hothalostandardmassjcbnzr`
Description: Indicate that the `mass` property of an `standard` implementation of the `hotHalo` component class is inactive for differential equation solving.
Code lines: 12
Contained by: module `galacticus_nodes`

subroutine: `hothalostandardmassrate`
Description: Accumulate to the rate of change of the `mass` property of an `standard` implementation of the `hotHalo` component class.
Code lines: 31
Contained by: module `galacticus_nodes`

function: `hothalostandardmassrateget`
Description: Get the rate of change of the `mass` property of an `standard` implementation of the `hotHalo` component class.
Code lines: 23
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

subroutine: `hothalostandardmassscale`
Description: Set the absolute scale of the `mass` property of an `standard` implementation of the `hotHalo` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

subroutine: `hothalostandardmassset`
Description: Set the `mass` property of an `standard` implementation of the `hotHalo` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `hothalostandardmasssinkrate`
Description: Accumulate the rate of change of the `massSink` property of the `standard` implementation of the `hotHalo` component using a deferred function.
Code lines: 12
Contained by: module `galacticus_nodes`

subroutine: `hothalostandardmasssinkratefunction`
Description: Set the function to be used for the `rate` method of the `massSink` property of the `HotHaloStandard` component.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `hothalostandardmasssinkrateisattached`
Description: Return true if the deferred function used to rate the `massSink` property of the `HotHaloStandard` component class has been attached.
Code lines: 8
Contained by: module `galacticus_nodes`

function: `hothalostandardouterradiuscount`
Description: Return a count of the number of scalar properties in the `outerRadius` property of an `standard` implementation of the `hotHalo` component class.

Code lines: 12
Contained by: module galacticus_nodes

function: hothalostandardouterradiusget
Description: Get the value of the outerRadius property of the standard implementation of the hotHalo component using a deferred function.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: hothalostandardouterradiusgetfunction
Description: Set the function to be used for the get method of the outerRadius property of the HotHaloStandard component.
Code lines: 10
Contained by: module galacticus_nodes

function: hothalostandardouterradiusgetisattached
Description: Return true if the deferred function used to get the outerRadius property of the HotHaloStandard component class has been attached.
Code lines: 8
Contained by: module galacticus_nodes

function: hothalostandardouterradiusgetvalue
Description: Get the outerRadius property of an standard implementation of the hotHalo component class.
Code lines: 10
Contained by: module galacticus_nodes

function: hothalostandardouterradiusgrowthrate
Description: Call the deferred function for the outerRadiusGrowthRate method of the hotHalo component class if it has been set.
Code lines: 22
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: hothalostandardouterradiusgrowthratedeferredfunctionset
Description: Set the function to be used for the outerRadiusGrowthRate method of the standard implementation of the hotHalo component class.
Code lines: 10
Contained by: module galacticus_nodes

function: hothalostandardouterradiusgrowthratedfrrdfnctnisset
Description: Return true if the deferred function for the outerRadiusGrowthRate method of the standard implementation of the hotHalo component class has been set.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: hothalostandardouterradiusjcbnzr
Description: Indicate that the outerRadius property of an standard implementation of the hotHalo component class is inactive for differential equation solving.
Code lines: 12
Contained by: module galacticus_nodes

subroutine: `hothalostandardouterradiusrate`
Description: Accumulate to the rate of change of the `outerRadius` property of an `standard` implementation of the `hotHalo` component class.
Code lines: 31
Contained by: module `galacticus_nodes`

function: `hothalostandardouterradiusrateget`
Description: Get the rate of change of the `outerRadius` property of an `standard` implementation of the `hotHalo` component class.
Code lines: 23
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

subroutine: `hothalostandardouterradiusscale`
Description: Set the absolute scale of the `outerRadius` property of an `standard` implementation of the `hotHalo` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

subroutine: `hothalostandardouterradiusset`
Description: Set the `outerRadius` property of an `standard` implementation of the `hotHalo` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `hothalostandardoutflowedabundancescount`
Description: Return a count of the number of scalar properties in the `outflowedAbundances` property of an `standard` implementation of the `hotHalo` component class.
Code lines: 12
Contained by: module `galacticus_nodes`

function: `hothalostandardoutflowedabundancesget`
Description: Get the `outflowedAbundances` property of an `standard` implementation of the `hotHalo` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `hothalostandardoutflowedabundancesjcbnzr`
Description: Indicate that the `outflowedAbundances` property of an `standard` implementation of the `hotHalo` component class is inactive for differential equation solving.
Code lines: 14
Contained by: module `galacticus_nodes`

subroutine: `hothalostandardoutflowedabundancesrate`
Description: Accumulate to the rate of change of the `outflowedAbundances` property of an `standard` implementation of the `hotHalo` component class.
Code lines: 38
Contained by: module `galacticus_nodes`

function: `hothalostandardoutflowedabundancesrateget`

Description: Get the rate of change of the `outflowedAbundances` property of an `standard` implementation of the `hotHalo` component class.
Code lines: 26
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: `hothalostandardoutflowedabundancesscale`
Description: Set the absolute scale of the `outflowedAbundances` property of an `standard` implementation of the `hotHalo` component class.
Code lines: 15
Contained by: module galacticus_nodes

subroutine: `hothalostandardoutflowedabundancesset`
Description: Set the `outflowedAbundances` property of an `standard` implementation of the `hotHalo` component class.
Code lines: 10
Contained by: module galacticus_nodes

function: `hothalostandardoutflowedangularmomentumcount`
Description: Return a count of the number of scalar properties in the `outflowedAngularMomentum` property of an `standard` implementation of the `hotHalo` component class.
Code lines: 12
Contained by: module galacticus_nodes

function: `hothalostandardoutflowedangularmomentumget`
Description: Get the `outflowedAngularMomentum` property of an `standard` implementation of the `hotHalo` component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: `hothalostandardoutflowedangularmomentumjcbnzr`
Description: Indicate that the `outflowedAngularMomentum` property of an `standard` implementation of the `hotHalo` component class is inactive for differential equation solving.
Code lines: 12
Contained by: module galacticus_nodes

subroutine: `hothalostandardoutflowedangularmomentumrate`
Description: Accumulate to the rate of change of the `outflowedAngularMomentum` property of an `standard` implementation of the `hotHalo` component class.
Code lines: 31
Contained by: module galacticus_nodes

function: `hothalostandardoutflowedangularmomentumrateget`
Description: Get the rate of change of the `outflowedAngularMomentum` property of an `standard` implementation of the `hotHalo` component class.
Code lines: 23
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: `hothalostandardoutflowedangularmomentumscale`

Description: Set the absolute scale of the `outflowedAngularMomentum` property of an `standard` implementation of the `hotHalo` component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: `hothalostandardoutflowedangularmomentumset`
Description: Set the `outflowedAngularMomentum` property of an `standard` implementation of the `hotHalo` component class.
Code lines: 10
Contained by: module galacticus_nodes

function: `hothalostandardoutflowedmasscount`
Description: Return a count of the number of scalar properties in the `outflowedMass` property of an `standard` implementation of the `hotHalo` component class.
Code lines: 12
Contained by: module galacticus_nodes

function: `hothalostandardoutflowedmassget`
Description: Get the `outflowedMass` property of an `standard` implementation of the `hotHalo` component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: `hothalostandardoutflowedmassjcbnzr`
Description: Indicate that the `outflowedMass` property of an `standard` implementation of the `hotHalo` component class is inactive for differential equation solving.
Code lines: 12
Contained by: module galacticus_nodes

subroutine: `hothalostandardoutflowedmassrate`
Description: Accumulate to the rate of change of the `outflowedMass` property of an `standard` implementation of the `hotHalo` component class.
Code lines: 31
Contained by: module galacticus_nodes

function: `hothalostandardoutflowedmassrateget`
Description: Get the rate of change of the `outflowedMass` property of an `standard` implementation of the `hotHalo` component class.
Code lines: 23
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: `hothalostandardoutflowedmassscale`
Description: Set the absolute scale of the `outflowedMass` property of an `standard` implementation of the `hotHalo` component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: `hothalostandardoutflowedmassset`
Description: Set the `outflowedMass` property of an `standard` implementation of the `hotHalo` component class.
Code lines: 10

Contained by: module galacticus_nodes

subroutine: hothalostandardoutflowingabundancesrate
Description: Accumulate the rate of change of the outflowingAbundances property of the standard implementation of the hotHalo component using a deferred function.
Code lines: 12
Contained by: module galacticus_nodes

subroutine: hothalostandardoutflowingabundancesratefunction
Description: Set the function to be used for the rate method of the outflowingAbundances property of the HotHaloStandard component.
Code lines: 10
Contained by: module galacticus_nodes

function: hothalostandardoutflowingabundancesrateisattached
Description: Return true if the deferred function used to rate the outflowingAbundances property of the HotHaloStandard component class has been attached.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: hothalostandardoutflowingangularmomentumrate
Description: Accumulate the rate of change of the outflowingAngularMomentum property of the standard implementation of the hotHalo component using a deferred function.
Code lines: 12
Contained by: module galacticus_nodes

subroutine: hothalostandardoutflowingangularmomentumratefunction
Description: Set the function to be used for the rate method of the outflowingAngularMomentum property of the HotHaloStandard component.
Code lines: 10
Contained by: module galacticus_nodes

function: hothalostandardoutflowingangularmomentumrateisattached
Description: Return true if the deferred function used to rate the outflowingAngularMomentum property of the HotHaloStandard component class has been attached.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: hothalostandardoutflowingmassrate
Description: Accumulate the rate of change of the outflowingMass property of the standard implementation of the hotHalo component using a deferred function.
Code lines: 12
Contained by: module galacticus_nodes

subroutine: hothalostandardoutflowingmassratefunction
Description: Set the function to be used for the rate method of the outflowingMass property of the HotHaloStandard component.
Code lines: 10
Contained by: module galacticus_nodes

function: `hothalostandardoutflowingmassrateisattached`
Description: Return true if the deferred function used to rate the `outflowingMass` property of the `HotHaloStandard` component class has been attached.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: `hothalostandardoutflowreturn`
Description: Call the deferred function for the `outflowReturn` method of the `hotHalo` component class if it has been set.
Code lines: 22
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: `hothalostandardoutflowreturndeferredfunctionset`
Description: Set the function to be used for the `outflowReturn` method of the `standard` implementation of the `hotHalo` component class.
Code lines: 10
Contained by: module galacticus_nodes

function: `hothalostandardoutflowreturndfrrdfnctnisset`
Description: Return true if the deferred function for the `outflowReturn` method of the `standard` implementation of the `hotHalo` component class has been set.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: `hothalostandardoutputcount`
Description: Increment the count of properties to output for a `standard` implementation of the `hotHalo` component.
Code lines: 20
Contained by: module galacticus_nodes

subroutine: `hothalostandardoutputnames`
Description: Return the names of properties to output for a `standard` implementation of the `hotHalo` component.
Code lines: 64
Contained by: module galacticus_nodes

subroutine: `hothalostandardpostoutput`
Description: Perform post-output processing for a `standard` implementation of the `hotHalo` component.
Code lines: 11
Contained by: module galacticus_nodes

function: `hothalostandardstrippedabundancescount`
Description: Return a count of the number of scalar properties in the `strippedAbundances` property of an `standard` implementation of the `hotHalo` component class.
Code lines: 12
Contained by: module galacticus_nodes

function: `hothalostandardstrippedabundancesget`

Description: Get the `strippedAbundances` property of an `standard` implementation of the `hotHalo` component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: `hothalostandardstrippedabundancesjcbnzr`
Description: Indicate that the `strippedAbundances` property of an `standard` implementation of the `hotHalo` component class is inactive for differential equation solving.
Code lines: 14
Contained by: module galacticus_nodes

subroutine: `hothalostandardstrippedabundancesrate`
Description: Accumulate to the rate of change of the `strippedAbundances` property of an `standard` implementation of the `hotHalo` component class.
Code lines: 38
Contained by: module galacticus_nodes

function: `hothalostandardstrippedabundancesrateget`
Description: Get the rate of change of the `strippedAbundances` property of an `standard` implementation of the `hotHalo` component class.
Code lines: 26
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: `hothalostandardstrippedabundancesscale`
Description: Set the absolute scale of the `strippedAbundances` property of an `standard` implementation of the `hotHalo` component class.
Code lines: 15
Contained by: module galacticus_nodes

subroutine: `hothalostandardstrippedabundancesset`
Description: Set the `strippedAbundances` property of an `standard` implementation of the `hotHalo` component class.
Code lines: 10
Contained by: module galacticus_nodes

function: `hothalostandardstrippedmasscount`
Description: Return a count of the number of scalar properties in the `strippedMass` property of an `standard` implementation of the `hotHalo` component class.
Code lines: 12
Contained by: module galacticus_nodes

function: `hothalostandardstrippedmassget`
Description: Get the `strippedMass` property of an `standard` implementation of the `hotHalo` component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: `hothalostandardstrippedmassjcbnzr`
Description: Indicate that the `strippedMass` property of an `standard` implementation of the `hotHalo` component class is inactive for differential equation solving.

Code lines: 12
Contained by: module galacticus_nodes

subroutine: hothalostandardstrippedmassrate
Description: Accumulate to the rate of change of the strippedMass property of an standard implementation of the hotHalo component class.
Code lines: 31
Contained by: module galacticus_nodes

function: hothalostandardstrippedmassrateget
Description: Get the rate of change of the strippedMass property of an standard implementation of the hotHalo component class.
Code lines: 23
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: hothalostandardstrippedmassscale
Description: Set the absolute scale of the strippedMass property of an standard implementation of the hotHalo component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: hothalostandardstrippedmassset
Description: Set the strippedMass property of an standard implementation of the hotHalo component class.
Code lines: 10
Contained by: module galacticus_nodes

function: hothalostandardunaccretedmasscount
Description: Return a count of the number of scalar properties in the unaccretedMass property of an standard implementation of the hotHalo component class.
Code lines: 12
Contained by: module galacticus_nodes

function: hothalostandardunaccretedmassget
Description: Get the unaccretedMass property of an standard implementation of the hotHalo component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: hothalostandardunaccretedmassjcbnzr
Description: Indicate that the unaccretedMass property of an standard implementation of the hotHalo component class is inactive for differential equation solving.
Code lines: 12
Contained by: module galacticus_nodes

subroutine: hothalostandardunaccretedmassrate
Description: Accumulate to the rate of change of the unaccretedMass property of an standard implementation of the hotHalo component class.
Code lines: 31
Contained by: module galacticus_nodes

function: `hothalostandardunaccretedmassrateget`
Description: Get the rate of change of the `unaccretedMass` property of an `standard` implementation of the `hotHalo` component class.
Code lines: 23
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

subroutine: `hothalostandardunaccretedmassscale`
Description: Set the absolute scale of the `unaccretedMass` property of an `standard` implementation of the `hotHalo` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

subroutine: `hothalostandardunaccretedmassset`
Description: Set the `unaccretedMass` property of an `standard` implementation of the `hotHalo` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `hothalostrippedabundances`
Description: Returns the default value for the `strippedAbundances` property for the `hotHalo` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `hothalostrippedabundancesattributematch`
Description: Return a text list of component implementations in the `hotHalo` class that have the desired attributes for the `strippedAbundances` property
Code lines: 46
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

function: `hothalostrippedabundancesisgettable`
Description: Returns true if the `strippedAbundances` property is gettable for the `hotHalo` component class.
Code lines: 8
Contained by: module `galacticus_nodes`

function: `hothalostrippedabundancesrateget`
Description: Returns a zero rate for the `strippedAbundances` property for the `hotHalo` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `hothalostrippedmass`
Description: Returns the default value for the `strippedMass` property for the `hotHalo` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `hothalostrippedmassattributematch`

Description: Return a text list of component implementations in the `hotHalo` class that have the desired attributes for the `strippedMass` property
Code lines: 46
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: `hothalostrippedmassisgettable`
Description: Returns true if the `strippedMass` property is gettable for the `hotHalo` component class.
Code lines: 8
Contained by: module galacticus_nodes

function: `hothalostrippedmassrateget`
Description: Returns a zero rate for the `strippedMass` property for the `hotHalo` component class.
Code lines: 13
Contained by: module galacticus_nodes

function: `hothalotrackedoutflowabundances`
Description: Returns the default value for the `trackedOutflowAbundances` property for the `hotHalo` component class.
Code lines: 13
Contained by: module galacticus_nodes

function: `hothalotrackedoutflowabundancesattributematch`
Description: Return a text list of component implementations in the `hotHalo` class that have the desired attributes for the `trackedOutflowAbundances` property
Code lines: 28
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: `hothalotrackedoutflowabundancesisgettable`
Description: Returns true if the `trackedOutflowAbundances` property is gettable for the `hotHalo` component class.
Code lines: 8
Contained by: module galacticus_nodes

function: `hothalotrackedoutflowabundancesrateget`
Description: Returns a zero rate for the `trackedOutflowAbundances` property for the `hotHalo` component class.
Code lines: 13
Contained by: module galacticus_nodes

function: `hothalotrackedoutflowmass`
Description: Returns the default value for the `trackedOutflowMass` property for the `hotHalo` component class.
Code lines: 13
Contained by: module galacticus_nodes

function: `hothalotrackedoutflowmassattributematch`
Description: Return a text list of component implementations in the `hotHalo` class that have the desired attributes for the `trackedOutflowMass` property
Code lines: 28

Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: hothalotrackedoutflowmassisgettable
Description: Returns true if the trackedOutflowMass property is gettable for the hotHalo component class.
Code lines: 8
Contained by: module galacticus_nodes

function: hothalotrackedoutflowmassrateget
Description: Returns a zero rate for the trackedOutflowMass property for the hotHalo component class.
Code lines: 13
Contained by: module galacticus_nodes

function: hothalounaccretedmass
Description: Returns the default value for the unaccretedMass property for the hotHalo component class.
Code lines: 13
Contained by: module galacticus_nodes

function: hothalounaccretedmassattributematch
Description: Return a text list of component implementations in the hotHalo class that have the desired attributes for the unaccretedMass property
Code lines: 64
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: hothalounaccretedmassisgettable
Description: Returns true if the unaccretedMass property is gettable for the hotHalo component class.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: hothalounaccretedmassrate
Description: Accept a rate set for the unaccretedMass property of the hotHalo component class. Trigger an interrupt to create the component.
Code lines: 21
Contained by: module galacticus_nodes
Modules used: galacticus_error

function: hothalounaccretedmassrateget
Description: Returns a zero rate for the unaccretedMass property for the hotHalo component class.
Code lines: 13
Contained by: module galacticus_nodes

function: hothaloverysimpleabundancescount
Description: Return a count of the number of scalar properties in the abundances property of an verySimple implementation of the hotHalo component class.
Code lines: 12
Contained by: module galacticus_nodes

function: hothaloverysimpleabundancesget

Description: Get the `abundances` property of an `verySimple` implementation of the `hotHalo` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `hothaloverysimpleabundancesjcbnzr`
Description: Indicate that the `abundances` property of an `verySimple` implementation of the `hotHalo` component class is inactive for differential equation solving.
Code lines: 14
Contained by: module `galacticus_nodes`

subroutine: `hothaloverysimpleabundancesrate`
Description: Accumulate to the rate of change of the `abundances` property of an `verySimple` implementation of the `hotHalo` component class.
Code lines: 38
Contained by: module `galacticus_nodes`

function: `hothaloverysimpleabundancesrateget`
Description: Get the rate of change of the `abundances` property of an `verySimple` implementation of the `hotHalo` component class.
Code lines: 26
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

subroutine: `hothaloverysimpleabundancesscale`
Description: Set the absolute scale of the `abundances` property of an `verySimple` implementation of the `hotHalo` component class.
Code lines: 15
Contained by: module `galacticus_nodes`

subroutine: `hothaloverysimpleabundancesset`
Description: Set the `abundances` property of an `verySimple` implementation of the `hotHalo` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `hothaloverysimpledelayedoutflowedabundancescount`
Description: Return a count of the number of scalar properties in the `outflowedAbundances` property of an `verySimpleDelayed` implementation of the `hotHalo` component class.
Code lines: 12
Contained by: module `galacticus_nodes`

function: `hothaloverysimpledelayedoutflowedabundancesget`
Description: Get the `outflowedAbundances` property of an `verySimpleDelayed` implementation of the `hotHalo` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `hothaloverysimpledelayedoutflowedabundancesjcbnzr`
Description: Indicate that the `outflowedAbundances` property of an `verySimpleDelayed` implementation of the `hotHalo` component class is inactive for differential equation solving.

Code lines: 14
Contained by: module galacticus_nodes

subroutine: hothaloverysimpledelayedoutflowedabundancesrate
Description: Accumulate to the rate of change of the outflowedAbundances property of an verySimpleDelayed implementation of the hotHalo component class.
Code lines: 38
Contained by: module galacticus_nodes

function: hothaloverysimpledelayedoutflowedabundancesrateget
Description: Get the rate of change of the outflowedAbundances property of an verySimpleDelayed implementation of the hotHalo component class.
Code lines: 26
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: hothaloverysimpledelayedoutflowedabundancesscale
Description: Set the absolute scale of the outflowedAbundances property of an verySimpleDelayed implementation of the hotHalo component class.
Code lines: 15
Contained by: module galacticus_nodes

subroutine: hothaloverysimpledelayedoutflowedabundancesset
Description: Set the outflowedAbundances property of an verySimpleDelayed implementation of the hotHalo component class.
Code lines: 10
Contained by: module galacticus_nodes

function: hothaloverysimpledelayedoutflowedmasscount
Description: Return a count of the number of scalar properties in the outflowedMass property of an verySimpleDelayed implementation of the hotHalo component class.
Code lines: 12
Contained by: module galacticus_nodes

function: hothaloverysimpledelayedoutflowedmassget
Description: Get the outflowedMass property of an verySimpleDelayed implementation of the hotHalo component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: hothaloverysimpledelayedoutflowedmassjcbnzr
Description: Indicate that the outflowedMass property of an verySimpleDelayed implementation of the hotHalo component class is inactive for differential equation solving.
Code lines: 12
Contained by: module galacticus_nodes

subroutine: hothaloverysimpledelayedoutflowedmassrate
Description: Accumulate to the rate of change of the outflowedMass property of an verySimpleDelayed implementation of the hotHalo component class.
Code lines: 31
Contained by: module galacticus_nodes

function: `hothaloverysimpledelayedoutflowedmassrateget`
Description: Get the rate of change of the `outflowedMass` property of an `verySimpleDelayed` implementation of the `hotHalo` component class.
Code lines: 23
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

subroutine: `hothaloverysimpledelayedoutflowedmassscale`
Description: Set the absolute scale of the `outflowedMass` property of an `verySimpleDelayed` implementation of the `hotHalo` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

subroutine: `hothaloverysimpledelayedoutflowedmassset`
Description: Set the `outflowedMass` property of an `verySimpleDelayed` implementation of the `hotHalo` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `hothaloverysimpledelayedoutputcount`
Description: Increment the count of properties to output for a `verySimpleDelayed` implementation of the `hotHalo` component.
Code lines: 16
Contained by: module `galacticus_nodes`

subroutine: `hothaloverysimpledelayedoutputnames`
Description: Return the names of properties to output for a `verySimpleDelayed` implementation of the `hotHalo` component.
Code lines: 28
Contained by: module `galacticus_nodes`

subroutine: `hothaloverysimpledelayedpostoutput`
Description: Perform post-output processing for a `verySimpleDelayed` implementation of the `hotHalo` component.
Code lines: 11
Contained by: module `galacticus_nodes`

function: `hothaloverysimplemasscount`
Description: Return a count of the number of scalar properties in the `mass` property of an `verySimple` implementation of the `hotHalo` component class.
Code lines: 12
Contained by: module `galacticus_nodes`

function: `hothaloverysimplemassget`
Description: Get the `mass` property of an `verySimple` implementation of the `hotHalo` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `hothaloverysimplemassjcbnzr`
Description: Indicate that the `mass` property of an `verySimple` implementation of the `hotHalo` component class is inactive for differential equation solving.
Code lines: 12
Contained by: module `galacticus_nodes`

subroutine: `hothaloverysimplemassrate`
Description: Accumulate to the rate of change of the `mass` property of an `verySimple` implementation of the `hotHalo` component class.
Code lines: 31
Contained by: module `galacticus_nodes`

function: `hothaloverysimplemassrateget`
Description: Get the rate of change of the `mass` property of an `verySimple` implementation of the `hotHalo` component class.
Code lines: 23
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

subroutine: `hothaloverysimplemassscale`
Description: Set the absolute scale of the `mass` property of an `verySimple` implementation of the `hotHalo` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

subroutine: `hothaloverysimplemassset`
Description: Set the `mass` property of an `verySimple` implementation of the `hotHalo` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `hothaloverysimpleouterradiusget`
Description: Get the value of the `outerRadius` property of the `verySimple` implementation of the `hotHalo` component using a deferred function.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `hothaloverysimpleouterradiusgetfunction`
Description: Set the function to be used for the `get` method of the `outerRadius` property of the `HotHaloVerySimple` component.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `hothaloverysimpleouterradiusgetisattached`
Description: Return true if the deferred function used to get the `outerRadius` property of the `HotHaloVerySimple` component class has been attached.
Code lines: 8
Contained by: module `galacticus_nodes`

subroutine: `hothaloverysimpleoutflowingabundancesrate`

Description: Accumulate the rate of change of the `outflowingAbundances` property of the `verySimple` implementation of the `hotHalo` component using a deferred function.
Code lines: 12
Contained by: module galacticus_nodes

subroutine: `hothaloverysimpleoutflowingabundancesratefunction`
Description: Set the function to be used for the `rate` method of the `outflowingAbundances` property of the `HotHaloVerySimple` component.
Code lines: 10
Contained by: module galacticus_nodes

function: `hothaloverysimpleoutflowingabundancesrateisattached`
Description: Return true if the deferred function used to rate the `outflowingAbundances` property of the `HotHaloVerySimple` component class has been attached.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: `hothaloverysimpleoutflowingmassrate`
Description: Accumulate the rate of change of the `outflowingMass` property of the `verySimple` implementation of the `hotHalo` component using a deferred function.
Code lines: 12
Contained by: module galacticus_nodes

subroutine: `hothaloverysimpleoutflowingmassratefunction`
Description: Set the function to be used for the `rate` method of the `outflowingMass` property of the `HotHaloVerySimple` component.
Code lines: 10
Contained by: module galacticus_nodes

function: `hothaloverysimpleoutflowingmassrateisattached`
Description: Return true if the deferred function used to rate the `outflowingMass` property of the `HotHaloVerySimple` component class has been attached.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: `hothaloverysimpleoutputcount`
Description: Increment the count of properties to output for a `verySimple` implementation of the `hotHalo` component.
Code lines: 18
Contained by: module galacticus_nodes

subroutine: `hothaloverysimpleoutputnames`
Description: Return the names of properties to output for a `verySimple` implementation of the `hotHalo` component.
Code lines: 36
Contained by: module galacticus_nodes

subroutine: `hothaloverysimplepostoutput`
Description: Perform post-output processing for a `verySimple` implementation of the `hotHalo` component.
Code lines: 10

Contained by: module galacticus_nodes

function: hothaloverysimpleunaccretedmasscount
Description: Return a count of the number of scalar properties in the unaccretedMass property of an verySimple implementation of the hotHalo component class.
Code lines: 12
Contained by: module galacticus_nodes

function: hothaloverysimpleunaccretedmassget
Description: Get the unaccretedMass property of an verySimple implementation of the hotHalo component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: hothaloverysimpleunaccretedmassjcbnzr
Description: Indicate that the unaccretedMass property of an verySimple implementation of the hotHalo component class is inactive for differential equation solving.
Code lines: 12
Contained by: module galacticus_nodes

subroutine: hothaloverysimpleunaccretedmassrate
Description: Accumulate to the rate of change of the unaccretedMass property of an verySimple implementation of the hotHalo component class.
Code lines: 31
Contained by: module galacticus_nodes

function: hothaloverysimpleunaccretedmassrateget
Description: Get the rate of change of the unaccretedMass property of an verySimple implementation of the hotHalo component class.
Code lines: 23
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: hothaloverysimpleunaccretedmassscale
Description: Set the absolute scale of the unaccretedMass property of an verySimple implementation of the hotHalo component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: hothaloverysimpleunaccretedmassset
Description: Set the unaccretedMass property of an verySimple implementation of the hotHalo component class.
Code lines: 10
Contained by: module galacticus_nodes

function: indicesbranchtip
Description: Returns the default value for the branchTip property for the indices component class.
Code lines: 13
Contained by: module galacticus_nodes

function: `indicesbranchtipattributematch`
Description: Return a text list of component implementations in the `indices` class that have the desired attributes for the `branchTip` property
Code lines: 30
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

function: `indicesbranchtipisgettable`
Description: Returns true if the `branchTip` property is gettable for the `indices` component class.
Code lines: 8
Contained by: module `galacticus_nodes`

function: `indicesbranchtiprateget`
Description: Returns a zero rate for the `branchTip` property for the `indices` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

subroutine: `indicesnulloutputcount`
Description: Increment the count of properties to output for a `null` implementation of the `indices` component.
Code lines: 22
Contained by: module `galacticus_nodes`

subroutine: `indicesnulloutputnames`
Description: Return the names of properties to output for a `null` implementation of the `indices` component.
Code lines: 39
Contained by: module `galacticus_nodes`

subroutine: `indicesoutput`
Description: Populate output buffers with properties to output for a `indices` component.
Code lines: 34
Contained by: module `galacticus_nodes`
Modules used: `multi_counters`

subroutine: `indicesoutputcount`
Description: Increment the count of properties to output for a generic `indices` component.
Code lines: 15
Contained by: module `galacticus_nodes`

subroutine: `indicesoutputnames`
Description: Establish the names of properties to output for a generic `indices` component.
Code lines: 20
Contained by: module `galacticus_nodes`

subroutine: `indicespostoutput`
Description: Perform post-output processing of a `indices` component.
Code lines: 14

Contained by: module galacticus_nodes

function: indicesstandardbranchtipget
Description: Get the branchTip property of an standard implementation of the indices component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: indicesstandardbranchtipset
Description: Set the branchTip property of an standard implementation of the indices component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: indicesstandardoutputcount
Description: Increment the count of properties to output for a standard implementation of the indices component.
Code lines: 21
Contained by: module galacticus_nodes

subroutine: indicesstandardoutputnames
Description: Return the names of properties to output for a standard implementation of the indices component.
Code lines: 37
Contained by: module galacticus_nodes

subroutine: interoutputcreatebyinterrupt
Description: Create the interOutput component of self via an interrupt.
Code lines: 10
Contained by: module galacticus_nodes

function: interoutputdiskstarformationrate
Description: Returns the default value for the diskStarFormationRate property for the interOutput component class.
Code lines: 17
Contained by: module galacticus_nodes

function: interoutputdiskstarformationrateattributematch
Description: Return a text list of component implementations in the interOutput class that have the desired attributes for the diskStarFormationRate property
Code lines: 28
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: interoutputdiskstarformationrateisgettable
Description: Returns true if the diskStarFormationRate property is gettable for the interOutput component class.
Code lines: 9
Contained by: module galacticus_nodes

subroutine: interoutputdiskstarformationraterate

Description: Accept a rate set for the `diskStarFormationRate` property of the `interOutput` component class. Trigger an interrupt to create the component.
Code lines: 21
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

function: `interoutputdiskstarformationraterateget`
Description: Returns a zero rate for the `diskStarFormationRate` property for the `interOutput` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

subroutine: `interoutputnulloutputcount`
Description: Increment the count of properties to output for a `null` implementation of the `interOutput` component.
Code lines: 22
Contained by: module `galacticus_nodes`

subroutine: `interoutputnulloutputnames`
Description: Return the names of properties to output for a `null` implementation of the `interOutput` component.
Code lines: 39
Contained by: module `galacticus_nodes`

subroutine: `interoutputoutput`
Description: Populate output buffers with properties to output for a `interOutput` component.
Code lines: 36
Contained by: module `galacticus_nodes`
Modules used: `multi_counters`

subroutine: `interoutputoutputcount`
Description: Increment the count of properties to output for a generic `interOutput` component.
Code lines: 15
Contained by: module `galacticus_nodes`

subroutine: `interoutputoutputnames`
Description: Establish the names of properties to output for a generic `interOutput` component.
Code lines: 20
Contained by: module `galacticus_nodes`

subroutine: `interoutputpostoutput`
Description: Perform post-output processing of a `interOutput` component.
Code lines: 14
Contained by: module `galacticus_nodes`

function: `interoutputspheroidstarformationrate`
Description: Returns the default value for the `spheroidStarFormationRate` property for the `interOutput` component class.
Code lines: 17
Contained by: module `galacticus_nodes`

function: `interoutputspheroidstarformationrateattributematch`
Description: Return a text list of component implementations in the `interOutput` class that have the desired attributes for the `spheroidStarFormationRate` property
Code lines: 28
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

function: `interoutputspheroidstarformationrateisgettable`
Description: Returns true if the `spheroidStarFormationRate` property is gettable for the `interOutput` component class.
Code lines: 9
Contained by: module `galacticus_nodes`

subroutine: `interoutputspheroidstarformationraterate`
Description: Accept a rate set for the `spheroidStarFormationRate` property of the `interOutput` component class. Trigger an interrupt to create the component.
Code lines: 21
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

function: `interoutputspheroidstarformationraterateget`
Description: Returns a zero rate for the `spheroidStarFormationRate` property for the `interOutput` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `interoutputstandarddiskstarformationratecount`
Description: Return a count of the number of scalar properties in the `diskStarFormationRate` property of an `standard` implementation of the `interOutput` component class.
Code lines: 12
Contained by: module `galacticus_nodes`

function: `interoutputstandarddiskstarformationrateget`
Description: Get the `diskStarFormationRate` property of an `standard` implementation of the `interOutput` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `interoutputstandarddiskstarformationratejcbnzr`
Description: Indicate that the `diskStarFormationRate` property of an `standard` implementation of the `interOutput` component class is inactive for differential equation solving.
Code lines: 12
Contained by: module `galacticus_nodes`

subroutine: `interoutputstandarddiskstarformationraterate`
Description: Accumulate to the rate of change of the `diskStarFormationRate` property of an `standard` implementation of the `interOutput` component class.
Code lines: 31
Contained by: module `galacticus_nodes`

function: `interoutputstandarddiskstarformationraterateget`
Description: Get the rate of change of the `diskStarFormationRate` property of an `standard` implementation of the `interOutput` component class.
Code lines: 23
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

subroutine: `interoutputstandarddiskstarformationratescale`
Description: Set the absolute scale of the `diskStarFormationRate` property of an `standard` implementation of the `interOutput` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

subroutine: `interoutputstandarddiskstarformationrateset`
Description: Set the `diskStarFormationRate` property of an `standard` implementation of the `interOutput` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `interoutputstandardoutputcount`
Description: Increment the count of properties to output for a `standard` implementation of the `interOutput` component.
Code lines: 21
Contained by: module `galacticus_nodes`

subroutine: `interoutputstandardoutputnames`
Description: Return the names of properties to output for a `standard` implementation of the `interOutput` component.
Code lines: 43
Contained by: module `galacticus_nodes`

function: `interoutputstandardspheroidstarformationratecount`
Description: Return a count of the number of scalar properties in the `spheroidStarFormationRate` property of an `standard` implementation of the `interOutput` component class.
Code lines: 12
Contained by: module `galacticus_nodes`

function: `interoutputstandardspheroidstarformationrateget`
Description: Get the `spheroidStarFormationRate` property of an `standard` implementation of the `interOutput` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `interoutputstandardspheroidstarformationratejcbnzr`
Description: Indicate that the `spheroidStarFormationRate` property of an `standard` implementation of the `interOutput` component class is inactive for differential equation solving.
Code lines: 12
Contained by: module `galacticus_nodes`

subroutine: `interoutputstandardspheroidstarformationraterate`
Description: Accumulate to the rate of change of the `spheroidStarFormationRate` property of an `standard` implementation of the `interOutput` component class.
Code lines: 31
Contained by: module galacticus_nodes

function: `interoutputstandardspheroidstarformationraterateget`
Description: Get the rate of change of the `spheroidStarFormationRate` property of an `standard` implementation of the `interOutput` component class.
Code lines: 23
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: `interoutputstandardspheroidstarformationratescale`
Description: Set the absolute scale of the `spheroidStarFormationRate` property of an `standard` implementation of the `interOutput` component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: `interoutputstandardspheroidstarformationrateset`
Description: Set the `spheroidStarFormationRate` property of an `standard` implementation of the `interOutput` component class.
Code lines: 10
Contained by: module galacticus_nodes

function: `massflowstatisticscooledmass`
Description: Returns the default value for the `cooledMass` property for the `massFlowStatistics` component class.
Code lines: 13
Contained by: module galacticus_nodes

function: `massflowstatisticscooledmassattributematch`
Description: Return a text list of component implementations in the `massFlowStatistics` class that have the desired attributes for the `cooledMass` property
Code lines: 28
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: `massflowstatisticscooledmassisgettable`
Description: Returns true if the `cooledMass` property is gettable for the `massFlowStatistics` component class.
Code lines: 8
Contained by: module galacticus_nodes

function: `massflowstatisticscooledmassrateget`
Description: Returns a zero rate for the `cooledMass` property for the `massFlowStatistics` component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: `massflowstatisticsnulloutputcount`
Description: Increment the count of properties to output for a `null` implementation of the `massFlowStatistics` component.
Code lines: 22
Contained by: module `galacticus_nodes`

subroutine: `massflowstatisticsnulloutputnames`
Description: Return the names of properties to output for a `null` implementation of the `massFlowStatistics` component.
Code lines: 39
Contained by: module `galacticus_nodes`

subroutine: `massflowstatisticsoutput`
Description: Populate output buffers with properties to output for a `massFlowStatistics` component.
Code lines: 34
Contained by: module `galacticus_nodes`
Modules used: `multi_counters`

subroutine: `massflowstatisticsoutputcount`
Description: Increment the count of properties to output for a generic `massFlowStatistics` component.
Code lines: 15
Contained by: module `galacticus_nodes`

subroutine: `massflowstatisticsoutputnames`
Description: Establish the names of properties to output for a generic `massFlowStatistics` component.
Code lines: 20
Contained by: module `galacticus_nodes`

subroutine: `massflowstatisticspostoutput`
Description: Perform post-output processing of a `massFlowStatistics` component.
Code lines: 14
Contained by: module `galacticus_nodes`

function: `massflowstatisticsstandardcooledmasscount`
Description: Return a count of the number of scalar properties in the `cooledMass` property of an `standard` implementation of the `massFlowStatistics` component class.
Code lines: 12
Contained by: module `galacticus_nodes`

function: `massflowstatisticsstandardcooledmassget`
Description: Get the `cooledMass` property of an `standard` implementation of the `massFlowStatistics` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `massflowstatisticsstandardcooledmassjcbnzr`
Description: Indicate that the `cooledMass` property of an `standard` implementation of the `massFlowStatistics` component class is inactive for differential equation solving.
Code lines: 12

Contained by: module galacticus_nodes

subroutine: massflowstatisticsstandardcooledmassrate
Description: Accumulate to the rate of change of the cooledMass property of an standard implementation of the massFlowStatistics component class.
Code lines: 31
Contained by: module galacticus_nodes

function: massflowstatisticsstandardcooledmassrateget
Description: Get the rate of change of the cooledMass property of an standard implementation of the massFlowStatistics component class.
Code lines: 23
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: massflowstatisticsstandardcooledmassscale
Description: Set the absolute scale of the cooledMass property of an standard implementation of the massFlowStatistics component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: massflowstatisticsstandardcooledmassset
Description: Set the cooledMass property of an standard implementation of the massFlowStatistics component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: massflowstatisticsstandardoutputcount
Description: Increment the count of properties to output for a standard implementation of the massFlowStatistics component.
Code lines: 21
Contained by: module galacticus_nodes

subroutine: massflowstatisticsstandardoutputnames
Description: Return the names of properties to output for a standard implementation of the massFlowStatistics component.
Code lines: 37
Contained by: module galacticus_nodes

function: merger_tree_create_event
Description: Create a new event in a merger tree.
Code lines: 24
Contained by: module galacticus_nodes

subroutine: merger_tree_destroy
Description: Destroys the entire merger tree.
Code lines: 29
Contained by: module galacticus_nodes

function: merger_tree_earliest_time

Description: Return the earliest time in a merger tree.
Code lines: 26
Contained by: module galacticus_nodes

function: merger_tree_earliest_time_evolving
Description: Return the earliest time in a merger tree.
Code lines: 26
Contained by: module galacticus_nodes

function: merger_tree_latest_time
Description: Return the latest time in a merger tree.
Code lines: 20
Contained by: module galacticus_nodes

function: merger_tree_node_get
Description: Return a pointer to a node in tree given the index of the node.
Code lines: 25
Contained by: module galacticus_nodes

subroutine: merger_tree_remove_event
Description: Removed an event from self.
Code lines: 31
Contained by: module galacticus_nodes

function: merger_tree_size_of
Description: Return the size (in bytes) of a merger tree.
Code lines: 16
Contained by: module galacticus_nodes

function: merger_tree_walk_descend_to_progenitors
Description: Descend to the deepest progenitor (satellites and children) of self.
Code lines: 18
Contained by: module galacticus_nodes

interface: mergertree
Description: Interface to merger tree constructors.
Code lines: 5
Contained by: module galacticus_nodes

function: mergertreeconstructor
Description: Constructor for the merger tree class. Currently does nothing.
Code lines: 9
Contained by: module galacticus_nodes

type: mergertreelist
Description: A class used for building linked lists of merger trees.
Code lines: 6
Contained by: module galacticus_nodes

function: `mergingstatisticsgalaxymajormergertime`
Description: Returns the default value for the `galaxyMajorMergerTime` property for the `mergingStatistics` component class.
Code lines: 17
Contained by: module `galacticus_nodes`

function: `mergingstatisticsgalaxymajormergertimeattributematch`
Description: Return a text list of component implementations in the `mergingStatistics` class that have the desired attributes for the `galaxyMajorMergerTime` property
Code lines: 30
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

function: `mergingstatisticsgalaxymajormergertimeisgettable`
Description: Returns true if the `galaxyMajorMergerTime` property is gettable for the `mergingStatistics` component class.
Code lines: 9
Contained by: module `galacticus_nodes`

function: `mergingstatisticsgalaxymajormergertimerateget`
Description: Returns a zero rate for the `galaxyMajorMergerTime` property for the `mergingStatistics` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `mergingstatisticsmajormajormergertimeget`
Description: Get the `majorMergerTime` property of an `major` implementation of the `mergingStatistics` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `mergingstatisticsmajormajormergertimeset`
Description: Set the `majorMergerTime` property of an `major` implementation of the `mergingStatistics` component class.
Code lines: 20
Contained by: module `galacticus_nodes`
Modules used: `memory_management`

function: `mergingstatisticsmajormergertime`
Description: Returns the default value for the `majorMergerTime` property for the `mergingStatistics` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `mergingstatisticsmajormergertimeattributematch`
Description: Return a text list of component implementations in the `mergingStatistics` class that have the desired attributes for the `majorMergerTime` property
Code lines: 30
Contained by: module `galacticus_nodes`

Modules used: iso_varying_string

function: mergingstatisticsmajormergertimeisgettable
Description: Returns true if the majorMergerTime property is gettable for the mergingStatistics component class.
Code lines: 8
Contained by: module galacticus_nodes

function: mergingstatisticsmajormergertimerateget
Description: Returns a zero rate for the majorMergerTime property for the mergingStatistics component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: mergingstatisticsmajoroutputcount
Description: Increment the count of properties to output for a major implementation of the mergingStatistics component.
Code lines: 22
Contained by: module galacticus_nodes

subroutine: mergingstatisticsmajoroutputnames
Description: Return the names of properties to output for a major implementation of the mergingStatistics component.
Code lines: 39
Contained by: module galacticus_nodes

function: mergingstatisticsmasswhenfirstisolated
Description: Returns the default value for the massWhenFirstIsolated property for the mergingStatistics component class.
Code lines: 13
Contained by: module galacticus_nodes

function: mergingstatisticsmasswhenfirstisolatedattributematch
Description: Return a text list of component implementations in the mergingStatistics class that have the desired attributes for the massWhenFirstIsolated property
Code lines: 30
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: mergingstatisticsmasswhenfirstisolatedisgettable
Description: Returns true if the massWhenFirstIsolated property is gettable for the mergingStatistics component class.
Code lines: 8
Contained by: module galacticus_nodes

function: mergingstatisticsmasswhenfirstisolatedrateget
Description: Returns a zero rate for the massWhenFirstIsolated property for the mergingStatistics component class.
Code lines: 13
Contained by: module galacticus_nodes

function: `mergingstatisticsnodeformationtime`
Description: Returns the default value for the `nodeFormationTime` property for the `mergingStatistics` component class.
Code lines: 17
Contained by: module `galacticus_nodes`

function: `mergingstatisticsnodeformationtimeattributematch`
Description: Return a text list of component implementations in the `mergingStatistics` class that have the desired attributes for the `nodeFormationTime` property
Code lines: 30
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

function: `mergingstatisticsnodeformationtimeisgettable`
Description: Returns true if the `nodeFormationTime` property is gettable for the `mergingStatistics` component class.
Code lines: 9
Contained by: module `galacticus_nodes`

function: `mergingstatisticsnodeformationtimerateget`
Description: Returns a zero rate for the `nodeFormationTime` property for the `mergingStatistics` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `mergingstatisticsnodehierarchylevel`
Description: Returns the default value for the `nodeHierarchyLevel` property for the `mergingStatistics` component class.
Code lines: 17
Contained by: module `galacticus_nodes`

function: `mergingstatisticsnodehierarchylevelattributematch`
Description: Return a text list of component implementations in the `mergingStatistics` class that have the desired attributes for the `nodeHierarchyLevel` property
Code lines: 30
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

function: `mergingstatisticsnodehierarchylevelisgettable`
Description: Returns true if the `nodeHierarchyLevel` property is gettable for the `mergingStatistics` component class.
Code lines: 9
Contained by: module `galacticus_nodes`

function: `mergingstatisticsnodehierarchylevelmaximum`
Description: Returns the default value for the `nodeHierarchyLevelMaximum` property for the `mergingStatistics` component class.
Code lines: 17
Contained by: module `galacticus_nodes`

function: `mergingstatisticsnodehierarchylevelmaximumattributematch`
Description: Return a text list of component implementations in the `mergingStatistics` class that have the desired attributes for the `nodeHierarchyLevelMaximum` property
Code lines: 30
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

function: `mergingstatisticsnodehierarchylevelmaximumisgettable`
Description: Returns true if the `nodeHierarchyLevelMaximum` property is gettable for the `mergingStatistics` component class.
Code lines: 9
Contained by: module `galacticus_nodes`

function: `mergingstatisticsnodehierarchylevelmaximumrateget`
Description: Returns a zero rate for the `nodeHierarchyLevelMaximum` property for the `mergingStatistics` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `mergingstatisticsnodehierarchylevelrateget`
Description: Returns a zero rate for the `nodeHierarchyLevel` property for the `mergingStatistics` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `mergingstatisticsnodemajormergertime`
Description: Returns the default value for the `nodeMajorMergerTime` property for the `mergingStatistics` component class.
Code lines: 17
Contained by: module `galacticus_nodes`

function: `mergingstatisticsnodemajormergertimeattributematch`
Description: Return a text list of component implementations in the `mergingStatistics` class that have the desired attributes for the `nodeMajorMergerTime` property
Code lines: 30
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

function: `mergingstatisticsnodemajormergertimeisgettable`
Description: Returns true if the `nodeMajorMergerTime` property is gettable for the `mergingStatistics` component class.
Code lines: 9
Contained by: module `galacticus_nodes`

function: `mergingstatisticsnodemajormergertimerateget`
Description: Returns a zero rate for the `nodeMajorMergerTime` property for the `mergingStatistics` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

subroutine: `mergingstatisticsnulloutputcount`
Description: Increment the count of properties to output for a `null` implementation of the `mergingStatistics` component.
Code lines: 22
Contained by: module `galacticus_nodes`

subroutine: `mergingstatisticsnulloutputnames`
Description: Return the names of properties to output for a `null` implementation of the `mergingStatistics` component.
Code lines: 39
Contained by: module `galacticus_nodes`

subroutine: `mergingstatisticsoutput`
Description: Populate output buffers with properties to output for a `mergingStatistics` component.
Code lines: 36
Contained by: module `galacticus_nodes`
Modules used: `multi_counters`

subroutine: `mergingstatisticsoutputcount`
Description: Increment the count of properties to output for a generic `mergingStatistics` component.
Code lines: 15
Contained by: module `galacticus_nodes`

subroutine: `mergingstatisticsoutputnames`
Description: Establish the names of properties to output for a generic `mergingStatistics` component.
Code lines: 20
Contained by: module `galacticus_nodes`

subroutine: `mergingstatisticspostoutput`
Description: Perform post-output processing of a `mergingStatistics` component.
Code lines: 14
Contained by: module `galacticus_nodes`

function: `mergingstatisticsrecentmajormergercount`
Description: Returns the default value for the `recentMajorMergerCount` property for the `mergingStatistics` component class.
Code lines: 20
Contained by: module `galacticus_nodes`
Modules used: `node_component_merging_statistics_-recent_data`

function: `mergingstatisticsrecentmajormergercountattributematch`
Description: Return a text list of component implementations in the `mergingStatistics` class that have the desired attributes for the `recentMajorMergerCount` property
Code lines: 30
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

function: `mergingstatisticsrecentmajormergercountisgettable`

Description: Returns true if the `recentMajorMergerCount` property is gettable for the `mergingStatistics` component class.
Code lines: 9
Contained by: module galacticus_nodes

function: `mergingstatisticsrecentmajormergercountrateget`
Description: Returns a zero rate for the `recentMajorMergerCount` property for the `mergingStatistics` component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: `mergingstatisticsrecentoutputcount`
Description: Increment the count of properties to output for a `recent` implementation of the `mergingStatistics` component.
Code lines: 22
Contained by: module galacticus_nodes

subroutine: `mergingstatisticsrecentoutputnames`
Description: Return the names of properties to output for a `recent` implementation of the `mergingStatistics` component.
Code lines: 39
Contained by: module galacticus_nodes

function: `mergingstatisticsrecentrecentmajormergercountget`
Description: Get the `recentMajorMergerCount` property of an `recent` implementation of the `mergingStatistics` component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: `mergingstatisticsrecentrecentmajormergercountset`
Description: Set the `recentMajorMergerCount` property of an `recent` implementation of the `mergingStatistics` component class.
Code lines: 20
Contained by: module galacticus_nodes
Modules used: memory_management

function: `mergingstatisticsstandardgalaxymajormergertimeget`
Description: Get the `galaxyMajorMergerTime` property of an `standard` implementation of the `mergingStatistics` component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: `mergingstatisticsstandardgalaxymajormergertimeset`
Description: Set the `galaxyMajorMergerTime` property of an `standard` implementation of the `mergingStatistics` component class.
Code lines: 10
Contained by: module galacticus_nodes

function: `mergingstatisticsstandardmasswhenfirstisolatedget`
Description: Get the `massWhenFirstIsolated` property of an `standard` implementation of the `mergingStatistics` component class.

Code lines: 10
Contained by: module galacticus_nodes

subroutine: mergingstatisticsstandardmasswhenfirstisolatedset
Description: Set the massWhenFirstIsolated property of an standard implementation of the mergingStatistics component class.
Code lines: 10
Contained by: module galacticus_nodes

function: mergingstatisticsstandardnodeformationtimeget
Description: Get the nodeFormationTime property of an standard implementation of the mergingStatistics component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: mergingstatisticsstandardnodeformationtimeset
Description: Set the nodeFormationTime property of an standard implementation of the mergingStatistics component class.
Code lines: 10
Contained by: module galacticus_nodes

function: mergingstatisticsstandardnodehierarchylevelget
Description: Get the value of the nodeHierarchyLevel property of the standard implementation of the mergingStatistics component using a deferred function.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: mergingstatisticsstandardnodehierarchylevelgetfunction
Description: Set the function to be used for the get method of the nodeHierarchyLevel property of the MergingStatisticsStandard component.
Code lines: 10
Contained by: module galacticus_nodes

function: mergingstatisticsstandardnodehierarchylevelgetisattached
Description: Return true if the deferred function used to get the nodeHierarchyLevel property of the MergingStatisticsStandard component class has been attached.
Code lines: 8
Contained by: module galacticus_nodes

function: mergingstatisticsstandardnodehierarchylevelgetvalue
Description: Get the nodeHierarchyLevel property of an standard implementation of the mergingStatistics component class.
Code lines: 10
Contained by: module galacticus_nodes

function: mergingstatisticsstandardnodehierarchylevelmaximumget
Description: Get the value of the nodeHierarchyLevelMaximum property of the standard implementation of the mergingStatistics component using a deferred function.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: `mergingstatisticsstandardnodehierarchylevelmaximumgetfunction`
Description: Set the function to be used for the `get` method of the `nodeHierarchyLevelMaximum` property of the `MergingStatisticsStandard` component.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `mergingstatisticsstandardnodehierarchylevelmaximumgetisattached`
Description: Return true if the deferred function used to get the `nodeHierarchyLevelMaximum` property of the `MergingStatisticsStandard` component class has been attached.
Code lines: 8
Contained by: module `galacticus_nodes`

function: `mergingstatisticsstandardnodehierarchylevelmaximumgetvalue`
Description: Get the `nodeHierarchyLevelMaximum` property of an `standard` implementation of the `mergingStatistics` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `mergingstatisticsstandardnodehierarchylevelmaximumset`
Description: Set the `nodeHierarchyLevelMaximum` property of an `standard` implementation of the `mergingStatistics` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `mergingstatisticsstandardnodehierarchylevelset`
Description: Set the `nodeHierarchyLevel` property of an `standard` implementation of the `mergingStatistics` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `mergingstatisticsstandardnodemajormergertimeget`
Description: Get the `nodeMajorMergerTime` property of an `standard` implementation of the `mergingStatistics` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `mergingstatisticsstandardnodemajormergertimeset`
Description: Set the `nodeMajorMergerTime` property of an `standard` implementation of the `mergingStatistics` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `mergingstatisticsstandardoutputcount`
Description: Increment the count of properties to output for a `standard` implementation of the `mergingStatistics` component.
Code lines: 20
Contained by: module `galacticus_nodes`

subroutine: `mergingstatisticsstandardoutputnames`

Description: Return the names of properties to output for a `standard` implementation of the `mergingStatistics` component.
Code lines: 53
Contained by: module `galacticus_nodes`

function: `nbodygenericaddintegerproperty`
Description: Call the deferred function for the `addIntegerProperty` method of the `nBody` component class if it has been set.
Code lines: 23
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

subroutine: `nbodygenericaddintegerpropertydeferredfunctionset`
Description: Set the function to be used for the `addIntegerProperty` method of the `generic` implementation of the `nBody` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `nbodygenericaddintegerpropertydfrrdfnctnisset`
Description: Return true if the deferred function for the `addIntegerProperty` method of the `generic` implementation of the `nBody` component class has been set.
Code lines: 8
Contained by: module `galacticus_nodes`

function: `nbodygenericaddrealproperty`
Description: Call the deferred function for the `addRealProperty` method of the `nBody` component class if it has been set.
Code lines: 23
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

subroutine: `nbodygenericaddrealpropertydeferredfunctionset`
Description: Set the function to be used for the `addRealProperty` method of the `generic` implementation of the `nBody` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `nbodygenericaddrealpropertydfrrdfnctnisset`
Description: Return true if the deferred function for the `addRealProperty` method of the `generic` implementation of the `nBody` component class has been set.
Code lines: 8
Contained by: module `galacticus_nodes`

function: `nbodygenericintegersget`
Description: Get the `integers` property of an `generic` implementation of the `nBody` component class.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `nbodygenericintegersset`
Description: Set the `integers` property of an `generic` implementation of the `nBody` component class.

Code lines: 20
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: nbodygenericoutputcount
Description: Increment the count of properties to output for a generic implementation of the nBody component.
Code lines: 22
Contained by: module galacticus_nodes

subroutine: nbodygenericoutputnames
Description: Return the names of properties to output for a generic implementation of the nBody component.
Code lines: 39
Contained by: module galacticus_nodes

function: nbodygenericrealsget
Description: Get the reals property of an generic implementation of the nBody component class.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: nbodygenericrealsset
Description: Set the reals property of an generic implementation of the nBody component class.
Code lines: 20
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: nbodygenericsetintegerproperty
Description: Call the deferred function for the setIntegerProperty method of the nBody component class if it has been set.
Code lines: 22
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: nbodygenericsetintegerpropertydeferredfunctionset
Description: Set the function to be used for the setIntegerProperty method of the generic implementation of the nBody component class.
Code lines: 10
Contained by: module galacticus_nodes

function: nbodygenericsetintegerpropertydfrrdfnctnisset
Description: Return true if the deferred function for the setIntegerProperty method of the generic implementation of the nBody component class has been set.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: nbodygenericsetrealproperty
Description: Call the deferred function for the setRealProperty method of the nBody component class if it has been set.
Code lines: 22

Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: nbodygenericsetrealpropertydeferredfunctionset
Description: Set the function to be used for the setRealProperty method of the generic implementation of the nBody component class.
Code lines: 10
Contained by: module galacticus_nodes

function: nbodygenericsetrealpropertydfrrdfnctnisset
Description: Return true if the deferred function for the setRealProperty method of the generic implementation of the nBody component class has been set.
Code lines: 8
Contained by: module galacticus_nodes

function: nbodyintegers
Description: Returns the default value for the integers property for the nBody component class.
Code lines: 13
Contained by: module galacticus_nodes

function: nbodyintegersattributematch
Description: Return a text list of component implementations in the nBody class that have the desired attributes for the integers property
Code lines: 30
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: nbodyintegersisgettable
Description: Returns true if the integers property is gettable for the nBody component class.
Code lines: 8
Contained by: module galacticus_nodes

function: nbodyintegersrateget
Description: Returns a zero rate for the integers property for the nBody component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: nbodynulloutputcount
Description: Increment the count of properties to output for a null implementation of the nBody component.
Code lines: 22
Contained by: module galacticus_nodes

subroutine: nbodynulloutputnames
Description: Return the names of properties to output for a null implementation of the nBody component.
Code lines: 39
Contained by: module galacticus_nodes

subroutine: nbodyoutput

Description: Populate output buffers with properties to output for a `nBody` component.
Code lines: 38
Contained by: module `galacticus_nodes`
Modules used: `multi_counters`

subroutine: `nbodyoutputcount`
Description: Increment the count of properties to output for a generic `nBody` component.
Code lines: 15
Contained by: module `galacticus_nodes`

subroutine: `nbodyoutputnames`
Description: Establish the names of properties to output for a generic `nBody` component.
Code lines: 20
Contained by: module `galacticus_nodes`

subroutine: `nbodypostoutput`
Description: Perform post-output processing of a `nBody` component.
Code lines: 14
Contained by: module `galacticus_nodes`

function: `nbodyreals`
Description: Returns the default value for the `reals` property for the `nBody` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `nbodyrealsattributematch`
Description: Return a text list of component implementations in the `nBody` class that have the desired attributes for the `reals` property
Code lines: 30
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

function: `nbodyrealsisgettable`
Description: Returns true if the `reals` property is gettable for the `nBody` component class.
Code lines: 8
Contained by: module `galacticus_nodes`

function: `nbodyrealsrateget`
Description: Returns a zero rate for the `reals` property for the `nBody` component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `node_component_black_hole_simple_enclosed_mass`
Description: Computes the mass within a given radius for a central black hole. Black hole is treated as a point mass.
Code lines: 25
Contained by: module `galacticus_nodes`
Modules used: `galactic_structure_options`

function: `node_component_black_hole_simple_seed_mass`
Description: Return the seed mass for simple black holes.
Code lines: 43
Contained by: module `galacticus_nodes`
Modules used: `input_parameters`

function: `node_component_black_hole_standard_enclosed_mass`
Description: Computes the mass within a given radius for a central black hole. Black hole is treated as a point mass.
Code lines: 25
Contained by: module `galacticus_nodes`
Modules used: `galactic_structure_options`

function: `node_component_black_hole_standard_seed_mass`
Description: Return the seed mass for standard black holes.
Code lines: 43
Contained by: module `galacticus_nodes`
Modules used: `input_parameters`

function: `node_component_black_hole_standard_seed_spin`
Description: Return the seed spin for standard black holes.
Code lines: 15
Contained by: module `galacticus_nodes`
Modules used: `input_parameters`

function: `node_component_black_hole_standard_spin`
Description: Return the spin of a standard black hole.
Code lines: 12
Contained by: module `galacticus_nodes`

function: `node_component_density_null`
Description: A null implementation of the density in a component. Always returns zero.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `node_component_deserialize_null`
Description: Deserialize a generic tree node component.
Code lines: 9
Contained by: module `galacticus_nodes`

subroutine: `node_component_disk_standard_attach_pipes`
Description: Attach cooling pipes to the standard disk component.
Code lines: 21
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

function: `node_component_disk_standard_density`
Description: Computes the density at a given position for an standard disk.

Code lines: 49
Contained by: module galacticus_nodes
Modules used: coordinates, galactic_structure_options, node_component_disk_standard_data, numerical_constants_math, tables

function: node_component_disk_standard_enclosed_mass
Description: Computes the mass within a given radius for an standard disk.
Code lines: 49
Contained by: module galacticus_nodes
Modules used: galactic_structure_options, node_component_disk_standard_data, tables

function: node_component_disk_standard_half_mass_radius
Description: Return the half-mass radius of the standard disk.
Code lines: 20
Contained by: module galacticus_nodes
Modules used: galacticus_error, node_component_disk_standard_data

function: node_component_disk_standard_potential
Description: Compute the gravitational potential due to an standard disk.
Code lines: 41
Contained by: module galacticus_nodes
Modules used: bessel_functions, coordinates, galactic_structure_options, node_component_disk_standard_data, numerical_constants_physical, tables

function: node_component_disk_standard_rotation_curve
Description: Computes the rotation curve at a given radius for an standard disk.
Code lines: 32
Contained by: module galacticus_nodes
Modules used: galactic_structure_options, node_component_disk_standard_data, numerical_constants_physical, tables

function: node_component_disk_standard_rotation_curve_gradient
Description: Computes the rotation curve gradient for an standard disk.
Code lines: 35
Contained by: module galacticus_nodes
Modules used: galactic_structure_options, node_component_disk_standard_data, numerical_constants_physical, numerical_constants_prefixes, tables

function: node_component_disk_standard_surface_density
Description: Computes the surface density at a given position for an standard disk.
Code lines: 78
Contained by: module galacticus_nodes
Modules used: coordinates, galactic_structure_options, node_component_disk_standard_data, numerical_constants_math

tables

subroutine: `node_component_disk_very_simple_attach_pipe`
Description: Attach cooling pipes to the very simple disk component.
Code lines: 18
Contained by: module galacticus_nodes
Modules used: galacticus_error

function: `node_component_disk_very_simple_enclosed_mass`
Description: Computes the mass within a given radius for an very simple disk.
Code lines: 40
Contained by: module galacticus_nodes
Modules used: galactic_structure_options galacticus_error

function: `node_component_disk_very_simple_size_half_mass_radius`
Description: Return the half-mass radius of the very simple size disk.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: `node_component_dump_null`
Description: Dump a generic tree node component.
Code lines: 7
Contained by: module galacticus_nodes

subroutine: `node_component_dump_raw_null`
Description: Dump a generic tree node component in binary.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: `node_component_dump_xml_null`
Description: Dump a generic tree node component to XML.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: `node_component_dynamics_statistics_bars_record`
Description: Record the dynamical state.
Code lines: 47
Contained by: module galacticus_nodes
Modules used: memory_management

function: `node_component_enclosed_mass_null`
Description: A null implementation of the enclosed mass in a component. Always returns zero.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: `node_component_generic_destroy`
Description: Destroy a generic tree node component.
Code lines: 8
Contained by: module galacticus_nodes

function: `node_component_generic_type`
Description: Returns the name of a generic tree node component.
Code lines: 9
Contained by: module `galacticus_nodes`

function: `node_component_host_node`
Description: Return the host tree node of a tree node component.
Code lines: 8
Contained by: module `galacticus_nodes`

function: `node_component_hot_halo_cold_mode_mass_total`
Description: Return the total active mass in the hot halo.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `node_component_hot_halo_outflow_tracking_mass_removal_rate`
Description: Handle instances where mass is removed from the the outflow tracking hot halo component class.
Code lines: 13
Contained by: module `galacticus_nodes`

subroutine: `node_component_hot_halo_standard_mass_removal_rate`
Description: Handle instances of mass removal from the standard hot halo component class. For the standard hot halo component type, we do nothing.
Code lines: 18
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

function: `node_component_hot_halo_standard_mass_total`
Description: Return the total active mass in the hot halo.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `node_component_null_double0_inout`
Description: A null `double` function for rank 0 `nodeComponent` arrays.
Code lines: 8
Contained by: module `galacticus_nodes`

subroutine: `node_component_null_void0_inout`
Description: A null `void` function for rank 0 `nodeComponent` arrays.
Code lines: 7
Contained by: module `galacticus_nodes`

subroutine: `node_component_ode_step_initialize_null`
Description: Initialize a generic tree node component for an ODE solver step.
Code lines: 7
Contained by: module `galacticus_nodes`

subroutine: `node_component_output_count_null`
Description: Dump a generic tree node component.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `node_component_output_names_null`
Description: Dump a generic tree node component.
Code lines: 12
Contained by: module `galacticus_nodes`

subroutine: `node_component_output_null`
Description: Dump a generic tree node component.
Code lines: 14
Contained by: module `galacticus_nodes`
Modules used: `multi_counters`

function: `node_component_potential_null`
Description: A null implementation of the gravitational potential in a component. Always returns zero.
Code lines: 11
Contained by: module `galacticus_nodes`

subroutine: `node_component_read_raw_null`
Description: Read a generic tree node component in binary.
Code lines: 8
Contained by: module `galacticus_nodes`

function: `node_component_rotation_curve_gradient_null`
Description: A null implementation of the gradient of the rotation curve due to a component. Always returns zero.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `node_component_rotation_curve_null`
Description: A null implementation of the rotation curve due to a component. Always returns zero.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `node_component_satellite_orbiting_time_of_merging`
Description: Return the `timeOfMerging` property of the `satelliteOrbiting` component class.
Code lines: 19
Contained by: module `galacticus_nodes`

function: `node_component_satellite_preset_merge_time`
Description: Return the `mergeTime` property of the `satellitePreset` component class.
Code lines: 18
Contained by: module `galacticus_nodes`

subroutine: `node_component_satellite_preset_merge_time_set`

Description: Sets the `mergeTime` property of the `satellitePreset` component class.
Code lines: 15
Contained by: module galacticus_nodes

function: `node_component_satellite_standard_merge_time`
Description: Return the `mergeTime` property of the `satelliteStandard` component.
Code lines: 16
Contained by: module galacticus_nodes

function: `node_component_satellite_standard_time_of_merging`
Description: Return the `timeOfMerging` property of the `satelliteStandard` component class.
Code lines: 18
Contained by: module galacticus_nodes

subroutine: `node_component_satellite_standard_time_of_merging_set`
Description: Set the `timeOfMerging` property of the `satelliteStandard` component.
Code lines: 19
Contained by: module galacticus_nodes

function: `node_component_satellite_very_simple_merge_time`
Description: Return the `mergeTime` property of the `satelliteVerySimple` component.
Code lines: 16
Contained by: module galacticus_nodes

function: `node_component_satellite_very_simple_time_of_merging`
Description: Return the `timeOfMerging` property of the `satelliteVerySimple` component.
Code lines: 19
Contained by: module galacticus_nodes

subroutine: `node_component_serialization_offsets`
Description: Return the serialization count of a generic tree node component.
Code lines: 9
Contained by: module galacticus_nodes

function: `node_component_serialize_count_zero`
Description: Return the serialization count of a generic tree node component.
Code lines: 9
Contained by: module galacticus_nodes

subroutine: `node_component_serialize_null`
Description: Serialize a generic tree node component.
Code lines: 9
Contained by: module galacticus_nodes

function: `node_component_spheroid_standard_density`
Description: Computes the density at a given position for an standard spheroid.
Code lines: 55
Contained by: module galacticus_nodes
Modules used: coordinates galactic_structure_options

node_component_spheroid_standard_data numerical_constants_math

function: node_component_spheroid_standard_enclosed_mass
Description: Computes the mass within a given radius for an standard spheroid.
Code lines: 49
Contained by: module galacticus_nodes
Modules used: galactic_structure_options node_component_spheroid_standard_data

function: node_component_spheroid_standard_half_mass_radius
Description: Return the half-mass radius of the standard spheroid.
Code lines: 20
Contained by: module galacticus_nodes
Modules used: galacticus_error mass_distributions
node_component_spheroid_standard_data

function: node_component_spheroid_standard_potential
Description: Return the potential due to the standard spheroid.
Code lines: 37
Contained by: module galacticus_nodes
Modules used: coordinates galactic_structure_options
node_component_spheroid_standard_data numerical_constants_physical

function: node_component_spheroid_standard_rotation_curve
Description: Computes the rotation curve at a given radius for a standard spheroid.
Code lines: 24
Contained by: module galacticus_nodes
Modules used: galactic_structure_options numerical_constants_physical

function: node_component_spheroid_standard_rotation_curve_gradient
Description: Computes the rotation curve gradient for the standard spheroid.
Code lines: 29
Contained by: module galacticus_nodes
Modules used: galactic_structure_options numerical_constants_math
numerical_constants_physical numerical_constants_prefixes

function: node_component_spheroid_very_simple_enclosed_mass
Description: Computes the mass within a given radius for an very simple spheroid.
Code lines: 40
Contained by: module galacticus_nodes
Modules used: galactic_structure_options galacticus_error

function: node_component_spheroid_very_simple_half_mass_radius
Description: Return the half-mass radius of the very simple spheroid.
Code lines: 10
Contained by: module galacticus_nodes

function: node_component_surface_density_null
Description: A null implementation of the surface density in a component. Always returns zero.
Code lines: 10

Contained by: module galacticus_nodes

subroutine: nodeclasshierarchyfinalize
Description: Finalize the Galacticus node/component class hierarchy.
Code lines: 27
Contained by: module galacticus_nodes

subroutine: nodeclasshierarchyinitialize
Description: Initialize the Galacticus node/component class hierarchy.
Code lines: 853
Contained by: module galacticus_nodes
Modules used: input_parameters iso_varying_string memory_management

type: nodecomponent
Description: A class for components in nodes.
Code lines: 206
Contained by: module galacticus_nodes

type: nodecomponentagestatistics
Description: Type for the ageStatistics component class.
Code lines: 355
Contained by: module galacticus_nodes

subroutine: nodecomponentagestatisticsbuilder
Description: Build a generic ageStatistics component from a supplied XML definition.
Code lines: 19
Contained by: module galacticus_nodes
Modules used: fox_dom galacticus_error

subroutine: nodecomponentagestatisticscreate
Description: Create the ageStatistics component of self.
Code lines: 38
Contained by: module galacticus_nodes
Modules used: galacticus_display galacticus_error iso_varying_string string_handling

subroutine: nodecomponentagestatisticsdestroy
Description: Destroy the ageStatistics component of self
Code lines: 15
Contained by: module galacticus_nodes

subroutine: nodecomponentagestatisticsdumpascii
Description: Dump the content of a ageStatistics component.
Code lines: 16
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string

subroutine: `nodecomponentagestatisticsfinalize`
Description: Finalize a generic `ageStatistics` component.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: `nodecomponentagestatisticsinitialize`
Description: Initialize a generic `ageStatistics` component.
Code lines: 15
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: `nodecomponentagestatisticsmove`
Description: Move instances of the `ageStatistics` component, from one node to another.
Code lines: 70
Contained by: module galacticus_nodes
Modules used: galacticus_error

type: `nodecomponentagestatisticsnull`
Description: Class for the null implementation of the ageStatistics component.
Code lines: 124
Contained by: module galacticus_nodes

subroutine: `nodecomponentagestatisticsnullbuilder`
Description: Build a `null` implementation of the `ageStatistics` component from a supplied XML definition.
Code lines: 18
Contained by: module galacticus_nodes
Modules used: fox_dom galacticus_error memory_management

subroutine: `nodecomponentagestatisticsnulldeserializeraw`
Description: Deserialize the contents of a null implementation of the ageStatistics component from raw (binary) file.
Code lines: 16
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: `nodecomponentagestatisticsnulldeserializevalues`
Description: Deserialize evolvable properties of a null implementation of the ageStatistics component from array.
Code lines: 17
Contained by: module galacticus_nodes

subroutine: `nodecomponentagestatisticsnullfinalize`
Description: Finalize a `null` implementation of the `ageStatistics` component.
Code lines: 13
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: `nodecomponentagestatisticsnullinitialize`
Description: Initialize a `null` member of the `ageStatistics` component.
Code lines: 11
Contained by: module `galacticus_nodes`

function: `nodecomponentagestatisticsnullisactive`
Description: Return true if the null implementation of the ageStatistics component is the active choice.
Code lines: 8
Contained by: module `galacticus_nodes`

function: `nodecomponentagestatisticsnullnamefromindex`
Description: Return the name of the property of given index for a `null` implementation of the `ageStatistics` component class.
Code lines: 21
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

subroutine: `nodecomponentagestatisticsnullserializeascii`
Description: Serialize the contents of a null implementation of the ageStatistics component to ASCII.
Code lines: 16
Contained by: module `galacticus_nodes`
Modules used: `galacticus_display` `iso_varying_string` `string_handling`

function: `nodecomponentagestatisticsnullserializecount`
Description: Return a count of the serialization of a null implementation of the ageStatistics component.
Code lines: 15
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentagestatisticsnullserializeoffsets`
Description: Compute offsets into serialization arrays for a `null` implementation of the `ageStatistics` component.
Code lines: 22
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentagestatisticsnullserializeraw`
Description: Serialize the contents of a null implementation of the ageStatistics component to raw (binary) file.
Code lines: 14
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentagestatisticsnullserializevalues`
Description: Serialize evolvable properties of a `null` implementation of the `ageStatistics` component to array.
Code lines: 17
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentagestatisticsnullserializexml`

Description: Serialize the contents of a null implementation of the ageStatistics component to XML.
Code lines: 14
Contained by: module galacticus_nodes

function: nodecomponentagestatisticsnullsizeof
Description: Return the size in bytes of a null implementation of the ageStatistics component.
Code lines: 9
Contained by: module galacticus_nodes

function: nodecomponentagestatisticsnulltype
Description: Returns the type name for the null implementation of the ageStatistics component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: nodecomponentagestatisticsremove
Description: Remove an instance of the ageStatistics component from a node.
Code lines: 42
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: nodecomponentagestatisticsserializeascii
Description: Serialize the content of a ageStatistics component to ASCII.
Code lines: 16
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string

function: nodecomponentagestatisticssizeof
Description: Return the size in bytes of a nodeComponentAgeStatistics component.
Code lines: 9
Contained by: module galacticus_nodes

type: nodecomponentagestatisticsstandard
Description: Class for the standard implementation of the ageStatistics component.
Code lines: 333
Contained by: module galacticus_nodes

subroutine: nodecomponentagestatisticsstandardbuilder
Description: Build a standard implementation of the ageStatistics component from a supplied XML definition.
Code lines: 42
Contained by: module galacticus_nodes
Modules used: fox_dom galacticus_error memory_management

subroutine: nodecomponentagestatisticsstandarddeserializeraw
Description: Deserialize the contents of a standard implementation of the ageStatistics component from raw (binary) file.
Code lines: 15
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: `nodecomponentagestatisticsstandarddeserializevalues`
Description: Deserialize evolvable properties of a standard implementation of the ageStatistics component from array.
Code lines: 28
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentagestatisticsstandardfinalize`
Description: Finalize a `standard` implementation of the `ageStatistics` component.
Code lines: 13
Contained by: module `galacticus_nodes`
Modules used: `memory_management`

subroutine: `nodecomponentagestatisticsstandardinitialize`
Description: Initialize a `standard` member of the `ageStatistics` component.
Code lines: 12
Contained by: module `galacticus_nodes`

function: `nodecomponentagestatisticsstandardisactive`
Description: Return true if the standard implementation of the ageStatistics component is the active choice.
Code lines: 8
Contained by: module `galacticus_nodes`

function: `nodecomponentagestatisticsstandardnamefromindex`
Description: Return the name of the property of given index for a `standard` implementation of the `ageStatistics` component class.
Code lines: 45
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

subroutine: `nodecomponentagestatisticsstandardserializeascii`
Description: Serialize the contents of a standard implementation of the ageStatistics component to ASCII.
Code lines: 28
Contained by: module `galacticus_nodes`
Modules used: `galacticus_display` `iso_varying_string` `string_handling`

function: `nodecomponentagestatisticsstandardserializecount`
Description: Return a count of the serialization of a standard implementation of the ageStatistics component.
Code lines: 46
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentagestatisticsstandardserializeoffsets`
Description: Compute offsets into serialization arrays for a `standard` implementation of the `ageStatistics` component.
Code lines: 70
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentagestatisticsstandardserializeraw`
Description: Serialize the contents of a standard implementation of the ageStatistics component to raw (binary) file.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: `nodecomponentagestatisticsstandardserializevalues`
Description: Serialize evolvable properties of a `standard` implementation of the `ageStatistics` component to array.
Code lines: 28
Contained by: module galacticus_nodes

subroutine: `nodecomponentagestatisticsstandardserializexml`
Description: Serialize the contents of a standard implementation of the ageStatistics component to XML.
Code lines: 18
Contained by: module galacticus_nodes

function: `nodecomponentagestatisticsstandardsizeof`
Description: Return the size in bytes of a standard implementation of the ageStatistics component.
Code lines: 9
Contained by: module galacticus_nodes

function: `nodecomponentagestatisticsstandardtype`
Description: Returns the type name for the standard implementation of the ageStatistics component class.
Code lines: 13
Contained by: module galacticus_nodes

function: `nodecomponentagestatisticstype`
Description: Returns the type name for the ageStatistics component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: `nodecomponentassign`
Description: Assign a node component to another node component.
Code lines: 459
Contained by: module galacticus_nodes

type: `nodecomponentbasic`
Description: Type for the `basic` component class.
Code lines: 635
Contained by: module galacticus_nodes

subroutine: `nodecomponentbasicbuilder`
Description: Build a generic `basic` component from a supplied XML definition.
Code lines: 19
Contained by: module galacticus_nodes

Description: Serialize the contents of a null implementation of the basic component to XML.
Code lines: 14
Contained by: module galacticus_nodes

function: `nodecomponentbasicnullsizeof`
Description: Return the size in bytes of a null implementation of the basic component.
Code lines: 9
Contained by: module galacticus_nodes

function: `nodecomponentbasicnulltype`
Description: Returns the type name for the null implementation of the basic component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: `nodecomponentbasicremove`
Description: Remove an instance of the `basic` component from a node.
Code lines: 74
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: `nodecomponentbasicserializeascii`
Description: Serialize the content of a `basic` component to ASCII.
Code lines: 16
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string

function: `nodecomponentbasicsizeof`
Description: Return the size in bytes of a nodeComponentBasic component.
Code lines: 9
Contained by: module galacticus_nodes

type: `nodecomponentbasicstandard`
Description: Class for the standard implementation of the basic component.
Code lines: 274
Contained by: module galacticus_nodes

subroutine: `nodecomponentbasicstandardbuilder`
Description: Build a `standard` implementation of the `basic` component from a supplied XML definition.
Code lines: 48
Contained by: module galacticus_nodes
Modules used: fox_dom galacticus_error memory_management

subroutine: `nodecomponentbasicstandarddeserializeraw`
Description: Deserialize the contents of a standard implementation of the basic component from raw (binary) file.
Code lines: 16
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: `nodecomponentbasicstandarddeserializevalues`
Description: Deserialize evolvable properties of a standard implementation of the basic component from array.
Code lines: 20
Contained by: module galacticus_nodes

type: `nodecomponentbasicstandardextended`
Description: Class for the standardExtended implementation of the basic component.
Code lines: 312
Contained by: module galacticus_nodes

subroutine: `nodecomponentbasicstandardextendedbuilder`
Description: Build a `standardExtended` implementation of the `basic` component from a supplied XML definition.
Code lines: 43
Contained by: module galacticus_nodes
Modules used: fox_dom galacticus_error memory_management

subroutine: `nodecomponentbasicstandardextendeddeserializeraw`
Description: Deserialize the contents of a standardExtended implementation of the basic component from raw (binary) file.
Code lines: 16
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: `nodecomponentbasicstandardextendeddeserializevalues`
Description: Deserialize evolvable properties of a standardExtended implementation of the basic component from array.
Code lines: 25
Contained by: module galacticus_nodes

subroutine: `nodecomponentbasicstandardextendedfinalize`
Description: Finalize a `standardExtended` implementation of the `basic` component.
Code lines: 13
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: `nodecomponentbasicstandardextendedinitialize`
Description: Initialize a `standardExtended` member of the `basic` component.
Code lines: 13

Contained by: module galacticus_nodes

function: nodecomponentbasicstandardextendedisactive
Description: Return true if the standardExtended implementation of the basic component is the active choice.
Code lines: 8
Contained by: module galacticus_nodes

function: nodecomponentbasicstandardextendednamefromindex
Description: Return the name of the property of given index for a standardExtended implementation of the basic component class.
Code lines: 30
Contained by: module galacticus_nodes
Modules used: iso_varying_string

subroutine: nodecomponentbasicstandardextendedserializeascii
Description: Serialize the contents of a standardExtended implementation of the basic component to ASCII.
Code lines: 29
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string string_handling

function: nodecomponentbasicstandardextendedserializecount
Description: Return a count of the serialization of a standardExtended implementation of the basic component.
Code lines: 27
Contained by: module galacticus_nodes

subroutine: nodecomponentbasicstandardextendedserializeoffsets
Description: Compute offsets into serialization arrays for a standardExtended implementation of the basic component.
Code lines: 40
Contained by: module galacticus_nodes

subroutine: nodecomponentbasicstandardextendedserializeraw
Description: Serialize the contents of a standardExtended implementation of the basic component to raw (binary) file.
Code lines: 14
Contained by: module galacticus_nodes

subroutine: nodecomponentbasicstandardextendedserializevalues
Description: Serialize evolvable properties of a standardExtended implementation of the basic component to array.
Code lines: 25
Contained by: module galacticus_nodes

subroutine: nodecomponentbasicstandardextendedserializexml
Description: Serialize the contents of a standardExtended implementation of the basic component to XML.
Code lines: 19

Contained by: module galacticus_nodes

function: nodecomponentbasicstandardextendedsizeof
Description: Return the size in bytes of a standardExtended implementation of the basic component.
Code lines: 9
Contained by: module galacticus_nodes

function: nodecomponentbasicstandardextendedtype
Description: Returns the type name for the standardExtended implementation of the basic component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: nodecomponentbasicstandardfinalize
Description: Finalize a standard implementation of the basic component.
Code lines: 13
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: nodecomponentbasicstandardinitialize
Description: Initialize a standard member of the basic component.
Code lines: 13
Contained by: module galacticus_nodes

function: nodecomponentbasicstandardisactive
Description: Return true if the standard implementation of the basic component is the active choice.
Code lines: 8
Contained by: module galacticus_nodes

function: nodecomponentbasicstandardnamefromindex
Description: Return the name of the property of given index for a standard implementation of the basic component class.
Code lines: 31
Contained by: module galacticus_nodes
Modules used: iso_varying_string

subroutine: nodecomponentbasicstandardserializeascii
Description: Serialize the contents of a standard implementation of the basic component to ASCII.
Code lines: 31
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string string_handling

function: nodecomponentbasicstandardserializecount
Description: Return a count of the serialization of a standard implementation of the basic component.
Code lines: 30
Contained by: module galacticus_nodes

subroutine: nodecomponentbasicstandardserializeoffsets

Description: Compute offsets into serialization arrays for a `standard` implementation of the `basic` component.
Code lines: 42
Contained by: module galacticus_nodes

subroutine: `nodecomponentbasicstandardserializeraw`
Description: Serialize the contents of a standard implementation of the basic component to raw (binary) file.
Code lines: 14
Contained by: module galacticus_nodes

subroutine: `nodecomponentbasicstandardserializevalues`
Description: Serialize evolvable properties of a `standard` implementation of the `basic` component to array.
Code lines: 20
Contained by: module galacticus_nodes

subroutine: `nodecomponentbasicstandardserializexml`
Description: Serialize the contents of a standard implementation of the basic component to XML.
Code lines: 19
Contained by: module galacticus_nodes

function: `nodecomponentbasicstandardsizeof`
Description: Return the size in bytes of a standard implementation of the basic component.
Code lines: 9
Contained by: module galacticus_nodes

type: `nodecomponentbasicstandardtracking`
Description: Class for the standardTracking implementation of the basic component.
Code lines: 149
Contained by: module galacticus_nodes

subroutine: `nodecomponentbasicstandardtrackingbuilder`
Description: Build a `standardTracking` implementation of the `basic` component from a supplied XML definition.
Code lines: 25
Contained by: module galacticus_nodes
Modules used: `fox_dom` galacticus_error memory_management

subroutine: `nodecomponentbasicstandardtrackingdeserializeraw`
Description: Deserialize the contents of a standardTracking implementation of the basic component from raw (binary) file.
Code lines: 13
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: `nodecomponentbasicstandardtrackingdeserializevalues`
Description: Deserialize evolvable properties of a standardTracking implementation of the basic component from array.
Code lines: 17

Contained by: module galacticus_nodes

subroutine: nodecomponentbasicstandardtrackingfinalize
Description: Finalize a standardTracking implementation of the basic component.
Code lines: 13
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: nodecomponentbasicstandardtrackinginitialize
Description: Initialize a standardTracking member of the basic component.
Code lines: 10
Contained by: module galacticus_nodes

function: nodecomponentbasicstandardtrackingisactive
Description: Return true if the standardTracking implementation of the basic component is the active choice.
Code lines: 8
Contained by: module galacticus_nodes

function: nodecomponentbasicstandardtrackingnamefromindex
Description: Return the name of the property of given index for a standardTracking implementation of the basic component class.
Code lines: 16
Contained by: module galacticus_nodes
Modules used: iso_varying_string

subroutine: nodecomponentbasicstandardtrackingserializeascii
Description: Serialize the contents of a standardTracking implementation of the basic component to ASCII.
Code lines: 20
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string string_handling

function: nodecomponentbasicstandardtrackingserializecount
Description: Return a count of the serialization of a standardTracking implementation of the basic component.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: nodecomponentbasicstandardtrackingserializeoffsets
Description: Compute offsets into serialization arrays for a standardTracking implementation of the basic component.
Code lines: 15
Contained by: module galacticus_nodes

subroutine: nodecomponentbasicstandardtrackingserializeraw
Description: Serialize the contents of a standardTracking implementation of the basic component to raw (binary) file.
Code lines: 11
Contained by: module galacticus_nodes

subroutine: `nodecomponentbasicstandardtrackingserializevalues`
Description: Serialize evolvable properties of a `standardTracking` implementation of the `basic` component to array.
Code lines: 17
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentbasicstandardtrackingserializexml`
Description: Serialize the contents of a standardTracking implementation of the basic component to XML.
Code lines: 16
Contained by: module `galacticus_nodes`

function: `nodecomponentbasicstandardtrackingsizeof`
Description: Return the size in bytes of a standardTracking implementation of the basic component.
Code lines: 9
Contained by: module `galacticus_nodes`

function: `nodecomponentbasicstandardtrackingtype`
Description: Returns the type name for the standardTracking implementation of the basic component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `nodecomponentbasicstandardtype`
Description: Returns the type name for the standard implementation of the basic component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `nodecomponentbasictype`
Description: Returns the type name for the basic component class.
Code lines: 13
Contained by: module `galacticus_nodes`

type: `nodecomponentblackhole`
Description: Type for the `blackHole` component class.
Code lines: 488
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentblackholebuilder`
Description: Build a generic `blackHole` component from a supplied XML definition.
Code lines: 19
Contained by: module `galacticus_nodes`
Modules used: `fox_dom` `galacticus_error`

subroutine: `nodecomponentblackholecreate`
Description: Create the `blackHole` component of `self`.
Code lines: 38
Contained by: module `galacticus_nodes`
Modules used: `galacticus_display` `galacticus_error`

iso_varying_string string_handling

subroutine: `nodecomponentblackholedestroy`
Description: Destroy the `blackHole` component of `self`
Code lines: 15
Contained by: module galacticus_nodes

subroutine: `nodecomponentblackholedumpascii`
Description: Dump the content of a `blackHole` component.
Code lines: 16
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string

subroutine: `nodecomponentblackholefinalize`
Description: Finalize a generic `blackHole` component.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: `nodecomponentblackholeinitialize`
Description: Initialize a generic `blackHole` component.
Code lines: 15
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: `nodecomponentblackholemove`
Description: Move instances of the `blackHole` component, from one node to another.
Code lines: 98
Contained by: module galacticus_nodes
Modules used: galacticus_error

type: `nodecomponentblackholenoncentral`
Description: Class for the nonCentral implementation of the blackHole component.
Code lines: 182
Contained by: module galacticus_nodes

subroutine: `nodecomponentblackholenoncentralbuilder`
Description: Build a `nonCentral` implementation of the `blackHole` component from a supplied XML definition.
Code lines: 25
Contained by: module galacticus_nodes
Modules used: fox_dom galacticus_error memory_management

subroutine: `nodecomponentblackholenoncentraldeserializeraw`
Description: Deserialize the contents of a nonCentral implementation of the blackHole component from raw (binary) file.
Code lines: 13
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: `nodecomponentblackholenoncentraldeserializevalues`
Description: Deserialize evolvable properties of a nonCentral implementation of the blackHole component from array.
Code lines: 21
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentblackholenoncentralfinalize`
Description: Finalize a `nonCentral` implementation of the `blackHole` component.
Code lines: 13
Contained by: module `galacticus_nodes`
Modules used: `memory_management`

subroutine: `nodecomponentblackholenoncentralinitialize`
Description: Initialize a `nonCentral` member of the `blackHole` component.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `nodecomponentblackholenoncentralisactive`
Description: Return true if the nonCentral implementation of the blackHole component is the active choice.
Code lines: 8
Contained by: module `galacticus_nodes`

function: `nodecomponentblackholenoncentralnamefromindex`
Description: Return the name of the property of given index for a `nonCentral` implementation of the `blackHole` component class.
Code lines: 23
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

subroutine: `nodecomponentblackholenoncentralserializeascii`
Description: Serialize the contents of a nonCentral implementation of the blackHole component to ASCII.
Code lines: 20
Contained by: module `galacticus_nodes`
Modules used: `galacticus_display` `iso_varying_string` `string_handling`

function: `nodecomponentblackholenoncentralserializecount`
Description: Return a count of the serialization of a nonCentral implementation of the blackHole component.
Code lines: 19
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentblackholenoncentralserializeoffsets`
Description: Compute offsets into serialization arrays for a `nonCentral` implementation of the `blackHole` component.
Code lines: 26
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentblackholenoncentralserializeraw`
Description: Serialize the contents of a nonCentral implementation of the blackHole component to raw (binary) file.
Code lines: 11
Contained by: module galacticus_nodes

subroutine: `nodecomponentblackholenoncentralserializevalues`
Description: Serialize evolvable properties of a `nonCentral` implementation of the `blackHole` component to array.
Code lines: 21
Contained by: module galacticus_nodes

subroutine: `nodecomponentblackholenoncentralserializexml`
Description: Serialize the contents of a nonCentral implementation of the blackHole component to XML.
Code lines: 16
Contained by: module galacticus_nodes

function: `nodecomponentblackholenoncentralsizeof`
Description: Return the size in bytes of a nonCentral implementation of the blackHole component.
Code lines: 9
Contained by: module galacticus_nodes

function: `nodecomponentblackholenoncentraltype`
Description: Returns the type name for the nonCentral implementation of the blackHole component class.
Code lines: 13
Contained by: module galacticus_nodes

type: `nodecomponentblackholenull`
Description: Class for the null implementation of the blackHole component.
Code lines: 124
Contained by: module galacticus_nodes

subroutine: `nodecomponentblackholenullbuilder`
Description: Build a `null` implementation of the `blackHole` component from a supplied XML definition.
Code lines: 18
Contained by: module galacticus_nodes
Modules used: `fox_dom` galacticus_error memory_management

subroutine: `nodecomponentblackholenulldeserializeraw`
Description: Deserialize the contents of a null implementation of the blackHole component from raw (binary) file.
Code lines: 16
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: `nodecomponentblackholenulldeserializevalues`
Description: Deserialize evolvable properties of a null implementation of the blackHole component from array.

Code lines: 17
Contained by: module galacticus_nodes

subroutine: nodecomponentblackholenullfinalize
Description: Finalize a null implementation of the blackHole component.
Code lines: 13
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: nodecomponentblackholenullinitialize
Description: Initialize a null member of the blackHole component.
Code lines: 11
Contained by: module galacticus_nodes

function: nodecomponentblackholenullisactive
Description: Return true if the null implementation of the blackHole component is the active choice.
Code lines: 8
Contained by: module galacticus_nodes

function: nodecomponentblackholenullnamefromindex
Description: Return the name of the property of given index for a null implementation of the blackHole component class.
Code lines: 21
Contained by: module galacticus_nodes
Modules used: iso_varying_string

subroutine: nodecomponentblackholenullserializeascii
Description: Serialize the contents of a null implementation of the blackHole component to ASCII.
Code lines: 16
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string string_handling

function: nodecomponentblackholenullserializecount
Description: Return a count of the serialization of a null implementation of the blackHole component.
Code lines: 15
Contained by: module galacticus_nodes

subroutine: nodecomponentblackholenullserializeoffsets
Description: Compute offsets into serialization arrays for a null implementation of the blackHole component.
Code lines: 22
Contained by: module galacticus_nodes

subroutine: nodecomponentblackholenullserializeraw
Description: Serialize the contents of a null implementation of the blackHole component to raw (binary) file.
Code lines: 14
Contained by: module galacticus_nodes

subroutine: `nodecomponentblackholenullserializevalues`
Description: Serialize evolvable properties of a `null` implementation of the `blackHole` component to array.
Code lines: 17
Contained by: module galacticus_nodes

subroutine: `nodecomponentblackholenullserializexml`
Description: Serialize the contents of a null implementation of the blackHole component to XML.
Code lines: 14
Contained by: module galacticus_nodes

function: `nodecomponentblackholenullsizeof`
Description: Return the size in bytes of a null implementation of the blackHole component.
Code lines: 9
Contained by: module galacticus_nodes

function: `nodecomponentblackholenulltype`
Description: Returns the type name for the null implementation of the blackHole component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: `nodecomponentblackholeremove`
Description: Remove an instance of the `blackHole` component from a node.
Code lines: 58
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: `nodecomponentblackholeserializeascii`
Description: Serialize the content of a `blackHole` component to ASCII.
Code lines: 16
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string

type: `nodecomponentblackholesimple`
Description: Class for the simple implementation of the blackHole component.
Code lines: 181
Contained by: module galacticus_nodes

subroutine: `nodecomponentblackholesimplebuilder`
Description: Build a `simple` implementation of the `blackHole` component from a supplied XML definition.
Code lines: 24
Contained by: module galacticus_nodes
Modules used: fox_dom galacticus_error memory_management

subroutine: `nodecomponentblackholesimpledeserializeraw`
Description: Deserialize the contents of a simple implementation of the blackHole component from raw (binary) file.

Code lines: 12
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: nodecomponentblackholesimpledeserializevalues
Description: Deserialize evolvable properties of a simple implementation of the blackHole component from array.
Code lines: 16
Contained by: module galacticus_nodes

subroutine: nodecomponentblackholesimplefinalize
Description: Finalize a simple implementation of the blackHole component.
Code lines: 13
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: nodecomponentblackholesimpleinitialize
Description: Initialize a simple member of the blackHole component.
Code lines: 9
Contained by: module galacticus_nodes

function: nodecomponentblackholesimpleisactive
Description: Return true if the simple implementation of the blackHole component is the active choice.
Code lines: 8
Contained by: module galacticus_nodes

function: nodecomponentblackholesimplenamefromindex
Description: Return the name of the property of given index for a simple implementation of the blackHole component class.
Code lines: 24
Contained by: module galacticus_nodes
Modules used: iso_varying_string

subroutine: nodecomponentblackholesimpleserializeascii
Description: Serialize the contents of a simple implementation of the blackHole component to ASCII.
Code lines: 19
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string string_handling

function: nodecomponentblackholesimpleserializecount
Description: Return a count of the serialization of a simple implementation of the blackHole component.
Code lines: 22
Contained by: module galacticus_nodes

subroutine: nodecomponentblackholesimpleserializeoffsets
Description: Compute offsets into serialization arrays for a simple implementation of the blackHole component.
Code lines: 28
Contained by: module galacticus_nodes

subroutine: `nodecomponentblackholesimpleserializeraw`
Description: Serialize the contents of a simple implementation of the blackHole component to raw (binary) file.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentblackholesimpleserializevalues`
Description: Serialize evolvable properties of a `simple` implementation of the `blackHole` component to array.
Code lines: 16
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentblackholesimpleserializexml`
Description: Serialize the contents of a simple implementation of the blackHole component to XML.
Code lines: 16
Contained by: module `galacticus_nodes`

function: `nodecomponentblackholesimplesizeof`
Description: Return the size in bytes of a simple implementation of the blackHole component.
Code lines: 9
Contained by: module `galacticus_nodes`

function: `nodecomponentblackholesimpletype`
Description: Returns the type name for the simple implementation of the blackHole component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `nodecomponentblackholesizeof`
Description: Return the size in bytes of a nodeComponentBlackHole component.
Code lines: 9
Contained by: module `galacticus_nodes`

type: `nodecomponentblackholestandard`
Description: Class for the standard implementation of the blackHole component.
Code lines: 310
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentblackholestandardbuilder`
Description: Build a `standard` implementation of the `blackHole` component from a supplied XML definition.
Code lines: 42
Contained by: module `galacticus_nodes`
Modules used: `fox_dom` `galacticus_error` `memory_management`

subroutine: `nodecomponentblackholestandarddeserializeraw`
Description: Deserialize the contents of a standard implementation of the blackHole component from raw (binary) file.
Code lines: 15

Contained by: module galacticus_nodes

subroutine: nodecomponentblackholestandardfinalize
Description: Finalize a standard implementation of the blackHole component.
Code lines: 13
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: nodecomponentblackholestandardinitialize
Description: Initialize a standard member of the blackHole component.
Code lines: 12
Contained by: module galacticus_nodes

function: nodecomponentblackholestandardisactive
Description: Return true if the standard implementation of the blackHole component is the active choice.
Code lines: 8
Contained by: module galacticus_nodes

function: nodecomponentblackholestandardnamefromindex
Description: Return the name of the property of given index for a standard implementation of the blackHole component class.
Code lines: 31
Contained by: module galacticus_nodes
Modules used: iso_varying_string

subroutine: nodecomponentblackholestandardserializeascii
Description: Serialize the contents of a standard implementation of the blackHole component to ASCII.
Code lines: 28
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string string_handling

function: nodecomponentblackholestandardserializecount
Description: Return a count of the serialization of a standard implementation of the blackHole component.
Code lines: 30
Contained by: module galacticus_nodes

subroutine: nodecomponentblackholestandardserializeoffsets
Description: Compute offsets into serialization arrays for a standard implementation of the blackHole component.
Code lines: 42
Contained by: module galacticus_nodes

subroutine: `nodecomponentblackholestandardserializeraw`
Description: Serialize the contents of a standard implementation of the blackHole component to raw (binary) file.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: `nodecomponentblackholestandardserializevalues`
Description: Serialize evolvable properties of a `standard` implementation of the `blackHole` component to array.
Code lines: 20
Contained by: module galacticus_nodes

subroutine: `nodecomponentblackholestandardserializexml`
Description: Serialize the contents of a standard implementation of the blackHole component to XML.
Code lines: 22
Contained by: module galacticus_nodes

function: `nodecomponentblackholestandardsizeof`
Description: Return the size in bytes of a standard implementation of the blackHole component.
Code lines: 9
Contained by: module galacticus_nodes

function: `nodecomponentblackholestandardtype`
Description: Returns the type name for the standard implementation of the blackHole component class.
Code lines: 13
Contained by: module galacticus_nodes

function: `nodecomponentblackholetype`
Description: Returns the type name for the blackHole component class.
Code lines: 13
Contained by: module galacticus_nodes

type: `nodecomponentdarkmatterprofile`
Description: Type for the `darkMatterProfile` component class.
Code lines: 369
Contained by: module galacticus_nodes

subroutine: `nodecomponentdarkmatterprofilebuilder`
Description: Build a generic `darkMatterProfile` component from a supplied XML definition.
Code lines: 19
Contained by: module galacticus_nodes
Modules used: `fox_dom` galacticus_error

Code lines: 21
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

subroutine: `nodecomponentdarkmatterprofilenullserializeascii`
Description: Serialize the contents of a null implementation of the darkMatterProfile component to ASCII.
Code lines: 16
Contained by: module `galacticus_nodes`
Modules used: `galacticus_display` `iso_varying_string` `string_handling`

function: `nodecomponentdarkmatterprofilenullserializecount`
Description: Return a count of the serialization of a null implementation of the darkMatterProfile component.
Code lines: 15
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentdarkmatterprofilenullserializeoffsets`
Description: Compute offsets into serialization arrays for a `null` implementation of the `darkMatterProfile` component.
Code lines: 22
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentdarkmatterprofilenullserializeraw`
Description: Serialize the contents of a null implementation of the darkMatterProfile component to raw (binary) file.
Code lines: 14
Contained by: module galacticus_nodes

subroutine: `nodecomponentdarkmatterprofilenullserializevalues`
Description: Serialize evolvable properties of a `null` implementation of the `darkMatterProfile` component to array.
Code lines: 17
Contained by: module galacticus_nodes

subroutine: `nodecomponentdarkmatterprofilenullserializexml`
Description: Serialize the contents of a null implementation of the darkMatterProfile component to XML.
Code lines: 14
Contained by: module galacticus_nodes

function: `nodecomponentdarkmatterprofilenullsizeof`
Description: Return the size in bytes of a null implementation of the darkMatterProfile component.
Code lines: 9
Contained by: module galacticus_nodes

function: `nodecomponentdarkmatterprofilenulltype`
Description: Returns the type name for the null implementation of the darkMatterProfile component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: `nodecomponentdarkmatterprofileremove`
Description: Remove an instance of the `darkMatterProfile` component from a node.
Code lines: 58
Contained by: module galacticus_nodes
Modules used: galacticus_error

type: `nodecomponentdarkmatterprofilescale`
Description: Class for the scale implementation of the darkMatterProfile component.
Code lines: 232
Contained by: module galacticus_nodes

subroutine: `nodecomponentdarkmatterprofilescalebuilder`
Description: Build a `scale` implementation of the `darkMatterProfile` component from a supplied XML definition.
Code lines: 36
Contained by: module galacticus_nodes
Modules used: `fox_dom` galacticus_error memory_management

subroutine: `nodecomponentdarkmatterprofilescaledeserializeraw`

Description: Deserialize the contents of a scale implementation of the darkMatterProfile component from raw (binary) file.
Code lines: 14
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: nodecomponentdarkmatterprofilescaledeserializevalues
Description: Deserialize evolvable properties of a scale implementation of the darkMatterProfile component from array.
Code lines: 16
Contained by: module galacticus_nodes

subroutine: nodecomponentdarkmatterprofilescalefinalize
Description: Finalize a scale implementation of the darkMatterProfile component.
Code lines: 13
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: nodecomponentdarkmatterprofilescaleinitialize
Description: Initialize a scale member of the darkMatterProfile component.
Code lines: 11
Contained by: module galacticus_nodes

function: nodecomponentdarkmatterprofilescaleisactive
Description: Return true if the scale implementation of the darkMatterProfile component is the active choice.
Code lines: 8
Contained by: module galacticus_nodes

function: nodecomponentdarkmatterprofilescalenamefromindex
Description: Return the name of the property of given index for a scale implementation of the darkMatterProfile component class.
Code lines: 24
Contained by: module galacticus_nodes
Modules used: iso_varying_string

type: nodecomponentdarkmatterprofilescalepreset
Description: Class for the scalePreset implementation of the darkMatterProfile component.
Code lines: 194
Contained by: module galacticus_nodes

subroutine: nodecomponentdarkmatterprofilescalepresetbuilder
Description: Build a scalePreset implementation of the darkMatterProfile component from a supplied XML definition.
Code lines: 30
Contained by: module galacticus_nodes
Modules used: fox_dom galacticus_error memory_management

subroutine: nodecomponentdarkmatterprofilescalepresetdeserializeraw

Description: Deserialize the contents of a scalePreset implementation of the darkMatterProfile component from raw (binary) file.
Code lines: 13
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: nodecomponentdarkmatterprofilescalepresetdeserializevalues
Description: Deserialize evolvable properties of a scalePreset implementation of the darkMatterProfile component from array.
Code lines: 16
Contained by: module galacticus_nodes

subroutine: nodecomponentdarkmatterprofilescalepresetfinalize
Description: Finalize a scalePreset implementation of the darkMatterProfile component.
Code lines: 13
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: nodecomponentdarkmatterprofilescalepresetinitialize
Description: Initialize a scalePreset member of the darkMatterProfile component.
Code lines: 10
Contained by: module galacticus_nodes

function: nodecomponentdarkmatterprofilescalepresetisactive
Description: Return true if the scalePreset implementation of the darkMatterProfile component is the active choice.
Code lines: 8
Contained by: module galacticus_nodes

function: nodecomponentdarkmatterprofilescalepresetnamefromindex
Description: Return the name of the property of given index for a scalePreset implementation of the darkMatterProfile component class.
Code lines: 24
Contained by: module galacticus_nodes
Modules used: iso_varying_string

subroutine: nodecomponentdarkmatterprofilescalepresetserializeascii
Description: Serialize the contents of a scalePreset implementation of the darkMatterProfile component to ASCII.
Code lines: 22
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string string_handling

function: nodecomponentdarkmatterprofilescalepresetserializecount
Description: Return a count of the serialization of a scalePreset implementation of the darkMatterProfile component.
Code lines: 22
Contained by: module galacticus_nodes

subroutine: `nodecomponentdarkmatterprofilescalepresetserializeoffsets`
Description: Compute offsets into serialization arrays for a `scalePreset` implementation of the `darkMatterProfile` component.
Code lines: 28
Contained by: module galacticus_nodes

subroutine: `nodecomponentdarkmatterprofilescalepresetserializeraw`
Description: Serialize the contents of a scalePreset implementation of the darkMatterProfile component to raw (binary) file.
Code lines: 11
Contained by: module galacticus_nodes

subroutine: `nodecomponentdarkmatterprofilescalepresetserializevalues`
Description: Serialize evolvable properties of a `scalePreset` implementation of the `darkMatterProfile` component to array.
Code lines: 16
Contained by: module galacticus_nodes

subroutine: `nodecomponentdarkmatterprofilescalepresetserializexml`
Description: Serialize the contents of a scalePreset implementation of the darkMatterProfile component to XML.
Code lines: 16
Contained by: module galacticus_nodes

function: `nodecomponentdarkmatterprofilescalepresetsizeof`
Description: Return the size in bytes of a scalePreset implementation of the darkMatterProfile component.
Code lines: 9
Contained by: module galacticus_nodes

function: `nodecomponentdarkmatterprofilescalepresettype`
Description: Returns the type name for the scalePreset implementation of the darkMatterProfile component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: `nodecomponentdarkmatterprofilescaleserializeascii`
Description: Serialize the contents of a scale implementation of the darkMatterProfile component to ASCII.
Code lines: 25
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string string_handling

function: `nodecomponentdarkmatterprofilescaleserializecount`
Description: Return a count of the serialization of a scale implementation of the darkMatterProfile component.
Code lines: 22
Contained by: module galacticus_nodes

subroutine: `nodecomponentdarkmatterprofilescaleserializeoffsets`

Description: Compute offsets into serialization arrays for a `scale` implementation of the `darkMatterProfile` component.
Code lines: 28
Contained by: module galacticus_nodes

subroutine: `nodecomponentdarkmatterprofilescaleserializeraw`
Description: Serialize the contents of a scale implementation of the darkMatterProfile component to raw (binary) file.
Code lines: 12
Contained by: module galacticus_nodes

subroutine: `nodecomponentdarkmatterprofilescaleserializevalues`
Description: Serialize evolvable properties of a `scale` implementation of the `darkMatterProfile` component to array.
Code lines: 16
Contained by: module galacticus_nodes

subroutine: `nodecomponentdarkmatterprofilescaleserializexml`
Description: Serialize the contents of a scale implementation of the darkMatterProfile component to XML.
Code lines: 17
Contained by: module galacticus_nodes

type: `nodecomponentdarkmatterprofilescaleshape`
Description: Class for the scaleShape implementation of the darkMatterProfile component.
Code lines: 222
Contained by: module galacticus_nodes

subroutine: `nodecomponentdarkmatterprofilescaleshapebuilder`
Description: Build a `scaleShape` implementation of the `darkMatterProfile` component from a supplied XML definition.
Code lines: 31
Contained by: module galacticus_nodes
Modules used: `fox_dom` galacticus_error memory_management

subroutine: `nodecomponentdarkmatterprofilescaleshapedeserializeraw`
Description: Deserialize the contents of a scaleShape implementation of the darkMatterProfile component from raw (binary) file.
Code lines: 14
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: `nodecomponentdarkmatterprofilescaleshapedeserializevalues`
Description: Deserialize evolvable properties of a scaleShape implementation of the darkMatterProfile component from array.
Code lines: 21
Contained by: module galacticus_nodes

subroutine: `nodecomponentdarkmatterprofilescaleshapefinalize`

Description: Finalize a `scaleShape` implementation of the `darkMatterProfile` component.
Code lines: 13
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: `nodecomponentdarkmatterprofilescaleshapeinitialize`
Description: Initialize a `scaleShape` member of the `darkMatterProfile` component.
Code lines: 11
Contained by: module galacticus_nodes

function: `nodecomponentdarkmatterprofilescaleshapeisactive`
Description: Return true if the scaleShape implementation of the darkMatterProfile component is the active choice.
Code lines: 8
Contained by: module galacticus_nodes

function: `nodecomponentdarkmatterprofilescaleshapenamefromindex`
Description: Return the name of the property of given index for a `scaleShape` implementation of the `darkMatterProfile` component class.
Code lines: 23
Contained by: module galacticus_nodes
Modules used: iso_varying_string

subroutine: `nodecomponentdarkmatterprofilescaleshapeserializeascii`
Description: Serialize the contents of a scaleShape implementation of the darkMatterProfile component to ASCII.
Code lines: 23
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string string_handling

function: `nodecomponentdarkmatterprofilescaleshapeserializecount`
Description: Return a count of the serialization of a scaleShape implementation of the darkMatterProfile component.
Code lines: 19
Contained by: module galacticus_nodes

subroutine: `nodecomponentdarkmatterprofilescaleshapeserializeoffsets`
Description: Compute offsets into serialization arrays for a `scaleShape` implementation of the `darkMatterProfile` component.
Code lines: 26
Contained by: module galacticus_nodes

subroutine: `nodecomponentdarkmatterprofilescaleshapeserializeraw`
Description: Serialize the contents of a scaleShape implementation of the darkMatterProfile component to raw (binary) file.
Code lines: 12
Contained by: module galacticus_nodes

subroutine: `nodecomponentdarkmatterprofilescaleshapeserializevalues`

Description: Serialize evolvable properties of a `scaleShape` implementation of the `darkMatterProfile` component to array.
Code lines: 21
Contained by: module galacticus_nodes

subroutine: `nodecomponentdarkmatterprofilescaleshapeserializexml`
Description: Serialize the contents of a scaleShape implementation of the darkMatterProfile component to XML.
Code lines: 17
Contained by: module galacticus_nodes

function: `nodecomponentdarkmatterprofilescaleshapesizeof`
Description: Return the size in bytes of a scaleShape implementation of the darkMatterProfile component.
Code lines: 9
Contained by: module galacticus_nodes

function: `nodecomponentdarkmatterprofilescaleshapetype`
Description: Returns the type name for the scaleShape implementation of the darkMatterProfile component class.
Code lines: 13
Contained by: module galacticus_nodes

function: `nodecomponentdarkmatterprofilescalesizeof`
Description: Return the size in bytes of a scale implementation of the darkMatterProfile component.
Code lines: 9
Contained by: module galacticus_nodes

function: `nodecomponentdarkmatterprofilescaletype`
Description: Returns the type name for the scale implementation of the darkMatterProfile component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: `nodecomponentdarkmatterprofileserializeascii`
Description: Serialize the content of a `darkMatterProfile` component to ASCII.
Code lines: 16
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string

function: `nodecomponentdarkmatterprofilesizeof`
Description: Return the size in bytes of a nodeComponentDarkMatterProfile component.
Code lines: 9
Contained by: module galacticus_nodes

function: `nodecomponentdarkmatterprofiletype`
Description: Returns the type name for the darkMatterProfile component class.
Code lines: 13
Contained by: module galacticus_nodes

type: `nodecomponentdisk`
Description: Type for the `disk` component class.
Code lines: 943
Contained by: module galacticus_nodes

subroutine: `nodecomponentdiskbuilder`
Description: Build a generic `disk` component from a supplied XML definition.
Code lines: 19
Contained by: module galacticus_nodes
Modules used: fox_dom galacticus_error

subroutine: `nodecomponentdiskcreate`
Description: Create the `disk` component of `self`.
Code lines: 38
Contained by: module galacticus_nodes
Modules used: galacticus_display galacticus_error iso_varying_string string_handling

subroutine: `nodecomponentdiskdestroy`
Description: Destroy the `disk` component of `self`
Code lines: 15
Contained by: module galacticus_nodes

subroutine: `nodecomponentdiskdumpascii`
Description: Dump the content of a `disk` component.
Code lines: 16
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string

subroutine: `nodecomponentdiskfinalize`
Description: Finalize a generic `disk` component.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: `nodecomponentdiskinitialize`
Description: Initialize a generic `disk` component.
Code lines: 15
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: `nodecomponentdiskmove`
Description: Move instances of the `disk` component, from one node to another.
Code lines: 98
Contained by: module galacticus_nodes
Modules used: galacticus_error

type: `nodecomponentdisknull`
Description: Class for the null implementation of the disk component.

Code lines: 124
Contained by: module galacticus_nodes

subroutine: nodecomponentdisknullbuilder
Description: Build a null implementation of the disk component from a supplied XML definition.
Code lines: 18
Contained by: module galacticus_nodes
Modules used: fox_dom galacticus_error memory_management

subroutine: nodecomponentdisknulldeserializeraw
Description: Deserialize the contents of a null implementation of the disk component from raw (binary) file.
Code lines: 16
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: nodecomponentdisknulldeserializevalues
Description: Deserialize evolvable properties of a null implementation of the disk component from array.
Code lines: 17
Contained by: module galacticus_nodes

subroutine: nodecomponentdisknullfinalize
Description: Finalize a null implementation of the disk component.
Code lines: 13
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: nodecomponentdisknullinitialize
Description: Initialize a null member of the disk component.
Code lines: 11
Contained by: module galacticus_nodes

function: nodecomponentdisknullisactive
Description: Return true if the null implementation of the disk component is the active choice.
Code lines: 8
Contained by: module galacticus_nodes

function: nodecomponentdisknullnamefromindex
Description: Return the name of the property of given index for a null implementation of the disk component class.
Code lines: 21
Contained by: module galacticus_nodes
Modules used: iso_varying_string

subroutine: nodecomponentdisknullserializeascii
Description: Serialize the contents of a null implementation of the disk component to ASCII.
Code lines: 16
Contained by: module galacticus_nodes

Modules used: galacticus_display iso_varying_string string_handling

function: nodecomponentdisknullserializecount
Description: Return a count of the serialization of a null implementation of the disk component.
Code lines: 15
Contained by: module galacticus_nodes

subroutine: nodecomponentdisknullserializeoffsets
Description: Compute offsets into serialization arrays for a null implementation of the disk component.
Code lines: 22
Contained by: module galacticus_nodes

subroutine: nodecomponentdisknullserializeraw
Description: Serialize the contents of a null implementation of the disk component to raw (binary) file.
Code lines: 14
Contained by: module galacticus_nodes

subroutine: nodecomponentdisknullserializevalues
Description: Serialize evolvable properties of a null implementation of the disk component to array.
Code lines: 17
Contained by: module galacticus_nodes

subroutine: nodecomponentdisknullserializexml
Description: Serialize the contents of a null implementation of the disk component to XML.
Code lines: 14
Contained by: module galacticus_nodes

function: nodecomponentdisknullsizeof
Description: Return the size in bytes of a null implementation of the disk component.
Code lines: 9
Contained by: module galacticus_nodes

function: nodecomponentdisknulltype
Description: Returns the type name for the null implementation of the disk component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: nodecomponentdiskremove
Description: Remove an instance of the disk component from a node.
Code lines: 58
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: nodecomponentdiskserializeascii
Description: Serialize the content of a disk component to ASCII.
Code lines: 16
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string

function: `nodecomponentdisksizeof`
Description: Return the size in bytes of a nodeComponentDisk component.
Code lines: 9
Contained by: module galacticus_nodes

type: `nodecomponentdiskstandard`
Description: Class for the standard implementation of the disk component.
Code lines: 742
Contained by: module galacticus_nodes

subroutine: `nodecomponentdiskstandardbuilder`
Description: Build a `standard` implementation of the `disk` component from a supplied XML definition.
Code lines: 96
Contained by: module galacticus_nodes
Modules used: `fox_dom` galacticus_error memory_management

subroutine: `nodecomponentdiskstandarddeserializeraw`
Description: Deserialize the contents of a standard implementation of the disk component from raw (binary) file.
Code lines: 24
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: `nodecomponentdiskstandarddeserializevalues`
Description: Deserialize evolvable properties of a standard implementation of the disk component from array.
Code lines: 57
Contained by: module galacticus_nodes

subroutine: `nodecomponentdiskstandardfinalize`
Description: Finalize a `standard` implementation of the `disk` component.
Code lines: 15
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: `nodecomponentdiskstandardinitialize`
Description: Initialize a `standard` member of the `disk` component.
Code lines: 21
Contained by: module galacticus_nodes

function: `nodecomponentdiskstandardisactive`
Description: Return true if the standard implementation of the disk component is the active choice.
Code lines: 8
Contained by: module galacticus_nodes

function: `nodecomponentdiskstandardnamefromindex`
Description: Return the name of the property of given index for a `standard` implementation of the `disk` component class.

Code lines: 84
Contained by: module galacticus_nodes
Modules used: iso_varying_string

subroutine: nodecomponentdiskstandardserializeascii
Description: Serialize the contents of a standard implementation of the disk component to ASCII.
Code lines: 60
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string string_handling

function: nodecomponentdiskstandardserializecount
Description: Return a count of the serialization of a standard implementation of the disk component.
Code lines: 91
Contained by: module galacticus_nodes

subroutine: nodecomponentdiskstandardserializeoffsets
Description: Compute offsets into serialization arrays for a standard implementation of the disk component.
Code lines: 151
Contained by: module galacticus_nodes

subroutine: nodecomponentdiskstandardserializeraw
Description: Serialize the contents of a standard implementation of the disk component to raw (binary) file.
Code lines: 22
Contained by: module galacticus_nodes

subroutine: nodecomponentdiskstandardserializevalues
Description: Serialize evolvable properties of a standard implementation of the disk component to array.
Code lines: 57
Contained by: module galacticus_nodes

subroutine: nodecomponentdiskstandardserializexml
Description: Serialize the contents of a standard implementation of the disk component to XML.
Code lines: 34
Contained by: module galacticus_nodes

function: nodecomponentdiskstandardsizeof
Description: Return the size in bytes of a standard implementation of the disk component.
Code lines: 14
Contained by: module galacticus_nodes

function: nodecomponentdiskstandardtype
Description: Returns the type name for the standard implementation of the disk component class.
Code lines: 13
Contained by: module galacticus_nodes

function: nodecomponentdisktype

Description: Returns the type name for the disk component class.
Code lines: 13
Contained by: module galacticus_nodes

type: nodecomponentdiskverysimple
Description: Class for the verySimple implementation of the disk component.
Code lines: 492
Contained by: module galacticus_nodes

subroutine: nodecomponentdiskverysimplebuilder
Description: Build a verySimple implementation of the disk component from a supplied XML definition.
Code lines: 60
Contained by: module galacticus_nodes
Modules used: fox_dom galacticus_error memory_management

subroutine: nodecomponentdiskverysimpledeserializeraw
Description: Deserialize the contents of a verySimple implementation of the disk component from raw (binary) file.
Code lines: 18
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: nodecomponentdiskverysimpledeserializevalues
Description: Deserialize evolvable properties of a verySimple implementation of the disk component from array.
Code lines: 40
Contained by: module galacticus_nodes

subroutine: nodecomponentdiskverysimplefinalize
Description: Finalize a verySimple implementation of the disk component.
Code lines: 14
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: nodecomponentdiskverysimpleinitialize
Description: Initialize a verySimple member of the disk component.
Code lines: 15
Contained by: module galacticus_nodes

function: nodecomponentdiskverysimpleisactive
Description: Return true if the verySimple implementation of the disk component is the active choice.
Code lines: 8
Contained by: module galacticus_nodes

function: nodecomponentdiskverysimplenamefromindex
Description: Return the name of the property of given index for a verySimple implementation of the disk component class.
Code lines: 56
Contained by: module galacticus_nodes

Modules used: iso_varying_string

subroutine: nodecomponentdiskverysimpleserializeascii
Description: Serialize the contents of a verySimple implementation of the disk component to ASCII.
Code lines: 41
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string string_handling

function: nodecomponentdiskverysimpleserializecount
Description: Return a count of the serialization of a verySimple implementation of the disk component.
Code lines: 59
Contained by: module galacticus_nodes

subroutine: nodecomponentdiskverysimpleserializeoffsets
Description: Compute offsets into serialization arrays for a verySimple implementation of the disk component.
Code lines: 95
Contained by: module galacticus_nodes

subroutine: nodecomponentdiskverysimpleserializeraw
Description: Serialize the contents of a verySimple implementation of the disk component to raw (binary) file.
Code lines: 16
Contained by: module galacticus_nodes

subroutine: nodecomponentdiskverysimpleserializevalues
Description: Serialize evolvable properties of a verySimple implementation of the disk component to array.
Code lines: 40
Contained by: module galacticus_nodes

subroutine: nodecomponentdiskverysimpleserializexml
Description: Serialize the contents of a verySimple implementation of the disk component to XML.
Code lines: 26
Contained by: module galacticus_nodes

type: nodecomponentdiskverysimplesize
Description: Class for the verySimpleSize implementation of the disk component.
Code lines: 169
Contained by: module galacticus_nodes

subroutine: nodecomponentdiskverysimplesizebuilder
Description: Build a verySimpleSize implementation of the disk component from a supplied XML definition.
Code lines: 31
Contained by: module galacticus_nodes
Modules used: fox_dom galacticus_error memory_management

subroutine: `nodecomponentdiskverysimplesizedeserializeraw`
Description: Deserialize the contents of a verySimpleSize implementation of the disk component from raw (binary) file.
Code lines: 14
Contained by: module `galacticus_nodes`
Modules used: `memory_management`

subroutine: `nodecomponentdiskverysimplesizedeserializevalues`
Description: Deserialize evolvable properties of a verySimpleSize implementation of the disk component from array.
Code lines: 17
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentdiskverysimplesizefinalize`
Description: Finalize a `verySimpleSize` implementation of the `disk` component.
Code lines: 13
Contained by: module `galacticus_nodes`
Modules used: `memory_management`

subroutine: `nodecomponentdiskverysimplesizeinitialize`
Description: Initialize a `verySimpleSize` member of the `disk` component.
Code lines: 11
Contained by: module `galacticus_nodes`

function: `nodecomponentdiskverysimplesizeisactive`
Description: Return true if the verySimpleSize implementation of the disk component is the active choice.
Code lines: 8
Contained by: module `galacticus_nodes`

function: `nodecomponentdiskverysimplesizenamefromindex`
Description: Return the name of the property of given index for a `verySimpleSize` implementation of the `disk` component class.
Code lines: 16
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

function: `nodecomponentdiskverysimplesizeof`
Description: Return the size in bytes of a verySimple implementation of the disk component.
Code lines: 13
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentdiskverysimplesizeserializeascii`
Description: Serialize the contents of a verySimpleSize implementation of the disk component to ASCII.
Code lines: 23
Contained by: module `galacticus_nodes`
Modules used: `galacticus_display` `iso_varying_string` `string_handling`

function: `nodecomponentdiskverysimplesizeserializecount`
Description: Return a count of the serialization of a verySimpleSize implementation of the disk component.
Code lines: 13
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentdiskverysimplesizeserializeoffsets`
Description: Compute offsets into serialization arrays for a `verySimpleSize` implementation of the `disk` component.
Code lines: 15
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentdiskverysimplesizeserializeraw`
Description: Serialize the contents of a verySimpleSize implementation of the disk component to raw (binary) file.
Code lines: 12
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentdiskverysimplesizeserializevalues`
Description: Serialize evolvable properties of a `verySimpleSize` implementation of the `disk` component to array.
Code lines: 17
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentdiskverysimplesizeserializexml`
Description: Serialize the contents of a verySimpleSize implementation of the disk component to XML.
Code lines: 18
Contained by: module `galacticus_nodes`

function: `nodecomponentdiskverysimplesizesizeof`
Description: Return the size in bytes of a verySimpleSize implementation of the disk component.
Code lines: 9
Contained by: module `galacticus_nodes`

function: `nodecomponentdiskverysimplesizetype`
Description: Returns the type name for the verySimpleSize implementation of the disk component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `nodecomponentdiskverysimpletype`
Description: Returns the type name for the verySimple implementation of the disk component class.
Code lines: 13
Contained by: module `galacticus_nodes`

type: `nodecomponentdynamicsstatistics`
Description: Type for the `dynamicsStatistics` component class.
Code lines: 229
Contained by: module `galacticus_nodes`

type: `nodecomponentdynamicsstatisticsbars`
Description: Class for the bars implementation of the dynamicsStatistics component.
Code lines: 183
Contained by: module galacticus_nodes

subroutine: `nodecomponentdynamicsstatisticsbarsbuilder`
Description: Build a `bars` implementation of the `dynamicsStatistics` component from a supplied XML definition.
Code lines: 43
Contained by: module galacticus_nodes
Modules used: `fox_dom` galacticus_error memory_management

subroutine: `nodecomponentdynamicsstatisticsbarsdeserializeraw`
Description: Deserialize the contents of a bars implementation of the dynamicsStatistics component from raw (binary) file.
Code lines: 31
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: `nodecomponentdynamicsstatisticsbarsdeserializevalues`
Description: Deserialize evolvable properties of a bars implementation of the dynamicsStatistics component from array.
Code lines: 17
Contained by: module galacticus_nodes

subroutine: `nodecomponentdynamicsstatisticsbarsfinalize`
Description: Finalize a `bars` implementation of the `dynamicsStatistics` component.
Code lines: 13
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: `nodecomponentdynamicsstatisticsbarsinitialize`
Description: Initialize a `bars` member of the `dynamicsStatistics` component.
Code lines: 14
Contained by: module galacticus_nodes

function: `nodecomponentdynamicsstatisticsbarsisactive`
Description: Return true if the bars implementation of the dynamicsStatistics component is the active choice.
Code lines: 8
Contained by: module galacticus_nodes

function: `nodecomponentdynamicsstatisticsbarsnamefromindex`
Description: Return the name of the property of given index for a `bars` implementation of the `dynamicsStatistics` component class.
Code lines: 21
Contained by: module galacticus_nodes
Modules used: iso_varying_string

subroutine: `nodecomponentdynamicsstatisticsbarsserializeascii`
Description: Serialize the contents of a bars implementation of the dynamicsStatistics component to ASCII.
Code lines: 38
Contained by: module `galacticus_nodes`
Modules used: `galacticus_display` `iso_varying_string` `string_handling`

function: `nodecomponentdynamicsstatisticsbarsserializecount`
Description: Return a count of the serialization of a bars implementation of the dynamicsStatistics component.
Code lines: 15
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentdynamicsstatisticsbarsserializeoffsets`
Description: Compute offsets into serialization arrays for a `bars` implementation of the `dynamicsStatistics` component.
Code lines: 22
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentdynamicsstatisticsbarsserializeraw`
Description: Serialize the contents of a bars implementation of the dynamicsStatistics component to raw (binary) file.
Code lines: 24
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentdynamicsstatisticsbarsserializevalues`
Description: Serialize evolvable properties of a `bars` implementation of the `dynamicsStatistics` component to array.
Code lines: 17
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentdynamicsstatisticsbarsserializexml`
Description: Serialize the contents of a bars implementation of the dynamicsStatistics component to XML.
Code lines: 24
Contained by: module `galacticus_nodes`

function: `nodecomponentdynamicsstatisticsbarssizeof`
Description: Return the size in bytes of a bars implementation of the dynamicsStatistics component.
Code lines: 12
Contained by: module `galacticus_nodes`

function: `nodecomponentdynamicsstatisticsbarstype`
Description: Returns the type name for the bars implementation of the dynamicsStatistics component class.
Code lines: 13
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentdynamicsstatisticsbuilder`
Description: Build a generic `dynamicsStatistics` component from a supplied XML definition.
Code lines: 19
Contained by: module galacticus_nodes
Modules used: `fox_dom` galacticus_error

subroutine: `nodecomponentdynamicsstatisticscreate`
Description: Create the `dynamicsStatistics` component of `self`.
Code lines: 38
Contained by: module galacticus_nodes
Modules used: galacticus_display galacticus_error iso_varying_string string_handling

subroutine: `nodecomponentdynamicsstatisticsdestroy`
Description: Destroy the `dynamicsStatistics` component of `self`
Code lines: 15
Contained by: module galacticus_nodes

subroutine: `nodecomponentdynamicsstatisticsdumpascii`
Description: Dump the content of a `dynamicsStatistics` component.
Code lines: 16
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string

subroutine: `nodecomponentdynamicsstatisticsfinalize`
Description: Finalize a generic `dynamicsStatistics` component.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: `nodecomponentdynamicsstatisticsinitialize`
Description: Initialize a generic `dynamicsStatistics` component.
Code lines: 15
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: `nodecomponentdynamicsstatisticsmove`
Description: Move instances of the `dynamicsStatistics` component, from one node to another.
Code lines: 70
Contained by: module galacticus_nodes
Modules used: galacticus_error

type: `nodecomponentdynamicsstatisticsnull`
Description: Class for the null implementation of the dynamicsStatistics component.
Code lines: 124
Contained by: module galacticus_nodes

subroutine: `nodecomponentdynamicsstatisticsnullbuilder`
Description: Build a `null` implementation of the `dynamicsStatistics` component from a supplied XML definition.

Code lines: 18
Contained by: module galacticus_nodes
Modules used: fox_dom galacticus_error memory_management

subroutine: nodecomponentdynamicsstatisticsnulldeserializeraw
Description: Deserialize the contents of a null implementation of the dynamicsStatistics component from raw (binary) file.
Code lines: 16
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: nodecomponentdynamicsstatisticsnulldeserializevalues
Description: Deserialize evolvable properties of a null implementation of the dynamicsStatistics component from array.
Code lines: 17
Contained by: module galacticus_nodes

subroutine: nodecomponentdynamicsstatisticsnullfinalize
Description: Finalize a null implementation of the dynamicsStatistics component.
Code lines: 13
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: nodecomponentdynamicsstatisticsnullinitialize
Description: Initialize a null member of the dynamicsStatistics component.
Code lines: 11
Contained by: module galacticus_nodes

function: nodecomponentdynamicsstatisticsnullisactive
Description: Return true if the null implementation of the dynamicsStatistics component is the active choice.
Code lines: 8
Contained by: module galacticus_nodes

function: nodecomponentdynamicsstatisticsnullnamefromindex
Description: Return the name of the property of given index for a null implementation of the dynamicsStatistics component class.
Code lines: 21
Contained by: module galacticus_nodes
Modules used: iso_varying_string

subroutine: nodecomponentdynamicsstatisticsnullserializeascii
Description: Serialize the contents of a null implementation of the dynamicsStatistics component to ASCII.
Code lines: 16
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string string_handling

function: `nodecomponentdynamicsstatisticsnullserializecount`
Description: Return a count of the serialization of a null implementation of the dynamicsStatistics component.
Code lines: 15
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentdynamicsstatisticsnullserializeoffsets`
Description: Compute offsets into serialization arrays for a `null` implementation of the `dynamicsStatistics` component.
Code lines: 22
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentdynamicsstatisticsnullserializeraw`
Description: Serialize the contents of a null implementation of the dynamicsStatistics component to raw (binary) file.
Code lines: 14
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentdynamicsstatisticsnullserializevalues`
Description: Serialize evolvable properties of a `null` implementation of the `dynamicsStatistics` component to array.
Code lines: 17
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentdynamicsstatisticsnullserializexml`
Description: Serialize the contents of a null implementation of the dynamicsStatistics component to XML.
Code lines: 14
Contained by: module `galacticus_nodes`

function: `nodecomponentdynamicsstatisticsnullsizeof`
Description: Return the size in bytes of a null implementation of the dynamicsStatistics component.
Code lines: 9
Contained by: module `galacticus_nodes`

function: `nodecomponentdynamicsstatisticsnulltype`
Description: Returns the type name for the null implementation of the dynamicsStatistics component class.
Code lines: 13
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentdynamicsstatisticsremove`
Description: Remove an instance of the `dynamicsStatistics` component from a node.
Code lines: 42
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

subroutine: `nodecomponentdynamicsstatisticsserializeascii`
Description: Serialize the content of a `dynamicsStatistics` component to ASCII.

Code lines: 16
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string

function: nodecomponentdynamicsstatisticssizeof
Description: Return the size in bytes of a nodeComponentDynamicsStatistics component.
Code lines: 9
Contained by: module galacticus_nodes

function: nodecomponentdynamicsstatisticstype
Description: Returns the type name for the dynamicsStatistics component class.
Code lines: 13
Contained by: module galacticus_nodes

type: nodecomponentformationtime
Description: Type for the formationTime component class.
Code lines: 152
Contained by: module galacticus_nodes

subroutine: nodecomponentformationtimebuilder
Description: Build a generic formationTime component from a supplied XML definition.
Code lines: 19
Contained by: module galacticus_nodes
Modules used: fox_dom galacticus_error

type: nodecomponentformationtimecole2000
Description: Class for the Cole2000 implementation of the formationTime component.
Code lines: 129
Contained by: module galacticus_nodes

subroutine: nodecomponentformationtimecole2000builder
Description: Build a Cole2000 implementation of the formationTime component from a supplied XML definition.
Code lines: 24
Contained by: module galacticus_nodes
Modules used: fox_dom galacticus_error memory_management

subroutine: nodecomponentformationtimecole2000deserializeraw
Description: Deserialize the contents of a Cole2000 implementation of the formationTime component from raw (binary) file.
Code lines: 12
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: nodecomponentformationtimecole2000deserializevalues
Description: Deserialize evolvable properties of a Cole2000 implementation of the formationTime component from array.
Code lines: 17
Contained by: module galacticus_nodes

subroutine: `nodecomponentformationtimecole2000finalize`
Description: Finalize a `Cole2000` implementation of the `formationTime` component.
Code lines: 13
Contained by: module `galacticus_nodes`
Modules used: `memory_management`

subroutine: `nodecomponentformationtimecole2000initialize`
Description: Initialize a `Cole2000` member of the `formationTime` component.
Code lines: 9
Contained by: module `galacticus_nodes`

function: `nodecomponentformationtimecole2000isactive`
Description: Return true if the Cole2000 implementation of the formationTime component is the active choice.
Code lines: 8
Contained by: module `galacticus_nodes`

function: `nodecomponentformationtimecole2000namefromindex`
Description: Return the name of the property of given index for a `Cole2000` implementation of the `formationTime` component class.
Code lines: 21
Contained by: module `galacticus_nodes`
Modules used: `iso_varying_string`

subroutine: `nodecomponentformationtimecole2000serializeascii`
Description: Serialize the contents of a Cole2000 implementation of the formationTime component to ASCII.
Code lines: 19
Contained by: module `galacticus_nodes`
Modules used: `galacticus_display` `iso_varying_string` `string_handling`

function: `nodecomponentformationtimecole2000serializecount`
Description: Return a count of the serialization of a Cole2000 implementation of the formationTime component.
Code lines: 15
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentformationtimecole2000serializeoffsets`
Description: Compute offsets into serialization arrays for a `Cole2000` implementation of the `formationTime` component.
Code lines: 22
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentformationtimecole2000serializeraw`
Description: Serialize the contents of a Cole2000 implementation of the formationTime component to raw (binary) file.
Code lines: 10
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentformationtimecole2000serializevalues`
Description: Serialize evolvable properties of a `Cole2000` implementation of the `formationTime` component to array.
Code lines: 17
Contained by: module galacticus_nodes

subroutine: `nodecomponentformationtimecole2000serializexml`
Description: Serialize the contents of a Cole2000 implementation of the formationTime component to XML.
Code lines: 15
Contained by: module galacticus_nodes

function: `nodecomponentformationtimecole2000sizeof`
Description: Return the size in bytes of a Cole2000 implementation of the formationTime component.
Code lines: 9
Contained by: module galacticus_nodes

function: `nodecomponentformationtimecole2000type`
Description: Returns the type name for the Cole2000 implementation of the formationTime component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: `nodecomponentformationtimecreate`
Description: Create the `formationTime` component of `self`.
Code lines: 38
Contained by: module galacticus_nodes
Modules used: galacticus_display, galacticus_error, iso_varying_string, string_handling

subroutine: `nodecomponentformationtimedestroy`
Description: Destroy the `formationTime` component of `self`
Code lines: 15
Contained by: module galacticus_nodes

subroutine: `nodecomponentformationtimedumpascii`
Description: Dump the content of a `formationTime` component.
Code lines: 16
Contained by: module galacticus_nodes
Modules used: galacticus_display, iso_varying_string

subroutine: `nodecomponentformationtimefinalize`
Description: Finalize a generic `formationTime` component.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: `nodecomponentformationtimeinitialize`
Description: Initialize a generic `formationTime` component.

Code lines: 15
Contained by: module galacticus_nodes
Modules used: galacticus_error

type: nodecomponentformationtimemassfraction
Description: Class for the massFraction implementation of the formationTime component.
Code lines: 142
Contained by: module galacticus_nodes

subroutine: nodecomponentformationtimemassfractionbuilder
Description: Build a massFraction implementation of the formationTime component from a supplied XML definition.
Code lines: 24
Contained by: module galacticus_nodes
Modules used: fox_dom galacticus_error memory_management

subroutine: nodecomponentformationtimemassfractiondeserializeraw
Description: Deserialize the contents of a massFraction implementation of the formationTime component from raw (binary) file.
Code lines: 12
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: nodecomponentformationtimemassfractiondeserializevalues
Description: Deserialize evolvable properties of a massFraction implementation of the formationTime component from array.
Code lines: 17
Contained by: module galacticus_nodes

subroutine: nodecomponentformationtimemassfractionfinalize
Description: Finalize a massFraction implementation of the formationTime component.
Code lines: 13
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: nodecomponentformationtimemassfractioninitialize
Description: Initialize a massFraction member of the formationTime component.
Code lines: 9
Contained by: module galacticus_nodes

function: nodecomponentformationtimemassfractionisactive
Description: Return true if the massFraction implementation of the formationTime component is the active choice.
Code lines: 8
Contained by: module galacticus_nodes

function: nodecomponentformationtimemassfractionnamefromindex
Description: Return the name of the property of given index for a massFraction implementation of the formationTime component class.
Code lines: 21

Contained by: module galacticus_nodes
Modules used: iso_varying_string

subroutine: nodecomponentformationtimemassfractionserializeascii
Description: Serialize the contents of a massFraction implementation of the formationTime component to ASCII.
Code lines: 19
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string string_handling

function: nodecomponentformationtimemassfractionserializecount
Description: Return a count of the serialization of a massFraction implementation of the formationTime component.
Code lines: 15
Contained by: module galacticus_nodes

subroutine: nodecomponentformationtimemassfractionserializeoffsets
Description: Compute offsets into serialization arrays for a massFraction implementation of the formationTime component.
Code lines: 22
Contained by: module galacticus_nodes

subroutine: nodecomponentformationtimemassfractionserializeraw
Description: Serialize the contents of a massFraction implementation of the formationTime component to raw (binary) file.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: nodecomponentformationtimemassfractionserializevalues
Description: Serialize evolvable properties of a massFraction implementation of the formationTime component to array.
Code lines: 17
Contained by: module galacticus_nodes

subroutine: nodecomponentformationtimemassfractionserializexml
Description: Serialize the contents of a massFraction implementation of the formationTime component to XML.
Code lines: 15
Contained by: module galacticus_nodes

function: nodecomponentformationtimemassfractionsizeof
Description: Return the size in bytes of a massFraction implementation of the formationTime component.
Code lines: 9
Contained by: module galacticus_nodes

function: nodecomponentformationtimemassfractiontype
Description: Returns the type name for the massFraction implementation of the formationTime component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: `nodecomponentformationtimemove`
Description: Move instances of the `formationTime` component, from one node to another.
Code lines: 84
Contained by: module `galacticus_nodes`
Modules used: `galacticus_error`

type: `nodecomponentformationtimenull`
Description: Class for the null implementation of the formationTime component.
Code lines: 124
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentformationtimenullbuilder`
Description: Build a `null` implementation of the `formationTime` component from a supplied XML definition.
Code lines: 18
Contained by: module `galacticus_nodes`
Modules used: `fox_dom` `galacticus_error` `memory_management`

subroutine: `nodecomponentformationtimenulldeserializeraw`
Description: Deserialize the contents of a null implementation of the formationTime component from raw (binary) file.
Code lines: 16
Contained by: module `galacticus_nodes`
Modules used: `memory_management`

subroutine: `nodecomponentformationtimenulldeserializevalues`
Description: Deserialize evolvable properties of a null implementation of the formationTime component from array.
Code lines: 17
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentformationtimenullfinalize`
Description: Finalize a `null` implementation of the `formationTime` component.
Code lines: 13
Contained by: module `galacticus_nodes`
Modules used: `memory_management`

subroutine: `nodecomponentformationtimenullinitialize`
Description: Initialize a `null` member of the `formationTime` component.
Code lines: 11
Contained by: module `galacticus_nodes`

function: `nodecomponentformationtimenullisactive`
Description: Return true if the null implementation of the formationTime component is the active choice.
Code lines: 8
Contained by: module `galacticus_nodes`

function: `nodecomponentformationtimenullnamefromindex`
Description: Return the name of the property of given index for a `null` implementation of the `formationTime` component class.
Code lines: 21
Contained by: module galacticus_nodes
Modules used: iso_varying_string

subroutine: `nodecomponentformationtimenullserializeascii`
Description: Serialize the contents of a null implementation of the formationTime component to ASCII.
Code lines: 16
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string string_handling

function: `nodecomponentformationtimenullserializecount`
Description: Return a count of the serialization of a null implementation of the formationTime component.
Code lines: 15
Contained by: module galacticus_nodes

subroutine: `nodecomponentformationtimenullserializeoffsets`
Description: Compute offsets into serialization arrays for a `null` implementation of the `formationTime` component.
Code lines: 22
Contained by: module galacticus_nodes

subroutine: `nodecomponentformationtimenullserializeraw`
Description: Serialize the contents of a null implementation of the formationTime component to raw (binary) file.
Code lines: 14
Contained by: module galacticus_nodes

subroutine: `nodecomponentformationtimenullserializevalues`
Description: Serialize evolvable properties of a `null` implementation of the `formationTime` component to array.
Code lines: 17
Contained by: module galacticus_nodes

subroutine: `nodecomponentformationtimenullserializexml`
Description: Serialize the contents of a null implementation of the formationTime component to XML.
Code lines: 14
Contained by: module galacticus_nodes

function: `nodecomponentformationtimenullsizeof`
Description: Return the size in bytes of a null implementation of the formationTime component.
Code lines: 9
Contained by: module galacticus_nodes

function: `nodecomponentformationtimenulltype`

Description: Returns the type name for the null implementation of the formationTime component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: nodecomponentformationtimeremove
Description: Remove an instance of the formationTime component from a node.
Code lines: 50
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: nodecomponentformationtimeserializeascii
Description: Serialize the content of a formationTime component to ASCII.
Code lines: 16
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string

function: nodecomponentformationtimesizeof
Description: Return the size in bytes of a nodeComponentFormationTime component.
Code lines: 9
Contained by: module galacticus_nodes

function: nodecomponentformationtimetype
Description: Returns the type name for the formationTime component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: nodecomponentgeterror
Description: Function used to report errors when attempting to get a component from a node. Error reporting is handled here to avoid having the relatively expensive creation/destruction of a varying string object in the actual get functions (which are called a very large number of times).
Code lines: 16
Contained by: module galacticus_nodes
Modules used: galacticus_error iso_varying_string string_handling

type: nodecomponenthosthistory
Description: Type for the hostHistory component class.
Code lines: 145
Contained by: module galacticus_nodes

subroutine: nodecomponenthosthistorybuilder
Description: Build a generic hostHistory component from a supplied XML definition.
Code lines: 19
Contained by: module galacticus_nodes
Modules used: fox_dom galacticus_error

subroutine: nodecomponenthosthistorycreate
Description: Create the hostHistory component of self.

Code lines: 38
Contained by: module galacticus_nodes
Modules used: galacticus_display galacticus_error iso_varying_string string_handling

subroutine: nodecomponenthosthistorydestroy
Description: Destroy the hostHistory component of self
Code lines: 15
Contained by: module galacticus_nodes

subroutine: nodecomponenthosthistorydumpascii
Description: Dump the content of a hostHistory component.
Code lines: 16
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string

subroutine: nodecomponenthosthistoryfinalize
Description: Finalize a generic hostHistory component.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: nodecomponenthosthistoryinitialize
Description: Initialize a generic hostHistory component.
Code lines: 15
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: nodecomponenthosthistorymove
Description: Move instances of the hostHistory component, from one node to another.
Code lines: 70
Contained by: module galacticus_nodes

type: nodecomponenthosthistorynull
Description: Class for the null implementation of the hostHistory component.
Code lines: 124
Contained by: module galacticus_nodes

subroutine: nodecomponenthosthistorynullbuilder
Description: Build a null implementation of the hostHistory component from a supplied XML definition.
Code lines: 18
Contained by: module galacticus_nodes
Modules used: fox_dom galacticus_error memory_management

subroutine: nodecomponenthosthistorynulldeserializeraw
Description: Deserialize the contents of a null implementation of the hostHistory component from raw (binary) file.
Code lines: 16

Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: nodecomponenthosthistorynulldeserializevalues
Description: Deserialize evolvable properties of a null implementation of the hostHistory component from array.
Code lines: 17
Contained by: module galacticus_nodes

subroutine: nodecomponenthosthistorynullfinalize
Description: Finalize a null implementation of the hostHistory component.
Code lines: 13
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: nodecomponenthosthistorynullinitialize
Description: Initialize a null member of the hostHistory component.
Code lines: 11
Contained by: module galacticus_nodes

function: nodecomponenthosthistorynullisactive
Description: Return true if the null implementation of the hostHistory component is the active choice.
Code lines: 8
Contained by: module galacticus_nodes

function: nodecomponenthosthistorynullnamefromindex
Description: Return the name of the property of given index for a null implementation of the hostHistory component class.
Code lines: 21
Contained by: module galacticus_nodes
Modules used: iso_varying_string

subroutine: nodecomponenthosthistorynullserializeascii
Description: Serialize the contents of a null implementation of the hostHistory component to ASCII.
Code lines: 16
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string string_handling

function: nodecomponenthosthistorynullserializecount
Description: Return a count of the serialization of a null implementation of the hostHistory component.
Code lines: 15
Contained by: module galacticus_nodes

subroutine: nodecomponenthosthistorynullserializeoffsets
Description: Compute offsets into serialization arrays for a null implementation of the hostHistory component.
Code lines: 22
Contained by: module galacticus_nodes

subroutine: `nodecomponenthosthistorynullserializeraw`
Description: Serialize the contents of a null implementation of the hostHistory component to raw (binary) file.
Code lines: 14
Contained by: module galacticus_nodes

subroutine: `nodecomponenthosthistorynullserializevalues`
Description: Serialize evolvable properties of a `null` implementation of the `hostHistory` component to array.
Code lines: 17
Contained by: module galacticus_nodes

subroutine: `nodecomponenthosthistorynullserializexml`
Description: Serialize the contents of a null implementation of the hostHistory component to XML.
Code lines: 14
Contained by: module galacticus_nodes

function: `nodecomponenthosthistorynullsizeof`
Description: Return the size in bytes of a null implementation of the hostHistory component.
Code lines: 9
Contained by: module galacticus_nodes

function: `nodecomponenthosthistorynulltype`
Description: Returns the type name for the null implementation of the hostHistory component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: `nodecomponenthosthistoryremove`
Description: Remove an instance of the `hostHistory` component from a node.
Code lines: 42
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: `nodecomponenthosthistoryserializeascii`
Description: Serialize the content of a `hostHistory` component to ASCII.
Code lines: 16
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string

function: `nodecomponenthosthistorysizeof`
Description: Return the size in bytes of a nodeComponentHostHistory component.
Code lines: 9
Contained by: module galacticus_nodes

type: `nodecomponenthosthistorystandard`
Description: Class for the standard implementation of the hostHistory component.
Code lines: 142
Contained by: module galacticus_nodes

subroutine: `nodecomponenthosthistorystandardbuilder`
Description: Build a `standard` implementation of the `hostHistory` component from a supplied XML definition.
Code lines: 24
Contained by: module galacticus_nodes
Modules used: `fox_dom` galacticus_error memory_management

subroutine: `nodecomponenthosthistorystandarddeserializeraw`
Description: Deserialize the contents of a standard implementation of the hostHistory component from raw (binary) file.
Code lines: 12
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: `nodecomponenthosthistorystandarddeserializevalues`
Description: Deserialize evolvable properties of a standard implementation of the hostHistory component from array.
Code lines: 17
Contained by: module galacticus_nodes

subroutine: `nodecomponenthosthistorystandardfinalize`
Description: Finalize a `standard` implementation of the `hostHistory` component.
Code lines: 13
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: `nodecomponenthosthistorystandardinitialize`
Description: Initialize a `standard` member of the `hostHistory` component.
Code lines: 9
Contained by: module galacticus_nodes

function: `nodecomponenthosthistorystandardisactive`
Description: Return true if the standard implementation of the hostHistory component is the active choice.
Code lines: 8
Contained by: module galacticus_nodes

function: `nodecomponenthosthistorystandardnamefromindex`
Description: Return the name of the property of given index for a `standard` implementation of the `hostHistory` component class.
Code lines: 21
Contained by: module galacticus_nodes
Modules used: iso_varying_string

subroutine: `nodecomponenthosthistorystandardserializeascii`
Description: Serialize the contents of a standard implementation of the hostHistory component to ASCII.
Code lines: 19

Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string string_handling

function: nodecomponenthosthistorystandardserializecount
Description: Return a count of the serialization of a standard implementation of the hostHistory component.
Code lines: 15
Contained by: module galacticus_nodes

subroutine: nodecomponenthosthistorystandardserializeoffsets
Description: Compute offsets into serialization arrays for a standard implementation of the hostHistory component.
Code lines: 22
Contained by: module galacticus_nodes

subroutine: nodecomponenthosthistorystandardserializeraw
Description: Serialize the contents of a standard implementation of the hostHistory component to raw (binary) file.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: nodecomponenthosthistorystandardserializevalues
Description: Serialize evolvable properties of a standard implementation of the hostHistory component to array.
Code lines: 17
Contained by: module galacticus_nodes

subroutine: nodecomponenthosthistorystandardserializexml
Description: Serialize the contents of a standard implementation of the hostHistory component to XML.
Code lines: 15
Contained by: module galacticus_nodes

function: nodecomponenthosthistorystandardsizeof
Description: Return the size in bytes of a standard implementation of the hostHistory component.
Code lines: 9
Contained by: module galacticus_nodes

function: nodecomponenthosthistorystandardtype
Description: Returns the type name for the standard implementation of the hostHistory component class.
Code lines: 13
Contained by: module galacticus_nodes

function: nodecomponenthosthistorytype
Description: Returns the type name for the hostHistory component class.
Code lines: 13
Contained by: module galacticus_nodes

type: nodecomponenthothalo

Description: Type for the `hotHalo` component class.
Code lines: 1629
Contained by: module galacticus_nodes

subroutine: `nodecomponenthothalobuilder`
Description: Build a generic `hotHalo` component from a supplied XML definition.
Code lines: 19
Contained by: module galacticus_nodes

type: `nodecomponenthothalocoldmode`
Description: Class for the coldMode implementation of the hotHalo component.
Code lines: 333
Contained by: module galacticus_nodes

subroutine: `nodecomponenthothalocoldmodebuilder`
Description: Build a `coldMode` implementation of the `hotHalo` component from a supplied XML definition.
Code lines: 37
Contained by: module galacticus_nodes
Modules used: `fox_dom` galacticus_error memory_management

subroutine: `nodecomponenthothalocoldmodedeserializeraw`
Description: Deserialize the contents of a coldMode implementation of the hotHalo component from raw (binary) file.
Code lines: 15
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: `nodecomponenthothalocoldmodedeserializevalues`
Description: Deserialize evolvable properties of a coldMode implementation of the hotHalo component from array.
Code lines: 30
Contained by: module galacticus_nodes

subroutine: `nodecomponenthothalocoldmodefinalize`
Description: Finalize a `coldMode` implementation of the `hotHalo` component.
Code lines: 11
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: `nodecomponenthothalocoldmodeinitialize`
Description: Initialize a `coldMode` member of the `hotHalo` component.
Code lines: 12
Contained by: module galacticus_nodes

function: `nodecomponenthothalocoldmodeisactive`
Description: Return true if the coldMode implementation of the hotHalo component is the active choice.

Code lines: 8
Contained by: module galacticus_nodes

function: nodecomponenthothalocoldmodenamefromindex
Description: Return the name of the property of given index for a coldMode implementation of the hotHalo component class.
Code lines: 37
Contained by: module galacticus_nodes
Modules used: iso_varying_string

subroutine: nodecomponenthothalocoldmodeserializeascii
Description: Serialize the contents of a coldMode implementation of the hotHalo component to ASCII.
Code lines: 27
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string string_handling

function: nodecomponenthothalocoldmodeserializecount
Description: Return a count of the serialization of a coldMode implementation of the hotHalo component.
Code lines: 35
Contained by: module galacticus_nodes

subroutine: nodecomponenthothalocoldmodeserializeoffsets
Description: Compute offsets into serialization arrays for a coldMode implementation of the hotHalo component.
Code lines: 54
Contained by: module galacticus_nodes

subroutine: nodecomponenthothalocoldmodeserializeraw
Description: Serialize the contents of a coldMode implementation of the hotHalo component to raw (binary) file.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: nodecomponenthothalocoldmodeserializevalues
Description: Serialize evolvable properties of a coldMode implementation of the hotHalo component to array.
Code lines: 30
Contained by: module galacticus_nodes

subroutine: nodecomponenthothalocoldmodeserializexml
Description: Serialize the contents of a coldMode implementation of the hotHalo component to XML.
Code lines: 20
Contained by: module galacticus_nodes

function: nodecomponenthothalocoldmodesizeof
Description: Return the size in bytes of a coldMode implementation of the hotHalo component.
Code lines: 10
Contained by: module galacticus_nodes

function: `nodecomponenthothalocoldmodetype`
Description: Returns the type name for the coldMode implementation of the hotHalo component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: `nodecomponenthothalocreate`
Description: Create the `hotHalo` component of `self`.
Code lines: 38
Contained by: module galacticus_nodes
Modules used: galacticus_display, galacticus_error, iso_varying_string, string_handling

subroutine: `nodecomponenthothalodestroy`
Description: Destroy the `hotHalo` component of `self`
Code lines: 15
Contained by: module galacticus_nodes

subroutine: `nodecomponenthothalodumpascii`
Description: Dump the content of a `hotHalo` component.
Code lines: 16
Contained by: module galacticus_nodes
Modules used: galacticus_display, iso_varying_string

subroutine: `nodecomponenthothalofinalize`
Description: Finalize a generic `hotHalo` component.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: `nodecomponenthothaloinitialize`
Description: Initialize a generic `hotHalo` component.
Code lines: 15
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: `nodecomponenthothalomove`
Description: Move instances of the `hotHalo` component, from one node to another.
Code lines: 126
Contained by: module galacticus_nodes
Modules used: galacticus_error

type: `nodecomponenthothalonull`
Description: Class for the null implementation of the hotHalo component.
Code lines: 124
Contained by: module galacticus_nodes

subroutine: `nodecomponenthothalonullbuilder`
Description: Build a `null` implementation of the `hotHalo` component from a supplied XML definition.
Code lines: 18

Contained by: module galacticus_nodes
Modules used: fox_dom galacticus_error memory_management

subroutine: nodecomponenthothalonulldeserializeraw
Description: Deserialize the contents of a null implementation of the hotHalo component from raw (binary) file.
Code lines: 16
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: nodecomponenthothalonulldeserializevalues
Description: Deserialize evolvable properties of a null implementation of the hotHalo component from array.
Code lines: 17
Contained by: module galacticus_nodes

subroutine: nodecomponenthothalonullfinalize
Description: Finalize a null implementation of the hotHalo component.
Code lines: 13
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: nodecomponenthothalonullinitialize
Description: Initialize a null member of the hotHalo component.
Code lines: 11
Contained by: module galacticus_nodes

function: nodecomponenthothalonullisactive
Description: Return true if the null implementation of the hotHalo component is the active choice.
Code lines: 8
Contained by: module galacticus_nodes

function: nodecomponenthothalonullnamefromindex
Description: Return the name of the property of given index for a null implementation of the hotHalo component class.
Code lines: 21
Contained by: module galacticus_nodes
Modules used: iso_varying_string

subroutine: nodecomponenthothalonullserializeascii
Description: Serialize the contents of a null implementation of the hotHalo component to ASCII.
Code lines: 16
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string string_handling

function: nodecomponenthothalonullserializecount
Description: Return a count of the serialization of a null implementation of the hotHalo component.

Code lines: 15
Contained by: module galacticus_nodes

subroutine: nodecomponenthothalonullserializeoffsets
Description: Compute offsets into serialization arrays for a null implementation of the hotHalo component.
Code lines: 22
Contained by: module galacticus_nodes

subroutine: nodecomponenthothalonullserializeraw
Description: Serialize the contents of a null implementation of the hotHalo component to raw (binary) file.
Code lines: 14
Contained by: module galacticus_nodes

subroutine: nodecomponenthothalonullserializevalues
Description: Serialize evolvable properties of a null implementation of the hotHalo component to array.
Code lines: 17
Contained by: module galacticus_nodes

subroutine: nodecomponenthothalonullserializexml
Description: Serialize the contents of a null implementation of the hotHalo component to XML.
Code lines: 14
Contained by: module galacticus_nodes

function: nodecomponenthothalonullsizeof
Description: Return the size in bytes of a null implementation of the hotHalo component.
Code lines: 9
Contained by: module galacticus_nodes

function: nodecomponenthothalonulltype
Description: Returns the type name for the null implementation of the hotHalo component class.
Code lines: 13
Contained by: module galacticus_nodes

type: nodecomponenthothalooutflowtracking
Description: Class for the outflowTracking implementation of the hotHalo component.
Code lines: 279
Contained by: module galacticus_nodes

subroutine: nodecomponenthothalooutflowtrackingbuilder
Description: Build a outflowTracking implementation of the hotHalo component from a supplied XML definition.
Code lines: 31
Contained by: module galacticus_nodes
Modules used: fox_dom galacticus_error memory_management

subroutine: nodecomponenthothalooutflowtrackingdeserializeraw
Description: Deserialize the contents of a outflowTracking implementation of the hotHalo component from raw (binary) file.

Code lines: 14
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: nodecomponenthothalooutflowtrackingdeserializevalues
Description: Deserialize evolvable properties of a outflowTracking implementation of the hotHalo component from array.
Code lines: 26
Contained by: module galacticus_nodes

subroutine: nodecomponenthothalooutflowtrackingfinalize
Description: Finalize a outflowTracking implementation of the hotHalo component.
Code lines: 11
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: nodecomponenthothalooutflowtrackinginitialize
Description: Initialize a outflowTracking member of the hotHalo component.
Code lines: 11
Contained by: module galacticus_nodes

function: nodecomponenthothalooutflowtrackingisactive
Description: Return true if the outflowTracking implementation of the hotHalo component is the active choice.
Code lines: 8
Contained by: module galacticus_nodes

function: nodecomponenthothalooutflowtrackingnamefromindex
Description: Return the name of the property of given index for a outflowTracking implementation of the hotHalo component class.
Code lines: 30
Contained by: module galacticus_nodes
Modules used: iso_varying_string

subroutine: nodecomponenthothalooutflowtrackingserializeascii
Description: Serialize the contents of a outflowTracking implementation of the hotHalo component to ASCII.
Code lines: 24
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string string_handling

function: nodecomponenthothalooutflowtrackingserializecount
Description: Return a count of the serialization of a outflowTracking implementation of the hotHalo component.
Code lines: 27
Contained by: module galacticus_nodes

subroutine: nodecomponenthothalooutflowtrackingserializeoffsets
Description: Compute offsets into serialization arrays for a outflowTracking implementation of the hotHalo component.

Code lines: 40
Contained by: module galacticus_nodes

subroutine: nodecomponenthothalooutflowtrackingserializeraw
Description: Serialize the contents of a outflowTracking implementation of the hotHalo component to raw (binary) file.
Code lines: 12
Contained by: module galacticus_nodes

subroutine: nodecomponenthothalooutflowtrackingserializevalues
Description: Serialize evolvable properties of a outflowTracking implementation of the hotHalo component to array.
Code lines: 26
Contained by: module galacticus_nodes

subroutine: nodecomponenthothalooutflowtrackingserializexml
Description: Serialize the contents of a outflowTracking implementation of the hotHalo component to XML.
Code lines: 18
Contained by: module galacticus_nodes

function: nodecomponenthothalooutflowtrackingsizeof
Description: Return the size in bytes of a outflowTracking implementation of the hotHalo component.
Code lines: 10
Contained by: module galacticus_nodes

function: nodecomponenthothalooutflowtrackingtype
Description: Returns the type name for the outflowTracking implementation of the hotHalo component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: nodecomponenthothaloremove
Description: Remove an instance of the hotHalo component from a node.
Code lines: 74
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: nodecomponenthothaloserializeascii
Description: Serialize the content of a hotHalo component to ASCII.
Code lines: 16
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string

function: nodecomponenthothalosizeof
Description: Return the size in bytes of a nodeComponentHotHalo component.
Code lines: 9
Contained by: module galacticus_nodes

type: `nodecomponenthothalostandard`
Description: Class for the standard implementation of the hotHalo component.
Code lines: 922
Contained by: module galacticus_nodes

subroutine: `nodecomponenthothalostandardbuilder`
Description: Build a `standard` implementation of the `hotHalo` component from a supplied XML definition.
Code lines: 90
Contained by: module galacticus_nodes
Modules used: `fox_dom` galacticus_error memory_management

subroutine: `nodecomponenthothalostandarddeserializeraw`
Description: Deserialize the contents of a standard implementation of the hotHalo component from raw (binary) file.
Code lines: 23
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: `nodecomponenthothalostandarddeserializevalues`
Description: Deserialize evolvable properties of a standard implementation of the hotHalo component from array.
Code lines: 60
Contained by: module galacticus_nodes

subroutine: `nodecomponenthothalostandardfinalize`
Description: Finalize a `standard` implementation of the `hotHalo` component.
Code lines: 14
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: `nodecomponenthothalostandardinitialize`
Description: Initialize a `standard` member of the `hotHalo` component.
Code lines: 20
Contained by: module galacticus_nodes

function: `nodecomponenthothalostandardisactive`
Description: Return true if the standard implementation of the hotHalo component is the active choice.
Code lines: 8
Contained by: module galacticus_nodes

function: `nodecomponenthothalostandardnamefromindex`
Description: Return the name of the property of given index for a `standard` implementation of the `hotHalo` component class.
Code lines: 91
Contained by: module galacticus_nodes
Modules used: iso_varying_string

subroutine: `nodecomponenthothalostandardserializeascii`
Description: Serialize the contents of a standard implementation of the hotHalo component to ASCII.
Code lines: 56
Contained by: module `galacticus_nodes`
Modules used: `galacticus_display` `iso_varying_string` `string_handling`

function: `nodecomponenthothalostandardserializecount`
Description: Return a count of the serialization of a standard implementation of the hotHalo component.
Code lines: 99
Contained by: module `galacticus_nodes`

subroutine: `nodecomponenthothalostandardserializeoffsets`
Description: Compute offsets into serialization arrays for a `standard` implementation of the `hotHalo` component.
Code lines: 165
Contained by: module `galacticus_nodes`

subroutine: `nodecomponenthothalostandardserializeraw`
Description: Serialize the contents of a standard implementation of the hotHalo component to raw (binary) file.
Code lines: 21
Contained by: module `galacticus_nodes`

subroutine: `nodecomponenthothalostandardserializevalues`
Description: Serialize evolvable properties of a `standard` implementation of the `hotHalo` component to array.
Code lines: 60
Contained by: module `galacticus_nodes`

subroutine: `nodecomponenthothalostandardserializexml`
Description: Serialize the contents of a standard implementation of the hotHalo component to XML.
Code lines: 31
Contained by: module `galacticus_nodes`

function: `nodecomponenthothalostandardsizeof`
Description: Return the size in bytes of a standard implementation of the hotHalo component.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `nodecomponenthothalostandardtype`
Description: Returns the type name for the standard implementation of the hotHalo component class.
Code lines: 13
Contained by: module `galacticus_nodes`

function: `nodecomponenthothalotype`
Description: Returns the type name for the hotHalo component class.
Code lines: 13

Contained by: module galacticus_nodes

type: nodecomponenthothaloverysimple
Description: Class for the verySimple implementation of the hotHalo component.
Code lines: 361
Contained by: module galacticus_nodes

subroutine: nodecomponenthothaloverysimplebuilder
Description: Build a verySimple implementation of the hotHalo component from a supplied XML definition.
Code lines: 36
Contained by: module galacticus_nodes
Modules used: fox_dom galacticus_error memory_management

type: nodecomponenthothaloverysimpledelayed
Description: Class for the verySimpleDelayed implementation of the hotHalo component.
Code lines: 236
Contained by: module galacticus_nodes

subroutine: nodecomponenthothaloverysimpledelayedbuilder
Description: Build a verySimpleDelayed implementation of the hotHalo component from a supplied XML definition.
Code lines: 31
Contained by: module galacticus_nodes
Modules used: fox_dom galacticus_error memory_management

subroutine: nodecomponenthothaloverysimpledelayeddeserializeraw
Description: Deserialize the contents of a verySimpleDelayed implementation of the hotHalo component from raw (binary) file.
Code lines: 14
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: nodecomponenthothaloverysimpledelayeddeserializevalues
Description: Deserialize evolvable properties of a verySimpleDelayed implementation of the hotHalo component from array.
Code lines: 26
Contained by: module galacticus_nodes

subroutine: nodecomponenthothaloverysimpledelayedfinalize
Description: Finalize a verySimpleDelayed implementation of the hotHalo component.
Code lines: 11
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: nodecomponenthothaloverysimpledelayedinitialize
Description: Initialize a verySimpleDelayed member of the hotHalo component.
Code lines: 11

Contained by: module galacticus_nodes

function: nodecomponenthothaloverysimpledelayedisactive
Description: Return true if the verySimpleDelayed implementation of the hotHalo component is the active choice.
Code lines: 8
Contained by: module galacticus_nodes

function: nodecomponenthothaloverysimpledelayednamefromindex
Description: Return the name of the property of given index for a verySimpleDelayed implementation of the hotHalo component class.
Code lines: 30
Contained by: module galacticus_nodes
Modules used: iso_varying_string

subroutine: nodecomponenthothaloverysimpledelayedserializeascii
Description: Serialize the contents of a verySimpleDelayed implementation of the hotHalo component to ASCII.
Code lines: 24
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string string_handling

function: nodecomponenthothaloverysimpledelayedserializecount
Description: Return a count of the serialization of a verySimpleDelayed implementation of the hotHalo component.
Code lines: 27
Contained by: module galacticus_nodes

subroutine: nodecomponenthothaloverysimpledelayedserializeoffsets
Description: Compute offsets into serialization arrays for a verySimpleDelayed implementation of the hotHalo component.
Code lines: 40
Contained by: module galacticus_nodes

subroutine: nodecomponenthothaloverysimpledelayedserializeraw
Description: Serialize the contents of a verySimpleDelayed implementation of the hotHalo component to raw (binary) file.
Code lines: 12
Contained by: module galacticus_nodes

subroutine: nodecomponenthothaloverysimpledelayedserializevalues
Description: Serialize evolvable properties of a verySimpleDelayed implementation of the hotHalo component to array.
Code lines: 26
Contained by: module galacticus_nodes

subroutine: nodecomponenthothaloverysimpledelayedserializexml
Description: Serialize the contents of a verySimpleDelayed implementation of the hotHalo component to XML.
Code lines: 18

Contained by: module galacticus_nodes

function: nodecomponenthothaloverysimpledelayedsizeof
Description: Return the size in bytes of a verySimpleDelayed implementation of the hotHalo component.
Code lines: 10
Contained by: module galacticus_nodes

function: nodecomponenthothaloverysimpledelayedtype
Description: Returns the type name for the verySimpleDelayed implementation of the hotHalo component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: nodecomponenthothaloverysimpledeserializeraw
Description: Deserialize the contents of a verySimple implementation of the hotHalo component from raw (binary) file.
Code lines: 14
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: nodecomponenthothaloverysimpledeserializevalues
Description: Deserialize evolvable properties of a verySimple implementation of the hotHalo component from array.
Code lines: 25
Contained by: module galacticus_nodes

subroutine: nodecomponenthothaloverysimplefinalize
Description: Finalize a verySimple implementation of the hotHalo component.
Code lines: 11
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: nodecomponenthothaloverysimpleinitialize
Description: Initialize a verySimple member of the hotHalo component.
Code lines: 11
Contained by: module galacticus_nodes

function: nodecomponenthothaloverysimpleisactive
Description: Return true if the verySimple implementation of the hotHalo component is the active choice.
Code lines: 8
Contained by: module galacticus_nodes

function: nodecomponenthothaloverysimplenamefromindex
Description: Return the name of the property of given index for a verySimple implementation of the hotHalo component class.
Code lines: 35
Contained by: module galacticus_nodes
Modules used: iso_varying_string

subroutine: nodecomponenthothaloverysimpleserializeascii

Description: Serialize the contents of a verySimple implementation of the hotHalo component to ASCII.
Code lines: 26
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string string_handling

function: nodecomponenthothaloverysimpleserializecount
Description: Return a count of the serialization of a verySimple implementation of the hotHalo component.
Code lines: 35
Contained by: module galacticus_nodes

subroutine: nodecomponenthothaloverysimpleserializeoffsets
Description: Compute offsets into serialization arrays for a verySimple implementation of the hotHalo component.
Code lines: 53
Contained by: module galacticus_nodes

subroutine: nodecomponenthothaloverysimpleserializeraw
Description: Serialize the contents of a verySimple implementation of the hotHalo component to raw (binary) file.
Code lines: 12
Contained by: module galacticus_nodes

subroutine: nodecomponenthothaloverysimpleserializevalues
Description: Serialize evolvable properties of a verySimple implementation of the hotHalo component to array.
Code lines: 25
Contained by: module galacticus_nodes

subroutine: nodecomponenthothaloverysimpleserializexml
Description: Serialize the contents of a verySimple implementation of the hotHalo component to XML.
Code lines: 19
Contained by: module galacticus_nodes

function: nodecomponenthothaloverysimplesizeof
Description: Return the size in bytes of a verySimple implementation of the hotHalo component.
Code lines: 10
Contained by: module galacticus_nodes

function: nodecomponenthothaloverysimpletype
Description: Returns the type name for the verySimple implementation of the hotHalo component class.
Code lines: 13
Contained by: module galacticus_nodes

type: nodecomponentindices
Description: Type for the indices component class.
Code lines: 145
Contained by: module galacticus_nodes

subroutine: `nodecomponentindicesbuilder`
Description: Build a generic `indices` component from a supplied XML definition.
Code lines: 19
Contained by: module galacticus_nodes
Modules used: fox_dom galacticus_error

subroutine: `nodecomponentindicescreate`
Description: Create the `indices` component of `self`.
Code lines: 38
Contained by: module galacticus_nodes
Modules used: galacticus_display galacticus_error iso_varying_string string_handling

subroutine: `nodecomponentindicesdestroy`
Description: Destroy the `indices` component of `self`
Code lines: 15
Contained by: module galacticus_nodes

subroutine: `nodecomponentindicesdumpascii`
Description: Dump the content of a `indices` component.
Code lines: 16
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string

subroutine: `nodecomponentindicesfinalize`
Description: Finalize a generic `indices` component.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: `nodecomponentindicesinitialize`
Description: Initialize a generic `indices` component.
Code lines: 15
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: `nodecomponentindicesmove`
Description: Move instances of the `indices` component, from one node to another.
Code lines: 70
Contained by: module galacticus_nodes
Modules used: galacticus_error

type: `nodecomponentindicesnull`
Description: Class for the null implementation of the indices component.
Code lines: 124
Contained by: module galacticus_nodes

subroutine: `nodecomponentindicesnullbuilder`
Description: Build a `null` implementation of the `indices` component from a supplied XML definition.

Code lines: 18
Contained by: module galacticus_nodes
Modules used: fox_dom galacticus_error memory_management

subroutine: nodecomponentindicesnulldeserializeraw
Description: Deserialize the contents of a null implementation of the indices component from raw (binary) file.
Code lines: 16
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: nodecomponentindicesnulldeserializevalues
Description: Deserialize evolvable properties of a null implementation of the indices component from array.
Code lines: 17
Contained by: module galacticus_nodes

subroutine: nodecomponentindicesnullfinalize
Description: Finalize a null implementation of the indices component.
Code lines: 13
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: nodecomponentindicesnullinitialize
Description: Initialize a null member of the indices component.
Code lines: 11
Contained by: module galacticus_nodes

function: nodecomponentindicesnullisactive
Description: Return true if the null implementation of the indices component is the active choice.
Code lines: 8
Contained by: module galacticus_nodes

function: nodecomponentindicesnullnamefromindex
Description: Return the name of the property of given index for a null implementation of the indices component class.
Code lines: 21
Contained by: module galacticus_nodes
Modules used: iso_varying_string

subroutine: nodecomponentindicesnullserializeascii
Description: Serialize the contents of a null implementation of the indices component to ASCII.
Code lines: 16
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string string_handling

function: nodecomponentindicesnullserializecount

Description: Return a count of the serialization of a null implementation of the indices component.
Code lines: 15
Contained by: module galacticus_nodes

subroutine: nodecomponentindicesnullserializeoffsets
Description: Compute offsets into serialization arrays for a null implementation of the indices component.
Code lines: 22
Contained by: module galacticus_nodes

subroutine: nodecomponentindicesnullserializeraw
Description: Serialize the contents of a null implementation of the indices component to raw (binary) file.
Code lines: 14
Contained by: module galacticus_nodes

subroutine: nodecomponentindicesnullserializevalues
Description: Serialize evolvable properties of a null implementation of the indices component to array.
Code lines: 17
Contained by: module galacticus_nodes

subroutine: nodecomponentindicesnullserializexml
Description: Serialize the contents of a null implementation of the indices component to XML.
Code lines: 14
Contained by: module galacticus_nodes

function: nodecomponentindicesnullsizeof
Description: Return the size in bytes of a null implementation of the indices component.
Code lines: 9
Contained by: module galacticus_nodes

function: nodecomponentindicesnulltype
Description: Returns the type name for the null implementation of the indices component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: nodecomponentindicesremove
Description: Remove an instance of the indices component from a node.
Code lines: 42
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: nodecomponentindicesserializeascii
Description: Serialize the content of a indices component to ASCII.
Code lines: 16
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string

function: nodecomponentindicessizeof
Description: Return the size in bytes of a nodeComponentIndices component.

Code lines: 9
Contained by: module galacticus_nodes

type: nodecomponentindicesstandard
Description: Class for the standard implementation of the indices component.
Code lines: 142
Contained by: module galacticus_nodes

subroutine: nodecomponentindicesstandardbuilder
Description: Build a standard implementation of the indices component from a supplied XML definition.
Code lines: 24
Contained by: module galacticus_nodes
Modules used: fox_dom galacticus_error memory_management

subroutine: nodecomponentindicesstandarddeserializeraw
Description: Deserialize the contents of a standard implementation of the indices component from raw (binary) file.
Code lines: 12
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: nodecomponentindicesstandarddeserializevalues
Description: Deserialize evolvable properties of a standard implementation of the indices component from array.
Code lines: 17
Contained by: module galacticus_nodes

subroutine: nodecomponentindicesstandardfinalize
Description: Finalize a standard implementation of the indices component.
Code lines: 13
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: nodecomponentindicesstandardinitialize
Description: Initialize a standard member of the indices component.
Code lines: 9
Contained by: module galacticus_nodes

function: nodecomponentindicesstandardisactive
Description: Return true if the standard implementation of the indices component is the active choice.
Code lines: 8
Contained by: module galacticus_nodes

function: nodecomponentindicesstandardnamefromindex
Description: Return the name of the property of given index for a standard implementation of the indices component class.
Code lines: 21
Contained by: module galacticus_nodes

Modules used: iso_varying_string

subroutine: nodecomponentindicesstandardserializeascii
Description: Serialize the contents of a standard implementation of the indices component to ASCII.
Code lines: 19
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string string_handling

function: nodecomponentindicesstandardserializecount
Description: Return a count of the serialization of a standard implementation of the indices component.
Code lines: 15
Contained by: module galacticus_nodes

subroutine: nodecomponentindicesstandardserializeoffsets
Description: Compute offsets into serialization arrays for a standard implementation of the indices component.
Code lines: 22
Contained by: module galacticus_nodes

subroutine: nodecomponentindicesstandardserializeraw
Description: Serialize the contents of a standard implementation of the indices component to raw (binary) file.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: nodecomponentindicesstandardserializevalues
Description: Serialize evolvable properties of a standard implementation of the indices component to array.
Code lines: 17
Contained by: module galacticus_nodes

subroutine: nodecomponentindicesstandardserializexml
Description: Serialize the contents of a standard implementation of the indices component to XML.
Code lines: 15
Contained by: module galacticus_nodes

function: nodecomponentindicesstandardsizeof
Description: Return the size in bytes of a standard implementation of the indices component.
Code lines: 9
Contained by: module galacticus_nodes

function: nodecomponentindicesstandardtype
Description: Returns the type name for the standard implementation of the indices component class.
Code lines: 13
Contained by: module galacticus_nodes

function: nodecomponentindicestype
Description: Returns the type name for the indices component class.

Code lines: 13
Contained by: module galacticus_nodes

type: nodecomponentinteroutput
Description: Type for the interOutput component class.
Code lines: 229
Contained by: module galacticus_nodes

subroutine: nodecomponentinteroutputbuilder
Description: Build a generic interOutput component from a supplied XML definition.
Code lines: 19
Contained by: module galacticus_nodes
Modules used: fox_dom galacticus_error

subroutine: nodecomponentinteroutputcreate
Description: Create the interOutput component of self.
Code lines: 38
Contained by: module galacticus_nodes
Modules used: galacticus_display galacticus_error iso_varying_string string_handling

subroutine: nodecomponentinteroutputdestroy
Description: Destroy the interOutput component of self
Code lines: 15
Contained by: module galacticus_nodes

subroutine: nodecomponentinteroutputdumpascii
Description: Dump the content of a interOutput component.
Code lines: 16
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string

subroutine: nodecomponentinteroutputfinalize
Description: Finalize a generic interOutput component.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: nodecomponentinteroutputinitialize
Description: Initialize a generic interOutput component.
Code lines: 15
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: nodecomponentinteroutputmove
Description: Move instances of the interOutput component, from one node to another.
Code lines: 70
Contained by: module galacticus_nodes
Modules used: galacticus_error

type: `nodecomponentinteroutputnull`
Description: Class for the null implementation of the interOutput component.
Code lines: 124
Contained by: module galacticus_nodes

subroutine: `nodecomponentinteroutputnullbuilder`
Description: Build a `null` implementation of the `interOutput` component from a supplied XML definition.
Code lines: 18
Contained by: module galacticus_nodes
Modules used: `fox_dom` galacticus_error memory_management

subroutine: `nodecomponentinteroutputnulldeserializeraw`
Description: Deserialize the contents of a null implementation of the interOutput component from raw (binary) file.
Code lines: 16
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: `nodecomponentinteroutputnulldeserializevalues`
Description: Deserialize evolvable properties of a null implementation of the interOutput component from array.
Code lines: 17
Contained by: module galacticus_nodes

subroutine: `nodecomponentinteroutputnullfinalize`
Description: Finalize a `null` implementation of the `interOutput` component.
Code lines: 13
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: `nodecomponentinteroutputnullinitialize`
Description: Initialize a `null` member of the `interOutput` component.
Code lines: 11
Contained by: module galacticus_nodes

function: `nodecomponentinteroutputnullisactive`
Description: Return true if the null implementation of the interOutput component is the active choice.
Code lines: 8
Contained by: module galacticus_nodes

function: `nodecomponentinteroutputnullnamefromindex`
Description: Return the name of the property of given index for a `null` implementation of the `interOutput` component class.
Code lines: 21
Contained by: module galacticus_nodes
Modules used: iso_varying_string

subroutine: `nodecomponentinteroutputnullserializeascii`
Description: Serialize the contents of a null implementation of the interOutput component to ASCII.
Code lines: 16
Contained by: module `galacticus_nodes`
Modules used: `galacticus_display` `iso_varying_string` `string_handling`

function: `nodecomponentinteroutputnullserializecount`
Description: Return a count of the serialization of a null implementation of the interOutput component.
Code lines: 15
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentinteroutputnullserializeoffsets`
Description: Compute offsets into serialization arrays for a `null` implementation of the `interOutput` component.
Code lines: 22
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentinteroutputnullserializeraw`
Description: Serialize the contents of a null implementation of the interOutput component to raw (binary) file.
Code lines: 14
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentinteroutputnullserializevalues`
Description: Serialize evolvable properties of a `null` implementation of the `interOutput` component to array.
Code lines: 17
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentinteroutputnullserializexml`
Description: Serialize the contents of a null implementation of the interOutput component to XML.
Code lines: 14
Contained by: module `galacticus_nodes`

function: `nodecomponentinteroutputnullsizeof`
Description: Return the size in bytes of a null implementation of the interOutput component.
Code lines: 9
Contained by: module `galacticus_nodes`

function: `nodecomponentinteroutputnulltype`
Description: Returns the type name for the null implementation of the interOutput component class.
Code lines: 13
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentinteroutputremove`
Description: Remove an instance of the `interOutput` component from a node.
Code lines: 42

Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: nodecomponentinteroutputserializeascii
Description: Serialize the content of a interOutput component to ASCII.
Code lines: 16
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string

function: nodecomponentinteroutputsizeof
Description: Return the size in bytes of a nodeComponentInterOutput component.
Code lines: 9
Contained by: module galacticus_nodes

type: nodecomponentinteroutputstandard
Description: Class for the standard implementation of the interOutput component.
Code lines: 229
Contained by: module galacticus_nodes

subroutine: nodecomponentinteroutputstandardbuilder
Description: Build a standard implementation of the interOutput component from a supplied XML definition.
Code lines: 30
Contained by: module galacticus_nodes
Modules used: fox_dom galacticus_error memory_management

subroutine: nodecomponentinteroutputstandarddeserializeraw
Description: Deserialize the contents of a standard implementation of the interOutput component from raw (binary) file.
Code lines: 13
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: nodecomponentinteroutputstandarddeserializevalues
Description: Deserialize evolvable properties of a standard implementation of the interOutput component from array.
Code lines: 20
Contained by: module galacticus_nodes

subroutine: nodecomponentinteroutputstandardfinalize
Description: Finalize a standard implementation of the interOutput component.
Code lines: 13
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: nodecomponentinteroutputstandardinitialize
Description: Initialize a standard member of the interOutput component.
Code lines: 10

Contained by: module galacticus_nodes

function: nodecomponentinteroutputstandardisactive
Description: Return true if the standard implementation of the interOutput component is the active choice.
Code lines: 8
Contained by: module galacticus_nodes

function: nodecomponentinteroutputstandardnamefromindex
Description: Return the name of the property of given index for a standard implementation of the interOutput component class.
Code lines: 31
Contained by: module galacticus_nodes
Modules used: iso_varying_string

subroutine: nodecomponentinteroutputstandardserializeascii
Description: Serialize the contents of a standard implementation of the interOutput component to ASCII.
Code lines: 22
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string string_handling

function: nodecomponentinteroutputstandardserializecount
Description: Return a count of the serialization of a standard implementation of the interOutput component.
Code lines: 30
Contained by: module galacticus_nodes

subroutine: nodecomponentinteroutputstandardserializeoffsets
Description: Compute offsets into serialization arrays for a standard implementation of the interOutput component.
Code lines: 42
Contained by: module galacticus_nodes

subroutine: nodecomponentinteroutputstandardserializeraw
Description: Serialize the contents of a standard implementation of the interOutput component to raw (binary) file.
Code lines: 11
Contained by: module galacticus_nodes

subroutine: nodecomponentinteroutputstandardserializevalues
Description: Serialize evolvable properties of a standard implementation of the interOutput component to array.
Code lines: 20
Contained by: module galacticus_nodes

subroutine: nodecomponentinteroutputstandardserializexml
Description: Serialize the contents of a standard implementation of the interOutput component to XML.

subroutine: `nodecomponentmergingstatisticsrecentserializexml`
Description: Serialize the contents of a recent implementation of the mergingStatistics component to XML.
Code lines: 18
Contained by: module galacticus_nodes

function: `nodecomponentmergingstatisticsrecentsizeof`
Description: Return the size in bytes of a recent implementation of the mergingStatistics component.
Code lines: 10
Contained by: module galacticus_nodes

function: `nodecomponentmergingstatisticsrecenttype`
Description: Returns the type name for the recent implementation of the mergingStatistics component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: `nodecomponentmergingstatisticsremove`
Description: Remove an instance of the `mergingStatistics` component from a node.
Code lines: 58
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: `nodecomponentmergingstatisticsserializeascii`
Description: Serialize the content of a `mergingStatistics` component to ASCII.
Code lines: 16
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string

function: `nodecomponentmergingstatisticssizeof`
Description: Return the size in bytes of a nodeComponentMergingStatistics component.
Code lines: 9
Contained by: module galacticus_nodes

type: `nodecomponentmergingstatisticsstandard`
Description: Class for the standard implementation of the mergingStatistics component.

Code lines: 269
Contained by: module galacticus_nodes

subroutine: nodecomponentmergingstatisticsstandardbuilder
Description: Build a standard implementation of the mergingStatistics component from a supplied XML definition.
Code lines: 54
Contained by: module galacticus_nodes
Modules used: fox_dom galacticus_error memory_management

subroutine: nodecomponentmergingstatisticsstandarddeserializeraw
Description: Deserialize the contents of a standard implementation of the mergingStatistics component from raw (binary) file.
Code lines: 17
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: nodecomponentmergingstatisticsstandarddeserializevalues
Description: Deserialize evolvable properties of a standard implementation of the mergingStatistics component from array.
Code lines: 17
Contained by: module galacticus_nodes

subroutine: nodecomponentmergingstatisticsstandardfinalize
Description: Finalize a standard implementation of the mergingStatistics component.
Code lines: 13
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: nodecomponentmergingstatisticsstandardinitialize
Description: Initialize a standard member of the mergingStatistics component.
Code lines: 14
Contained by: module galacticus_nodes

function: nodecomponentmergingstatisticsstandardisactive
Description: Return true if the standard implementation of the mergingStatistics component is the active choice.
Code lines: 8
Contained by: module galacticus_nodes

function: nodecomponentmergingstatisticsstandardnamefromindex
Description: Return the name of the property of given index for a standard implementation of the mergingStatistics component class.
Code lines: 21
Contained by: module galacticus_nodes
Modules used: iso_varying_string

subroutine: nodecomponentmergingstatisticsstandardserializeascii
Description: Serialize the contents of a standard implementation of the mergingStatistics component to ASCII.

Code lines: 34
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string string_handling

function: nodecomponentmergingstatisticsstandardserializecount
Description: Return a count of the serialization of a standard implementation of the mergingStatistics component.
Code lines: 15
Contained by: module galacticus_nodes

subroutine: nodecomponentmergingstatisticsstandardserializeoffsets
Description: Compute offsets into serialization arrays for a **standard** implementation of the **mergingStatistics** component.
Code lines: 22
Contained by: module galacticus_nodes

subroutine: nodecomponentmergingstatisticsstandardserializeraw
Description: Serialize the contents of a standard implementation of the mergingStatistics component to raw (binary) file.
Code lines: 15
Contained by: module galacticus_nodes

subroutine: nodecomponentmergingstatisticsstandardserializevalues
Description: Serialize evolvable properties of a **standard** implementation of the **mergingStatistics** component to array.
Code lines: 17
Contained by: module galacticus_nodes

subroutine: nodecomponentmergingstatisticsstandardserializexml
Description: Serialize the contents of a standard implementation of the mergingStatistics component to XML.
Code lines: 20
Contained by: module galacticus_nodes

function: nodecomponentmergingstatisticsstandardsizeof
Description: Return the size in bytes of a standard implementation of the mergingStatistics component.
Code lines: 9
Contained by: module galacticus_nodes

function: nodecomponentmergingstatisticsstandardtype
Description: Returns the type name for the standard implementation of the mergingStatistics component class.
Code lines: 13
Contained by: module galacticus_nodes

function: nodecomponentmergingstatisticstype
Description: Returns the type name for the mergingStatistics component class.
Code lines: 13
Contained by: module galacticus_nodes

function: `nodecomponentnamefromindex`
Description: Return the name of the property of given index for a `nodeComponent` object.
Code lines: 21
Contained by: module galacticus_nodes
Modules used: iso_varying_string

type: `nodecomponentnbody`
Description: Type for the `nBody` component class.
Code lines: 187
Contained by: module galacticus_nodes

subroutine: `nodecomponentnbodybuilder`
Description: Build a generic `nBody` component from a supplied XML definition.
Code lines: 19
Contained by: module galacticus_nodes
Modules used: fox_dom galacticus_error

subroutine: `nodecomponentnbodycreate`
Description: Create the `nBody` component of `self`.
Code lines: 38
Contained by: module galacticus_nodes
Modules used: galacticus_display galacticus_error
iso_varying_string string_handling

subroutine: `nodecomponentnbodydestroy`
Description: Destroy the `nBody` component of `self`
Code lines: 15
Contained by: module galacticus_nodes

subroutine: `nodecomponentnbodydumpascii`
Description: Dump the content of a `nBody` component.
Code lines: 16
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string

subroutine: `nodecomponentnbodyfinalize`
Description: Finalize a generic `nBody` component.
Code lines: 13
Contained by: module galacticus_nodes

type: `nodecomponentnbodygeneric`
Description: Class for the generic implementation of the nBody component.
Code lines: 243
Contained by: module galacticus_nodes

subroutine: `nodecomponentnbodygenericbuilder`
Description: Build a `generic` implementation of the `nBody` component from a supplied XML definition.
Code lines: 31

Contained by: module galacticus_nodes
Modules used: fox_dom galacticus_error memory_management

subroutine: nodecomponentnbodygenericdeserializeraw
Description: Deserialize the contents of a generic implementation of the nBody component from raw (binary) file.
Code lines: 25
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: nodecomponentnbodygenericdeserializevalues
Description: Deserialize evolvable properties of a generic implementation of the nBody component from array.
Code lines: 17
Contained by: module galacticus_nodes

subroutine: nodecomponentnbodygenericfinalize
Description: Finalize a generic implementation of the nBody component.
Code lines: 12
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: nodecomponentnbodygenericinitialize
Description: Initialize a generic member of the nBody component.
Code lines: 12
Contained by: module galacticus_nodes

function: nodecomponentnbodygenericisactive
Description: Return true if the generic implementation of the nBody component is the active choice.
Code lines: 8
Contained by: module galacticus_nodes

function: nodecomponentnbodygenericnamefromindex
Description: Return the name of the property of given index for a generic implementation of the nBody component class.
Code lines: 21
Contained by: module galacticus_nodes
Modules used: iso_varying_string

subroutine: nodecomponentnbodygenericserializeascii
Description: Serialize the contents of a generic implementation of the nBody component to ASCII.
Code lines: 31
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string string_handling

function: nodecomponentnbodygenericserializecount
Description: Return a count of the serialization of a generic implementation of the nBody component.

Code lines: 15
Contained by: module galacticus_nodes

subroutine: nodecomponentnbodygenericserializeoffsets
Description: Compute offsets into serialization arrays for a generic implementation of the nBody component.
Code lines: 22
Contained by: module galacticus_nodes

subroutine: nodecomponentnbodygenericserializeraw
Description: Serialize the contents of a generic implementation of the nBody component to raw (binary) file.
Code lines: 19
Contained by: module galacticus_nodes

subroutine: nodecomponentnbodygenericserializevalues
Description: Serialize evolvable properties of a generic implementation of the nBody component to array.
Code lines: 17
Contained by: module galacticus_nodes

subroutine: nodecomponentnbodygenericserializexml
Description: Serialize the contents of a generic implementation of the nBody component to XML.
Code lines: 21
Contained by: module galacticus_nodes

function: nodecomponentnbodygenericsizeof
Description: Return the size in bytes of a generic implementation of the nBody component.
Code lines: 11
Contained by: module galacticus_nodes

function: nodecomponentnbodygenerictype
Description: Returns the type name for the generic implementation of the nBody component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: nodecomponentnbodyinitialize
Description: Initialize a generic nBody component.
Code lines: 15
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: nodecomponentnbodymove
Description: Move instances of the nBody component, from one node to another.
Code lines: 70
Contained by: module galacticus_nodes
Modules used: galacticus_error

type: nodecomponentnbodynull
Description: Class for the null implementation of the nBody component.

Code lines: 124
Contained by: module galacticus_nodes

subroutine: nodecomponentnbodynullbuilder
Description: Build a null implementation of the nBody component from a supplied XML definition.
Code lines: 18
Contained by: module galacticus_nodes
Modules used: fox_dom galacticus_error memory_management

subroutine: nodecomponentnbodynulldeserializeraw
Description: Deserialize the contents of a null implementation of the nBody component from raw (binary) file.
Code lines: 16
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: nodecomponentnbodynulldeserializevalues
Description: Deserialize evolvable properties of a null implementation of the nBody component from array.
Code lines: 17
Contained by: module galacticus_nodes

subroutine: nodecomponentnbodynullfinalize
Description: Finalize a null implementation of the nBody component.
Code lines: 13
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: nodecomponentnbodynullinitialize
Description: Initialize a null member of the nBody component.
Code lines: 11
Contained by: module galacticus_nodes

function: nodecomponentnbodynullisactive
Description: Return true if the null implementation of the nBody component is the active choice.
Code lines: 8
Contained by: module galacticus_nodes

function: nodecomponentnbodynullnamefromindex
Description: Return the name of the property of given index for a null implementation of the nBody component class.
Code lines: 21
Contained by: module galacticus_nodes
Modules used: iso_varying_string

subroutine: nodecomponentnbodynullserializeascii
Description: Serialize the contents of a null implementation of the nBody component to ASCII.
Code lines: 16

Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string string_handling

function: nodecomponentnbodynullserializecount
Description: Return a count of the serialization of a null implementation of the nBody component.
Code lines: 15
Contained by: module galacticus_nodes

subroutine: nodecomponentnbodynullserializeoffsets
Description: Compute offsets into serialization arrays for a null implementation of the nBody component.
Code lines: 22
Contained by: module galacticus_nodes

subroutine: nodecomponentnbodynullserializeraw
Description: Serialize the contents of a null implementation of the nBody component to raw (binary) file.
Code lines: 14
Contained by: module galacticus_nodes

subroutine: nodecomponentnbodynullserializevalues
Description: Serialize evolvable properties of a null implementation of the nBody component to array.
Code lines: 17
Contained by: module galacticus_nodes

subroutine: nodecomponentnbodynullserializexml
Description: Serialize the contents of a null implementation of the nBody component to XML.
Code lines: 14
Contained by: module galacticus_nodes

function: nodecomponentnbodynullsizeof
Description: Return the size in bytes of a null implementation of the nBody component.
Code lines: 9
Contained by: module galacticus_nodes

function: nodecomponentnbodynulltype
Description: Returns the type name for the null implementation of the nBody component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: nodecomponentnbodyremove
Description: Remove an instance of the nBody component from a node.
Code lines: 42
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: nodecomponentnbodyserializeascii
Description: Serialize the content of a nBody component to ASCII.
Code lines: 16
Contained by: module galacticus_nodes

Modules used: galacticus_display iso_varying_string

function: nodecomponentnbodysizeof
Description: Return the size in bytes of a nodeComponentNBody component.
Code lines: 9
Contained by: module galacticus_nodes

function: nodecomponentnbodytype
Description: Returns the type name for the nBody component class.
Code lines: 13
Contained by: module galacticus_nodes

type: nodecomponentposition
Description: Type for the position component class.
Code lines: 369
Contained by: module galacticus_nodes

subroutine: nodecomponentpositionbuilder
Description: Build a generic position component from a supplied XML definition.
Code lines: 19
Contained by: module galacticus_nodes
Modules used: fox_dom galacticus_error

subroutine: nodecomponentpositioncreate
Description: Create the position component of self.
Code lines: 38
Contained by: module galacticus_nodes
Modules used: galacticus_display galacticus_error iso_varying_string string_handling

subroutine: nodecomponentpositiondestroy
Description: Destroy the position component of self
Code lines: 15
Contained by: module galacticus_nodes

subroutine: nodecomponentpositiondumpascii
Description: Dump the content of a position component.
Code lines: 16
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string

subroutine: nodecomponentpositionfinalize
Description: Finalize a generic position component.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: nodecomponentpositioninitialize
Description: Initialize a generic position component.
Code lines: 15

Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: nodecomponentpositionmove
Description: Move instances of the position component, from one node to another.
Code lines: 98
Contained by: module galacticus_nodes
Modules used: galacticus_error

type: nodecomponentpositionnull
Description: Class for the null implementation of the position component.
Code lines: 124
Contained by: module galacticus_nodes

subroutine: nodecomponentpositionnullbuilder
Description: Build a null implementation of the position component from a supplied XML definition.
Code lines: 18
Contained by: module galacticus_nodes
Modules used: fox_dom galacticus_error memory_management

subroutine: nodecomponentpositionnulldeserializeraw
Description: Deserialize the contents of a null implementation of the position component from raw (binary) file.
Code lines: 16
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: nodecomponentpositionnulldeserializevalues
Description: Deserialize evolvable properties of a null implementation of the position component from array.
Code lines: 17
Contained by: module galacticus_nodes

subroutine: nodecomponentpositionnullfinalize
Description: Finalize a null implementation of the position component.
Code lines: 13
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: nodecomponentpositionnullinitialize
Description: Initialize a null member of the position component.
Code lines: 11
Contained by: module galacticus_nodes

function: nodecomponentpositionnullisactive
Description: Return true if the null implementation of the position component is the active choice.
Code lines: 8
Contained by: module galacticus_nodes

function: `nodecomponentpositionnullnamefromindex`
Description: Return the name of the property of given index for a `null` implementation of the `position` component class.
Code lines: 21
Contained by: module galacticus_nodes
Modules used: iso_varying_string

subroutine: `nodecomponentpositionnullserializeascii`
Description: Serialize the contents of a null implementation of the position component to ASCII.
Code lines: 16
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string string_handling

function: `nodecomponentpositionnullserializecount`
Description: Return a count of the serialization of a null implementation of the position component.
Code lines: 15
Contained by: module galacticus_nodes

subroutine: `nodecomponentpositionnullserializeoffsets`
Description: Compute offsets into serialization arrays for a `null` implementation of the `position` component.
Code lines: 22
Contained by: module galacticus_nodes

subroutine: `nodecomponentpositionnullserializeraw`
Description: Serialize the contents of a null implementation of the position component to raw (binary) file.
Code lines: 14
Contained by: module galacticus_nodes

subroutine: `nodecomponentpositionnullserializevalues`
Description: Serialize evolvable properties of a `null` implementation of the `position` component to array.
Code lines: 17
Contained by: module galacticus_nodes

subroutine: `nodecomponentpositionnullserializexml`
Description: Serialize the contents of a null implementation of the position component to XML.
Code lines: 14
Contained by: module galacticus_nodes

function: `nodecomponentpositionnullsizeof`
Description: Return the size in bytes of a null implementation of the position component.
Code lines: 9
Contained by: module galacticus_nodes

function: `nodecomponentpositionnulltype`
Description: Returns the type name for the null implementation of the position component class.

Code lines: 13
Contained by: module galacticus_nodes

type: nodecomponentpositionpreset
Description: Class for the preset implementation of the position component.
Code lines: 164
Contained by: module galacticus_nodes

subroutine: nodecomponentpositionpresetbuilder
Description: Build a preset implementation of the position component from a supplied XML definition.
Code lines: 41
Contained by: module galacticus_nodes
Modules used: fox_dom galacticus_error memory_management

subroutine: nodecomponentpositionpresetdeserializeraw
Description: Deserialize the contents of a preset implementation of the position component from raw (binary) file.
Code lines: 26
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: nodecomponentpositionpresetdeserializevalues
Description: Deserialize evolvable properties of a preset implementation of the position component from array.
Code lines: 17
Contained by: module galacticus_nodes

subroutine: nodecomponentpositionpresetfinalize
Description: Finalize a preset implementation of the position component.
Code lines: 13
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: nodecomponentpositionpresetinitialize
Description: Initialize a preset member of the position component.
Code lines: 13
Contained by: module galacticus_nodes

function: nodecomponentpositionpresetisactive
Description: Return true if the preset implementation of the position component is the active choice.
Code lines: 8
Contained by: module galacticus_nodes

function: nodecomponentpositionpresetnamefromindex
Description: Return the name of the property of given index for a preset implementation of the position component class.
Code lines: 21
Contained by: module galacticus_nodes
Modules used: iso_varying_string

type: `nodecomponentpositionpresetorphans`
Description: Class for the presetOrphans implementation of the position component.
Code lines: 245
Contained by: module galacticus_nodes

subroutine: `nodecomponentpositionpresetorphansbuilder`
Description: Build a `presetOrphans` implementation of the `position` component from a supplied XML definition.
Code lines: 58
Contained by: module galacticus_nodes
Modules used: `fox_dom` galacticus_error memory_management

subroutine: `nodecomponentpositionpresetorphansdeserializeraw`
Description: Deserialize the contents of a presetOrphans implementation of the position component from raw (binary) file.
Code lines: 39
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: `nodecomponentpositionpresetorphansdeserializevalues`
Description: Deserialize evolvable properties of a presetOrphans implementation of the position component from array.
Code lines: 17
Contained by: module galacticus_nodes

subroutine: `nodecomponentpositionpresetorphansfinalize`
Description: Finalize a `presetOrphans` implementation of the `position` component.
Code lines: 14
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: `nodecomponentpositionpresetorphansinitialize`
Description: Initialize a `presetOrphans` member of the `position` component.
Code lines: 18
Contained by: module galacticus_nodes

function: `nodecomponentpositionpresetorphansisactive`
Description: Return true if the presetOrphans implementation of the position component is the active choice.
Code lines: 8
Contained by: module galacticus_nodes

function: `nodecomponentpositionpresetorphansnamefromindex`
Description: Return the name of the property of given index for a `presetOrphans` implementation of the `position` component class.
Code lines: 16
Contained by: module galacticus_nodes
Modules used: iso_varying_string

subroutine: `nodecomponentpositionpresetorphansserializeascii`
Description: Serialize the contents of a presetOrphans implementation of the position component to ASCII.
Code lines: 49
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string string_handling

function: `nodecomponentpositionpresetorphansserializecount`
Description: Return a count of the serialization of a presetOrphans implementation of the position component.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: `nodecomponentpositionpresetorphansserializeoffsets`
Description: Compute offsets into serialization arrays for a `presetOrphans` implementation of the `position` component.
Code lines: 15
Contained by: module galacticus_nodes

subroutine: `nodecomponentpositionpresetorphansserializeraw`
Description: Serialize the contents of a presetOrphans implementation of the position component to raw (binary) file.
Code lines: 31
Contained by: module galacticus_nodes

subroutine: `nodecomponentpositionpresetorphansserializevalues`
Description: Serialize evolvable properties of a `presetOrphans` implementation of the `position` component to array.
Code lines: 17
Contained by: module galacticus_nodes

subroutine: `nodecomponentpositionpresetorphansserializexml`
Description: Serialize the contents of a presetOrphans implementation of the position component to XML.
Code lines: 29
Contained by: module galacticus_nodes

function: `nodecomponentpositionpresetorphanssizeof`
Description: Return the size in bytes of a presetOrphans implementation of the position component.
Code lines: 13
Contained by: module galacticus_nodes

function: `nodecomponentpositionpresetorphanstype`
Description: Returns the type name for the presetOrphans implementation of the position component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: `nodecomponentpositionpresetserializeascii`

Description: Serialize the contents of a preset implementation of the position component to ASCII.
Code lines: 35
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string string_handling

function: nodecomponentpositionpresetserializecount
Description: Return a count of the serialization of a preset implementation of the position component.
Code lines: 15
Contained by: module galacticus_nodes

subroutine: nodecomponentpositionpresetserializeoffsets
Description: Compute offsets into serialization arrays for a preset implementation of the position component.
Code lines: 22
Contained by: module galacticus_nodes

subroutine: nodecomponentpositionpresetserializeraw
Description: Serialize the contents of a preset implementation of the position component to raw (binary) file.
Code lines: 20
Contained by: module galacticus_nodes

subroutine: nodecomponentpositionpresetserializevalues
Description: Serialize evolvable properties of a preset implementation of the position component to array.
Code lines: 17
Contained by: module galacticus_nodes

subroutine: nodecomponentpositionpresetserializexml
Description: Serialize the contents of a preset implementation of the position component to XML.
Code lines: 23
Contained by: module galacticus_nodes

function: nodecomponentpositionpresetsizeof
Description: Return the size in bytes of a preset implementation of the position component.
Code lines: 12
Contained by: module galacticus_nodes

function: nodecomponentpositionpresettype
Description: Returns the type name for the preset implementation of the position component class.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: nodecomponentpositionremove
Description: Remove an instance of the position component from a node.
Code lines: 58
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: `nodecomponentpositionserializeascii`
Description: Serialize the content of a `position` component to ASCII.
Code lines: 16
Contained by: module `galacticus_nodes`
Modules used: `galacticus_display` `iso_varying_string`

function: `nodecomponentpositionsizeof`
Description: Return the size in bytes of a nodeComponentPosition component.
Code lines: 9
Contained by: module `galacticus_nodes`

type: `nodecomponentpositiontracedarkmatter`
Description: Class for the traceDarkMatter implementation of the position component.
Code lines: 142
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentpositiontracedarkmatterbuilder`
Description: Build a `traceDarkMatter` implementation of the `position` component from a supplied XML definition.
Code lines: 27
Contained by: module `galacticus_nodes`
Modules used: `fox_dom` `galacticus_error` `memory_management`

subroutine: `nodecomponentpositiontracedarkmatterdeserializeraw`
Description: Deserialize the contents of a traceDarkMatter implementation of the position component from raw (binary) file.
Code lines: 19
Contained by: module `galacticus_nodes`
Modules used: `memory_management`

subroutine: `nodecomponentpositiontracedarkmatterdeserializevalues`
Description: Deserialize evolvable properties of a traceDarkMatter implementation of the position component from array.
Code lines: 17
Contained by: module `galacticus_nodes`

subroutine: `nodecomponentpositiontracedarkmatterfinalize`
Description: Finalize a `traceDarkMatter` implementation of the `position` component.
Code lines: 11
Contained by: module `galacticus_nodes`
Modules used: `memory_management`

subroutine: `nodecomponentpositiontracedarkmatterinitialize`
Description: Initialize a `traceDarkMatter` member of the `position` component.
Code lines: 10
Contained by: module `galacticus_nodes`

function: `nodecomponentpositiontracedarkmatterisactive`

Description: Return true if the traceDarkMatter implementation of the position component is the active choice.
Code lines: 8
Contained by: module galacticus_nodes

function: `nodecomponentpositiontracedarkmatternamefromindex`

Description: Return the name of the property of given index for a `traceDarkMatter` implementation of the `position` component class.
Code lines: 21
Contained by: module galacticus_nodes
Modules used: iso_varying_string

subroutine: `nodecomponentpositiontracedarkmatterserializeascii`

Description: Serialize the contents of a traceDarkMatter implementation of the position component to ASCII.
Code lines: 24
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string string_handling

function: `nodecomponentpositiontracedarkmatterserializecount`

Description: Return a count of the serialization of a traceDarkMatter implementation of the position component.
Code lines: 15
Contained by: module galacticus_nodes

subroutine: `nodecomponentpositiontracedarkmatterserializeoffsets`

Description: Compute offsets into serialization arrays for a `traceDarkMatter` implementation of the `position` component.
Code lines: 22
Contained by: module galacticus_nodes

subroutine: `nodecomponentpositiontracedarkmatterserializeraw`

Description: Serialize the contents of a traceDarkMatter implementation of the position component to raw (binary) file.
Code lines: 14
Contained by: module galacticus_nodes

subroutine: `nodecomponentpositiontracedarkmatterserializevalues`
